## INTERIM REPORT

10

THE KING'S MOST EXCELLENT MAJESTY.

May It Please Your Majesty,

We, the Commissioners appointed to examine and report on the present conditions of agricultural and rural economy in British India, and to make recommendations for the improvement of agriculture and to promote the welfare and prosperity of the rural population ; in particular to investigate :—(a) the measures now being taken for the promotion of agricultural and veterinary research experiment, demonstration and education, for the compilation of agricultural statistics, for the introduction of new and better crops and for improvement in agricultural practice, dairy farming and the breeding of stock ; (b) the existing methods of transport and marketing of agricultural produce and stock ; (c) the methods by which agricultural operations are financed and credit afforded to agriculturists ; (d) the main factors affecting rural prosperity and the welfare of the agricultural population ; and to make recommendations ; availing ourselves of Your Majesty's permission to report our proceedings from time to time, desire to submit to Your Majesty the minutes of the evidence which we have taken up to the 7th of January 1927 on the subject of our Inquiry.

All of which we most humbly submit for Your Majesty's most gracious consideration.

(Signed) LINLITHGOW,  
*Chairman.*

## TERMS OF REFERENCE

Generally.

To examine and report on the present conditions of agriculture and rural economy in British India and to make recommendations for the improvement of agriculture and the promotion of the welfare and prosperity of the rural population ;

In particular to investigate -

- (a) the measures now being taken for the promotion of agricultural and veterinary research, experiment, demonstration and education, for the compilation of agricultural statistics, for the introduction of new and better crops and for improvement in agricultural practice, dairy farming and the breeding of stock ;
- (b) the existing methods of transport and marketing of agricultural produce and stock ;
- (c) the methods by which agricultural operations are financed and credit afforded to agriculturists ;
- (d) the main factors affecting rural prosperity and the welfare of the agricultural population ;

and to make recommendations.

It will not be within the scope of the Commission's duties to make recommendations regarding the existing system of landownership and tenancy or of the assessment of land revenue and irrigation charges, or the existing division of functions between the Government of India and the local Governments. But the Commission shall be at liberty to suggest means whereby the activities of the Governments in India may best be co-ordinated and to indicate directions in which the Government of India may usefully supplement the activities of local Governments.

## QUESTIONNAIRE

## PART I

Question.

1. Research.
2. Agricultural education.
3. Demonstration and propaganda.
4. Administration.
5. Finance.
6. Agricultural indebtedness.
7. Fragmentation of holdings.

## PART II

8. Irrigation.
9. Soils.
10. Fertilisers.
11. Crops.
12. Cultivation.
13. Crop protection.
14. Implements.

## PART III

15. Veterinary.
16. Animal husbandry.

## PART IV

17. Agricultural industries.
18. Agricultural labour.
19. Forests.
20. Marketing.
21. Tariffs and sea freights.
22. Co-operation.
23. General education.
24. Attracting capital.
25. Welfare of rural population.
26. Statistics.

## QUESTIONNAIRE

### PART I

#### 1. Research.

(a) Have you suggestions to advance for the better organisation, administration and financing of—

(i) All research affecting the welfare of the agriculturist, including research into the scientific value of the indigenous theory and traditional methods of agriculture,

(ii) Veterinary research ?

(b) If in cases known to you progress is not being made because of the want of skilled workers, or field or laboratory facilities for study or by reason of any other handicaps, please give particulars. [Suggestions of a general kind should be made under (a) ; answers under this heading should relate to specific subjects. The purpose is to secure a list of the problems met with by scientific investigators in the course of their work which are being held over because of lack of resources or deficient organisation.]

(c) Can you suggest any particular subject for research not at present being investigated to which attention might usefully be turned ?

#### 2. Agricultural Education.

With reference to any form of agricultural education of which you may have experience, please state your views on the following :—

(i) Is the supply of teachers and institutions sufficient ?

(ii) Is there an urgent need for extension of teaching facilities in any district or districts known to you personally ?

(iii) Should teachers in rural areas be drawn from the agricultural classes ?

(iv) Are the attendances at existing institutions as numerous as you would expect in present circumstances ; if not, state reasons. Can you suggest measures likely to stimulate the demand for instruction ?

(v) What are the main incentives which induce lads to study agriculture ?

(vi) Are pupils mainly drawn from the agricultural classes ?

(vii) Are there any modifications in existing courses of study which appear to be called for ; if so, what are they ?

(viii) What are your views upon (a) nature study ; (b) school plots ; (c) school farms ?

(ix) What are the careers of the majority of students who have studied agriculture ?

(x) How can agriculture be made attractive to middle class youths ?

(xi) Are there recent movements for improving the technical knowledge of students who have studied agriculture ?

- (xii) How can adult education in rural tracts be popularised ?  
 (xiii) In suggesting any scheme for better educational facilities in rural areas, please give your views for (a) its administration and (b) its finance.

### 3. Demonstration and Propaganda.

(a) What are the measures which in your view have been successful in influencing and improving the practice of cultivators ?

(b) Can you make suggestions for increasing the effectiveness of field demonstrations ?

(c) Can you suggest methods whereby cultivators may be induced to adopt expert advice ?

(d) If you are aware of any striking instances of the success or the failure of demonstration and propaganda work, please give particulars and indicate the reasons for success or for failure.

### 4. Administration.

(a) Do you wish to suggest means towards the better co-ordination of the activities of the Governments in India or to indicate directions in which the Government of India may usefully supplement the activities of the local Governments ?

(b) Is it your opinion that the expert scientific knowledge required in the development of agriculture in the different Provinces could be supplied to a greater extent than is the case at present by increasing the scientific staff of the Government of India ? If so, indicate the types of work which would benefit by pooling the services of experts, and suggest how that work should be controlled.

(c) Are you satisfied from the agricultural standpoint with the services afforded by—

- (i) The Agricultural and Veterinary Services,
- (ii) Railways and steamers,
- (iii) Roads,
- (iv) Meteorological Department,
- (v) Posts, and
- (vi) Telegraphs, including wireless ?

If not, please indicate directions in which you think these Services might be improved or extended.

### 5. Finance.

(a) What are your views as to the steps that should be taken for the better financing of agricultural operations and for the provision of short and long-term credit to cultivators ?

(b) Do you wish to suggest means whereby cultivators may be induced to make fuller use of the Government system of *taccavi* ?

### 6. Agricultural Indebtedness.

(a) What in your opinion are :—

- (i) the main causes of borrowing,
- (ii) the sources of credit, and
- (iii) the reasons preventing repayment.

(b) What measures in your opinion are necessary for lightening agriculture's burden of debt? For example, should special measures be taken to deal with rural insolvency, to enforce the application of the Usurious Loans Act, or to facilitate the redemption of mortgages?

(c) Should measures be taken to restrict or control the credit of cultivators such as limiting the right of mortgage and sale? Should non-terminable mortgages be prohibited?

## 7. Fragmentation of Holdings.

(a) Do you wish to suggest means for reducing the loss in agricultural efficiency attendant upon the excessive subdivision of holdings?

(b) What are the obstacles in the way of consolidation and how can they be overcome?

(c) Do you consider legislation to be necessary to deal with minors widows with life interest, persons legally incapable, alienation and discontents, and to keep disputes out of the courts?

## PART II

### 8. Irrigation.

(a) Name any district or districts in which you advocate the adoption of new irrigation schemes, or suggest extensions or improvements in the existing systems or methods of irrigation by—

- (i) Perennial and non-perennial canals,
- (ii) Tanks and ponds,
- (iii) Wells.

What are the obstacles in your district or Province to the extension of irrigation by each of the above methods?

(b) Are you satisfied with the existing methods of distributing canal water to cultivators? Describe the methods that have been employed to prevent wastage of water by evaporation and by absorption in the soil. What form of outlet for distribution to cultivators, at the tail end do you regard as the most equitable and economical? Have these methods and devices been successful, or do you wish to suggest improvements?

(N.B.—Irrigation charges are *not* within the terms of reference of the Commission, and should not be commented upon.)

### 9. Soils.

(a) Have you suggestions to make—

- (i) for the improvement of soils, whether by drainage or other means, not dealt with under other headings in this questionnaire.
- (ii) for the reclamation of Alkali (Usar) or other uncultivable land,
- (iii) for the prevention of the erosion of the surface soil by flood water.

(b) Can you give instances of soils known to you which, within your recollection, have—

- (i) undergone marked improvement,
- (ii) suffered marked deterioration?

If so, please give full particulars.

(c) What measures should Government take to encourage the reclamation of areas of cultivable land which have gone out of cultivation ?

#### 10. Fertilisers.

(a) In your opinion, could greater use be profitably made of natural manures or artificial fertilisers ? If so, please indicate the directions in which you think improvement possible.

(b) Can you suggest measures to prevent the fraudulent adulteration of fertilisers ?

(c) What methods would you employ to popularise new and improved fertilisers ?

(d) Mention any localities known to you in which a considerable increase in the use of manures has recently taken place.

(e) Has effect of manuring with phosphates, nitrates, sulphate of ammonia, and potash manures been sufficiently investigated ? If so, what is the result of such investigation ?

(f) What methods would you employ to discourage the practice of using cowdung as fuel ?

#### 11. Crops.

(a) Please give your views on—

- (i) the improvement of existing crops,
- (ii) the introduction of new crops including fodder crops,
- (iii) the distribution of seeds,
- (iv) the prevention of damage by wild animals.

(b) Can you suggest any heavy yielding food crops in replacement of the present crops ?

(c) Any successful efforts in improving crops or substituting more profitable crops which have come under your own observation should be mentioned.

#### 12. Cultivation.

Can you suggest improvements in—

- (i) the existing system of tillage, or
- (ii) the customary rotations or mixtures of the more important crops ?

#### 13. Crop Protection, Internal and External.

Please give your views on—

- (i) The efficacy and sufficiency of existing measures for protection of crops from external infection, pests and diseases.
- (ii) The desirability of adopting internal measures against infection.

#### 14. Implements.

(a) Have you any suggestion for the improvement of existing, or the introduction of new, agricultural implements and machinery ?

(b) What steps do you think may usefully be taken to hasten the adoption by the cultivator of improved implements ?

(c) Are there any difficulties which manufacturers have to contend with in the production of agricultural implements or their distribution for sale throughout the country? If so, can you suggest means by which these difficulties may be removed?

### PART III

#### 15. Veterinary.

(a) Should the Civil Veterinary Department be under the Director of Agriculture or should it be independent?

(b) (i) Are dispensaries under the control of Local (District) Boards? Does this system work well?

(ii) Is the need for expansion being adequately met?

(iii) Would you advocate the transfer of control to Provincial authority?

(c) (i) Do agriculturists make full use of the veterinary dispensaries? If not, can you suggest improvements to remedy this?

(ii) Is full use made of touring dispensaries?

(d) What are the obstacles met with in dealing with contagious diseases? Do you advocate legislation dealing with notification, segregation, disposal of diseased carcasses, compulsory inoculation of contacts and prohibition of the movement of animals exposed to infection? Failing legislation, can you suggest other means of improving existing conditions?

(e) Is there any difficulty in securing sufficient serum to meet the demand?

(f) What are the obstacles in the way of popularising preventive inoculation? Is any fee charged, and, if so, does this act as a deterrent?

(g) Do you consider that the provision of further facilities for research into animal disease is desirable?

If so, do you advocate that such further facilities should take the form of—

(i) an extension of the Muktesar Institute, or

(ii) the setting up, or extension of, Provincial Veterinary Research Institutions?

(h) Do you recommend that special investigations should be conducted by—

(i) officers of the Muktesar Institute, or

(ii) research officers in the Provinces?

(i) Do you recommend the appointment of a Superior Veterinary Officer with the Government of India? What advantages do you expect would result from such an appointment?

#### 16. Animal Husbandry.

(a) Do you wish to make suggestions for—

(i) improving the breeds of livestock,

(ii) the betterment of the dairying industry,

(iii) improving existing practice in animal husbandry?

(b) Comment on the following as causes of injury to cattle in your district—

(i) Overstocking of common pastures, ;

(ii) Absence of enclosed pastures, such as grass borders in tilled fields,

(iii) Insufficiency of dry fodder such as the straw of cereals or the stems and leaves of pulses,

(iv) Absence of green fodders in dry seasons,

(v) Absence of mineral constituents in fodder and feeding stuffs.

(c) Please mention the months of the year in which fodder shortage is most marked in your district. For how many weeks does scarcity of fodder usually exist? After this period of scarcity ends how many weeks elapse before young growing cattle begin to thrive?

(d) Can you suggest any practicable methods of improving or supplementing the fodder supply that would be applicable to your district?

(e) How can landowners be induced to take a keener practical interest in these matters?

#### PART IV

##### 17. Agricultural Industries.

(a) Can you give any estimate of the number of days of work done by an average cultivator on his holding during the year? What does he do in the slack season?

(b) Can you suggest means for encouraging the adoption of subsidiary industries? Can you suggest any new subsidiary industries to occupy the spare time of the family which could be established with Government aid?

(c) What are the obstacles in the way of expansion of such industries as beekeeping, poultry rearing, fruit growing, sericulture, pisciculture, lac culture, rope making, basket making, etc.?

(d) Do you think that Government should do more to establish industries connected with the preparation of agricultural produce for consumption, such as oil pressing, sugar making, cotton ginning, rice hulling, utilisation of wheat straw for card-board, utilisation of cotton seed for felt, fodder, oil and fuel, utilisation of rice straw for paper, etc.?

(e) Could subsidiary employment be found by encouraging industrial concerns to move to rural areas? Can you suggest methods?

(f) Do you recommend a more intensive study of each rural industry in its technical, commercial and financial aspects, with a view to, among other things, introduction of improved tools and appliances?

(g) Can you suggest any other measures which might lead to greater rural employment?

(h) Can you suggest means whereby the people could be induced to devote their spare time to improving the health conditions of their own environment?

### 18. Agricultural Labour.

(a) What measures, if any, should be taken to attract agricultural labour from areas in which there is a surplus to—

(i) areas under cultivation in which there is a shortage of such labour?  
and

(ii) areas in which large tracts of cultivable land remain uncultivated?

Please distinguish between suggestions designed to relieve seasonal unemployment and proposals for the permanent migration of agricultural population.

(b) If there is any shortage of agricultural labour in your Province, what are the causes thereof and how could they be removed?

(c) Can you suggest measures designed to facilitate the occupation and development, by surplus agricultural labour, of areas not at present under cultivation?

### 19. Forests.

(a) Do you consider that forest lands as such are at present being put to their fullest use for agricultural purposes? For instance, are grazing facilities granted to the extent compatible with the proper preservation of forest areas? If not, state the changes or developments in current practice which you consider advisable.

(b) Can you suggest means whereby the supply of firewood and fodder in rural areas may be increased?

(c) Has deterioration of forests led to soil erosion? What remedies would you suggest for erosion and damage from floods?

(d) Can you indicate any methods by which supply of moisture in the soil, the rainfall and supply of canal water can be increased and regulated by afforestation or by the increased protection of forests so as to benefit agriculture? Would the same methods be useful in preventing the destruction by erosion of agricultural land?

(e) Is there an opening for schemes of afforestation in the neighbourhood of villages?

(f) Are forests suffering deterioration from excessive grazing? Is soil erosion being thereby facilitated? Suggest remedies.

### 20. Marketing.

(a) Do you consider existing market facilities to be satisfactory? Please specify and criticise the markets to which you refer, and make suggestions for their improvement.

(b) Are you satisfied with the existing system of marketing and distribution? If not, please indicate the produce to which you refer and describe and criticise in detail the channels of marketing and distribution from the producer to the consumer in India (or exporter in the case of produce exported overseas). State the services rendered by each intermediary and whether such intermediary acts in the capacity of merchant or commission agent, and comment upon the efficiency of these services and the margins upon which such intermediaries operate. Please describe

the method by which each transaction is financed, or in the case of barter, by which an exchange is effected.

(c) Do you wish to suggest steps whereby the quality, purity, grading or packing of agricultural produce may be improved, distinguishing where possible between produce destined for—

(i) Indian markets ?

(ii) Export markets ?

(d) Do you think that more effective steps might be taken to place at the disposal of cultivators, merchants and traders information as to market conditions, whether Indian or overseas ; crop returns ; complaints as to Indian produce from wheresoever originating ; and agricultural and marketing news in general ?

## 21. Tariffs and Sea Freights.

Do existing (a) customs duties, both import and export, and (b) sea freights adversely affect the prosperity of the Indian cultivator ? If so, have you any recommendations to make ?

## 22. Co-operation.

(a) What steps do you think should be taken to encourage the growth of the co-operative movement—

(i) by Government,

(ii) by non-official agencies ?

(b) Have you any observations to make upon—

(i) Credit societies ;

(ii) Purchase societies ;

(iii) Societies formed for the sale of produce or stock ;

(iv) Societies for effecting improvements—*e.g.*, the digging of wells and the construction of bunds, walls and fences, or the planting of hedges ;

(v) Societies formed for the aggregation of fragmented holdings and their redistribution in plots of reasonable size ;

(vi) Societies for the co-operative use of agricultural machinery ;

(vii) Societies for joint farming ;

(viii) Cattle breeding societies ;

(ix) Societies formed for any purpose connected with agriculture or with the betterment of village life, but not specified above ?

(c) Where co-operative schemes for joint improvement, such as co-operative irrigation or co-operative fencing or a co-operative consolidation of holdings scheme, cannot be given effect to owing to the unwillingness of a small minority to join, do you think legislation should be introduced in order to compel such persons to join for the common benefit of all ?

(d) Do you consider that those societies of which you have personal knowledge have, in the main, achieved their object ?

### 23. General Education.

(a) Do you wish to make observations upon existing systems of education in their bearing upon the agricultural efficiency of the people? If you make suggestions, please distinguish, as far as possible, between—

- (i) Higher or collegiate,
- (ii) Middle school, and
- (iii) Elementary school education.

(b) (i) Can you suggest any methods whereby rural education may improve the ability and culture of agriculturists of all grades while retaining their interest in the land?

(ii) What is your experience of compulsory education in rural areas?

(iii) What is the explanation of the small proportion of boys in rural primary schools who pass through the fourth class?

### 24. Attracting Capital.

(a) What steps are necessary in order to induce a larger number of men of capital and enterprise to take to agriculture?

(b) What are the factors tending to discourage owners of agricultural land from carrying out improvements?

### 25. Welfare of Rural Population.

(a) Outside the subjects enumerated above, have you any suggestions to offer for improving hygiene in rural areas and for the promotion of the general well-being and prosperity of the rural population?

(b) Are you, for instance, in favour of Government conducting economic surveys in typical villages with a view to ascertaining the economic position of the cultivators? If so, what, in your opinion, should be the scope and methods of such enquiries?

(c) If you have carried out anything in the nature of such intensive enquiry, please state the broad conclusions which you reached.

### 26 Statistics.

(a) Do you wish to make suggestions for the extension or improvement of the existing methods of—

- (i) ascertaining areas under cultivation and crops;
- (ii) estimating the yield of agricultural produce;
- (iii) enumerating livestock and implements;
- (iv) collecting information on land tenure, the incidence of land revenue and the size of the agricultural population;
- (v) arranging and publishing agricultural statistics?

(b) Have you any other suggestions to make under this heading?

Raja Sri KRISHNA CHANDRA GAJAPATI NARAYANA DRO of Parlekumedi. Professor N. CHAKRABARTY. Dr. L. K. HALLER. Mr. B. S. KAMAT.
---	---

Mr. J. N. GUPTA, I.C.S.  
 Rai A. O. DASGUPTA Bahadur. } (*Co-opted Members*).

Mr. J. A. MANN, I.C.S.  
 Mr. F. W. H. SMITH. } (*Joint Secretaries*).

Mr. R. S. FINLOW, B.Sc., F.I.C., Director of Agriculture, Bengal,  
 and

Mr. K. McLEAN, Assistant Director of Agriculture, Bengal

#### Replies to the Questionnaire

QUESTION I.—RISERACH.—(a) The organisation of the Bengal Agricultural Department for research has been explained in several memoranda, submitted to the Commission in June 1926.

The system of research has worked satisfactorily as far as it has been applied, and very valuable results have been achieved in the production of improved strains of staple crops; investigation of material necessities of the various types of soil in the Province; improvement in agricultural practice, etc. Much more research is needed however and some important matters have not yet been touched, e.g., irrigation, poultry, fruit, etc. It is also of great importance to carry out a soil survey at the earliest possible date in order to enable advice in regard to manurial results to be given without the delay involved in soil analysis.

Irrigation may prove to be the crucial factor in deciding whether Bengal shall make an appreciably larger advance in agricultural prosperity than would otherwise be the case.

Increasing the supply of fodder must be, in any tract, a question of cultivation during the dry weather if a corresponding diminution of the human food supply is not to take place, and irrigation is the only key to hot weather cultivation in Bengal or elsewhere.

Mr. R. S. Finlow and  
 Mr. K. McLean.

It will be gathered that while results have already been obtained which are amply sufficient to prove to demonstration the value of careful scientific investigations into Bengal agriculture, there is still much to be done including several lines of work which have not yet been touched. Much of this research is of local importance and must be done by increasing the staff of local experts. For instance it has already been arranged that cattle, poultry and irrigation, are each to have their own special officers, but fruit and luo, which probably have considerable prospects of expansion in Bengal still await attention. On the other hand, cotton, paddy, oil-seeds, pulses, Bimphatam jute, hemp, etc., are all-India crops, and it is to be considered whether an extra Provincial or all-India organisation would not in the end do greater service on the investigation of these crops. Jute is also now grown in four Provinces, viz., Bengal, Bihar, Assam and the United Provinces and may be included on these grounds. Much work has of course already been done on jute by the Bengal Department of Agriculture and it is probable that for some years the races of jute already available as a result of this work may not be much improved on. On the other hand, a hybrid or a mutation may arise which will give yields far higher than the ones now in existence. At the same time the subject of manures requires much further investigation and this is of great importance, as jute is one of the crops in a rotation which receives manure. If sugarcane is also in the rotation, it probably receives the bulk of the manure, but otherwise jute takes its place in this respect.

The success of the Indian Cotton Committee has led to a suggestion that the principle on which this Committee is established could, with advantage, be extended to other crops or groups of crops and that, while not replacing local research, the Government of India, working through such committees, could supplement local research on the respective subjects. Such a suggestion seems worthy of examination. In the first place it is admitted that prosperous agriculture is the most potent influence making towards the welfare of the State, and every reasonable suggestion is therefore worthy of examination. It is possible that under provincial control research may not prosper as it should, and a system of committees as mentioned above would probably not be subject to the same influences and would insure that investigations into any particular subject would not languish. Secondly, when each Province is working in a watertight compartment as it were, there must be a good deal of unnecessary overlapping which could be avoided. Another objection would be that prominent members of the respective trades would become collaborators in scientific investigations into the staples in which they are commercially interested, a matter of great importance. Moreover, at least a portion of the cost of the work of the committee would be recovered by a rise on the produce in question. There are powerful arguments in favour of such a scheme and it would appear that they should receive serious attention. It is necessary to say that there would be no object in the Government of India assuming responsibility for all research, any more than the Central Cotton Committee does so as far as cotton research is concerned. The Provincial Governments still continue research into cotton, their work being probably stimulated rather than the reverse, by suggestions, or criticism, and possibly to some extent by a spirit of emulation. Thus while such research committees would not tend to discourage local research, they would greatly help local departments in carrying out work for which men and funds are not available locally.

In regard to the indigenous theory and the traditional methods of Indian agriculture, it seems that every expert working in this country must be aware, and take account, of local conditions. It would be different if the research work were not being done on the spot—in Europe for instance.

(4) & (c) are both answered in the above, which also deals with (a) and (b) of Question 4

QUESTION 2.—AGRICULTURAL EDUCATION.—(i) & (ii) At the present time there is no institution for higher agricultural education in North-Eastern India. The Agricultural College at Sabour, then in the Province of Bengal as it was after the first partition in 1905, by arrangement catered for Eastern Bengal and Assam. Sabour was closed in 1922 because of lack of students from the Province of Bihar in which Sabour was included after the repartition of Bengal in 1912. The history of Sabour is that at first, as long as it was thought that the course might provide an easy entry into Government service, the College was full of students, but when no Government posts could be offered, the entries declined rapidly. It is still not certain that the demand has increased since 1922; but Bengal will soon have to recruit considerably more agricultural officers in the subordinate grade, and the number of holders of Sabour diplomas who are still disengaged is very small. This is where Bengal may be badly held up. At the same time there is no doubt that the old Sabour course was woefully deficient and that the Sabour students who joined this department were of no practical use without further training. The entrance qualification for Sabour was Matriculation, and it appears that practically no boys take any science subject for Matriculation. Therefore recruits for Sabour arrived with no knowledge at all of science. Moreover, many recruits were town-bred boys;

Mr. R. S. Finlow and

Mr. K. McLean.

and there had not only, in a two years' course, to assimilate the elements of science on which the course was based, but to absorb the principles of practical agriculture—an obvious impossibility. We have now found that an average Sahour graduate to only becomes of real use as a District Agricultural Officer after he has been sent for training to the Dacca farm and attached in turn to the Expert Sections and as an Overseer on the farm. In fact one or two of the most efficient agricultural officers have first spent some years as Assistants in the Expert Section at Dacca. Their work during this period not only makes them thoroughly familiar with the essentials of the research which is being conducted at Dacca; but the field work involved in the research gives them a reasonable practical training. Such men make efficient propaganda agents and their experience at Dacca soon enables them to run a small district farm of 20 acres or so quite creditably. There is the reason for believing that a preliminary training in pure science, followed by two years' practical work at the Dacca farm, is capable of producing a reasonably efficient District Agricultural Officer, who knows sufficient to enable him to benefit by experience.

This was the basis on which the scheme for the Dacca Agricultural Institute was drawn up. It contemplated taking youths, preferably of agricultural parentage, and with a minimum of training in pure science, up to Intermediate Science standard. Accepted candidates will first receive another year's pre-entrance including physics, chemistry and botany, after which they will spend two years over an almost entirely practical course at the proposed Institute. The details of the practical course are given in the draft syllabus.

The Secondary Agricultural School at Dacca is the only institution in Bengal which exists specially for teaching agriculture. Two such schools were originally established, the second being at Chinsura. It will be seen that the schools were full so long as demonstrators (Lower Subordinate Agricultural Service) were being appointed, but they emptied as soon as retrenchment put an end, for the time being, to the demand for demonstrators. The Chinsura School was closed in 1921 under orders of retrenchment and, in the meantime, Dacca School, having only had about half its complement of students, the vacant places have been utilized to give demonstrators already in the course a refresher course.

It will thus appear that there is no great genuine demand for agricultural education as such and that there is at present no indication of a demand for additional institutions. The reason is that there is a general impression that agriculture is not a profession for a gentleman and the almost purely literary curricula at the schools encourage this.

It was, in an attempt to produce a change towards a more practical training that, with Messrs. Gunn and Stapleton of the Education Department, steps were taken which led up to the sending of Mr. Stapleton's committee to study the Punjab system of agricultural education in schools. This system has now been approved by Government in Bengal and, given approval of the Council, a start will be made in the next year, 1927.

Generally it would seem that a real demand for vocational agricultural education could not be expected before the mass of the people are aware, not only that there are facilities for such education, but also that it is likely to do real good. The introduction of agriculture into the curricula of schools on the Punjab system will do this by making boys learn in the ordinary course of their school career, and just as they learn geography or mathematics, that there is such a thing as improved agriculture; also that agriculture is not a degrading profession. This in itself will lead to a demand for further training at secondary schools and later at the Agricultural Institute—*vide Agricultural Journal of India*, Volume XI, Part I, January 1910.

(iii) The Punjab scheme contemplates that teachers of agriculture shall belong to the agricultural classes; but it does not seem to be essential that teachers of other subjects should necessarily be drawn from the country.

(iv), (v) & (vi) Deal with above.

(vii) Pupils at the Dacca Agricultural School must be one of people who are cultivators or directly connected with cultivation of the land.

(viii) Nature study has been tried in primary schools for years, but is making little or no progress, owing partly, it is said, to lack of training in teachers and consequent lack of interest. It would seem that the only way to ameliorate this state of affairs is to improve the course of training at the  *guru-training*  schools, but whether such improvement is possible, or would properly equip a  *guru*  to train children in nature study and gardening, is not possible to say. Only experience can decide and any extra training the  *guru*  may get at a reasonable cost, must all be in the right direction.

For the agricultural class in middle and high schools, the farm of upto 5 acres must be preferable to a school garden, if only to make the boy demonstrate to himself the truth of what he has been told in the class regarding possible improvements in agricultural practice. The objection to the farm is that it is too expensive; but we think it should be looked upon not only in the light of a school training ground but as a demonstration farm for the neighbourhood. If well run, such small farms, scattered all over the country

Mr. R. S. Plowman  
Mr. K. McLenn.

would be valuable aids in familiarising the public with agricultural improvement. It has been objected to the Punjab scheme that it will not touch the boy who does not go beyond a primary school. It is probable that apart from the doubtful wisdom of attempting to teach agriculture to mere children, the expense of a sufficiently qualified master for all primary schools would be prohibitive. In this case the small farms at middle or high schools would help to bring the boy who has left the primary school, as well as neighbouring cultivators, into visual contact with departmental recommendations for improvements in agriculture.

(12) Of the number of Bengal students who attended the Sabour College, practically all have gone into Government service. All are not now in the Agricultural Department as, after retrenchment, some were taken into other departments.

Of students at the Agricultural school at Dacca, the following information is available:—

The condition of entry into the school is that a candidate must be a son of a cultivator or be directly connected with the land. Of 45 old students of the school whose whereabouts are known, 24 are engaged more or less directly in agriculture. Sixteen have taken agriculture as their sole occupation either as farmers, fieldmen or estate or agricultural teachers in schools, four combine agriculture with shopkeeping and four are employed as agents by a manure firm. Two or three remain unemployed.

(2) *vide* remarks on Question 2 (i) and (ii) above. The introduction of agriculture into the ordinary educational system will tend in this direction, especially as it becomes more and more realised that the openings for boys with purely literary education are limited. A third factor is that the cultivator, in jute growing tracts at any rate, is probably decidedly better off than the so-called *bhadralog*. The cultivator grows his own food to a very large extent, and, however high its price, he keeps enough to feed himself and family. On the other hand the *bhadralog* have to buy food, and suffer correspondingly when the price goes up. This will tend to drive the *bhadralog* youth towards agriculture. On the other hand it is important that the idea that a *bhadralog* must farm a large area of land should not be propagated. There is little or no good land to spare in Bengal and for every large farm a number of ordinary cultivators have to become landless labourers. This seems just what should be avoided, as a system of peasant proprietors, each with a stake in the country, tends towards political stability. The students from any ordinary course at an agricultural college must be, like the average raw graduate in science, of little use without considerable practical experience. This can only come in the case of agriculture from living in a farm and helping to work it.

In Bengal there is a training reserve of six agricultural officers (Subordinate Service) who are attached to the Dacca farm for further practical training. There is also provision at district farms and sericultural nurseries for sons of cultivators, and still rarer to come to farms or nurseries, at ordinary labourers' wages, on condition that they are taught improved practice in their respective professions. Even here it is being found that a whole year at a farm or a nursery tends in many cases towards a desire in the youth to forsake farming as a livelihood and to seek Government service. It has been suggested that, instead of one whole year in one period, two periods of six months each, at an appreciable interval from each other, might avoid this difficulty.

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.**—(a) By reference to the *Review of Agricultural Operations in India 1923-24*, and annual reports on the work of the Agricultural Department in Bengal it will be gathered that in ordinary circumstances the dissemination of improved seed is the first obvious step in improving the practice of cultivators, and this has been done on a large scale throughout India. Nearly all other improvements involve the expenditure of considerable capital which the ordinary cultivator cannot afford. Credit facilities on a large scale thus become necessary and moreover, the cultivator is apparently more cautious, where he knows he is involving himself in debt. He may have a bad season when perhaps manures, for instance, will not pay the cost of application.

In North-Eastern India a striking demonstration of how the cultivator, once convinced, is capable of taking up an improvement in a wholesale manner is the use of Messrs. Renwick's iron sugarcane mills and boiling pans. Messrs. Renwick's chief activity is the hiring out of these implements, which are to be found almost anywhere in Bengal or Bihar where sugarcane is grown. A considerable hiring fee is charged but an arrangement, once made, is a guarantee to the cultivator that he will be able to reap his sugarcane crop within a reasonable time. If a part of the machinery breaks and cannot be replaced at the local agency, a new part is brought up from headquarters by telegram and passenger train. The result is that substantial men well able to purchase sugarcane rollers and pans, deliberately go to Messrs. Renwick's. If they purchase their own machinery they require a *patry* to repair it or are liable for heavy fees for repairs, probably completed at such a late date, that loss, or serious diminution of profits on the crop, may occur.

Mr. R. S. Finlow and  
Mr. K. McLean.

(b) It seems likely to become our experience that, having once "broken the ice" with cultivators, i.e., having proved the genuine worth of what we have to recommend, the cultivator is prepared to trust us and to take our advice without question. Everything depends, firstly on the genuineness of the recommendation, and, secondly, on the agent making the recommendation. Even if the recommendation is a good one, its adoption by an admittedly incompetent person automatically creates difficulties. This is why we have always held that, once a result has been obtained and proved for any particular tract, the District Agricultural Officer is normally the deciding factor in the sequel. A cultivator instinctively recognises a competent man.

(c) and (d), 3(a) and 3(b) are answers to these questions.

QUESTION 4.—AGRICULTURAL SERVICES.—(a) and (b), see answer to Question 1.

(c) (1) As regards the Agricultural and Veterinary Services, I have no doubt that rapid progress in both sectors, and propaganda depends entirely on the quality of men available. Admitting the crucial importance of agriculture to the State it cannot be denied that the prospects of the Agricultural Services should be such as to attract at least as good men as those who are recruited by any other service, not excluding the executive service. I am not entitled to speak for the Veterinary Service but I can vouch for the fact that the research work of the Bengal Department of Agriculture is absolutely sound and that its results are already applied on such a scale as to make the department an overwhelmingly profitable investment for the people of Bengal. Vide Bulletin I and II of 1924-25; also departmental Annual Report for 1924-25 pages 21-23; also *Review of the Cultivation of the Cultivator in India, 1924-25*.

QUESTION 5.—FINANCE.—Financial aid to cultivators will be necessary for all improvements involving expenditure of ready money. The lining out of sugar and crushing and bullock machinery by Messrs. Roychuck & Co. of Kuchina (vide Question 2 (a)) shows that developments in this direction are possible. It would seem that similar arrangements would be possible if not advisable, not only in the case of tractors, but of other expensive implements such as harrows, ploughs and possibly threshers.

There seems some prospect that commercial firms may be prepared to take up a hire-purchase system such as is done with sewing machines.

The Agricultural and Sanitary Improvements Act is capable of being applied to drainage and irrigation schemes, but not for the purchase of seeds, manure, implements, etc. An amendment of the Act to enlarge its scope in this direction is contemplated. In effect the Agricultural and Sanitary Improvements Act is equivalent to an extension of *lazzari* which itself is the question 12—may be of considerable assistance as a preliminary to the formation of a co-operative supply society. Co-operation must of course be the ultimate essential method of financing the cultivator and if, as recent developments promise, the co-operative societies become both supply and sales as well as credit agencies, a very long step will have been taken in the solution of all the problems with which this question deals.

QUESTION 6.—AGRICULTURAL IMMOBILITIES.—(a) (i) Of those who are forced to borrow some of the main causes may be—

(a) Comparative incompetence.

(b) Misfortune such as loss of bullocks by disease; destruction of property by fire and failure of crops, etc.

(c) Expenditure on marriages and other festivals.

(ii) The ordinary *ukhajan* is the common source of credit.

(iii) The reasons preventing repayment are probably similar to those necessitating borrowing; but in addition, onerous terms of a loan may make repayment difficult or impossible.

Only a detailed enquiry can disclose the proportion of cultivators who are in debt. The proportion probably varies from district to district. It is common to find of the whole country-wide being in hopeless debt but this is not the case, and a considerable proportion of cultivators are solvent. This is probably particularly true in the jute-growing districts of Bengal. For instance, Juel (*Fernandez of a Bengal village*) says that 65 per cent of the population of Faridpur are free from debt and that only 14 per cent owe an amount equal to a year's income, i.e., are in what he calls "hopeless debt." There is little doubt that on the whole, jute growers of the most paying of all Indian crops. There have been heavy lapses, e.g., in 1914-15; but, on the whole, in the last 20 years jute may be said to have more than doubled in price, and the financial status of the jute cultivator has appreciated accordingly.

In the last year (1925-26) record prices were obtained and the cultivator who had made profits on the sale of Rs. 200, or more, per acre, certainly imported large quantities of commodities to better his housing or commodation and to increase his godown space. In Eastern Bengal ryots are reported in many cases to have paid off their debts and it is

Mr. R. S. Finlow and  
Mr. K. McLean.

certainly true that they have held up the biggest jute crop on record, for better prices, in a way which would not have been dreamt of a few years ago.

In Bengal too the price of rice has continually appreciated and though, in actual value, it costs the cultivator more, on this account, to live, he produces the rice he eats, and the surplus brings him a much better price than formerly. In these respects the cultivator is probably more fortunate in Bengal than in other parts of India.

(b) and (c) We have not sufficient special knowledge of the subjects to examine the merits of particular measures for lightening the burden of debt, but generally, it is advisable that if a cultivator is forced to borrow, he should be able to do so at a reasonable rate; and excessive interest or other onerous terms should not be allowed. Moreover, there should be nothing in ordinary procedure which would tend to hinder a debtor from discharging his debt.

Control of credit of cultivators seems advisable but it would probably be very difficult and might cause trouble. In any case alongside such protective measures as the above, in view of the small resources of the cultivator, and the necessity of expenditure of capital on implements, manures, etc., if he is to materially better his condition, it is important that constructive schemes should render credit facilities for legitimate objects easily available. It is probable that if the cultivator forms a habit of borrowing to finance improvement, his attitude towards credit in general will change, and that he will be less inclined to borrow for purchases which are not wholly justifiable.

Increase of co-operative purchase and sale societies, land mortgage banks and an extension of factories would all help in this direction.

The ryot is and must be conservative, if only because he cannot afford to be otherwise; but we have ample experience of him to know that once he understands a new policy he is found he will take to the reform in agriculture without hesitation.

**QUESTION 7.—INVESTIGATION OF HOLDINGS.**—(a) & (b) This is discussed in detail in the Report on the Consolidation of Holdings in the Punjab by Messrs. Mellan and Bose (q.v.) The points may be summarised as follows:—

In Eastern Bengal the benefits would not be so obvious as (1) reduction of boundaries would not occur as these are required for bunding water for transplanted paddy, (2) cultivators already live on their holdings not in distant villages, (3) improved implements are not necessary for paddy cultivation, (4) holdings are so small that no material benefit would be achieved.

In Northern and Western Bengal and in the *dhul* tracts consolidation of holdings would prove beneficial.

The system of land tenure in Bengal, entangling innumerable people with interest in the land, is an obstacle difficult if not impossible to overcome. Consolidation of holdings would mean fragmentation of *jotes* which would be strongly resented by the *jotedars*.

Further, the question of *salami* would have to be overcome. The whole matter requires investigation by a committee as proposed in the report.

(c) We consider that legislation on these points is necessary.

**QUESTION 8.—IRRIGATION.**—(a) (i) In Bengal the only canal at present used for irrigation is the Eden Canal in the Burdwan Division and this is only available in the monsoon and few succeeding months. A second canal to take off, like the Eden Canal, from the Damodar river, is in course of construction.

Investigation, it is said, has been made of the possibility of storing water in the highlands of Chota Nagpur, but apparently the difficulties are insuperable.

(ii) Years ago, in Western Bengal (Midnapore, Bankura, Birbhum and Burdwan districts) large *bunds* or tanks, were made on the slopes of the undulating country to hold water for irrigation of the paddy after the end of the monsoon. Gradually many *bunds* fell into decay but recently there has been a movement towards re-excavating them. Mr. G. S. Dutt, I.C.S., then Collector of Birbhum, and Rai A. C. Binnerji Bahadur were prominent in regard to this work.

Recently several small irrigation schemes involving the use of water from small rivers by means of a weir and sluice arrangement have been initiated in the districts of Bankura and Birbhum. Rai A. C. Binnerji Bahadur has been actively associated with several of them.

(iii) Wells are also used for irrigation in Western Bengal, especially in the potato-growing tract near Calcutta, and irrigation of tobacco from wells is resorted to in Rangpur, Northern Bengal.

Where there are tanks, burrow-pits, and even from rivers, water is lifted by the *dons* and the swing basket. These methods are common in Western Bengal, also, particularly in Eastern Bengal, for the irrigation of *boro* paddy in the hot weather.

(b) In memoranda on fodder, etc., already submitted to the Commission; also in other publications, including departmental annual reports, etc., it has been pointed out that irrigation has great possibilities in Bengal. Irrigation schemes would all be

Mr. R. S. Finlow and  
Mr. K. McLean.

comparatively small, and out of Birbhum, Midnapore and Bankura nearly all would depend on the pumping or on lifting of water. In the comparatively high red soil tracts of the *Chitrag* and the Madhupur jungles, tube wells might be the best means of supplying water. At the same time river water is very far away, and the whole question needs investigation. In the highlands of Western Bengal the rivers are few, and the geological formation renders it improbable that artesian wells or tube wells could be hoped for as a source of water. Apparently, therefore, this tract must largely depend on the *hums* and on the small rivers which are already described. In the rest of Burdwan Division, the Presidency Division, Eastern Bengal and many parts of Northern Bengal, e.g., Bogra, Rajshahi, Madder, etc., there is little doubt that irrigation in the cold weather and especially in the early hot weather would enormously facilitate cultivation and would, in most years, ensure bumper crops. An Agricultural Engineer is about to be appointed to this Province, but the importance of the problem is such, especially in the matter of food production, also cultivation of pyrethrum, economic crop like sugarcane, tobacco, etc., that an investigation by a special Commission would be well justified.

QUESTION 2.—*Sours*.—(a) (i) Lower Bengal is entirely deltaic and the rivers wander through it and change their courses as the process of filling up proceeds. In some tracts, particularly in the Burdwan and Presidency Divisions, interference with this natural tendency of the rivers to wander has resulted in serious deterioration of the surrounding country. In tracts of this sort to be found in the Hooghly and Khosla districts; also in Nadia, Jessore and Murshidabad districts. The deterioration in Hooghly and Hooghly is especially directly due to keeping the Haldia river within its present channel, etc., it would, under other circumstances, have overflowed the country and gradually raised it above its present level. As it is, much land is difficult to cultivate because it is too high for the transplanted paddy and yet there is a little really high land that tanks have to be dug to make lower water. Often only one crop in the year is possible, and the land is idle for six months at a time. There is little doubt that deltaic Bengal has become populated to a considerable extent before the time, and the process of fever, deterioration of rivers, etc., has not been partly due to this.

Certain portions of this tract are capable, if irrigation were available, either from rivers or from tube wells, of yielding considerable additions to the food and fodder supply of the country and this is one of the most promising avenues of development. These are the *Chitrag* and the *Madhupur* tracts, to be one portion of the area to make it, a high land capable of growing good revenue crops like sugarcane, potatoes and tobacco, and lowering a corresponding portion of it to bring it into the normal level of the *Chitrag*. The other alternative is to grow the present crop of early maturing paddy on the land as it is and utilize irrigation for hot weather cultivation of cotton, fodder, food crops, etc. The former, though probably the more efficient, would also be very expensive, while the investment to be obtained from irrigation would be a considerable immediate help. Moreover, if, in the end, pressure on the land becomes extreme the first alternative could still be employed.

In the Presidency Division many rivers have "deteriorated" i.e., their channels have gradually filled up and the water, if available as it used to be, flows elsewhere. It has been suggested that the large irrigation works up country, depending on the Ganges and the *Sour* rivers, are partly responsible for this; but in the rains the volume of water is not seriously diminished and the Ganges floods are as high as ever they were. It has also been suggested that inadequately large bridges and culverts under railways and roads diminish the sufficient velocity of flow in the river channels which have deteriorated to this extent. There are certainly some striking instances of this when a bridge of, say 100 feet span, is placed over a river whose channel is 200 feet wide. This can only result in deterioration. On the other hand natural processes are undoubtedly at work in this district, where the tendency is for rivers to leave their courses in comparatively high land, for lower tracts, which have to be gradually raised by deposition of silt from the rivers. The fact that, in such country, the banks of the rivers are the highest land in the tract is evidence of this tendency.

There are said to be two of the districts, which are most affected by "deterioration" and in both districts there are tracts which are described as "dying". The adjacent district of Faridpur also has problems which are similar though perhaps not quite so acute. Several years ago a scheme was examined for the rejuvenation of the river *Barish* in Jessore, and it was found that the *Thakur* river courses connected with the *Chitrag* or *Madhupur*, which fill with water in the rains, were mostly silted up. The result is that the water from rivers does not flow into the *Chitrag* until the flood is high, and that when it does flow into the *Chitrag* the water rises so high that it may drown even deep water paddy. Again, owing to the silted *Chitrag* the water cannot get out of the *Chitrag* in time to allow of timely sowing (cold weather) cultivation and so crops in such cases are affected. The result is bad crops followed by decreased revenue paid on the part of the people. The latter entails fever which again reacts in a vicious circle. It would

Mr. R. S. Finlow and  
Mr. K. McLean.

appears that the obvious initial action required is the re-excavation of the *dhals* between the rivers and the *bhils*. If this were done the latter would act their normal part of "spill" areas in the monsoon and as reservoirs for feeding the rivers in the cold weather. Definite instances of this are given in the note quoted above.

These problems are purely delicate and are probably unique in India but, on account of the density of the population, they are urgently worthy of serious investigation as involving promise of increased production.

(a) (ii) Erosion is chiefly to be noticed in the rolling upland tracts of the districts of Burdham, Bankura and Midnapore in Western Bengal.

The problem is a complex one. Originally the greater part of the country was probably clothed with *sal* forest which besides possibly affecting the distribution of the rainfall, if not its total quantity, held up rain water, and caused its gradual filtering down to the river channels. In course of time the forests have receded before cultivation, first to the tops of the undulations, and later, in many cases, have vanished altogether. In such tracts heavy rain gradually washes all surface soil down the slopes towards the bottom of the valleys. In the next year the rain runs more quickly off the upper portions of the slopes and carries more surface soil with it. This is in short a description of erosion, and in the end the tops of the undulations are bare and hold no rain water, which runs down the slopes into the river channel, almost as soon as it is precipitated from the clouds. The result is, firstly, that water which should have percolated slowly through the soil of the upper slopes is not available and consequently the crops which on the lower portions of the undulations had moisture to ripen their crops. This is exactly what is happening to-day in large tracts in Western Bengal. Secondly, the water running so quickly into the river channels brings the latter into heavy flood which causes frequent and serious damage in the lower reaches of the river, viz. the subdivisions of *Tantai* and *Tandak* in the district of Midnapore.

The amount of erosion which is taking place in Western Bengal at the present time is serious and will appreciably affect the potential area for the production of food in the district. The problem is one of importance in view of the encouraging results with cotton, fodder crops, pulses, etc., which are being obtained at the Government farms in the districts of Bankura and Burdham.

The only means of saving many thousands of acres of good land in Western Bengal from destruction are by (a) reforestation and (b) terracing. A judicious combination of each of these could, we have reason to believe, gradually reclaim vast areas which have suffered seriously from erosion.

(a) (iii) There are no large areas of uncultivated land in Bengal and such small areas as are available are naturally the most difficult. They would be in the undulating country of Western Bengal; in the *barind* in Northern Bengal; or the *Madhupur* jungle tract in Eastern Bengal. It seems, however, that in and around villages there is often great waste of land which could grow vegetables and other intensively cultivated crops but which are to-day, in the majority of cases, mainly areas of scrub jungle. It is allowed that there must be a certain amount of scrub in a house; also that there must be space for a cattle, and so on; but with all this the necessity to be unnecessarily waste of good land. Suitable propaganda would be the means of bringing such land into use.

QUESTION 10.—FERTILISERS.—(a) The scarcity of fertilisers in India is the natural or artificial, is vital to the scheme of agricultural development in India.

Even from the point of view of improved crops, the fertiliser question is likely to be critical in the course of time, because the improved crops mean an appreciably greater drain on the soil, which must be replaced if the improved crops are to be of permanent benefit. But apart from this, an extra increment of profit is to be looked for on many soils from a general use of fertilisers. For instance, it has been shown that based on the old red alluvium that phosphates, lime and potash (the latter for juice) are all be profitably employed; while recent results with an melon and sulphate strongly indicate that it is a useful manure on lime and lime for juice, transplanted paddy and sugarcane.

As a contrast to the old red alluvium the new alluvium or grey silt is usually rich in potash and phosphate and is liable to suffer with nitrogenous fertilisers are not yet available.

(b) The only artificial fertilisers in common use in Bengal are *oil cakes* and, to a certain extent, bone. The bone is sold by large firms, but *oil cakes*, bought from small dealers, are often badly adulterated. Legislation has been suggested to penalise adulteration, but this would probably not help the ordinary small cultivator who has no one whom he requires it, and possibly does not know whether it is adulterated, or if so used to adulteration, that he does not make any vocal protest. As far as I can see, the co-operative society is the most hopeful way of ensuring that cultivators take manures as well paid. It should be fairly easy for members of a co-operative society to pool their requirements, which would be bought under a guarantee from firms of repute. In the event of legislation the co-operative societies could have the stocks of cake dealers analysed and prosecute dishonest men.

Mr. R. S. Finlow and  
Mr. K. McLean.

As an adjunct, in tracts where sales are likely to justify it, there is a tendency for large manure firms to establish local agencies. It has even been proposed that Government farms should be utilised in this respect by the firms.

(c) Where departmental work is already known, there will be little difficulty in popularising fertilisers, provided credit facilities are available. In most such places it should not be difficult to form a co-operative society if there is not one already. In other places there is a difficulty to be overcome, although the department may demonstrate, there seems to be an initial difficulty in forming a co-operative society, and it has been suggested that this is where *taccari* loans would be of real use. At present, in Bengal at any rate, *taccari* loans are unpopular, not only with the Collector and his staff, because of the difficulty of collection, but also with the cultivators, because they are associated with times of shortage and general distress. It has already been suggested to Government by us and by Mr. Peddie, Collector of Midnapore, that the *taccari* loan might achieve a more normal object by being utilised as a preliminary to the formation of co-operative societies. For this purpose the Collector, in consultation with the Director of Agriculture, could select a few cultivators of good reputation to receive the loans for purchase of manures. These few people would then use the manure, and their crops would be a demonstration, on a sufficient scale, in the neighbourhood of having the requisite number of cultivators together for the formation of the society. Of course, in places where credit societies already exist, the matter is comparatively simple.\*

(d) The only instance of considerably increased use of artificial manure in the Province is noticeable in the potato-growing tracts near Calcutta, and to some extent in sugarcane growing tracts. There is also a distinctly increasing demand in red soil tracts for bone for transplanted paddy. As a result of propaganda, the use of water-hyacinth both rotted and as ash, is now practically universal in infected tracts, in Eastern Bengal. Instances have been noted where water-hyacinth has been carried upwards of a mile from a *hal* to manure transplanted paddy higher up.

(e) In Bengal the value of bone phosphate on red soils is now well-known; rock phosphate does not seem to produce anything like the same result as bone meal. As all red soils are acid and as practically all the remainder contain no carbonate of calcium, the use of superphosphate is not recommended.

Nitrates have not so far produced the results which might be expected. They have, however, not yet been thoroughly investigated. Probably they would do better on *rahigra*, than for the *harif* season. On pure nitrate of potash as a top dressing produced a better result than nitrate of soda. Calcium cyanamide has not given encouraging results so far.

Ammonium sulphate on jute is promising on hard land. It is to be objected to on leaving an acid residue, which is inadvisable on acid soils, which have not been limed.

It may be concluded that in good bone, lime and potash, the use of artificial fertilisers has not yet been sufficiently investigated in Bengal.

(f) In many parts of Bengal the use of cow dung remains necessary for household purposes, unless cheap supplies of coal or cheap oil-burning stoves become available. Charcoal is steadily rising in price.

OPERATION II.—(Crops).—(a) (i) Much work has been done on the production of pure line cultures of staple crops in Bengal and improved types of jute and paddy are now being taken up on a large scale. The same applies to sugarcane though the selection work on this crop has not been done in Bengal. Tobacco cultivation is spreading as a result of departmental efforts and work is in progress on cotton, jute, and oil seeds, as well as on newly imported crops, *vide* various departmental Annual Reports, Dacca, Nos. I and II of 1924, etc.

(ii) New crops recently introduced are:—ground-nuts into Western Bengal; potatoes into Eastern Bengal, several fodder crops including a millet from Manchuria; *rhana* from Bombay. Guinea grass, ray grass, etc., all these are promising in certain areas; but probably investigation will disclose further possible improvements. For instance, late maturing ground-nuts are of little use in Western Bengal as, if the soil hardens before the nuts ripen, the cost of digging is prohibitive. Selection has therefore been directed towards an early ripening type, one of which now appears to have been found.

Potato cultivation was demonstrated in Eastern Bengal in the early years immediately the formation of the Department of Agriculture and is now well known in the tract. The main difficulty is that of obtaining seed from the hills, as plants seed give tubers inferior in size.

Of the fodder crops, the Japanese millet (*Jenietum* sp.) is very promising, as it is a rapid grower and ripens seed in about 2 months. It is thus a genuine catch-crop and, given water, it can be grown over the greater part of the year. Several crops can be obtained without re-sowing, and at Dacca 4 cuttings totalling about 500 mannds (18 tons) per acre have been obtained in about 4 months. One advantage of the plant is that it

Mr. R. S. Flintow and  
Mr. R. McLean.

is succulent and nutritious throughout whereas *sergham* sp. become very hard and pithy at the base of the stem.

*Echino* takes 1-3 months to mature but, like Japanese millet, remains succulent throughout the stem. It is a very promising crop and, in combination with Japanese millet and *juar* (s. *juar* sp.), would be used to carry the rice fodder on, after the end of the rain, till the end of the year, when rice would be available. The above of course refers to unirrigated tracts.

Gumti grass is an extraordinarily useful fodder crop, a very early grower and a very luxuriant and succulent fodder crop long as there is moisture in the soil.

Some varieties of coix have obtained from the Director of Agriculture in Bihar have shown considerable promise in Western Bengal.

As indicated elsewhere, the Departmental Annual Reports for 1921-22 and 1922-23, Western Bengal, etc., the rolling upland border districts of Bighnia, Bankura and Midnapore, show practically nothing but paddy on the slopes. The rice crop in the upper terrace is always precarious and its crops are less suitable to substitute hybrid *klaf* crops. Cotton, castor, millets, etc., would not, all taken together, be able to offer a considerable variation in the price of crop requirements.

(a) (i) As regards the distribution of seeds, I have already submitted to the Commission in various annual reports.

(a) (ii) As regards the P. N. B. seed material, it does not do very serious damage. The country adjacent to the Ganges is infested with pyrs and Government is now being asked to empower the Collector of Rayachoti to pay rewards for the destruction of pyrs in the Natarail division.

Jackals do come during the soft sugarcane which is unprotected by fencing or by wrappings with trash; also to maize, which however is not a common crop. In parts of the Burdwan and Preidrey Division, muskies do damage.

(b) As mentioned in the reply to Question 11(a) (i), we are endeavouring to replace the precarious paddy crop on the highland in Western Bengal by better yielding food crops.

(c) Please see above.

Question 12 - CIRCUMSTANCES - (a) It is possible that highland cultivation and also low land cultivation might be considerably helped by tractors. But it would not do for cultivators to form societies for the purchase of such machinery, unless the number of members is sufficiently great to justify the establishment of a comprehensive workshop for repairs, in charge of a really competent manager. Will or such precautions the tractors would only cut themselves out of the owners.

In many tracts, the substitution of iron ploughs for the country plough virtually adds to the fertility of the soil. The spring tined harrow is a very useful implement for these tracts, also the drag harrow, but all are expensive and duly to be used more so. Perhaps the benefit of these implements could be secured to the cultivator by co-operative effort or by deferred payment. One of the main difficulties in regard to improved implements is the smallness of the bullocks and over-cautionness of the cultivator in regard to his bullocks even when they are big enough.

(ii) See above Question 11.

An increase in the cultivation of revenue producing crops like opium, tobacco, potatoes, etc., is possible on a considerable scale in Bengal. Results have already been achieved in this direction and the work continues.

The prospect of profitable change in rotation will be much enhanced when the problem of irrigation for Bengal is solved. It is probable that the production of fodder crop will have to be done in the dry weather season if the human food supply is not to be curtailed.

Question 13 - CIRCUMSTANCES - INTERNAL AND EXTERNAL - (a) The Government of India Crop Protection Act, if properly administered, seems sufficient protection against external infection.

(ii) The question of internal measures is one which, so far as I know, has not been sufficiently investigated.

Taking the Province of Bengal, it is possible that a pest promptly reported from one district might enable precautions to be taken in neighbouring tracts. For instance the hairy caterpillar (*diarrina obliqua*) one of the most voracious and destructive of pests, can be detected several yards away by bending and examining the under surfaces of the leaves of a crop of jute. If the pest is detected in time it can be checked in the area in which it is detected and news of its attack can at the same time be sent to adjacent tracts.

The question of protection by parasites of common pests under investigation. The parasite of the common boll-worm of cotton, discovered by Lafrey, is a case in point.

Question 14 - IMPROVEMENTS - (a) Attempts have been made to improve the Indian plough by putting an up-to-date plough body on the pole and handle of the country implement. The bastard implement produced is unsatisfactory.

Mr. R. S. Finlow and  
Mr. K. McLean.

The only solution is to adapt the up-to-date plough *in toto* to local conditions.

Several firms put out ploughs, some good and some indifferent, but nearly all too expensive, and this prevents their adoption on a large scale.

All general purpose ploughs in India should be fitted with a bar point, which is much more convenient for the cultivator than complicated shares and points.

The S. T. narrow is an implement which is invaluable in Bengal but here again it gets further and further away from the cultivator, as prices rise year by year. The difficulty with modern implements in India is that makers do not know the local conditions and will not modify their implement to meet local conditions. They point out that modification means altering their plant at a huge cost and the demand from India would not meet the cost.

Makers require to have a practical representative in India. They are generally represented by agents who know nothing of the practical use of the implements. A firm marketing a good plough, light and strong, at a reasonable price, will have a long run over.

(b) One great difficulty with the demonstration of implements is the belief of the cultivator that his cattle are not strong enough to draw the implement. It will take time to overcome this prejudice.

The money question is the chief obstacle and could be overcome by settling on the hire-purchase system as is done throughout the villages with sewing machines.

(c) Replies have been incorporated in (a) and (b) above.

QUESTION 15.—VETERINARY.—The only remark it is desired to offer on this subject is that the Veterinary Department should be independent of the Department of Agriculture. Both departments should of course work in close collaboration.

QUESTION 16.—ANIMAL HUSBANDRY.—(a) (i) Bengal is not a cattle-breeding Province. There are no breeders in the proper sense of the term and the only improvement in the cattle has been through Government agency.

Up to the present the lines of work have been—

At Rangpur—

(1) Improving a local herd by selection.

(2) Raising a cross Hissar—local herd of good milkers and fixing a type suited to the Province.

At Dacca—Raising a herd of pure Sindhis.

The improvement can be seen from the fact that the minimum yield per lactation period of 300 days of animals admitted to the herd has been raised from 600 lbs. in 1916 to 3,000 lbs. at the present day.

The demand for bulks is increasing and the question of breeding centres to bear the demand is under discussion.

To meet the demand for dairy cattle for towns' milk-supply, an Ayrshire bull is stationed at Dacca for crossing with local cows.

(ii) The question of improvement of the dairy industry is linked up with education. An up-to-date dairy is provided for in the Dacca Institute scheme and there is also on foot a scheme embracing a commercial dairy in Krishnagar where men can be thoroughly trained in the business.

(iii) Vide "The Improvement and Care of Cattle in Bengal," pages 1-9.

(b) (i) Common pastures are practically without exception overcrowded. The grazing is also of very poor quality. The solution lies in the utilisation of waste areas for growing fodder crops.

(ii) There are small areas of grass borders between fields, the quality of the grazing varying with the locality. Where *dhru* grass abounds this grazing is good but rank unpalatable grasses predominate.

(iii) In some years there is a shortage of paddy straw; prices run high; and cultivators are inclined to sell off the stocks they have. The cattle have to forage for themselves and there is very little difference between the roughage they pick up and the paddy straw it replaces, as the latter is of poor feeding value.

(iv) In Western Bengal the cattle certainly suffer during the hot weather but in Eastern Bengal early rains bring on the grass. As stated above, the grazing is of poor quality and fodder crops must be substituted.

(v) This is under investigation.

(c) The periods when there is scarcity vary throughout the Province and from district to district.

In the riverine tracts, a great proportion of the land is under water, from July to October, 1½ months. During this period the cattle are housed on the small island which constitutes the homestead and feed only on paddy straw and such fresh aquatic grass as can be taken out of the adjacent deep-water paddy crops.

On the high lands of Eastern Bengal the period of scarcity is from December to April when most westerns come on, whilst Western Bengal suffers from December right up to the break of the rains in June.

Mr. R. S. Finlow and  
Mr. K. McLean.

The term "thriving" hardly applies to Bengal cattle but in Western Bengal there is an improvement about a month after the rains break.

(d) By the introduction of fodder crops. Efforts are now being made by demonstration and propaganda to popularise the growing of crops recommended by the department.

(e) The landowner in Bengal is generally apathetic regarding agriculture. There are however several enthusiastic men in Bengal who realise they can do a lot of good and there are prospects of the numbers increasing.

QUESTION 17.—AGRICULTURAL INDUSTRIES—(a) This differs from district to district and from village to village according to the type of land.

It should not be inferred that a cultivator who has 150 days on which he appears to do no work can be translated into an industrial concern. These off days are interspersed between crops and, moreover, on many of them he is occupied on domestic duties such as repairs to his house, sheds and *bunds* or cleaning tanks or *mullah*.

A survey of Bengal will show that most of these men have other work to keep them occupied. In the deep water paddy tracts they are fishermen, in Chittagong they are engaged in poultry keeping and so on.

The ideal to aim at, however, is to have cultivation so intensive that the cultivator is occupied throughout the year. With proper irrigation facilities this is possible over the greater part of Bengal. In the one crop paddy land of Western Bengal and, to a more limited extent, in the *hal* tracts of Eastern Bengal it is not possible. In Western Bengal, where irrigation is not possible, the existing subsidiary industries require special attention and in the *hal* tracts the fisheries should be organised.

(b) These subsidiary industries should be stimulated by providing better facilities for marketing the produce, and this matter should be taken up conjointly by the Co-operative and Industries Departments. The encouragement of the growing of tree cotton as hedge plants is another matter which has been advocated by this department. The cotton produced is sufficient to keep the female members occupied in spinning thread for their own clothing.

(c) There are no obstacles in the way of these industries beyond lack of organisation which has been referred to above. The department is already engaged in improving sericulture, and a poultry section is being established. There is a scheme now before Government regarding the establishment of a fruit section and it is proposed to take up the investigation of bee culture on a permanent basis.

The Department of Fisheries was reformed on the recommendations of the Bengal Retrenchment Committee.

(d) These are trade questions and the best way of fostering these industries is to establish committees, such as the Indian Cotton Committee with representatives from the traders concerned and Government.

Such committees foster production of the raw material but it is for the Co-operative and Industries Departments to organise societies for cotton ginning, rice-husking, etc., on a co-operative basis and the producing cultivators should have an interest in these concerns.

(h) This can be done by the introduction of rural science classes in schools as contemplated in the Punjab and by intensive propaganda by the different Government departments concerned.

QUESTION 18.—AGRICULTURAL LABOUR—(a) Bengal is one of the most densely populated Provinces in India, yet it employs many thousands of labourers from the Santhal Parganas, Bihar, and the United Provinces. Not only the jute mills of Calcutta and the coal-fields of Chota Nagpur absorb such labour, the large jute collecting centres like Narayanganj, Chandpur, Serajganj, etc., all employ large numbers of *Paschim-nallas* and, for a big jute crop in Bengal, Bihar are also employed in the reaping of the crop. Moreover, most of the earth work for embankments, excavations, etc., in Bengal and Assam, is done by *Namis* from the United Provinces. In the reaping and preparation of jute, Bihar labour, not so experienced as that of Bengal, is comparatively expensive as well as inefficient; but as earth workers the men from Azimgarh are extremely efficient.

In Bengal, in spite of the large importation of labour from the west there is an unemployment problem and about three years ago a Government Committee was appointed to investigate it. The unemployment is not to be found among the cooly or the cultivator class; but amongst *thakrads* and Anglo-Indians; in which communities there appears to be actual distress.

Needless to say the distress is not due to inability to obtain work to earn daily bread, but inability to obtain clerical or other work to the taste of the seker. It is for this class of the population that it has been proposed to give facilities for the establishment of farms of considerable area much bigger than would satisfy the needs of the ordinary cultivator. If such procedure would lead to more intensive farming and greater production

Mr. R. S. Finlow and  
Mr. K. McLean.

per acre it is to be defended but not otherwise: as every big farm established would normally mean the ousting from their own land of a corresponding number of cultivators who would probably become landless labourers. It may be said that there is still vacant land in the Sunderbans, in the Madhupur jungle tract in Eastern Bengal; the *barind* in Northern Bengal, and possibly also in parts of Western Bengal. This is true; but on the other hand all these tracts are comparatively inhospitable. In the *barind* the bulk of the cultivators are Santalis; while cultivators on the red soils of Eastern Bengal are migrating to more fertile land in Assam. It is to be considered whether the best thing would not be to settle unemployed *bhadralog* directly in Assam.

(b) There is, of course, always a large demand for labour in Calcutta and in the coal-fields. Elsewhere shortage of labour in Bengal is intermittent and depends to a considerable extent on the size of the jute crop. For a big crop Biluani labour comes in from the west. For the rice crop some migration of labour takes place. For instance, Chittagong, Noakhali and Barisal cultivators go to Burma to reap paddy, while labourers from Nadia go to Barisal for reaping the large *bulam* paddy crop.

(c) There are few such areas in Bengal as are worth consideration in this respect. In thinly populated tracts in Western Bengal and elsewhere, improved agricultural prospects would cause the population to expand naturally without immigration.

QUESTION 19.—FOURERS.—(a) Outside the Terai, Chittagong and the Sunderbans, there are practically no Government forests in the plains of Bengal.

In the Darjeeling Hills the Forest Department give facilities to agriculturists to grow crops on areas where the forest is being replaced by new.

In the Chittagong Hill Tracts the practice of *jhumming* is causing anxiety regarding the bamboo forests.

(b) It is possible that by careful cultivation of quick growing trees on village sites supplies of firewood might be appreciably increased. In Western Bengal there are opportunities for re-afforestation but the difficulties are considerable as practically all the land is zamindari.

In Bengal the general question of fodder is not associated with forest grazing, because there are so few forests.

(c) and (d) Deterioration of forests in Western Bengal has led to erosion. The only methods of reclamation now would be terracing and replanting.

The terracing would naturally hold up moisture for lands lower down and correspondingly increase their agricultural possibilities. Even in the Madhupur jungle tract forests in Eastern Bengal considerable erosion is going on. In fact the whole system in the latter tract of highland intersected by *bydes* of low land, in which the drainage takes place towards the *dhul* and the river, are only the result of long erosion. This has now proceeded so far in the tract in question that the differences in level are nowhere more than a few feet. Erosion, however, still continues but may be stopped by terracing; *vide* answer to Question 9 (a) (ii).

QUESTION 20.—MIDDLEMEN.—There is room for organisation of markets and in the elimination of the middleman.

To take the case of jute. Between the cultivator and the export market on the one hand or the jute mill on the other, there may be four agencies, *e.g.*, the *faria*, *bejari*, *araidar* or *mahajan* and the baler. The *faria* is a small dealer who buys small quantities of jute from the cultivator and sells to the *bejari*. The *bejari* is financed by the *mahnjan* or *araidar* and the latter takes the jute to the baler. This succession of middlemen is not universal of course. For instance, the *bejari* often deals direct with ryots and, if he is a wealthy man, he dispenses with the *araidar*; on the other hand baling firms sometimes substitute the *araidar* and advance money to *bejaris*; while in Eastern Bengal the cultivator frequently deals with the baling firm direct, if an agency of the latter is within reasonable distance.

The *faria* is a dealer and not a commission agent; the *bejari* is a dealer or a commission agent according as he works on his own capital or on that of either the *araidar* or the baler. The *araidar* is of course merely a financier who takes interest—at the rate of annas 4 per maund of jute—on the money he advances.

The margins of the various middlemen may be estimated as follows:—

*Faria*—annas 2 to annas 6 according to the season.

*Bejari*—annas 4 to Re. 1.

*Araidar*—annas 4.

Besides there are margins of the baling firms, say annas 10, including handling and storing, and freightage, insurance, etc., to Calcutta, annas 12.

Thus the difference between the price to the cultivator and the price to the mill, or the exporter, may be put at from Rs. 2 to Rs. 2.8 per maund, or, on an average, say, 20 per cent.

Mr. R. S. Finlow and  
Mr. K. McLean.

During the last twenty years the average quality of jute has probably deteriorated. Twenty years ago, this was the subject of investigation and it was decided that no deterioration of the plant has taken place but that the method of preparation had become less useful. The margin between the prices of good and bad jute varies considerably. It may not be more than Rs. 2 per maund but on the other hand it may be considerably more. In the present year the producer of good quality jute is fortunate because the margin of price between good and bad quality jute is wide. On the whole, however, the tendency has been towards smaller margin between good and bad quality, with its consequent reaction on the cultivator and the class of fibre he produces.

(c) The co-operative jute buying organisation\* now being established in Bengal aims at bringing the profits involved in quality, purity, grading and packing to accrue to the cultivator, but if the cultivator is able to eliminate the bulk of the middleman's profit between himself and the export buyer, or the Calcutta mill, he will probably have achieved most of what is possible.

(d) All these suggestions may be put into practice, but the rate of progress in this direction will depend largely on the rate at which organisation of the cultivator proceeds.

QUESTION 23.—GENERAL EDUCATION.—The remarks under Question 2 refer to General Education and its proposed modification to suit an agricultural population.

QUESTION 24.—ATTRACTING CAPITAL.—(a) We do not consider that the establishment on a big scale of large farms by capitalists is economically sound. It would mean that the peasant proprietor, who is the backbone of agriculture in Bengal, would be turned out of his holding to become a casual labourer. Moreover, it is probable that the aggregate income per acre from large farms would be less than that from holdings farmed intensively. We consider that intensive cultivation of small holdings is the end to be aimed at and that it can be achieved, given sound advice and financial aid for purchase of manures, good bullocks, better implements, etc. This would of course attract a very large amount of capital particularly, if, as is desirable, irrigation is also provided.

In some "deteriorated" tracts, e.g., in the districts of Nadia and Jessore, it may be possible, to re-examine *thalas*, and, generally, to take such measures as will free the tract from malaria. This could only be done by considerable expenditure of capital, whether by Government or by owners, or by societies, or companies, formed for the purpose, which would take over the land and sell it, after improvement, to peasant proprietors on deferred terms.

(b) Usually the tenant has occupancy rights, and if a landlord spends money on improving an estate, he could not, without the previous consent of the tenant, recover, as rent, interest on the capital sunk, excepting through the Courts. On the other hand, if a tenant desires to improve his holding by erecting a house, digging a tank, etc., he has to pay *salami* to the zamindar.

Thus there is discouragement to both landlord and tenant against introducing improvements.

QUESTION 25.—WELFARE OF RURAL POPULATION.—(a) Pure water supply; better medical attention; sanitation are all necessary. In most parts of Bengal, the tube well offers a sure method of obtaining good and pure water.

(b) Investigations of this kind are already in progress. It is probably impossible to obtain a complete economic picture of a village in a short time. Probably the survey should be a normal part of the work of the District Magistrate's staff, which should be increased for the purpose, if necessary, and which should be assisted by other departments wherever possible.

(c) No intensive economic enquiries had been commenced until recently; but under instructions all District Agricultural Officers will investigate one or two villages in their respective districts as part of their training. Generally it is considered that a Board of Economic Enquiry should be set up in Bengal on the lines of that working in the Punjab. This should not be an official Board but should embrace all sections of the community interested in social welfare. It should be subsidised by Government.

QUESTION 26.—STATISTICS.—Excepting that for jute, the forecasts for all other crops are compiled entirely from information received from the Collectors. It is to be admitted that the source of this information is generally unreliable, being originally, at the bottom, the village *chowkidar*.

The chief characteristic of the *chowkidar*, as indicated in the forecasts, is his pessimism; for according to him the production of many crops appears to be on the decrease, and it has recently been necessary to initiate enquiries with the object of ascertaining whether the land is really becoming less fertile, and yielding less produce, or whether the alleged decrease is not in the imagination of the reporters.

The difficulty with all crops excepting jute is that there is no commercial check. With jute, however, in an ordinary year, the imports into Calcutta, which are recorded from,

\* See Questions 18061-18064 on page 41.

form an excellent check. The jute forecast is compiled differently from other forecasts, largely on account of this check. The Presidents of panchayats are in charge of the operation for their respective jurisdictions; and under recent orders each Officer checked the returns of the panchayats. These returns are eventually reported through Sub divisional Officers to the Collector who forwards them to the Director of Agriculture. Officers of the Agricultural Department assist whenever possible in checking the returns and in compiling them at headquarters.

The conservatism referred to above regarding statistics for other crops is also characteristic of the reports regarding jute and this tendency has to be continually corrected in compiling the forecast. Fortunately independent commercial estimates of the jute crop are always at the disposal of the Director, which is a great help.

Generally it may be said that in a tract which has been culturally surveyed, the area under any crop could be calculated correct to an acre, by means of the survey maps, if the staff available is large enough. Similarly in cutting-out estimates for determining the average yield, an accurate result would be obtained by so large a staff. The expense of such a staff would however probably be prohibitive.

Some jute firms make comparatively accurate forecasts, not by estimating the area in absolute figure, but by comparing the present year with the previous one. This estimate is done by employees, who have been stationed in their respective tracts for years, and who know almost instinctively, from the appearance of the crop, whether on the land, approximately how much more, or less, it is than in the previous year. Their observations are, however, supported and amplified by detailed enquiries in the neighbourhood. In this way, from a large number of typical centres, the local office or the firm receives a series of neatly accurate comparisons which enabled to make a correspondingly accurate total estimate.

The use of the aeroplane in forecasts has been suggested and is worth consideration. The utility would of course depend on ability to recognize a particular crop from a photograph. This should not be difficult with jute, which stands out so prominently among the surrounding paddy. Moreover, in Bengal high-growing crops like jute are comparatively rare.

The accuracy of crop forecasts is obviously an important matter, not only for the commercial world but for the cultivator. The situation, however, appears to be considered in regards the cultivator and possibly even regarding the manufacturer. It was suggested, at a recent meeting in Toidpur, that a forecast of consumption should be made, and reported to the cultivator, so that he could adjust the respective areas of the crops he grows. There is a very definite tendency for the jute cultivator to organize himself just now, and if his co-operative societies succeed, the reason, no reason why, ultimately, representatives of producers, manufacturers and consumers should not arrange matters between themselves for the good of all concerned.

In any case the more the cultivator becomes a definite organised body the better the chance of such a desirable contingency arising.

- (a) (iii) A live-stock census has just been published in Bengal.
- (a) (iv) This would best be done by the District Magistrate, not as an intensive enquiry but as a routine portion of the duties of his staff.

17520. Is Mr. McLean in charge of propaganda ?—Yes.

17521. Mr. McLean, may we have from you briefly what your own training has been and which posts you held ?—I took my degree in Agriculture in Edinburgh, and went to Ontario to work under the Canadian Government for one year. I returned and did the larger part of a year with the Valuation Department at Home. I got this appointment in India in 1914, and I was Deputy Director of Agriculture, Eastern Circle, Bengal. Between 1916 and 1919 I was in the Army, and then I returned as Deputy Director. When Mr. Finlow became Director, I became the Fibre Expert and last year I was made Assistant Director.

17522. We shall assume that you, gentlemen, agree with each other in any answer given by the other unless you say something to the contrary ?—Yes.

17523. I shall address myself mainly to you, Mr. Finlow, as Director of Agriculture. You have provided the Commission in various documents with some account of the organisation of your staff both at the headquarters and throughout the Presidency?—Yes.

17524. I should like at this stage to make quite certain that the matter is clear. Are the terms "Assistant Director" and "Deputy Director" synonymous ?—No.

17525. Then who are your Deputy Directors ?—There are three Deputy Directors, Mr. Smith, Mr. Sarkar (who is officiating as Deputy Director in the vacancy created by the death, last week, of Rai Bahadur Rajeswar Das Gupta) and Mr. Malik from the Punjab who has also been appointed to officiate.

17526. I see from these notes that your Deputy Directors are mainly concerned with the management of farms and field experiments. Is that so ?—Yes, and also propaganda in the districts.

17527. Next below your Deputy Directors in the organisation come your Superintendents ?—Yes.

17528. They are in charge of Commissioner's Divisions ; is that so ?—Well, that has rather been altered since the retrenchment took effect. The original idea in appointing Superintendents was that they should have charge of Commissioner's Divisions under the Deputy Director of Agriculture. But after retrenchment there were not sufficient to go round.

17529. Would you tell the Commission how they are disposed at the moment ?—At the present moment some of them are officiating in the Imperial Service ; one Mr. Dutt is officiating as Second Botanist ; two as Superintendents of Sericulture ; two of them are attached on special duty at the present moment, one on tobacco and the other on sugarcane.

17530. How many Commissioner's Divisions are there in this Presidency ?—Five.

17531. And in fact how many Superintendents do you have in charge of Commissioner's Divisions ?—There is none at the present moment. This note was written a few months ago.

17532. Do you think there is anything more up-to-date than you have provided us with ?—I do not think so.

17533. I would like to ask you whether you aim at restoring this grade in your organisation ?—I do not think we do. What we would like to do is to have Deputy Directors of Agriculture in every Division rather than Superintendents. That is what we were aiming at before the retrenchment took place.

17534. The next step is the District Agricultural Officers ; what grade of officers hold these posts ?—They are of the Upper Subordinate Service.

17535. Then, last of all your demonstrators ?—Yes.

17536. What grade are they ?—Of the Lower Subordinate Service.

17537. What stamp of men do you get for your District Agricultural Officers ?—So far, most of them have been trained at the Agricultural College at Sabour in Bihar. Some of them were trained at other colleges in India, one at Poona and one or two at Nagpur. But the majority of them are Sabour men.

17538. Are they countrymen or townsmen mostly ?—I am afraid I cannot say.

17539. Are they efficient ?—Not too efficient, especially immediately after the course which was not sufficient. It was only a two years' course ; the entrance examination was matriculation, and there was not sufficient time to train them in the two years. To produce very good men and in order to make them efficient it was necessary to give them further training.

—Mr. R. S. Finlow and  
Mr. K. McLean.

17510. What about their prospects?—At the present moment their pay is from Rs. 125 rising to Rs. 300 with a possibility, for a few of them, of getting into the provincial grade.

17511. Would you desire to see their prospects extended?—I think the District Agricultural Officer is the most important officer in the whole of the propaganda organisation. I think he is the crux of the whole problem. I should like to see the prospects of the District Agricultural Officer such that the service would attract as good men as are going to any of the other services of Government.

17512. Have you commenced recruiting for the Superior Provincial Service in accordance with the recommendations of the Lee Commission?—No. The rules have not been finally approved by Government yet.

17513. In order to open the road to such of these District Agricultural Officers as are worthy of promotion, what steps would be necessary to be taken?—Do you mean in regard to their prospects?

17514. Yes?—A proposal would have to be made to Government to better their prospects.

17515. Have you any definite scheme worked out?—Not for anything better; we have just brought their prospects to the present stage, which I have described.

17516. Then as regards your demonstrators, what training do they get?—The original demonstrators had only the training which we could give them in our year on the Dacca farm or on any other big farm like Rangpur or Chinsura.

17517. Chinsura school having now been closed?—Yes.

17518. The farm is still open?—Yes; the farm still exists.

17519. Are most of these demonstrators men who, as boys, had been through the Dacca Agricultural School?—No; they were appointed some years before the Dacca school was established. But now before we appoint any new demonstrators of course we do insist on the school qualification.

17520. Are these demonstrators satisfactory?—Some of them are, but as a body they are not entirely satisfactory. I mean their training is not sufficient.

17521. In what respect, technically?—Yes; it is really a question of knowledge and their being able to influence the cultivators in their immediate neighbourhood; but we are training them, taking them into the Dacca farm at the rate of 10 or 12 per year and putting them through the school course; they will be very much better men afterwards.

17522. How about their knowledge of the managerial and commercial side of the agriculture? Do you think it is important?—You mean on the part of the demonstrators?

17523. I do?—I do not think they know much about it.

17524. Would you agree that advice given by a demonstrator who understands the commercial side of farming is likely to be more palatable to the cultivator than advice given to him by one who is a technician and nothing else?—It all depends on the personality of the demonstrator.

17525. But if the demonstrator happens to talk nonsense about the commercial side of the cultivator's business, it is not likely to enhance the cultivator's confidence in the demonstrator's knowledge of agriculture as a whole, is it not?—No; but so far in the popularisation of improved seed the demonstrator has not had much chance of going wrong, and in the meantime he is gaining practical experience at the Government farm in the district to which he is posted.

17526. Have you any system of attaching demonstrators to a farm conducted on economic lines?—All demonstrators are attached to farms in which an area is set aside to be cultivated on a commercial basis and on economic lines.

17527. With costings or without?—With costings.

17528. Is it your experience that demonstrators do in fact leave those farms with a sound general knowledge of the management side of farming and the commercial side of marketing?—It is difficult to go so far as that; but it certainly improves their knowledge a great deal.

17529. How long are they on these farms?—They are more or less permanently attached to the farms until they are sent out to particular tracts where their services are needed.

17530. That, I think, concludes your organisation in the Presidency itself?—Yes.

Mr. R. S. Finlow and  
Mr. K. McLean.

17561. Now as regards your headquarters and research, are these concentrated mainly at Dacca?—Yes.

17562. Your rice centre is at Chinsura, is it not?—There is a good deal of work on rice at Chinsura but Dacca is the headquarters for rice too.

17563. For everything, is it?—Yes.

17564. There you have under your own direction your Economic Botanist, Chemist, Fibre Expert, Entomologist and Mycologist?—The men holding the posts of Entomologist and Mycologist are only assistants; they are not men of the Imperial or of the Provincial Service; they are both men in the subordinate service.

17565. Are they graduates?—One is a graduate and the other is not. They both were trained at Pusa.

17566. Your Economic Botanist?—The Economic Botanist is Dr. Heeter.

17567. Your Fibre Expert?—Mr. McLean at present does the work of Fibre Expert.

17568. And your Agricultural Chemist?—The Agricultural Chemist is Mr. Carbery.

17569. And do these posts make up the whole of your staff?—There is a second Economic Botanist.

17570. Then you have a certain amount of work going on at Chinsura which includes work on rice?—Yes.

17571. Anything on cattle?—Nothing on cattle at Chinsura.

17572. What else at Chinsura?—Rice, sugarcane, jute and a certain amount of work on oil-seeds and pulses and other crops. There is also some work on cotton but it is not very important.

17573. Not much work on cotton?—No.

17574. Have you a farm in every district?—Not yet.

17575. That is what you are aiming at?—Yes; we have them in 20 districts; in some districts there are more than one farm, for instance, in Rangpur there are three.

17576. Sir Henry Lawrence: Twenty out of how many?—Twenty out of 27 districts; I should mention that there are proposals for the establishment of two more farms which will make 22 farms in 27 districts.

17577. Professor Gangulee: These are all experimental farms?—No; they are partly experimental and partly demonstration farms.

17578. The Chairman: Have you any European officers on short-term contracts?—No.

17579. Have you any experience of that?—No.

17580. On the first page of your note you say, "Irrigation may prove to be the crucial factor in deciding whether Bengal shall make an appreciably larger advance in agricultural prosperity than would otherwise be the case." Are you suggesting there that your department, the Agricultural Department, should make an investigation and carry on research or are you willing to leave that to the Irrigation Department?—This point has been raised before Government and it was decided that the Irrigation Department should take charge of irrigation works which involve flow irrigation; but the supply of water from a well, for instance, or from a tube-well, would be work which we should undertake, in the first instance, as an experimental measure.

17581. At this stage I should like to ask you whether you have anything other than that which you have put in your note to tell the Royal Commission about Pusa, its usefulness to this Presidency or the reverse, the teaching there or anything else that may be appropriate. If you wish to give evidence on this question *in camera*, I shall clear the room at a later stage and give you an opportunity of speaking in private. If, on the other hand, you are prepared to speak in public, I hope you will?—I have no objection to speaking in public.

17582. Are you satisfied with the work that Pusa is doing?—Yes.

17583. What do you say about the prestige of Pusa?—As far as we are concerned, it is high. I have worked at Pusa myself, I am familiar with the class of work which is being done there, and my opinion is that its standard is as high as it can well be.

17584. And as high as it has ever been?—Yes.

17585. Are you satisfied that the central direction of research at Pusa is sufficiently definite?—Yes, I have no other suggestions to make in that respect.

Mr. R. S. Finlow and  
Mr. K. McLean.

17586. Have you anything to say on the teaching side?—I do not know much about it.

17587. You have nothing to say on that point?—No.

17588 Mr. McLean, you will interpose any remarks or any points you wish to; both the witnesses are before the Commission. You are impressed, I gather from page 2 of your note, with the success of the work of the Indian Central Cotton Committee?—Yes.

17589. And you argue from that that research in other agricultural matters might well be organised, crop by crop?—Yes.

17590 What are the crops which you suggest might be organised in that fashion?—Jute is one.

17591. Any others?—Pulses and oil-seeds and possibly, I am not sure, paddy.

17592. Any other fibre crop?—There is no other fibre crop; of course there is hemp, but the work on that could probably be carried on by the same committee which would work on jute; and apart from cotton, the amount of other fibres grown in the country is comparatively small.

17593. Any other crops?—I cannot think of any at the moment except tobacco.

17594 To some extent, some of these crops are organised, are they not?—Sugarcane is of course organised; there is the Sugar Bureau.

17595. I think we have the full particulars, but I want to put to you a question or two on this matter of financing these organisations. In the case of cotton it is a cess?—Yes.

17596 And in the case of a crop, the greater part of which is exported, no doubt the cess offers an easy and fair way of financing the organisation?—Yes.

17597. Do you think it would be fair to finance agricultural research generally on a cess levied on agricultural produce which is exported?—I think it might come on different Provinces with very different weight.

17598 You would have the grower of crops for export paying, however little, for work on his neighbour's crop, which is not to be exported and which is paying no cess?—Yes. The incidence of it is very small, but if the whole of it fell on one particular Province, it would be hard.

17599. How would you view an acreage cess, will it affect definitely agricultural development?—At first sight, it is difficult to express an opinion; I have not considered the point at all. It seems to me to be the fairest way of all. Of course, I am not quite sure what administrative difficulties might be met with. It seems to me that it ought to be fairly easy to collect the cess with the land revenue, so many pies in the rupee or proposals of that nature, such as have already been made in Bengal for getting rid of the water-hyacinth. There is an export tax on jute of Rs. 4.8 0 a bale; that money is used by the Central Government for things other than agriculture, it is not spent on agriculture.

17600. Does that go to the general revenues?—Yes.

17601. Dr. Hyder: You have a local cess also?—Yes, there is a cess of 2 annas per bale which goes to the Calcutta Improvement Trust.

17602. The Chairman: What is the scope of the Calcutta Improvement Trust in regard to agriculture?—It has nothing to do with agriculture.

17603 Sir Henry Lawrence: Is the cess on bales imported into or exported from Calcutta?—It is on bales exported.

17604 The Chairman: I gather from your joint memorandum that you, gentlemen, are, broadly speaking, in favour of a good deal of research being carried on under the Imperial Government; is that so?—Yes, I think the Central Government can do a great deal to assist research in the Provinces.

17605 Have you in mind that the Central Government should attack problems of fundamental importance and of general application, and that provincial research should always be left to work out the application to the particular conditions in the particular Province?—Yes.

17606. How would you view the setting up of some Central Advisory Body or Development Commission, which would be at the disposal of Provinces who wish to seek their advice, which would have available the knowledge of all the work being carried on in other Provinces and in the Central Institution, and which may have at its disposal certain funds which might be allocated, perhaps on a percentage basis, to Provinces carrying on

Mr. R. S. Finlow and  
Mr. K. McLean.

research work, on condition that that work was co-ordinated with other work in other Provinces and with the Central Government research station?—I think it will do good.

17607. A body with representation of course from the Provinces upon it?—Yes, certainly.

17608. The central body might conceivably initiate some wide policy of research on some particular problem, but, in the main, the initiative would probably lie with the Provinces, who would put up a scheme and ask for advice and for a financial blessing?—That is what I think would probably happen.

17609. I take it that you accept the permanency of the provincialisation and the transfer of Agriculture?—Yes.

17610. So that, you would agree with me that any scheme of the sort that I have outlined, which did not commend itself to the Provincial Government or Administration would be doomed to failure?—Yes, of course.

17611. It is necessary that any such scheme should be attractive to the Provinces, if it is to be effective?—Exactly.

17612. You would not, I assume, favour any centralisation of executive authority in matters of research; you would leave the Provinces to their own masters in every respect?—Most decidedly; I would never dream of taking research away from the Provinces.

17613. Have you any notions in that direction which you care to lay before the Commission; would you like to develop the idea of a central body in any way?—No.

17614. Perhaps I may ask you whether, in your experience, there is lack of co-ordination at this moment?—I think probably there is a good deal of work which is being done in different Provinces, on crops, for instance, or perhaps on manure, or any other line of work which an Agricultural Department engages in, and in which most people are concerned. One is not thoroughly familiar with the work which is being done in other Provinces. One may be able to see the Annual Reports; but that is not sufficient; what we want is closer co-ordination of the work.

17615. Are you yourself engaged in any research at this moment?—No.

17616. What is the most important piece of research work being carried on under your instructions?—Plant breeding, with jute, rice, tobacco, cotton, the manurial requirements, of crops and there is the question of water-supply for paddy and other crops.

17617. Are you aware what is being done on that particular problem in the Presidency of Madras at this moment?—No, I do not think I am thoroughly conversant with it. I cannot recall any paper from Madras that I have seen on the subject of transpiration.

17618. Broadly speaking, it is true to say that you yourself are not in touch with the research work that is being carried on in Madras?—On the whole, I think one ought to say that; one reads the Annual Reports of course, but one has not the necessary amount of information which one should have.

17619. *Professor Gangulee*: Does your experiment refer to water-supply of paddy or water requirements of paddy?—It refers to water requirements of paddy.

17620. *The Chairman*: Have you any famine areas, so-called, in this Presidency?—Not in the real sense of the word.

17621. Do you use the term?—The term "famine" is used in Bengal occasionally, but it refers to Western Bengal really, which is a rolling country.

17622. Is it an unirrigated area?—Yes, it is merely when the rains fail that famine occurs there.

17623. Is this area unirrigated either by canals or wells?—There is a certain amount of irrigation from tanks.

17624. What work is your station at Dacca doing in the direction of cultivation experiments, designed to assist the cultivators in the dry areas; are you doing any work of that nature?—The district farms at Suri (Birbhum district) and at Bankura have been established with this object in view and good progress is being made.

17625. Are you making any contribution towards the problem of agriculture in the dry areas?—Yes.

17626. What contribution are you making?—We have farms in two out of the three principal districts, and we are experimenting with a number of crops of different varieties for that tract.

17627. Do you think the dry areas have had a fair share of your attention?—In the beginning, as far as we were concerned, they were in a different Province; we started work

Mr. R. S. Finlow and  
Mr. K. McLean.

in Eastern Bengal, but latterly a great deal of attention has been given to Western Bengal.

17628. What size is the average holding in those dry areas ?—I do not think I have got any exact figures for that.

17629. Are they small holdings ?—They are not big, but I would not like to give a figure ; I could get the figures for you.

17630. Would you agree that no class of cultivator is more deserving of attention and assistance than the small man in the dry area ?—Yes, I think so.

17631. That is where poverty is felt most severely, is it not ?—Yes, that is true.

17632. And the uncertainty of the season falls on them with greater severity ?—Yes.

17633. And, in the light of these views, you do feel that at this moment these people are receiving a fair share of your attention ?—I think so. On these farms, we have posted the most experienced men we have, and very special attention is being given to all the crops which it is possible to tackle as well as to manures and cultivation.

17634. Is cultivation proper improving ?—What we are doing is to see how far the various lands of the rolling country can be utilised for other crops than paddy. That is the main object of our work, and the results appear to be very encouraging indeed.

17635. How about the practice of ploughing ? Is that satisfactory in the districts ?—In Western Bengal they use the ordinary plough.

17636. Are they ploughing often enough ? Has that problem been demonstrated and taught to the villagers ?—We have not gone far enough to demonstrate fully any particular line of work at the present moment. We should say that we are dealing with monsoon cultivation, pure and simple, and the operations for a month or two succeeding the monsoon. Perhaps you are thinking of arid tracts ?

17637. I was concerned to discover from you what the problem was ?—The problem is monsoon cultivation.

17638. Is the practice of cultivation and the method of handling and tilling the soil of great importance in that particular area (Western Bengal) ?—They must be.

17639. Is the indigenous practice sound ?—The ordinary plough is all that they have at present in the way of implements. We are seeing if we can improve it.

17640. Would it be fair to say that, although it is your view that a fair share of your charge is being at this moment directed towards these particular problems, you are only at the beginning of your work in that direction ?—Yes ; we have not at the present moment got any results which we can apply on a very large scale.

17641. *Professor Gangulee* : You have just said that you have experienced men in charge of Western Bengal. Who are they ?—They are Rajnath Babu and Chuni Babu. Both of them are very senior men.

17642. *The Chairman* : With regard to agricultural education, is any agricultural work carried on at the Calcutta University ?—I would ask Professor Gangulee to reply to that question.

17643. You do not know ?—No, I do not know.

17644. Are you training any post graduate men in research work at Dacca ?—No.

17645. So that you have no views to lay before the Commission as to the standard of efficiency attained by the graduates of the Calcutta University ?—No.

17646. Have you any Indian research workers at Dacca ?—Yes.

17647. Where were they trained for the most part ?—They came from Calcutta. Some of them have also come from Dacca.

17648. Are they graduates of the University of Calcutta ?—Yes.

17649. What do you say about their attainments when they come to you ?—The men with the Honours degree are quite good.

17650. Are they good enough for higher research work ?—They require training in research ; they have a good equipment.

17651. You are satisfied with their attainments when they come to you ?—I think we can say so.

17652. *Dr. Hyder*. Do you get any men from the University of Dacca ?—Our staff is full. It was recruited before the Dacca University supplied graduates.

Mr. R. S. Finlow and  
Mr. K. McLean.

17053. *Professor Gangulee* : What is the nature of the research work that these young men are doing ? Is it botanical research or chemical research ?—It is botanical, chemical and bacteriological research.

17054. *The Chairman* : What about the training of Indians abroad ? Do you believe that Indians should leave this country as young men to be trained in Europe, or that their training in their earlier years should be entirely in India ?—If you want to produce a specialist, a man with a special knowledge of a particular subject, I should say that the soundest thing would be to send him wherever the best man is stationed.

17055. Go for the best teaching wherever it is ?—Yes.

17056. At what stage would you send him to that teaching ?—It is very difficult to say. The ordinary procedure would be for a student to graduate first ; then, possibly, even take a post-graduate course and then go to Europe.

17057. So that he would probably be five and twenty before he went to Europe ?—Yes.

17058. That, in your view, is quite early enough in life ?—Yes.

17059. On page 3 of your note you say, "There is therefore reason for believing that a preliminary training in pure science, followed by two years' practical work at the Dacca farm, is capable of producing a reasonably efficient District Agricultural Officer." Where do you suggest the preliminary training in pure science should be given ?—It might be at any suitable College or University.

17060. Then you pass on and mention the scheme for the Dacca Agricultural Institute. Has that scheme ever been given effect to ?—It has been before the Government for a number of years but it has not matured simply because of lack of funds.

17061. *Professor Gangulee* : For how many years has that scheme been before the Government ?—It was originally brought forward in 1919. At that time there was available a grant from the Government of India but it was withdrawn before the scheme could be put into operation.

17062. *The Chairman* : A word or two about the secondary agricultural school at Dacca. Is that school getting boys from all over the Presidency ?—The school is advertised all over the Presidency.

17063. Are the boys, in fact, coming from all over the Presidency ?—I cannot say exactly where they are coming from. (*Mr. McLean*.) All the applications this year came from Eastern Bengal and Northern Bengal.

17064. Are they sons of cultivators or sons of townsmen ?—About half and half ; but they are not sons of townsmen but sons of the *bhadralog*.

17065. What is your definition of *bhadralog* ?—People who will not do manual work.

17066. *Dr. Hyder* : And these are the people who go to the agricultural school ?—We had applications from them.

17067. *The Chairman* : Have you any control over or touch with this school at Dacca ?—Yes.

17068. Do you control the syllabus ?—Yes.

17069. I take it that English is the medium of teaching ?—No ; it is vernacular.

17070. It is a vernacular school entirely ?—Yes.

17071. A certain number of the boys, as you have pointed out in your memorandum, go back to agriculture as a profession ?—Yes, I have given the figures in my notes.

17072. Is no English taught at that school at all ?—No ; all the lectures are delivered in Bengalee.

17073. So that none of those boys can find their way to the Universities ?—Some of them do speak English.

17074. Where do they learn it ?—At the high school. Some of them have read up to the Matriculation standard.

17075. Do you keep up their English at all ?—No.

17076. They have to do that themselves ?—Yes.

17077. On page 3 you say, "For the agricultural classes in middle and high schools the farm of upto 5 acres must be preferable to a school garden." Does not the problem of farm management arise on a holding of 5 acres ?—The 5 acres was decided on as being a suitable area for a pair of bullocks.

**Mr. R. S. Finlow and  
Mr. K. McLean.**

17678. Does not the problem of farm management on a holding of that size arise?—Yes, certainly.

17679. Who is going to provide the management?—It will have to be in charge of a teacher.

17680. Do you think it is likely that the teacher, who in your view as expressed in this memorandum, can hardly cope with the teaching of nature study, will make a success of the farm management of a 5 acre holding?—He is a different type of man from one who teaches nature study in the primary school, and he will be constantly supervised.

17681. You think you can provide sufficient knowledge of management and I suppose also of marketing, namely, the commercial side, because you contemplate marketing the produce, do you not?—Yes.

17682. From amongst the school teachers in middle and high schools?—Yes.

17683. You think that can be done?—Yes.

17684. In answer to Question 2 you really cover the whole of our question on General Education and so I will deal with it now. You have in mind, I observe, that as regards primary education literacy is the first objective?—Yes.

17685. You do not think that it is worth while turning aside to attempt to teach agricultural practice or the vocation of agriculture to small children?—No.

17686. How much nature study, do you think of a useful kind is likely to be given by the average teacher in these elementary schools?—So far it has been very disappointing.

17687. On the question of literacy, I take it that it is the case in this Presidency as elsewhere in India that literacy is only attained by a small proportion of those who join the lowest classes; the leakage is considerable?—I think that is the case.

17688. You are probably in agreement with me that literacy, if it could be attained by an important proportion of the rural population, would make your work of administration and of the general improvement of agriculture a great deal easier?—Yes; think so.

17689. So, the question of literacy is very important from the agricultural angle?—I think so.

17690. Have you any suggestions to make whereby the percentage of literates in the rural population might be increased?—It is a tremendous problem. I have discussed this question with the provincial educational officers. I think you have with you a note by Mr. Michael West, Principal of the Dacca Training College, in which he expresses the view that there are too many primary schools at the present time to allow of efficient teaching. He points out that in Bankura district there are 1½ primary schools to a square mile. He advocates that the schools should be reduced in number and increased in capacity; so that they may have correspondingly more, and better paid masters, who will not have to teach several classes at once.

17691. Apart from the fact that there are large numbers of boys going to the primary school and leaving before they attain complete literacy, there is considerable relapse to illiteracy among those who attain it?—That seems to be doubted. If a boy once attains literacy he will retain it, but if he has not attained a sufficient standard of literacy, he cannot carry on after he leaves school, and so he relapses.

17692. Have you anything to say about female education or adult education in night schools?—No.

17693. On page 4, paragraph (x) in answer to our Question 2 (i) and (ii) you say, "The introduction of agriculture into the ordinary educational system will tend in this direction," (that is, to turn the boy's mind to the profession of agriculture) "especially as it becomes more and more realised that the openings for boys with purely literary education are limited." Is that a pious expression of your hope, or is it founded upon experience? Have they begun at all to realise it?—They certainly are realising now that the openings for boys with a purely literary education are limited.

17694. Do you see any reason to suppose that any considerable number of boys are deliberately turning from the path that leads to University education and a degree in order to take up other work?—Agriculture would be the next thing they would turn to as most of them are connected with agricultural families.

17695. That is what many of us would like. But I am trying to get from you whether you observe any tendency in this direction at this moment?—Agriculture has not yet been introduced into the schools.

Mr. R. S. Finlow and  
Mr. K. McLean.

17696. Do you observe any tendency on the part of the educated class in this Presidency to realise that the careers open to graduates, whether those careers are official or not, are limited in number and that other avocations in life are just as honourable, and some of them more remunerative and more worth aiming at? Do you see any tendency in that direction?—I think there is; I know of instances.

17697. *Dr. Hyder*: Is there any diminution in the number of people who pass out of the University of Calcutta after taking a degree in the Arts course?—I cannot say.

17698. *Professor Gangulee*: Do you have in mind the introduction of agriculture into the ordinary educational system? What actually have you in mind?—What I have in mind is what is known as the Punjab scheme.

17699. Giving a sort of agricultural bias by introducing a text-book on agriculture, and things of that sort?—It is a complete scheme the main object of which is to give the boy practical ideas, which the present purely literary system fails to do. Moreover, if in any degree successful, it must not only familiarise the student with the fact that there is such a thing as improved agriculture but also, in the great majority of cases, cause him to assimilate a number of valuable ideas.

17700. *The Chairman*: I see that from the Dacca school, out of 45 students whose whereabouts are known, 25 are engaged more or less directly in agriculture?—Yes.

17701. That is a very small proportion; is it not?—There were very few students after the first two years. As soon as we stopped recruiting demonstrators from boys trained there, the number of students dropped.

17702. It does not look as if agriculture on a commercial basis is what most of these boys have in mind when they go to school?—No.

17703. At the end of the section on agricultural education you say that, in order to get over the difficulty of persuading boys who have had agricultural education to go back to agriculture, it has been suggested that, instead of one whole year of training at a farm or nursery in one period, you might have two periods of six months each, at an appreciable interval from each other. Do you agree with that idea?—We have no experience at present; it is only a suggestion, and it relates to boys who go to sericultural nurseries.

17704. One thing that strikes me in reading through this note is you do not say anything about the need for an agricultural college in this Presidency. Do you wish to say anything on that point?—We have mentioned an agricultural institute.

17705. Is that in fact an agricultural college?—Yes.

17706. Do you press for that?—Yes.

17707. You want that?—It has been discussed throughout the whole of last year.

17708. You have put a great deal of matter before us, I may have missed something. Have you put in any definite statement as to what the scheme is?—A scheme has been put up to you which includes Mr. McLean's estimates.

17709. Very well, I will not ask you any question on that beyond this. Is it your suggestion that that agricultural college or institute should be linked to the University of Calcutta for the purposes of degree giving?—At present there is an arrangement with the Dacca University.

17710. With the Dacca University only? Not with both the Universities?—There is no arrangement with the Calcutta University. The Dacca University takes the boy after he passes the Intermediate Science and after he has been accepted as a candidate they give them an extra year in pure science and then he comes on to the Institute for purely practical training.

17711. There is a great deal of scientific research and scientific teaching going on in the Universities which might to some extent be incorporated with the life of the agricultural college as such; is that not so?—Yes, certainly.

17712. Do you contemplate getting lecturers from the University to lecture to the students of the agricultural college?—It is not in the scheme, but I have no doubt that it will happen.

17713. What is the standing of the Dacca University as compared with the Calcutta University, in your own judgment?—I do not like to say. I know very good work in chemistry is being done at Dacca and also of course in Calcutta. I think it would be impossible to express an opinion.

Mr. R. S. Finlow and  
Mr. K. McLean.

17714. What is the origin of the University of Dacca? How comes it to be there?—It was established immediately after the re-partition of Bengal.

17715. Does it strike you as a flourishing and live institution?—There are a very large number of students.

17716. *Dr. Hyder* : Was it as a result of the Calcutta University Commission's recommendations? The Calcutta University Commission thought that the University of Calcutta was too unwieldy?—I believe that is the case.

17717. *Professor Gangulie* : Have you any facility for research in botany?—I take it that you are referring to the Dacca University. The botanical side is being established now. At the research station at Dacca, botanical research is of course one of the most important sections.

17718. It is not yet established?—The Botanical Department in the Dacca University is not yet established.

17719. *The Chairman* : So much for that. I do not know whether you wish to amplify in any way what has been said before the Commission?—No.

17720. I turn then to Question 3, Demonstration and Propaganda. What type of demonstration do you find most effective, demonstration on plots controlled by the department or demonstration organised on cultivators' own holdings?—Demonstration on cultivators' own holdings; that is how you can get the cultivator to trust you.

17721. Demonstrations which are carried out on holdings entirely in the hands of the department are rather under suspicion; are they not?—Yes, sometimes, especially in the beginning; but not after the cultivator realises that your work is sound.

17722. It is thought that the land owned by the department is better than the land owned by the cultivator and the department has large quantities of fertilisers and other mysterious agencies?—Yes, but if the cultivator knows one and he sees his own type of rice or jute compared on a Government farm with a departmental type to the disadvantage of the former he draws his own conclusions. The suspicion of the cultivator as perfectly natural attitude in the beginning, is passing away.

17723. Are you developing your propaganda by means of demonstration on cultivators' own holdings?—Yes.

17724. *Professor Gangulie* : What arrangement do you have with the cultivator when you demonstrate on his farm?—If the crop is a failure, we pay the cost.

17725. You guarantee that?—Yes.

17726. *The Chairman* : In the matter of seed distribution, I think the experiment which you have made of handing over the distribution of seeds to a gentleman, who, I suppose, is working on a commercial basis, is very interesting?—He is working on a commercial basis.

17727. And I observe from the 1925-26 Report of the Department of Agriculture in this Presidency that the handing over of the distribution of jute seed only to this private person, Mr. Godden, has not in any way prevented the Indian Jute Mills Committee from extending a guarantee to Mr. Godden against loss?—No.

17728. Do you think this idea of subsidising a private seed-<sup>man</sup> working on a commercial basis is capable of extension?—With jute seed it is comparatively easy, but with rice it is rather difficult because of the bulky nature of the crop.

17729. Would you agree that one of the difficulties before the Agricultural Departments in India is the commercialisation of the sale of the seeds of improved varieties?—Yes; that is certainly a difficulty.

17730. There is a limit beyond which the State machine can hardly go in handling the seed for distribution; is there not?—Yes.

17731. And yet in ordinary districts the whole business of seed distribution on a commercial basis is in the hands of moneylenders?—Yes; that is ordinary bazar seeds.

17732. Are there any other commercial agencies available, so far as you can see, through which seeds of improved varieties might be distributed?—The trouble at present is that the *bania* sells ordinary bazar seeds; if you try to sell your departmental seeds through him it is impossible to control admixture, and the seed cannot be kept pure. We have already had considerable trouble based on the principle of imitation being the sincerest form of flattery, and it is doubtful, though I admit it has not been tried, if the *bania* would resist the temptation to mix departmental seed with inferior stuff.

Mr. R. S. Finlow and  
Mr. K. McLean.

17733. *Mr. Gupta* : Have you given a monopoly to this gentleman for the distribution of jute seed, or do you propose to extend that system by giving him a monopoly ?—I do not think so. There is no monopoly at present.

17734. Are you sure ?—I do not think there was any idea of a monopoly. The only idea of monopoly that came in at all was in order to protect ourselves and our seed. It was proposed that the position of agent for the sale of Government jute seed should be put up to auction like a ferry or a cattle "pound". I deliberately regretted the idea on the ground that, through malpractice, such a policy would inevitably result in ruining the reputation of Government seed. Of course, the demand from the cultivator would then vanish and so the whole object on account of which lakhs of public money have been spent on research would be defeated by unwise application of the results. I consider the present policy is the only reasonable one which could be decided on.

17735. *The Chairman* : Following on the last question, do you contemplate extending this plan as regards jute to other commercial persons or firms ?—Yes; there is not a monopoly in any way; but the conditions already laid down would have to be fulfilled.

17736. Have you any indications of the feeling of the public on this question ?—We had one or two men who enquired about it, but there have not been any other indications.

17737. You had no indications of public opinion since then about this work ?—I do not think so.

17738. In a critical sense ?—They were satisfied in most cases. The reputation of Government seed is as high as ever; which means that the cultivator himself endorses our policy. Other people do not matter.

17739. Are you using the co-operative organisation for the distribution of seeds ?—Yes, as far as possible.

17740. You find that works well ?—Where the co-operative societies are doing it, it has worked well. The results vary from district to district. There has been one very good instance in the Nadia district where the co-operative society took a very large quantity of seeds.

17741. Do you think that you are making full use of the co-operative organisations throughout the Presidency to carry out other forms of agricultural propaganda ?—We may be regarded as just commencing work of this kind.

17742. You are making a move in that direction ?—Yes.

17743. You find the leaders of the co-operative movement sympathetic ?—Yes, entirely.

17744. Are you trying propaganda by means of lantern lectures and cinemas ?—We have no cinemas; we have three lanterns for the whole of the Province; we hope to get a lantern for every district.

17745. Have you experimented with the cinema at all ?—No.

17746. You think there is a future before it ?—I think so.

17747. Have you any knowledge of the technique of film preparation ?—No.

17748. Would you take it from me that it is an extremely difficult and a very rare art ?—Yes.

17749. In view of that, would you look with favour on a bureau under the Government of India for the preparation of propaganda films to be at the disposal of the Provinces ?—Yes.

17750. You probably gather from the Press that the art where it exists commands a large price ?—Yes.

17751. And probably having shared the fate of most of us you know how bad a bad film can be ?—Yes.

17752. On the question of administration, I should like to ask you one question here of a general nature. How about your machinery, the machinery at your disposal for accumulating the records of past and possibly future experience ? Do you find that if you want to look up some subject on occasions, for instance, when peripatetic committees are worrying you, you have the information and the details of past experiments ready to hand ?—Not always. We have not got enough references; we generally refer to Pusa.

17753. I am thinking more of the accumulation and arrangement of experience, the result of experiments, and the result of administrative action; are they available to you at short notice ? Taking the question of silage, for instance, could you tell me the

Mr. R. S. Finlow and  
Mr. K. McLean,

history of every experiment conducted in this Presidency to popularise the practice of preserving fodder in silos ?—We are only aware of one.

17751. You think there have been others ? I only want to get from you whether you think that your apparatus or machine for recording experiments, recording administrative experience, is working well ?—It could certainly be improved.

17753. I suppose you as Director of Agriculture are responsible for preserving technical records, while the Secretariat is responsible for preserving records of administrative experience, is that so ?—Yes.

17756. Do you find that the Secretariat provides you easily and readily with facts of administrative experience ?—Yes.

17757. *Professor Gangulee* Have you, for instance, the complete record of the work done by Mr. Blackwood when he was Director of Agriculture ? His attention was devoted largely to cattle-breeding and he started the Rangpur farm, did he not ?—Yes.

17758. Have you in your possession sufficient documents to show the nature of the problems he tackled ?—You mean the reports ?

17759. A great deal of correspondence passed, when he was there, between him and the Imperial authorities on the question of cattle-breeding and so on ?—That is on record.

17760. *The Chairman* Do you find that the administrative work that passed through your own hands is very considerable ?—There is a good deal, yes.

17761. Are you satisfied that your office is well-organised in that respect ?—Yes.

17762. Your attention is not required upon matters which might well be dealt with by an officer concerned purely with administration ?—No.

17763. You think in that respect you are all right ?—I think so.

17764. You have not been bothered by unnecessary administrative details ?—No.

17765. What have you got in that way in your office ? Have you a responsible officer concerned purely with administrative matters to whom you could delegate certain work ?—I do not quite understand what you mean by administrative matters.

17766. I take it that apart from the technical side, there is a great deal of routine administrative work which passes through your hands as the man responsible for organisation in agricultural matters throughout the Presidency ?—The Personal Assistant does the actual routine and the Assistant Director takes up the organisation with regard to the work of propaganda of the Presidency.

17767. You as skilled scientific officer and head of the technical department are responsible for research, are you not ?—Yes.

17768. And that requires a certain amount of time ?—Yes.

17769. And do you think that you are getting reasonable opportunity to devote yourself to that class of work ?—The correspondence is increasing to a large extent.

17770. *Sir Henry Lawrence* : What is the position of the Personal Assistant ?—He is in the Provincial Service.

17771. What is the pay ?—Rs. 400 to Rs. 600.

17772. *The Chairman* : One or two questions with regard to your answer to our Question 4 on Administration. First about railways, do you know anything about the Railway Advisory Council in this Presidency ?—No.

17773. Do you know anything about the channels through which co-operations by cultivators or groups of cultivators can be made to the railway authorities ?—The only experience I have is as regards the complaints that pass through us, but as to what happens to the cultivator in general, I have no experience.

17774. Have the co-operative organisations made any complaint or suggestion to the railway authorities ?—I do not know.

17775. How about the railways in the Presidency from the agricultural point of view ? Are you satisfied with the numbers of branch and feeder lines provided and with the freight service generally ?—On the whole I think it is satisfactory ; I do not pretend to have any great knowledge of that subject. I know several new railways are projected.

17776. Do you ever as a department make representations to the railway authorities for special rates for particular agricultural products ?—Yes ; we got a concession with regard to seeds.

17777. Any easement in the matter of implements ?—The number of implements introduced has been so small that we have not done anything in that direction.

Mr. R. S. Finlow and  
Mr. K. McLean.

17778. But you do find the railway companies ready to listen to your suggestions ?—Yes.

17779. *Professor Gangulee* : With regard to manure what is the rate for oil-cakes ?—The normal goods rate.

17780. *The Chairman* : Have you anything to say on the condition of the roads ?—In Eastern Bengal the roads are substituted by waterways.

17781. But if we are going to talk about roads let us take the districts where they do exist. What about the roads in Western Bengal ?—There are good roads there.

17782. Are you satisfied with them ?—Yes.

17783. What about roads under the local authorities ?—They are not so good as the main roads.

17784. Are they better or worse than they used to be ?—I think on the whole they are worse.

17785. Are they bad enough to be a serious burden upon the agricultural industry ?—I do not think I am prepared to give an adequate general opinion on that.

17786. Have you in existence a system of toll gates ? Do you happen to know ?—The only toll is at the ferries over the rivers.

17787. Have you anything you wish to say as to the work of the Meteorological Department ? Are you getting from that department the services that you expect to get ?—We get all that we want.

17788. *Rai Bahadur Bannerji* : Is there any way of making the results of the Meteorological Department's work known to the common cultivators ?—The forecast of the weather can be made known to them by beat of drum.

17789. *The Chairman* : Is there any method existing at present ?—No, I do not think so.

17790. As regards post offices, have you any suggestions to offer ?—No.

17791. Would you agree that, from the agricultural angle, it is very important to encourage the cultivator to save money when he can ?—Yes.

17792. Do you think that, the post office, from that point of view, is doing all that it can to popularise the system of savings banks administered by the post office ?—I do not think I have sufficient experience about it. During War time the system of cash certificates had good results.

17793. What are they doing now ?—I do not know.

17794. You cannot envisage the day when villages in this Presidency will have in them broadcasting receivers ?—I think it is a long way off.

17795. *Professor Gangulee* : Why do you think it is a long way off ?—It can be done. But there are other things on which money should be spent first.

17796. You will agree with me that it is a most useful weapon in your hands for demonstration and propaganda ?—Quite so.

17797. *The Chairman* : I should like to know whether you have at your disposal, and if so whether you will lay before the Commission, any statistics as to the debt of cultivators in this Presidency. Do you know the extent of the long-term and short-term debts, and the proportion of the long-term debt that is secured on mortgage ?—I have already said that we do not regard our evidence in that connection as being of very particular value.

17798. You have no statistics of the sort to lay before the Commission ?—No, but there are statistics to be found in the Settlement Reports of Bakergunj, Faridpur and other districts.

17799. The mortgage debt may be ascertained from the reports of the Registration Department ?—Yes.

17800. But the fact is that there has not been a survey of this nature arranged, so as to make plain the extent of the debt of cultivators in this Presidency, whether to the Government or to moneylenders or to co-operative societies ?—I think that is true, excepting in the two districts that I have already mentioned.

17801. Do you think it would be a good thing, if an attempt is to be made to solve the very difficult problem of easing the load of debt, that some complete survey should be carried out ?—Yes, data would be necessary before anything could be done.

Mr. R. S. Finlay and  
Mr. K. McLean,

17802. Have you any land mortgage banks at work in this Presidency?—No, I do not think so.

17803. Not as far as you know?—No.

17804. Are you familiar with the working of the two Acts under which *taccavi* is made available in this Presidency? I suppose it is done under the two Acts, the Agricultural Loans Act and the Land Improvements Act?—Yes, but the Acts in question though capable of considerable use for the benefit of cultivators are practically only invoked when loans become necessary in times of distress. A third loan Act is the Agricultural and Sanitary Improvements Act which seems to be difficult to work.

17805. *Professor Gangulee*: Why is it difficult to work?—The schemes are divided into two, major and minor schemes; there seems to be difficulty in deciding which is a major scheme and which is a minor scheme and what the procedure shall be, and in general the Act seems to be too vague to be of great use.

17806. *The Chairman*: Have you yourself studied the question?—My experience is confined to proposals to utilise the Acts, not to working them.

17807. *Rai Bahadur Bannerji*: You, as Director of Agriculture, have perhaps nothing to do with this. It is the Collector of the district who deals with it?—Yes.

17808. Consequently, your experience in the matter is very limited?—It is very small.

17809. *The Chairman*: That is no doubt so. Of course, before you attempt to popularise any improvement which costs money, you have to ask yourself where you are going to get the money from?—Yes.

17810. To what extent you are directly concerned with the operation of the Act under which *taccavi* is made available in the country?—Yes.

17811. What is this Agricultural and Sanitary Improvements Act?—That is the Act I have been speaking about.

17812. I had better have it definitely from you. Under what other Acts is *taccavi* available to cultivators?—The Agriculturists' Loans Act is the one for *taccavi* loans.

17813. What about the Land Improvements Act?—Do you mean the Agricultural and Sanitary Improvements Act?

17814. *Professor Gangulee*: It is the Land Improvements Act?—The Agriculturists' Loans Act is an extension of the Land Improvements Act.

17815. *The Chairman*: Is that in operation?—The Agricultural and Sanitary Improvements Act?

I see that is your Act here, it is just a question of the title.

17816. *Mr. Gupta*: You were not suggesting that Act VI of 1920, the Agricultural Drainage Act, has anything to do with advancing money to ryots?—Not to individual ryots.

17817. It is only *taccavi* under the Land Improvements Act?—Yes.

17818. *The Chairman*: On page 5, under the heading "Agricultural Indebtedness," in answer to our Question 6, you say that amongst the causes which force cultivators to borrow, comparative incompetence takes the leading part. What is comparative incompetence?—One cultivator is probably a better cultivator than another, and if that is the case he will systematically make more out of his land.

17819. One man may be a better spender than another?—Yes, quite so.

17820. In the next paragraph you quote the work of Mr. Jock on the Economics of a Bengal Village?—Yes.

17821. What was the date of that survey?—1912.

17822. *Mr. Calvert*: Bengal district?—Yes.

17823. *The Chairman*: Are you familiar with the working of the Acts dealing with debt, whether all-India or provincial statutes?—No.

17824. So that, you do not want to answer any questions on it?—No.

17825. And you, Mr. McLean?—No.

17826. On page 6, you say that if the cultivator forms a habit of borrowing to finance improvement, his attitude towards credit in general will change, and that he will be less inclined to borrow for purchases which are not wholly justifiable. What do you mean by that?—I think it is bound to happen, if he is going to improve his condition; that is why it is put down.

Mr. R. S. Finlow and  
Mr. K. McLean.

17827. I wanted to know whether you had anything else in mind ?—Nothing.

17828. On the same point, Fragmentation of Holdings, have you at your disposal statistics showing the number of holdings below 5 acres and the number between say 5 and 10 acres and so on ; have you any exact idea of the size of the holdings ?—It is given in the Settlement Reports ; they vary a good deal ; in the case of Eastern Bengal, from 2 to 3 acres would be a reasonable figure.

17829. So far as you know, do the Settlement Reports give the figures to show the number of holdings of a given size ?—I do not think so.

17830. Would you attach any importance to a survey of that sort ?—I do not think I can express an opinion on it ; I do not know what the procedure would be, if you were investigating fragmentation.

17831. *Mr. Gupta* : The Census Report gives the figure of the size of the holding as 1·3 acres ?—Yes.

17832. *The Chairman* : Is it within your knowledge whether the figures shown in the Census give the number of holdings below 5 acres and between 5 and 10 acres and 10 and 15 acres and so on ?—I cannot say.

17833. Do you think that legislation is necessary to deal with minors, widows with life interest, persons legally incapable, alienation and discontents, and to keep disputes out of the Courts ? Is there anything which either of you wish to say in amplification of that answer ?—I studied the consolidation of holdings in the Punjab, and that is my view of what I saw in the Punjab, and not as regards Bengal.

17834. On the question of irrigation, page 6 of your note, I should like to ask you first whether you think there is sufficient touch and sufficient sympathetic touch between your department and the Irrigation Department ?—Yes.

17835. Would you agree with me that every irrigation problem has its agricultural problem ?—I think so.

17836. On what occasions do you meet the heads of the Irrigation Department ?—It is only in connection with particular schemes that arise.

17837. You do get round the table and talk things over ?—Yes.

17838. *Rai Bahadur Bannerji* : But beyond the question of deciding as to the merits or demerits of any particular irrigation scheme, have you any other chances of meeting with irrigation officers and discussing with them the necessities of the Province ?—There is no formal arrangement for such a meeting, it would be very advisable to have it.

17839. *The Chairman* : How about the Board of Agriculture in this Presidency ; is that in existence ?—Yes.

17840. Is it an active body ?—It does not meet very frequently ; it meets about once a year, but from next year we shall have meetings every quarter.

17841. Might that not be strengthened and developed into a very useful body ?—Yes.

17842. *Rai Bahadur Bannerji* : As matters stand now, do the recommendations made by the Board of Agriculture receive the attention of Government ?—They always receive attention from Government it is impossible to put everything into operation, but all the recommendations which the Board of Agriculture makes, go before Government and are discussed.

17843. *The Chairman* : Are your irrigation schemes in this Presidency divided under the headings productive and unproductive ?—As far as I know there are no productive irrigation schemes in Bengal.

17844. That distinction does not exist here ?—No.

17845. Minor works, small tanks, small *bunds* and things of that sort are in the hands of the cultivators themselves ?—They are done through co-operative agencies.

17846. I want to know from you whether there is any officer in the Presidency whose business it is to give technical advice on these minor and even petty schemes ?—There is an irrigation officer attached to the districts in which these schemes are being proceeded with.

17847. Are his services appreciated by the cultivators and made use of by them ?—When an irrigation officer was appointed for Bankura district, Birblum showed considerable anxiety to follow the example of Bankura.

17848. Do you think there is a good deal still to be done in the way of developing minor irrigation schemes ?—In Western Bengal there is certainly a very considerable scope for rejuvenating old tanks and harnessing small streams for the cultivation of paddy.

Mr. R. S. Finlow and  
Mr. K. McLean.

17849. What about well irrigation?—Except in particular tracts, it is not done on a large scale in Bengal.

17850. Do you think it is capable of development?—Yes, it is capable of improvement.

17851. Now, in the first place, how about the provision of funds for digging up these wells?—They would have to come up for funds either through the co-operative society or the Collector.

17852. In the shape of *facears*?—Yes.

17853. Do you suggest that Government should do more than they are doing at the moment to provide the technical advice and skill required for digging wells?—As far as the actual digging of wells is concerned there is a good deal of local talent. It would not be necessary to bring special men for that work.

17854. Local talent cannot deal with the tube well?—No, but I am speaking of the ordinary well.

17855. The well out of which water is raised by means of bullock lifts?—Yes, either hullock lift or bamboo lift. A tube well, of course, is a much more complicated business.

17856. We shall have to ask the Irrigation Department more about it, but can you tell the Commissioner whether there are any peripatetic boring parties available?—The Public Health Department has a party which go about to sink wells but they are not for irrigation purposes but for drinking purposes. There are no tube wells for irrigation in this Presidency at all. Government have just sanctioned fund for one tube well to be sunk on the Dacca farm as an experiment.

17857. Do any problems in connection with water-lagging arise in Western Bengal or elsewhere?—In Eastern Bengal water-lagging generally happens. There are also portions of the Howrah district as well as in Midnapore where it is a serious problem.

17858. Who is dealing with that?—It is not being dealt with. To a large extent there are periodic floods in Midnapore district which do a great deal of damage.

17859. Then it is a drainage problem?—I think it is due to the too rapid flow of water from the high lands in all the districts.

17860. Have you any saline land?—No, except in the tracts near the sea coast.

17861. Nothing to worry about?—No.

17862. Have you anything to say as to the principle according to which water is charged for, i.e., whether it is charged on volumetric basis or arrearage basis?—We have not sufficient experience of irrigation.

17863. On page 7, you suggest that an Agricultural Engineer is about to be appointed in the Province. Is he to be appointed to deal with well irrigation and other irrigation problems?—He will deal with irrigation from wells and tube wells but larger schemes deriving their water from rivers will remain in the hands of the Irrigation Department.

17864. You say that a small Commission might be of help. Would you suggest a standing Commission?—I think that would be a sound thing.

17865. So far as I understand, these irrigation problems in this Presidency are not problems which can be settled once for all because these deltaic rivers change their course and it seems to me as an outsider that standing committees or commission to deal with the changing problems in any particular area are really what is required?—I agree with you there. I think it is of great value to accumulate evidence.

17866. By that means you get a continuity of information which helps you in framing your policy?—Quite so.

17867. I understand that you do think that a soil survey through out the Presidency would be a good investment?—Yes.

17868. Have you any sort of survey at all?—We have done a rough survey but not a detailed one. We have analyses of all the typical soils of the Presidency.

17869. Is that for depth only?—It is up to 15 inches.

17870. *Professor Gangulee*: Both mechanical and chemical?—Chemical analyses of all soils have been made but a number of mechanical analyses have been made too. But what we want to do is to get right down to the villages, so that if we receive a request for advice from any particular place, we have only got to put our finger on the map and find out the nature of the soil.

17871. So far, nothing systematic has been done?—It is not sufficiently detailed yet.

Mr. R. S. Finlow and  
Mr. K. McLean.

17872. *The Chairman* : Have you worked out the cost ?—It would be a very big item.

17873. I do not quite understand the statement on page 7, where you say, " Much land is difficult to cultivate because it is too high for late transplanted paddy and yet there is so little really high land that tanks have to be dug to make house sites " ?—In order to make a site for a house you have to dig a tank. That is a common practice in this Presidency. In some places in monsoon the land is water-logged, i.e., it is not true high land ; yet it is not low enough to grow transplantation paddy. In more low-lying tracts also excavation of one site is the only way of making another site high enough to build a house. In considerable tracts in Eastern Bengal, the house sites are the only dry land in the monsoon.

17874. On the same page, you give your views about the way in which these problems of the soil may be dealt with, but you do not say very much about reclaiming by means of controlling silt-bearing water. Has that been developed in this Presidency at all ?—You mean on the Italian system. That goes on naturally over a very large area in Bengal. It is the ordinary process of the raising of a delta. No deliberate attempts have been made towards that end.

17875. You do not think there is an opening for it ?—I do, but I think the work has been done in the opposite direction in parts of the Presidency and Burdwan Division. The rivers have been embanked and the silt has been prevented from spreading over the surrounding country.

17876. And the natural drainage has been interfered with ?—Yes.

17877. Whereby the fertility, on the one hand, is lowered and the incidence of disease raised to a serious extent. My suggestion to you is that if this work has been perfected in Italy, is it not time that someone attempted to apply it here also ?—It might be a very difficult thing to do it now ; but I think an attempt should be made.

17878. Referring to your answer to our Question 10 on Fertilisers, what is the limiting factor in this Presidency ?—I think the money.

17879. That is a very potent one. But leaving out money and coming to the fertilisers, what is the limiting factor ? Is it nitrogen ?—On the silt soil it is nitrogen. On the red soils there are three limiting factors ; potash and lime for jute and phosphato and lime for mustard and cereals, of course nitrogen is necessary in all cases.

17880. *Professor Gangulee* : Do you find a great deal of potash deficiency in soils here ?—Some of the silt soils are almost potash minerals.

17881. Is there a deficiency of phosphate in red soils ?—There is a great deficiency of phosphate.

17882. *Rai Bahadur Bannerji* : Is not bonemeal getting dearer every year ?—It is tending to fall a little now. Just after the War it went up to a very high price ; it was 50 per cent. higher than it was before the War.

17883. *The Chairman* : Have you anything to say upon the wisdom or otherwise of putting an export tax upon bones ?—It is certainly necessary to do so in order to conserve the supply in the country.

17884. Are bones very largely exported from this country ?—There is a considerable export of them.

17885. Where are the bones processed for export ? Is it in Calcutta ?—Yes, in Calcutta.

17886. And do the firms who are carrying out this process sell bone manure to cultivators in Bengal ?—They do sell, but they do not do any propaganda work.

17887. *Dr. Hyder* : There is no prejudice against the use of bone ?—There is in some districts. For instance, in Malda there is considerable difficulty in getting even coolies to handle the bags containing bones.

17888. *The Chairman* : Has it occurred to you that one effect of prohibiting the export of bones or of imposing such a stiff export tax as to make export not a paying proposition might be to limit the output of bones processed by these manufacturers and by raising their overhead charges to make it impossible for them to sell bones at a reasonable price to cultivators in Bengal ?—I know it is a very complex question.

17889. *Professor Gangulee* : If the export of the bonemeal be prohibited or reduced, will not that be to the advantage of the cultivator who will then be in a position to purchase it ?—You would have to be very careful. You must so adjust your duty that the fall in price may not ruin the bone manufacturer. That is the point, I take it.

Mr. R. S. Finlow and  
Mr. K. McLean.

17890. Is it not possible to start small bonemeal factories with the help of the co-operative societies?—We are investigating that point now.

17891. *The Chairman*: Have you any co-operative organisations at present which are processing bones?—No.

17892. So that the economics of the question has not yet been dealt with?—We have only got the estimates.

17893. Is it necessary in this Presidency to take the grease out of the bones?—It is done, as a rule, by solvents.

17894. And also by steaming?—Yes.

17895. Is there any use in putting bones on the land in their raw state?—We have done it in the case of raw bones.

17896. Did they break up?—They did.

17897. Is the effect very quick?—The effect is quite quick on acid soils.

17898. Of course, it is different in different countries?—Yes.

17899. *Professor Ganqulee*: Have you compared that effect with that of steamed bones?—Yes.

17900. *The Chairman*: In answer to Question 11 on page 9 under the heading "Crops," you describe the process by which money crops are taking the place of food crops to some extent. You say, for instance, that the cultivation of ground-nuts is extending?—Yes.

17901. That means that the money crop is taking the place of food crop?—The ground-nut is grown largely on land which would otherwise not be cultivated.

17902. Have you areas in this Presidency where money crops tend to take the place of food crops?—The only such crop is jute, I think, and that is a fluctuating amount. It depends on the price of jute and on the price of rice.

17903. But in the main the land is under food crops?—Yes, almost 84 per cent.

17904. You do not think that the money crop is extending at the expense of the food crop areas?—No, I do not think so.

17905. Is the cultivation of potatoes increasing?—It is increasing considerably in Eastern Beagal and also in the tracts round Calcutta.

17906. As regards cultivation, in areas where you transplant paddy in this Presidency, have you introduced the single seedling method?—Yes.

17907. Has it not been a success?—It is not yet done very widely. We do it in our farms and recommend it to the cultivators.

17908. Is it spreading?—Not very rapidly.

17909. *Rai Bahadur Bannerji*: In Western Bengal, when the monsoon arrives very late, the single seedling method will be a failure?—That is a reason why it should not be introduced in those tracts.

17910. Are there important tracts where the practice is more familiar and where it will not present any real difficulty?—Certainly, in Northern Bengal.

17911. What method do you adopt to familiarise them?—It is a matter of using the method in our farms and advocating it through our demonstrators.

17912. *The Chairman*: I gather from your remarks on page 11 of your note that there is not great scope for improved implements in this Presidency?—Not up to the present.

17913. Has there been any noticeable case of a general adoption of any improved implements?—No, beyond the sugarcane mills produced by Messrs. Renwick and Co.

17914. And you are definitely of opinion that there is no field?—There is a field.

17915. In what direction; ploughs?—Ploughs and harrows.

17916. Is there any sign that Indian firms are coming forward?—We have got one or two in Calcutta.

17917. Are they active?—They are doing very little at present.

17918. How do you account for that?—The customers are few. The question of finance affects the sale of implements just as it does that of manures.

17919. Can they not work up a business?—They have just started; it is too early to say anything about them.

Mr. R. S. Finlow and  
Mr. K. McLean.

17920. What methods of sale are they attempting, instalments ?—Direct sales.

17921. Is that the best way ? Is that how the sugarcane mills were placed ?—They are not sales ; they hire out, but it is cash payment of the hire fee.

17922. What I am trying to get from you is whether you think the manufacturers of agricultural implements are taking advantage of the lesson learnt by the manufacturers of sugarcane mills ?—They are not, but I think the problem may be rather different.

17923. Do you think they might well do so ?—Yes.

17924. *Professor Gangulee* : Have you any Agricultural Engineer in your Department ?—No, but we hope provision for an Agricultural Engineer will be made in the coming budget.

17925. *The Chairman* : Do you know whether the manufacturers of agricultural implements in India have any difficulty in distributing their wares ? I do not mean difficulty in financing. I mean any particular difficulty in distribution connected with either the railways or other forms of transport. Have you anything to say on that question ?—No.

17926. In answer to our Question 15, on veterinary matters, you say quite definitely that the Veterinary Department should be independent of the Department of Agriculture. What is the position in this Presidency at this moment ?—It is independent.

17927. And you think it is working well ?—Yes.

17928. You think there is sufficiently close touch between the two departments ?—Yes.

17929. What do you say about the Government of India's veterinary organisation ? Have you any views about that ?—No.

17930. In answer to our Question 16 on Animal Husbandry, you point out that there is very little breeding of working bullocks going on in the Presidency ; is that the position ?—Yes.

17931. Are they mainly imported from outside ?—They are imported from places outside Bengal.

17932. Would it be possible to develop the breed of working bullocks ?—It will be possible when we fix the breed.

17933. You are aiming at the dual purpose animal, work and milk ?—Yes.

17934. When you come to urban milk-supply, you have the first cross with European breeds ?—That seems to be a promising line.

17935. In your experience does that particular cross make any contribution to the improvement in working cattle and the improvement in the indigenous breeds ?—It is not intended to do that ; the scheme is not developed.

17936. It is an entirely different problem altogether ?—Yes. On the other hand, I have come across, in different parts of the country, the progeny of European cattle which do retain stamina and vitality.

17937. Is there a demand for milk of good quality in large towns in this Presidency ?—Yes.

17938. *Professor Gangulee* : You say in the note that the demand for bulls is increasing. What arrangements are you making to supply the demand ?—We have a herd at Rangpur and another herd at Dacca.

17939. To supply the cultivator ?—Yes. Of course these two farms cannot possibly supply the whole of the cultivators in Bengal. What we will have to do eventually is to establish subsidiary farms.

17940. *The Chairman* : Are public health regulations in existence as regards purity of milk-supply in large towns in this Presidency ?—Not outside Calcutta.

17941. Do you think that the enforcement of reasonable regulations as to purity makes a very considerable contribution towards the problem of extending dairying, in that it gives to the dairymen who provides a good article a reasonable security as to markets, whereas the absence of such enforcement means that those who are not ashamed of adulterating milk, cheese, *ghi* and butter, are able to sell at so low a price as to make dairying according to modern ideas unprofitable ? Have you considered that problem at all ?—It is very necessary to have legislation to stop adulteration. We have to apply it to everybody. The difficulty would be the administration of it.

17942. You have just told us in evidence that these regulations do exist as regard Calcutta. Is it within your knowledge that they are enforced ?—Yes ; they are enforced.

17943. Do you know whether milk for sale in bazars is liable to inspection ?—Yes.

Mr. R. S. Finlow and  
Mr. K. McLean.

17944. Is it inspected?—Yes.

17945. Do you know whether the practice of adulteration, not necessarily fraudulent, is general in this city? Do you know whether the working classes in this city deliberately buy watered milk?—Yes; they do.

17946. Is the milk for the city supply derived mainly from cows or from buffaloes?—I should think half and half.

17947. Are these cows stall-fed?—Yes. The Calcutta supply is mainly from stall-fed animals.

17948. Are the buffaloes stall-fed?—Yes.

17949. Are they within the city boundary?—Both in and out.

17950. Where is the outside area?—All round Calcutta.

17951. There is no distant dairying area?—No.

17952. Is there any opening for the development of the dairying industry in your hill tracts?—The hill tracts are very far from Calcutta.

17953. Too far?—Yes.

17954. On the question of provision of good bulls, is there any demand for bulls?—It is very small at present, but there is an increasing demand from co-operative societies, agricultural societies and so on.

17955. If the breeding of good bulls is going to have an appreciable effect in improving the race of cattle, is it also necessary to have good cows well nourished?—Yes.

17956. Do the cows get a full share of the fodder?—Most of them are underfed.

17957. And the bullocks?—The same.

17958. So that the position of cattle in this Presidency is thoroughly unsatisfactory?—Yes; I think that is true.

17959. Then you say, and it appears to me rightly, that the provision of further food supplies for the cattle, supplies which are necessary to improve the working power of the cattle, and so make better cultivation possible, must be derived from fodder crops, and you point out the openings in various districts where fodder crops could be introduced between two existing crops?—Yes, with irrigation.

17960. Does irrigation exist in the areas you are thinking of, or has it yet to come?—It has yet to come.

17961. Do you think further irrigation in those areas would make a real contribution towards the improvement of cattle?—It has still to be absolutely proved by demonstration. But all the results that we have so far got lead to show that it is a feasible proposition.

17962. Would you agree that the improvement of cattle in this Presidency is one of the major, if not the most important of agricultural problems?—Yes.

17963. What special officer have you whose time is devoted to the work of cattle improvement?—We have not got a special officer at the present moment. His appointment is now being decided; he is about to be appointed.

17964. Do you agree that until some such officer is appointed there is very little hope that sufficient attention will be given to the cattle. Bengal's major agricultural problem is only now receiving attention?—Yes. A proposal to employ a cattle expert in 1922 was negatived by the Legislative Council.

17965. Have you anything to say on the question of silage? I observe from a note that, in water-logged areas you find it necessary to line the pit?—Every pit will have to be lined.

17966. Is it cheaper to line the pit than it is to build a tower silo?—We have gone into the figures. I cannot give the exact figures now, but as far as my memory goes, the cost is very much the same.\*

17967. Have you considered the possibility of making a pit by first making a mound? Does that work?—We have used pit silos on the banks of tanks.

17968. How do they work?—They are not very bad because they are above the water level. There is no doubt that if the water is kept out at the time when the silage is in the pit, you can make good silage.

---

\* The Superintending Engineer, Dacca, considers that a pit silo carefully lined to keep out subsoil water would be as expensive as a tower silo of similar capacity.

Mr. R. S. Finlow and  
Mr. K. McLean.

17080. Provided you once achieve the essential process of fermentation, silage has very considerable resistance against occasional water-logging?—Yes.

17070. *Professor Gangulee* : What crops do you use for silage?—Maize, millets, cow peas, any bulky growing crop. We are experimenting even with water-hyacinth.

17071. *The Chairman* : I rather gather that in your view a good deal more experimental research is required into this question of preserving fodder?—I think so.

17072. Would you agree that is a very important problem in this Presidency?—I think it is vital.

17073. Now, what about sheep and goats; is there any opening for sheep at all?—We keep a small flock of sheep on the Dacca farm; they multiply very rapidly. There are possibilities, but we have not sufficient experience. We want to go into that problem.

17074. And the breeding of goats?—And that too.

17075. Has it ever been suggested to you that there might be a remission in part or whole of the land revenue on the land used for the growth of fodder crops; in other words, the State might subsidise the growth of fodder crops?—That has not occurred to me, but it would hold out a very great inducement to the cultivator.

17076. It is more attractive to your department than to the Revenue Department?—Yes. In this country it is in *khaz mahals* that it could be done.

17077. But if some encouragement could be given it would probably give it a start?—Yes.

17078. Even if it were to be a temporary assistance?—Yes.

17079. *Rai Bahadur Bannerji* : When you say 'The landowner in Bengal is generally apathetic regarding agriculture,' what have you in mind?—I wish to say that there are exceptions and that there are indications that some landowners are beginning to appreciate the importance of agricultural improvement.

17080. *The Chairman* : You think there is an improvement in that direction?—I think so.

17081. On page 12, in answer to our Question 17, I should like to divide up this question under the two heads of part-time occupations on the one hand and on the other, subsidiary industries. Do you approve of the classification?—Yes.

17082. Now as regards part-time occupations, taking first your irrigated areas, have the villagers any important season in which their whole labour and time are not required on their holdings?—About the irrigated areas, I think, it would be better if we classify them according to the land which has one crop a year and land which has two crops a year.

17083. Taking your own classification, what cultivators in this Presidency have part-time occupations?—There are areas where there is only one paddy crop during the year. On those areas the cultivator sows the seed in June, transplants in July and reaps in November and December. It is a six months' crop. Then apart from small garden cultivation on a little piece of land round his house and that sort of thing, he probably has several months when he has nothing to do.

17084. They do not migrate in those seasons and do work elsewhere?—In some cases they do.

17085. Where do they go?—There is migration from Chittagong to Burma and from Nadia to Barisal.

17086. *Rai Bahadur Bannerji* : And has he not malarial fever for about two months in the year?—Yes, probably for sometime.

17087. He cannot be expected to do any hard work during that time?—No.

17088. *The Chairman* : A little mild exercise in the way of spare-time occupations might be a good thing, might it not?—I think it will help him a good deal.

17089. Have you anything which you wish to tell the Commission about these spare-time occupations? Do you think there is a large field for developing them?—There is certainly, particularly in the tracts I have mentioned.

17090. Who is responsible for that development?—That would be the Industries Department. I think that every cultivator could grow garden crops; also a little cotton and work up the lint in the house. I think that would certainly be a sound principle.

17091. Is silk-rearing and weaving a part-time occupation in any district of this Presidency?—Yes. In Malda there are a number of rearers who generally take up silk-rearing.

Mr. R. S. Finlow and  
Mr. K. McLean.

as a part-time occupation. It is an important part-time occupation in conjunction with mango cultivation and agriculture.

17992. Is lac cultivation a part-time occupation?—I would say so.

17993. Is that under you or under the Forest Department or the Industries Department?—We have been asked for advice on a number of occasions and we have given help through our Entomologist whenever it has been possible; but we have no special department for dealing with lac cultivation.

17994. Which department in Government is responsible, the Industries or the Forest?—It would be Industries. There is a lac institute now near Ranchi in Bihar.

17995. Is lac an important industry in this Presidency?—It is of considerable importance.

17996. There is no department responsible for it with its own technical officer?—As far as I know, no work is being done at present on that, no systematic work.

17997. Do you do anything in the way of popularising poultry?—No; we can hardly say we have got far enough to do very much but we have just appointed a special officer, and work has begun.

17998. *Dr. Hyder*: Is there any method of protecting chickens against kites? The gentleman who reports I have in my hand says that chickens are taken away by the kites.—Wire nothing on the top.

17999. *The Chairman*: Is there caste prejudice against keeping up poultry in any of the districts?—Not very strong.

18000. You do not think that would stop you?—No.

18001. *Rai Bahadur Bannerji*: Will a Hindu ever take up the poultry business?—I do not think the prejudice is so strong in Bengal. It is probably stronger in Western Bengal than in Eastern Bengal.

18002. *The Chairman*: As a spare-time occupation, is fruit-growing being developed at all?—We have done very little, practically, in fruit-growing.

18003. Have you got a horticultural officer?—There is a scheme for a horticulturist but we have not appointed one yet; it is a question of funds.

18004. So much for spare-time occupations. Now before I return to subsidiary industries I want to know whether you have ever asked yourself if there is room anywhere in the Presidency or in areas sufficiently near the Presidency for the development of hydro-electric power? Do you know anything about that at all?—A committee did investigate the subject some years ago and I believe, reported favourably.

18005. That is another scheme?—Yes.

18006. But there is no electricity yet?—No.

18007. Now in connection with the development of subsidiary industries designed for working up the raw material produced on the cultivators' holding, do you think there is any opening for investigation in that direction in the Presidency?—I think it is a very difficult question to answer. I know a certain amount about it, but I do not think my views will be of very much value to the Commission.

18008. This is a question on which I am sure you will have a view. Do you think that if the development of hydro-electric power had the effect of persuading those who are thinking of starting factories to choose sites in rural areas rather than to congregate at the port towns, that would be an advantage to the country side?—I think it is a question of local labour supply and facilities.

18009. You do not think the presence of a few factories dotted about the country side might serve to raise, at any rate, the ambition for a better standard of life?—I suppose it would.

18010. *Professor Gangulee*: It might relieve the pressure on the land a little bit?—It might to a certain extent, but it is a question of labour.

18011. *Rai Bahadur Bannerji*: You knew the establishment of these numerous rice mills in the country districts affected labour?—I do not think that has affected the problem very much.

18012. *The Chairman*: Certainly in my own country our experience is that the presence of an industrial population in the midst of an agricultural population tends obviously and very definitely to raise the rate of wages and, I think, the standard of living, certainly the ambition.

Mr. R. S. Finlow and  
Mr. K. McLean.

*Rai Bahadur Bannarji*: It is the same in this country also in those tracts in which rice mills have been established.

18013. *The Chairman*: Of course, the establishment of manufacture in the port towns has very little affected the standard of living or outlook in rural areas; so that you do feel that from the agricultural point of view it might be well worth seeing whether some development of the hydro-electric potentialities of the Presidency cannot be harnessed?—I think it should certainly be investigated.

18014. With regard to agricultural labour, you describe one stream of labour movement as emigration to Assam. Have you any other important movements of the population to other parts of India or to foreign countries?—There is an import of labour from Bihar to Bengal.

18015. That is an import?—Yes; there is no export so far as I know.

18016. There is no movement of agricultural labour to the Malay States or to any country of that sort?—I am not aware of it.

18017. Is there any movement to Assam?—That would be colonisation more than labour.

18018. *Rai Bahadur Bannarji*: Are you aware of the fact that some labour of West Bengal is being taken to the coal fields of Bihar and Assam?—Yes.

18019. *Professor Ganguly*: Is any labour going in considerable quantity to the tea gardens?—Not Bengal labour, except perhaps a small proportion from Birbhum.

18020. *The Chairman*: On your answer to our Question 10, Forests, I want to ask you whether you think that there is sufficient touch between your department and the Forest Department in the Presidency?—I think there is. We cannot meet very frequently, because their work is chiefly concerned with the boundary districts.

18021. Most distant from your own headquarters?—There are very few Government forests in the actual plains, they are either in the north, in the Terai and Darjeeling hills, or in the Chittagong Hill tracts, or in the Sunderbans.

18022. *Rai Bahadur Bannarji*: Nearly all the forest in Western Bengal is zamindari?—Yes.

18023. *The Chairman*: The forests then are owned by, and the timber is the property of, zamindars?—Yes.

18024. Have you important forest areas where cultivators have grazing rights?—No.

18025. So that that problem does not apply?—I do not think it applies in Bengal.

18026. Have you ever considered the possibility of forming a fodder reserve against fodder famine?—No, we have not. We do not get fodder famines in the same sense as in the Punjab or other Provinces.

18027. I wanted to be certain that you had not that problem in certain districts. So that you are mainly interested in forests because of the denudation as a result of over-cutting in the hills?—Yes.

18028. Do you know whether any attempt is being made to control what you call *jhuming*, that is shifting cultivation?—It is causing a good deal of anxiety; I have had considerable correspondence recently with the Deputy Commissioner of the Chittagong Hill tracts.

18029. Is it an agency tract?—Yes.

18030. There of course Government can control?—Yes; it is a very difficult problem to tackle.

18031. It is a very serious thing for the cultivators in the plains if they are going to be deluged with silt while at the same time valuable land is being washed away?—That does not happen in the Chittagong Hill tracts; it has a heavy rainfall, but it certainly has not proceeded so far as that. The erosion to which I have referred takes place almost entirely in Western Bengal.

18032. Silt is a blessing in the right place in limited quantities, but occasionally it may come in such large amounts as to cause the general ruin of important tracts?—Yes; I think I have already said that occasionally floods come down; there are frequent floods coming down in Western Bengal.

18033. Have you any instances of Government control of markets in this Presidency?—No.

18034. Do you know anything about the Government control of markets in Berar?—No.

Mr. R. S. Finlow and  
Mr. K. McLean.

18035. Have you any views as to the possibility of developing that?—No.

18036. You have described the method and the channels of the marketing of jute. Would you agree that, to some extent, in the case of an export crop, the cultivator is protected against the more extravagant exactions of the middlemen by the fact that the buyers representing large concerns move about the country side and more or less rule the market?—That is true.

18037. Of course, where the cultivator is tied hand and foot to a moneylender, he has to take what the moneylender chooses to give him?—Yes; there is great scope for the co-operative movement here.

18038. *Professor Gangulee*. For carrying on marketing?—Yes.

18039. Is anything being done in that direction?—Yes.

18040. *The Chairman*. What about the registration of commission agents; has that occurred to you? Would that be a feasible proposal?—If it is registration of the people going round in the districts, it is very difficult.

18041. Do you know anything about buying and selling on commission by middlemen?—In the jute trade, certainly, but I think it would be very difficult to control it, because the cultivator himself is often a small dealer.

18042. Is there much dealing between the cultivator and the *faria*?—No; the *faria* buys small quantities direct.

18043. And the *bepari*?—He is either a dealer or a commission agent.

18044. What I want to know from you is whether, when the man is ostensibly acting as a commission agent, he is very often in fact acting as a merchant?—I dare say he does.

18045. That would not happen if registration of commission agents were to be enforced?—It might be easier in the case of the *bepari*, but not in the case of the *faria*, because the *bepari* would be a bigger man, and they are not quite so numerous.

18046. *The Raja of Parlakimedi*: The *bepari* is always a merchant?—He is a changing sort of person; he is at times a commission agent, and at other times he is a dealer, just as it suits him.

18047. *The Chairman*: If you are selling my goods on commission, I know you will get the best possible price in order to earn the higher commission?—Yes.

18048. But if you represent yourself to be a commission agent, but are in fact buying for yourself, it gives you an opportunity, of which you may or may not choose to avail yourself, to do me down?—Yes.

18049. To give me about half the value of the produce, take a very small commission and make up the whole of the difference by selling yourself?—Yes, quite.

18050. On this question of marketing, do you feel that sufficient is known about the channels of marketing and the methods by which intermediaries operate in this Presidency?—I do not think so.

18051. Do you think that a further survey might be useful?—I think so.

18052. Would you agree that one of the most important lines of advance which is possible is to see that the cultivator gets a fair share of the real value of the things he grows?—Absolutely so.

18053. It is no use showing the cultivator how to increase his crop, if he has not got the means of getting a fair share of its value?—Exactly.

18054. On the question of weights and measures, is the practice very uneven throughout the Presidency?—I think it is very uneven.

18055. Have you considered the possibility of standardising weights and measures?—I cannot say I have.

18056. Would either of you like to say anything about it?—I think it would help a good deal, if it could be standardised, but there would be a good deal of local prejudice.

18057. On the part of the dealers in the main?—Yes, the dealers chiefly.

18058. Would you agree that the more complicated the method of measurement and exchange, the greater the advantage which the middleman would have, because he is doing it every day of his life, whereas the cultivator does it only when he has produce to sell?—Yes.

18059. There is something in human nature which persuades most cultivators in all countries that they know as much about marketing as any middleman in the market?—Yes.

Mr. R. S. Finlow and  
Mr. K. McLean.

18060. You do not express any view as to whether the time has come when an attempt should be made to standardise the weights and measures in this Presidency?—I would certainly say that it is feasible, and it should be done as soon as possible.

18061. On page 14, is your answer to Question 20 (c) printed as you wish it to be? You say "The co-operative jute buying organisation now being established in Bengal." Is it jute buying or jute selling?—The Registrar of Co-operative Societies is here, and I would ask him if he considers that is correct.

18062. Who put this in?—It is mine.

18063. Is it a jute buying organisation?—It is a buying and selling organisation.

18064. Its main purpose is to sell the cultivators' jute?—They take the cultivators' jute and sell it at the best possible price; it is probably a nursery.

18065. *Rai Bahadur Bannerji*: Do you not mean there that this co-operative society which will be formed and of which the cultivators themselves will be members will purchase all the jute crop available in the village and will stock it and sell it at the best rate?—That is the idea.

18066. And the profits will go to the cultivators?—Yes.

18067. *The Chairman*: I do not know whether it is realised, but of course when you are starting a selling organisation, one of the most difficult things you have to decide is whether the cultivator or the organisation as a whole is to take the trading risk, that is to say whether you are going to give the cultivator the market price on the day on which he brings his produce to the market, or whether he is to be given an advance and subsequently the balance of whatever price may be obtained?—Yes.

18068. You do not know which practice obtains in this particular case?—No.

18069. Does it occur to you that there is a big field for an Agricultural Economist in connection with these problems touching marketing?—If they are to be investigated, there will have to be a man on special duty to do it.

18070. It is very difficult really to get down to the business of improving the cultivator's position in this respect unless you know what is happening; the hazy reports of the enormous margins that the middleman is enjoying are not very helpful, are they?—I do not think so; you want exact information.

18071. Do you think that sufficient is being done now in this matter of information as to the reputation of Indian produce which is exported and the placing of that information at the disposal of the grower and the trader?—I think that more effective steps should be taken to let the cultivator have information about crops and prices and statistics on general marketing.

18072. *Professor Gangullee*: At the present moment, he does not get any information?—There is no official means of giving him any information.

18073. *The Chairman*: Would you agree that, in some directions in which it does appear at this moment to have a monopoly, her position is in fact being threatened?—In the matter of jute?

18074. Take the question of hemp?—No, I do not think so; I do not think it is in the case of jute either.

18075. You think that her position is secure? How about the question of oil-seeds?—I want to say that it is secure in regard to jute and hemp, for the present.

18076. Would you agree that the best way of securing those advantageous positions and retaining them is by looking about the world, watching most closely the trend of world demand and world market, and making that information available for the distributors, merchants, and particularly the growers of this country?—Yes.

18077. On the question of Indian hemp, I am going to read to you a letter as it is not marked private. It is written to the Indian Trade Commissioner in London by Messrs. Wigglesworth. It runs as follows: "In connection with Indian hemp, the following remark in a letter from our representative in Paris, has a bearing on the necessity of improving the quality if consumption is not to be diminished seriously. 'The French buyers inform me that the time may come, perhaps soon, when they will have to give up Indian hems altogether, even dressed, on account of the large quantity of dust. Workers everywhere object to the dust; in fact, it is not human to expect workers to stay for hours in clouds of dust. Ventilators and respirators do not improve matters much.' There is no doubt that India will have to look to its hurels with regard to hemp if it is to secure trade in competition with Russian hemp, which has now fallen considerably in price, the quality of which is much more suitable for the manufacture of twines and cordage." Is that not a direction in which India's present position is tending to

Mr. R. S. Finlow and  
Mr. K. McLean.

deteriorate to a serious extent? That looks serious, does it not? It looks to me uncommonly serious?—There have been complaints about the dust in Indian hemp for years.

18078. What steps have been taken to attempt, at any rate, to inform the cultivators as to this position and to make suggestions for the remedying of these evils?—In Bengal there is only one tract where hemp is grown and that is in the Serajgunj sub-division. The hemp that comes from Serajgunj is the best hemp that is exported from India. It is the cleanest hemp in the market and it fetches the highest price in the market. The information that I have obtained in regard to hemp from the United Provinces and from Itarsi in the Central Provinces is that their main difficulty is the water in which the hemp is retted. Their water-supply when the hemp crop is retted is insufficient for retting and they have to ret the hemp in pools of mud, with the result that the fibre obtained is a mass of dirt. That is very largely responsible, I think, for the dirty state of this Indian hemp. Of course, in Serajgunj in Bengal, there is plenty of water for retting. That probably accounts to a large extent for its cleanness.

18079. There is another very important buyer in Europe whose name I am not entitled to mention, who tells me in his letter that Indian hemp is defective. There is too much dust in it. Another correspondent tells me that fibre suffers from the way in which it is rolled up in packing?—Yes.

18080. The defects have, I suppose, been improved in recent years?—The Bengal hemp is marketed in Calcutta and it is in quite good condition.

18081. On the question of jute. Would you agree that such information as is at the disposal of the Government of their agents overseas, while it is placed at the disposal of the trade, is never placed at the disposal of the cultivator?—I think it is true to say that no serious steps are taken to inform the cultivators of the prices in the country districts.

18082. I do not know whether the opinion of cultivators would be sensitive to information of that sort?—In the jute growing tracts cultivators take a great deal of interest in the prices. In fact, I have been told that they actually receive telegrams from local dealers in Calcutta.

18083. Are you quite satisfied that India's position in the matter of jute is as unassailable as you suggest?—I said as regards the immediate future. I think I would rather not say in public what I know about it.

18084. If you wish to tell the Commission something in private about it, we will give you an opportunity?—I am prepared to make a short statement in private.

18085. On the broad question, you will agree with me, I am sure, that it is extraordinarily important that as so much of India's prosperity depends upon export markets, every attempt should be made to convey to all concerned all the information available from importing countries on the technical and commercial problems connected with these crops?—I do agree with you.

18086. Turning to page 14 under the heading "Welfare of Rural Population." You say investigations of the kind are in progress, that is, investigations of the economic position of cultivators. Could you give us any particulars about these investigations which are in progress?—I hope to be able to do so by the time you come to Dacca.

18087. In the meantime, you have nothing to tell us?—Not very much. I hope when you come to Dacca we shall have figures from several villages to put before you. They are not the results of complete investigations but they will give you some sort of idea as to the present state of things.

18088. On this question of the welfare of the rural population, can you provide the Commission with any general statement of the powers of local authorities *vis-à-vis* agricultural problems? Are local authorities empowered to spend funds on agricultural matters of any sort?—The District Boards are allowed to allot money for agricultural improvement.

18089. *Mr. Gupta*. Under section 60, they are. That question was raised under the drainage scheme, one opinion was that they are not, but I am not agreeable to that opinion.

18090. *Rai Bahadur Bannerji*: But the general custom up to date has been not to do it?—What I said was based on my experience of *Mr. Gupta's* districts.

18091. *Mr. Kamat*: Will you turn to the last page of your printed memorandum? Is not the point clear there that the Local Self-Government Act was amended in 1920 and under that amendment District Boards can help agriculture?—I cannot express an opinion.

\* Not reprinted.

Mr. R. S. Finlow and  
Mr. K. McLean.

*The Chairman:* If the witness is not in a position to give the information, we will get it elsewhere.

18092. Are you familiar with the statistics of inter-provincial rail-borne trade which was discontinued some years ago and which it is now proposed to renew?—I hope they will be renewed soon.

18093. Do you think it is valuable?—Yes. I can give you one instance. In the case of rice we wanted some information as to how far Bengal is self-supporting in the matter of rice. The whole essence of that inquiry depended upon the amount of rice taken away from Bengal and we could never have got that unless the report was published.

18094. So, as far as this Presidency goes, you are strongly in favour of the renewal of these figures?—Yes.

18095. *The Raja of Parlakimedi:* Let us go back to Pusa. Are you satisfied with the situation of the farm?—I think that Pusa estate is extraordinarily well kept.

18096. Do you approve of its being located at that place; I mean, the selection of site?—It might have been more central, I suppose; but you could not change it now.

18097. What is your opinion about Pusa meeting the demand of paddy growers?—I do not think Pusa should be expected to meet the demand of paddy growers, because the amount of paddy land in Pusa is very small.

18098. But the farm is in the heart of a paddy growing country?—Yes; but I do not know that Pusa would be able to do that. I should have thought that would be more local problem for investigation. I say that advisedly, because although Pusa has done a good deal of work in regard to wheat, the types of rice grown in Madras and those grown in Bengal are not satisfactorily interchanged. As a rule our experience has been if we import varieties of rice into Bengal for trial they behave abnormally. So that I should rather deprecate Pusa taking up the improvement of rice in the sense that it has done with wheat or gram.

18099. Then, are you thinking of having a separate farm for paddy research?—I think each Province ought to do a great deal of local research on rice.

18100. Is there anything being done in Bengal or Bihar?—On rice?

18101. Yes;—The investigations into rice in Bengal practically occupy the whole time of the Economic Botanist, Dr. Hector.

18102. Are these methods made accessible to the cultivator?—Yes. There is a large and increasing area under the improved varieties of rice, and we are establishing now, in order to hasten the process, in districts which are suitable for the improved varieties of rice, small seed farms in the organisation of which we hope to collaborate with the Co-operative Department at a very early date. I have already discussed it with the Registrar that he shall buy up the paddy of each farm and either distribute it or exchange it with neighbouring cultivators for their own paddy.

18103. What characteristics of the crop would these research institutions on paddy investigate?—Largely, yield; it might be also fineness of grain, scent, length of straw; everything.

18104. At present what are the aims of research?—Largely yield, that is, increasing the yield of grain.

18105. Irrespective of the quality or the fineness of grain?—There are various varieties of paddy which are being selected. For instance, the *balam* paddy in the Barisal district, is the finest paddy, at least one of the finest paddies in India, and we are working on that and we are also working on coarse varieties which are grown in other districts.

18106. But the coarse varieties are in greater demand, being consumed by the lower classes?—They are.

18107. Therefore, I think the department should concentrate more upon that than on the finer varieties. The department ought to pay more attention to those varieties which are more popular with the ryot population than to the finer varieties?—Yes, you must give proportionate attention to varieties which are commonly consumed.

18108. In answer to Question 2, page 3, you say that at present the study of agriculture is not very popular?—I think that is true.

18109. I think your reason is there are not many appointments available in the Agricultural Department. Would it improve matters if waste land free of premium was offered to agricultural graduates by the Government?—The question is whether there are waste lands or not? If you have got valuable waste lands, yes. But in Bengal the waste lands, where there are considerable areas of them, are in difficult situations, or are not very productive.

Mr. R. S. Finlow and  
Mr. K. McLean.

18110. *Professor Gangulee* : Are you referring to cultivable wastes ?—Yes. It may be malarious or it may be infertile soil, or it may be some other condition which prevents them being taken up by the cultivator.

18111. *The Raja of Parlatimedi* : If you give cultivable wastes in the neighbouring Province of Bihar and Orissa, would that give a sort of impetus to these boys ?—I think there is scope for them in Assam. If they care to go to Assam and break up the jungle tract there, there is real scope for them.

18112. Has it been made known to the public ?—It is known. The Bengal cultivators are going up there by tens of thousands ; they are colonising Assam.

18113. As regards Irrigation (page 6) you mention that there is scope for irrigation in Bengal but that it has not been taken up. May I know what is keeping it back ?—It has been a matter of funds. We have just obtained from the Government sanction for the sinking of a tube well on the Dacca farm for experimental work on the value of irrigation for crops. That tube well should be ready next hot weather, and from that we hope to get results which will enable us to make recommendations for the Province in general.

18114. Has the Legislative Council been actually approached for financing this sort of irrigation schemes ?—All the schemes have to go through the Legislative Council, of course.

18115. Proposals have gone up to them ?—Yes. It is really the Finance Department which has to say which schemes are the most urgent.

18116. Do you mention any specific methods of irrigation or do you leave it as irrigation in general ?—This is a particular proposal for the use of water from a tube well.

18117. But there are other irrigational sources ?—Yes.

18118. Is it just because it is a tube well that they did not approve of it ?—No, not at all.

18119. *Rai Bahadur Bannerji* : That does not properly fall within your province ?—No.

18120. *Professor Gangulee* : What is the point of contact between your department and the Department of Irrigation ?—This is the point of contact in these schemes. We shall show the Irrigation Department what our results are. We shall tell them, " We have done this work ; we have found that these crops can be grown, &c. much can be obtained by irrigation ; it is up to you to do the rest."

18121. *Rai Bahadur Bannerji* : Cannot your department make a request to the Department of Irrigation for any particular irrigation scheme ?—Yes ; we are asking them. I can give you another instance. In Eastern Mymensingh some months ago a number of cultivators who grow *boro* paddy (that is transplanted paddy, grown in the cold weather and the hot weather) came to us and said that through lack of rain, their paddy is often adversely affected in the hot weather. They suggested that there was river water or *bhil* water near by, and it might be possible to pump water to the *boro* paddy lands to ensure them a regular full crop. We immediately wrote to the Irrigation Department about this, the local Irrigation Engineer visited the tract with one of our officers and put up an estimate which is now before Government.

18122. *The Raja of Parlatimedi* : In answer to Question 24 (b), you mention that there are obstacles in the way which discourage improvement of land. May I know what your suggestions are to improve the situation ?—I am afraid I must confess considerable ignorance. But it seems to me from all the information I have got that anything which would tend to bring the landlord and the tenant together to make a mutual agreement outside the court is really what is needed.

18123. To minimise as much as possible going to courts for confirmation ?—Yes, exactly.

18124. Then, as regards fodder crops in this Province, do the cultivators grow fodder crops as much ?—No ; practically none.

18125. Not even Guinea grass ?—No, the only way they can be said to grow fodder is, on the low *bhil* lands, in the cold weather, when the water goes down, they often broadcast a pulse, generally *hesari*, which is grazed by the cattle. When the cattle cannot get grazing in the cold weather they get a little grain.

18126. It is entirely for the cattle ?—It is chiefly for the cattle. So far as I know, that is the only deliberate cultivation of fodder crops that takes place.

18127. Mr. P. J. Kerr in his "Improvement and Care of Cattle in Bengal" refers to the giving of mustard cake as part of concentrated food. Is it given throughout the year for milch cattle ?—Yes.

Mr. R. S. Finlow and  
Mr. K. McLean.

18128. Does it not have a bad effect upon the milk-giving property?—It is not a good cake, but it is the only cake that is available all through the districts. You cannot get soybean cake or coconut cake in Bengal.

18129. Gingly cake?—No. Mustard cake is the only cake that we have got on a sufficiently large scale.

18130. Is there any area under ground-nut in Bengal?—There is a very small area in Western Bengal.

18131. Is the stuff exported as it is or after the oil is extracted?—It is all used up locally and is not used for oil extraction. I do not think there is any export.

18132. It is only a very small area?—Yes.

18133. As a bye-industry would you encourage fish-breeding?—Yes.

18134. Fish is a very important factor in the diet of Bengal?—I think it is possible that pisciculture might be an important subsidiary industry.

18135. Are you prepared to include it in your memorandum?—Yes. Was it not mentioned in the memorandum?

18136. Mr. Kamat: Is it not a fact that your Department of Fisheries has been closed?—Yes.

18137. Sir James MacKenna: Mr. Pinlow, the Commission, as you know, have just come up from Madras where at Coimbatore we have seen the work of the Government Sugarcane Expert. I want to know whether you have had any experience of these Coimbatore canes?—We have tried a large number of the Coimbatore canes and some appear to be particularly suitable to Bengal conditions.

18138. Are your canes in North Bengal the thin variety or the thick?—In parts of Rajshahi there is a fairly thick cane but in the greater portion of the Province the canes are thin.

18139. You have got about a couple of hundred thousand to a quarter of a million acres of sugarcane?—Yes.

18140. Of that how much would be under thin? Three-fourths?—Yes; I think so.

18141. You think the Coimbatore canes can be introduced into a considerable area?—Yes, excepting in tracts where reed canes grow on lands which become submerged in the monsoon.

18142. How do they compare in the yield?—As regards the outturn of *gur* the Coimbatore cane seems to be 20 to 25 per cent better than *anna* (the cane hitherto advocated by the Bengal Department of Agriculture), and the juice forms a better *gur*.

18143. Have these Coimbatore canes been developed to the stage where you could judge whether they had considerable advantage over the others?—We laid it down that five years should pass before the cane was passed on to the cultivator, because of the danger of disease. The five years have passed now and the Coimbatore canes have really begun to give good results. The cultivator has seen it on our farms and he is taking them.

18144. They are taking an interest themselves?—Yes; they have actually come to the farm and taken the roots of old crops which are being discarded in the course of rotation.

18145. To what extent was your department affected by the Retrenchment Committee's operations?—It was rather badly retrenched. The District Agricultural Officers were reduced from 63 to 31 and demonstrators from 180 to 80.

18146. And the Deputy Director grade?—In the Deputy Director grade the appointments of two extra Deputy Directors were postponed.

18147. So, on account of the retrenchment your operations were practically reduced, so far as the personnel goes, by about 50 per cent?—They were very seriously reduced.

18148. And that was accepted by the Government?—Yes. The Retrenchment Committee's recommendations were much more drastic.

18149. But the final decision of the Government was that the operations of the Agricultural Department should be practically reduced by 50 per cent?—Yes, something like that.

18150. Do you approve of that policy?—No.

18151. Do you think that generally the population of Bengal approve of that?—I think that on the whole it was bad, because although a number of them were not sufficiently

Mr. R. S. Finlow and  
Mr. K. McLean.

trained, we should have been able to train them in the meantime, whereas now we have to take in raw men for work which is very urgently needed.

18152. Has this stop on the Report of the Retrenchment Committee been taken as a final closing down on the part of the Government or can you still send up schemes for development?—Yes; schemes we send up to Government are seriously considered and are approved by Government provided funds are available. That is the crucial point.

18153. But still you are encouraged to send up your schemes?—Yes; and they are prepared to discuss them.

18154. So the retrenchment was purely temporary, I hope?—Yes. His Excellency said, after the retrenchment had been effected, that if we could show sufficient justification for extra staff the Government would consider it.

18155. Retrenchment was largely due at that time to the financial position?—Yes; at that time the position was acute and they really did not know where to turn for money.

18156. You can still send up schemes?—Yes.

18157. Have you got such a scheme put up?—Yes.

18158. What are you asking?—We want to ask for a Deputy Director in every division and a District Agricultural Officer in every district and possibly extra men in the subdivisions and an increased number of demonstrators. That is the original policy of the Government, to have a larger number of demonstrators.

18159. You are just providing for that in your scheme?—Yes.

18160. Of your staff how many are Bengalis? Have you had to indent on other Provinces for a large portion of your staff?—No, not very much.

18161. I think you will admit that the Bengal student has very few opportunities really of proving his capacity for agricultural work?—Yes.

18162. Owing to the absence of an Agricultural College for agricultural training?—Yes; I think an Agricultural College or an Institute is an urgent necessity.

18163. It is rather lack of opportunity than lack of capacity?—I do not think there is any lack of capacity in Bengal.

18164. Facilities are not available?—It is possibly more or less a hereditary matter; agriculture has not been a popular thing with the generality of better class people in Bengal. It may take a generation to get rid of the idea.

18165. In answer to a question put by the Chairman you said you were of opinion that the Bengal Honours student from the Dacca or Calcutta University was quite promising in research work?—Yes.

18166. So if you get adequate facilities for training, there is no reason why you should not have a thoroughly competent staff?—I think so.

18167. If you start this Institute, are you going definitely to confine it to the training of candidates for the department?—We would take others if they desire to come, without any promise of employment.

18168. What is your experience of Indian Agricultural Colleges?—I cannot say very much; but I have been told that in the Punjab there is a certain amount of demand for education from the sons of cultivators; I do not know how far it is correct.

18169. Will you say that the primary object of your Institute is to train officers for the Department?—Yes; I think so; that must be the primary object.

18170. Do your Deputy Directors live on their farms?—Yes; the Deputy Director in Eastern Bengal lives in Dacca; the Deputy Director of Northern Bengal, at Rangpur; unfortunately for Western Bengal at present the headquarters is in Calcutta; it has always been rather a disadvantage.

18171. Do these Deputy Directors do any actual research work themselves?—At Dacca certainly; the Deputy Director of Eastern Bengal has always taken part in field research. It has been a question of collaboration between the Deputy Director and the experts.

18172. And the others?—In the other places the Deputy Director does collaborate with the expert in the same manner in his farm headquarters, in Northern Bengal, for instance.

Mr. R. S. Finlow and  
Mr. K. McLean.

18173. Do you consider the method of organisation of research by crops instead of by geographical areas better, the Madras system in which special staff is dealing with a particular crop and is responsible purely for scientific work, propaganda being left to the Deputy Directors in the geographical areas which they deal with?—My own appointment of Fibre Expert is more or less an appointment on those lines. I find it is an advantage, to allow him to do the work which seems to suit the necessities of the situation.

18174. In this Presidency jute and rice are the important crops?—Yes.

18175. Your oil-seeds and other crops are not important compared with jute and rice. They are subsidiary crops; they are not important compared with jute and rice.

18176. Now before a piece of research work is undertaken, how do you proceed? What is the method of attacking a new piece of research work? Suppose a Deputy Director wants to start a piece of research, does he start straight off or is the matter considered by a committee or referred to you for approval?—There has been for sometime a sort of informal committee at the Dyce Farm which discusses all the work which goes on at the farm; but an officer is not fettered in any way when he wishes to bring forward a subject for research.

18177. Does he get anybody's approval?—It is left largely to his discretion.

18178. Where does the Director come in?—In general supervision and suggestion more than actual direct control.

18179. Suppose a Deputy Director went in for a wild-cat scheme?—We could certainly stop that; but nothing of that sort has yet occurred.

18180. Just one other question about this pest which I suppose, is of great interest to the Government of Burma, the Government of Bengal and probably to other Governments as well, this hyacinth pest. To what extent are the methods in actual practice dealing with this pest feasible on a large scale?—There are three possible methods. There is man handling; the second is by the use of machinery and third is by a chemical spray. Personally I think that a combination of all three will probably be most satisfactory.

18181. But they are all expensive and they all involve labour?—Yes.

18182. Burma you know had a dredger at a cost of 3½ lakhs?—I saw that reported. I do not know what the dredger did, whether it ever did any work. The Irrigation Department have taken over the river here in Bengal and they have (I believe, I am right in saying so) constructed some form of crushing machinery. The hyacinth is cut and conveyed through crushers and cutters coming out in a very fine state of division. It is then thrown over board. It has been tried on a very small scale; but it has got to be proved whether it is a practical proposition on a large scale and whether a reasonable amount of machinery is capable of dealing with a very large amount of hyacinth.

18183. Do you not think, in view of its seriousness, it is a problem for concerted action? It causes an enormous loss to agriculture directly and indirectly?—I think in Bengal they have already come to the conclusion that without the collaboration of Assam and Burma, Bengal is practically helpless.

18184. Concerted action on the part of the Governments of Bengal, Assam and Burma is necessary?—Yes.

18185. The *Raja of Paralimedi*: Can it be used as manure?—Yes, it is an excellent manure.

18186. *Sir James MacKenna*: It is an enormous problem?—Yes.

18187. And it must be tackled in a very big way?—Yes, it is responsible for doing a lot of damage.

*Mr. Cahert*: In Faridpur the area which has gone out of cultivation, or the cultivation of which is spoiled by water-hyacinth is estimated to be 5 per cent at the present time.

18188. *Sir James MacKenna*: It is getting to dry land?—It runs the deep water-ridges.

18189. And of course the loss indirectly is increased because of the blocking up of easy transport by water-courses?—It absolutely closes certain water-courses; especially where the water is tidal the hyacinth comes down and then is brought back by the tide, and in the meantime other hyacinth has been brought down from the river from above, and in the end it piles itself up layer on layer, until it is solid enough for even a man or a bullock to walk across.

18190. *Professor Oranville*: I want a little more information about this system of research that you follow. In answer to *Sir James MacKenna* you said that the Director, the Deputy Directors or your experts can pursue any piece of research without any consultation?—Yes, normally.

Mr. R. S. Finlow and  
Mr. K. McLean.

18191. Do you discuss fundamental agricultural problems with your exports?—Yes.
18192. Do you chart out a programme for a year, or two or three years?—I do not think that is sound, I do not think you can say exactly what you can do in any one year.
18193. Not quantity but quality?—We examine it, we look at the results. All the reports of the work done are read carefully and if necessary criticised. Then I pay frequent visits to the farm and to the laboratory, and discuss the work that is in progress with the different officers.
18194. Do you have any system of a colloquium to discuss these questions?—It is nearly all informal.
18195. Is there any co-ordination between your Fibre Expert and the Economic Botanist, or between the Economic Botanist and the Agricultural Chemist?—Yes.
18196. Is your Economic Botanist familiar with the nature of research being conducted by the Agricultural Chemist?—The work on transpiration which I mentioned is being done in collaboration by the Agricultural Chemist and the Economic Botanist; similarly, the Fibre Expert and the Agricultural Chemist collaborated in very fruitful work on green manure.
18197. It is a sort of team work?—Yes.
18198. To tackle one particular problem?—Wherever possible, it is work in collaboration.
18199. In retrenching your department, which has been rather serious, was the full value of your work carefully appraised?—I suppose it was carefully considered.
18200. We therefore cannot come to this conclusion, that the items which were retrenched were found unnecessary by the Retrenchment Committee?—Certainly not, I do not think so.
18201. They took into consideration the full value of your work? Retrenchment was made only on financial grounds?—Yes; it was absolutely necessary that some retrenchment should be effected.
18202. You have stated that you have no systematic soil survey. Is any systematic effort made for an agricultural survey?—There is no systematic agricultural survey in progress at the present moment. Each Agricultural Officer has instructions to proceed as far as he possibly can in the direction of making a survey, to write up the results as he gets them, and to forward them to headquarters.
18203. On page 2, you say that the success of the Indian Central Cotton Committee has led to a suggestion that the principle of that Committee could be extended to other crops. Did this suggestion of carrying on researches by crops occur to you before it arose elsewhere?—That was a thing which was discussed three or four years ago.
18204. Was this your suggestion?—It was not mine.
18205. Did it arise in your mind independently of others?—I do not think it did, but I forget now.
18206. On page 2, you say that under provincial control research may not prosper as it should. Could you develop that idea? What have you in mind?—In that I am merely looking to such contingencies as took place, for instance, under retrenchment. We were then handicapped seriously by lack of money, and the work of the department was held back for years.
18207. When you say "subject to the same influences," you were referring chiefly to financial difficulties, and not to anything else?—Not particularly.
18208. Do you anticipate any difficulty from the politician?—That is a possible contingency; I think that there might be some political influence.
18209. Turning to the work of the Deputy Directors, they are largely responsible, as I understand, for propaganda work?—That is the main part of their duty.
18210. Propaganda and demonstration connected with propaganda?—Yes.
18211. They are also in charge of research?—They are nominally in charge of such research as is going on in the farms.
18212. You have got 19 farms; how many experimental farms are within the jurisdiction of each of the Deputy Directors?—Seven or eight farms.
18213. So, the Deputy Director has to look after the farms, do his propaganda work and demonstration, and carry on his own research?—Yes.
18214. Do you think it is humanly possible to do all that efficiently?—We want to get a Deputy Director in each division; that would reduce his number of farms to four or five.

Mr. R. S. Finlow and  
K. McLean.

18215. You receive a certain grant from the Indian Central Cotton Committee ?—No.  
 18216. Your Second Economic Botanist is working on cotton ?—Yes.  
 18217. Independently of any grant from the Indian Cotton Committee ?—Yes, it is local research.

18218. In Western Bengal there is a possibility of cotton cultivation ?—Yes.

18219. The research work done by Mr. Datta indicates that ?—The work which has been done indicates that there are some varieties which may do good there.

18220. With regard to your relationship with the Central authority in point of the research work which has already been accomplished by you, what definite assistance have you received from the Imperial research stations in Pusa, Coimbatore or elsewhere ?—I do not know that we would ask, if we were doing a piece of research, for the assistance of Pusa particularly, unless we had not got the staff to do it. Do you want instances of where Pusa has helped us ?

18221. Yes ?—I will give you one instance. When we began to grow jute seed on a large scale in Bihar, in the first year we encountered a fungus disease which was so serious that we thought we would have to abandon the whole scheme of producing jute seed on a large scale in Bihar, but with the assistance of Dr. Butler, in the course of a very short time, we were able to come to the conclusion not only that this fungus was very widespread throughout the jute growing tract, but we could control it by steeping the seed in copper sulphate, and later, that we could evade the disease altogether by sowing it at a different time. The work was done in collaboration with Pusa, and it has been of very great value indeed.

18222. With regard to the jute breeding investigation, which you have just referred to, was not the work undertaken only after the recommendation of the Board of Scientific Advice ?—The work on jute was done at the instance of the Bengal Chamber of Commerce.

18223. Therefore, we may take it that the work did not arise from the Department, but that it arose from an extraneous authority ?—There was no such thing as a department at that time.

18224. The recommendation came from the Bengal Chamber of Commerce ?—Yes.

18225. The matter went up to the Board ?—The matter went up to the local Government, and from the Government of Bengal to the Government of India, a sub-committee of the Board of Scientific Advice was appointed to investigate the matter.

18226. When was it taken in hand seriously ?—The work began about 1902. Of course, it had to begin with the collection of plants, and that was one aspect of course. There were various statements made in the market and elsewhere that the jute plant was deteriorating and producing a worse quality of fibre; that had to be investigated. Another aspect of the question was whether any improvement was possible. For the purposes of answering both these questions, a collection of fairly typical jute races was made from various parts in Bengal, and they were examined first of all as regards the quality of the fibre they produced. The result of that investigation was that if the preparation is careful and the plant is well grown, a good quality of jute is produced. The other side was the question of improvement. Of course, that was largely a matter of yield, making it a more efficient plant, and that was the work that the Department of Agriculture undertook as soon as it was established.

18227. Was this result that you have obtained today arrived at by selection or hybridisation, or both ?—I may say that the whole of the area under improved jute at the present time is from seed produced by selection. We have a number of hybrids, but none of them has quite come up to the best of the selected races.

18228. Could you tell the Commission the year when you obtained the two varieties of paddy of pure line selection ?—How many years back was it ?—Probably, about 1915.

18229. Has there been any further work on paddy breeding since ?—Absolutely constantly.

18230. The public constantly hear about *indrasail* and *katakara* varieties ?—The *indrasail* and *katakara* were two races of paddy which were specially selected for a very large tract in Eastern Bengal, Northern Bengal and Central Bengal; they were found not to be generally suitable for Western Bengal, on account of different physical and climatic conditions.

18231. When you say that the yield of these varieties is about 25 per cent above the ordinary rates of paddy, would you ascribe the increase solely to the pure line seed ?—Yes.

18232. Irrespective of the method of farming ?—Yes.

18233. Or the type of soil ?—Yes.

Mr. R. S. Finlow and  
 Mr. K. McLean.

18234. It is due to the hereditary function in the seed, irrespective of land?—Irrespective of any environment.

18235. With regard to fibre experiments, have you any data on the influence of soil on the quality of fibre?—In collaboration with the Indian Jute Mills Association we are in the middle of an investigation into that; it is a long story.

18236. I just wanted to know whether that point has occurred to you, because it is rather important. As you know, Canadian hemp has received a great set back because of the bad soil condition? Have you conducted any experiments on retting?—Yes, we have found that retting can be hastened.

18237. Of course, you know it is a bacteriological process?—Yes, and the notion of the bacteria can be considerably hastened by giving them suitable salts as nutriment. I doubt if that would be an economic proposition. To be successful in retting you ought to have a running stream, and if you are going to have a running stream, it becomes very expensive indeed.

18238. You have already given us some indication of your relationship with the paddy research station in Coimbatore. Did you pay a visit there?—We have merely had samples of paddy from Madras to test them in Bengal. The reason was that in Madras they seem to be able to get a higher yield of paddy than we have hitherto been able to get in Bengal.

18239. *The Chairman*: Is it really the case that you have not been to Coimbatore?—Yes.

18240. *Professor Gangulee*: You have visited the paddy-breeding station?—No; I have not been to Coimbatore; I have been to Madras.

18241. We were rather interested in the kind of work that is being done there. One of their experiments interested me a great deal; they are doing some work on salt resistant varieties. Do you think it is very important here?—We have also done it here. We have got a collection from Burma and Madras, the Sunderbans and Chittagong.

18242. Has Dr. Hector, who is in charge of your work here, come into contact with Mr. Illiffe of the Coimbatore station on any occasion in order to discuss these problems of paddy-breeding?—I do not think so, unless they may have met at a conference. I do not know whether they have ever met.

18243. *The Chairman*: Do you happen to know the first class fare to Coimbatore?—It would be about Rs. 130.

18244. *Professor Gangulee*: Have you sent any variety of paddy from here to Coimbatore?—I could not say.

18245. One more question about research. In your report you give us results of manual experiments. For how many seasons do you continue your manual experiments before you put your results out?—Many times. Many of them go on for years. The results quoted in one report are merely the results of the previous year.

18246. When you say 'previous year,' do I take it that it is one year's experiment?—These are only records and not the compilation of all the records.

18247. How long have your manual experiments been tested? After how many seasons' experiments have the results been obtained?—They go on for years and years. Take the case of lime and potash. That work has been going on for a number of years. It was fit to go out to the cultivators some time ago but we have not yet been able to get the necessary financial assistance.

18248. When you definitely recommend that phosphate is good for certain crops on red soils, how many seasons' trial do you actually make in your experiments before you arrive at a conclusion?—I would not like to give any particular number of years. It would probably be at least three, possibly four or even five. It all depends on the results themselves and how they agree.

18249. With regard to Agricultural Education. In the note that you have submitted you tell us, with regard to this proposed Agricultural Institute at Dacca, that the preliminary training in pure science should be followed by two years' practical work at Dacca farm and the qualification for admission in Intermediate (science) standard?—Intermediate science plus one year in science.

18250. What is the entrance standard for your Dacca Institute?—It is Intermediate science plus one year in pure science at the University.

18251. That is your entrance qualification for the Dacca Institute?—Before a student can come to the Institute to take his diploma course, he will have to take the Intermediate science plus one year in pure science at the Dacca University. Then he will begin the purely practical course at the Institute.

Mr. R. S. Finlow and  
Mr. K. McLean.

18252. The annual report of the department says, "It has now been proposed that Matriculation shall be the entrance standard." Which is correct?—Do you not remember that there was a discussion last June, I think you were present at the meeting.

18253. In reply to our Questionnaire you say that the entrance qualification will be Intermediate science standard and in this report I find the Matriculation standard. I want to know which is correct?—It has not been decided; it is still under discussion by Government. I think it would be a great mistake to admit a Matriculate to a course like the one we are contemplating at the Institute. It is a purely practical course and it assumes a certain knowledge of scientific processes. The average Matriculate does not know science at all.

18254. You have in your note referred to the failure of the Sabour College. What inference, do you think, might we derive from that failure?—I think the first deduction is that for the present (I do not prophesy at all, because I believe that conditions will alter in the future) an agricultural college must be started and filled almost entirely by people who are going to enter Government service. Later on it will be different, I believe. But for the present I think that we must contemplate that.

18255. The entrance qualification in the case of Sabour College was Matriculation?—Yes.

18256. Your idea in the proposed Dacca Institute is to have more of the practical than of the theoretical aspect of agriculture?—It will be entirely practical.

18257. You propose to teach pure science in the first year or for two years?—We propose to teach pure science in three years.

18258. Then put the pupil through a practical course of training?—Yes.

18259. Your idea is to keep these two aspects quite distinct. You do not think the combination of the two, practical and theoretical, may be successfully carried out?—Our experience was very unfortunate. It may have been due to the fact that they did not have sufficient time. We have considered this very very carefully and we have come to the conclusion that it would be better first of all to make the boy understand a certain amount of pure science, sufficient to enable him to follow the scientific cases of the practical processes that he is to carry out later on.

18260. So you are definitely of the opinion that the purely scientific aspect should be kept distinct from the practical aspect?—Personally I think so. But it is going to be tried only as an experiment which I am sure is going to succeed.

18261. Have you had experience in any of the European Universities where they teach agriculture?—I have never taught at any such place, but I have been a student there.

18262. Have you had occasion to visit any such institute?—Yes.

18263. Let us come to the secondary stage. In your secondary stage the model is the Punjab?—In the middle school education, yes.

18264. Have you visited the Punjab yourself?—I have not, but Mr. McLean was a member of a small committee which visited the Punjab to investigate the Punjab system.

18265. You base your scheme solely on the success of the Punjab scheme?—No. We have experience of two schools, one of which is at Amarpur in the Burdwan district. It really has been a success. There are eight schools in Bengal at the present moment which have agricultural classes. It is not only because this scheme has proved a success in the Punjab that we are going to adopt it in Bengal, but from our practical experience here. We have very few vernacular middle schools in this Presidency so we must apply it in the middle English schools.

18266. Do you know that middle vernacular schools are now on the decrease?—Yes.

18267. Even the peasants do not like their sons to be educated in purely vernacular schools?—Apparently so.

18268. With regard to the question of propaganda as to seed distribution, it is not quite clear what actual method you follow in your seed distribution?—We followed rather direct methods both as regards jaddy and jute. We went out to the districts and sent our officers out. We also sent out notices to the prominent people who could read; to panchayats and so on, and told them that we intended to distribute jute seed. We said we would distribute a quarter of a pound to each cultivator, on the condition that he would not cut the resulting crop until the seed was ripe and that he would grow the crop separate from his ordinary crop. Of course, we did not launch out into a huge scheme without testing it on a small scale first. At first we worked on a small scale. When that was successful, we proceeded on a bigger scale. It is that system which is responsible for the large area which is under departmentally improved jute areas.

Mr. R. S. Finlow and

Mr. K. McLean.

18269. This 3,000 maunds of departmental jute seed is grown on that method?—That was produced in Bihar. It was not grown on that method.

18270. I should like to know from where you have got this 3,000 maunds of jute?—Largely from Bihar, partly from Assam and to a certain extent from Nadia district.

18271. So these three areas supply these seeds?—Yes.

18272. Are they under your control?—A contract is made with growers in these areas to multiply seed with which we supply them. We take the seed so produced at a fixed price, provided it germinates 90 per cent and is clean and that the crop from which it is raised is subject to examination in the field.

18273. When you say "departmental seed," you mean to say that the original seed came from the department?—All the seed distributed or sold by the department is that of pure line types purchased by the Government Fibre Export. We supply growers with seed of these types for multiplication.

18274. You buy the seed from them on tests for germination and purity?—Yes, it is examined for purity while growing.

18275. You think by that means the standard of excellence which you have attained is safeguarded?—Yes, we test the seed; we take samples from each bag and test it to see that it is pure.

18276. Is the same process adopted with regard to rice?—We started the same process with rice, but it was a much more difficult problem, and besides, the quantity that we had to distribute was much larger, and the arrangement involved the return of an equal quantity of the seed after harvest. It was found that that led us into all sorts of difficulties; I mean there were outstandings which were not recovered and we had great difficulties; in the end we had to give it up. Now we have gone on to another system which involves the use of small seed farms in villages; I mean we go to a particular tract where we know the conditions are suitable for one of our paddies, we select an important person in the village who has a considerable amount of land, and we get him to start a small paddy seed farm. The produce of that farm is then exchanged with the ordinary seed which the cultivators would otherwise sow; if there is any difference in price between the two, the department is prepared up to a certain limit to stand the loss as a demonstration charge.

18277. Of course, you have no machinery to test the purity of seed as they have in England and other countries, as to germination, purity from weeds, and that sort of thing?—I do not agree and I think that no purer and better seed is to be found anywhere than that purchased by the Bengal Agricultural Department. The contents of every bag are tested, if it is dirty the seeds are winnowed and the charge is placed to the debit of the producer.

18278. With regard to the demonstrator who visits the various rural areas, would your demonstrator accompany the cultivator to his farm, walk over the land, point out errors of management and so forth, and have a chat with him?—Yes, certainly; that is supposed to be his duty.

18279. Is this idea of the demonstrator going over his farm and discussing matters with him popular with the cultivator?—It is becoming so now; I mean we can see things moving; there are definite requests for help now.

18280. *The Raja of Paralmed:* That depends also upon the demonstrator himself?—Yes, and the people on the spot, they are the whole problem.

18281. You must give a good District Agricultural Officer a good demonstrator?—The District Agricultural Officer himself is all that is necessary, because he will see that his demonstrators are good.

18282. *Professor Gangulee:* Of your 10 experimental farms how many are both experimental and demonstrational?—Practically all of them combine both functions.

18283. Who holds the demonstrations in these farms, the Agricultural Officer or the Deputy Director of Agriculture?—What we call a demonstration area is an area which is farmed in an ordinary way, I mean as an economic proposition.

18284. But I have not quite understood what part the Deputy Director of Agriculture plays in the demonstration work. When you hold a demonstration, is he present?—Yes; but not always of course. A crop demonstration is a comparatively static thing. He is in charge of all the farms and of the demonstrators ultimately.

18285. Does he talk with the cultivators?—Yes, certainly. I mean he cannot be in any one particular spot all the time; he has to go on tour, and when he goes on tour it is part of his duty to meet the cultivators on the spot.

Mr. R. S. Flintow and  
Mr. K. McLean.

18286. This idea of running your farms on an economic basis as a commercial proposition is a new one, is it not?—I should think it is about four years old and of course it only refers to a portion of each farm.

18287. It has been recently organised?—Yes.

18288. Many farms have not adopted that system, for example, Bankura?—Yes, Bankura and Suri are two farms which we regard for the present as being too important from an experimental point of view.

18289. When you work out the cost of cultivation do you take the minute details?—Yes.

18290. The number of hours ploughed and so on?—Yes.

18291. *Mr. Calvert*: Mr. McLean, on this problem of fragmentation of holdings, do you regard the question of consolidation in Bengal as hopeless or just a matter of time?—Very nearly hopeless, I think.

18292. You said that a committee had been proposed to investigate the matter; has that committee been appointed?—No, the committee was never appointed.

18293. You have visited the Punjab?—Yes.

18294. Have you any alternative method to suggest?—No, I am afraid I have not.

18295. Or any improvement which we could consider?—No, I thought the Punjab scheme was very excellent; unfortunately we cannot apply it here.

18296. The difficulties of tenure are too great, are they?—That is the trouble, the tenure of holdings.

18297. Mr. Pinlow, in discussing fertilisers you say that the improved crops mean an appreciably greater drain on the soil, which must be replaced?—Yes.

18298. That is almost in direct conflict with what Mr. Howard told the Indian Science Congress last January?—I think it is patent. Suppose you take a jute crop; a jute crop grown from improved seed produces say 3 or 4 maunds an acre more fibre. The fibre in the jute plant varies from 4 to 6 per cent of the plant, so that the total green weight of the plant would be say 20 times that amount, which would mean an extra 60 maunds, or 2 tons, of green matter per acre. In the preparation of the fibre practically the whole of that material goes into the water and is washed away.

18299. In discussing attracting capital on page 14 you say it is probable that the aggregate income per acre from large farms would be less than that from holdings farmed intensively?—Yes.

18300. Is that based on experience or is it just an opinion?—It is the difference between farming extensively and farming intensively. Theoretically of course it should be possible to cultivate a large farm to the same degree of efficiency as it is with a small farm, I mean, for instance, a garden; but in practice I do not think it happens. I mean if you have got a small area of one acre, you can put manure and labour into it, and it is more possible to do it on a small area or on a large number of small areas, than on one big area with comparatively few people working it.

18301. On the other hand it is argued that on the larger farm there is more scope for capital, labour-saving machinery, intelligence and skilled direction?—Not necessarily. I mean, as regards manure, provided there are credit facilities, there is no difference between the large farm and the small one.

18302. That is one of the contentious points from the economic point of view; I was wondering what your experience was. (*Mr. McLean*). You can grow intensively certain crops which are very paying, whereas you cannot grow them extensively. It means that you are increasing your aggregate return per acre.

18303. You assume that a large farm means extensive cultivation?—Yes, it must do, surely. A large farm means extensive cultivation as apart from intensive cultivation.

18304. *Mr. Gupta*: Must it necessarily be so?—Not necessarily, but in practice it would amount to that I am sure.

18305. *Mr. Calvert*: I do not know what variation of holding there is in Bengal, but does your experience indicate that your small cultivator does actually cultivate more intensively than your bigger cultivator?—We have not got any big cultivators in that sense; I mean five acres is about the limit taking it as an average. There are individuals in places who cultivate more, but I think it is safe to say that the average is within five acres.

18306. The most remarkable thing about most of India that I have noticed is that the small man tries to cultivate extensively, he cultivates the same crops as the big man

**Mr. R. S. Pinlow and  
Mr. K. McLean.**

and uses the same method; the 2½ acres man will grow rice in exactly the same way as the 15 acres man? I think the small man is able to do more.

18307. Yes, he is able to, but does he?—Well, there are more men to the acre, to start with, as a rule.

18308. Does not that generally mean, more leisure to the acre?—It might; of course that is putting it in another way; but I think you will find it goes into labour.

18309. But he actually grows the same crops?—Yes, probably; but on the other hand jute grown as a plantation crop on a large area has always failed hitherto over the labour difficulty.

18310. In discussing the welfare of the rural population, you mentioned the Punjab Board of Economic Enquiry. Is there any proposal to establish a similar Board here?—There is no official proposal.

18311. Do you think you would be able to get people sufficiently interested in rural problems to manage such a Board?—I think so, yes. I think we ought to be able to do that. In fact, I am sure there are people in Bengal sufficiently interested to devote a certain amount of time to it.

18312. Am I to understand that your department has given a monopoly of the distribution of jute seed to a particular firm?—No, just for the present Mr. Godden is Government agent for jute seed because Government said that the distribution was a scheme which was becoming too big for the Agricultural Department with its small staff to manage; and then we received an order that we should appoint an agent for the sale of Government jute seed.

18313. Suppose the Co-operative Department asked for seed for distribution?—They would get it immediately.

18314. Through you or Mr. Godden?—They would get it through Mr. Godden but at the same price as we should supply it to them.

18315. You say that this seed is at a premium over the ordinary seed?—Yes.

18316. Does not that open up an opportunity for private individuals to grow this special type of jute for seed?—Yes, certainly, and we take the seed provided we can supervise its production. It has also produced a number of imitators, I am sorry to say.

18317. You mean who are not adhering strictly to the advice?—People who are selling other kinds of seed as improved seed.

18318. There is no one trying on scientific lines to produce this high class seed as a private venture?—Yes. All our supply of improved seed is produced by private growers, whom we supply with pure seed for multiplication.

18319. Do they sell it themselves?—So far, all of them have said they would prefer we should do the selling of it, because they cannot be worried with collecting the small amounts of money; they do not like to take the risk either.

18320. I should like to ask you a few questions on the effect of a large market like Calcutta on agriculture round about. Does the cultivator round about Calcutta respond to the economic opportunity afforded by Calcutta?—I think he does to a considerable extent. Take vegetables; we have big areas round Calcutta where vegetable cultivation is practically the sole occupation of the cultivator. The village of Padmarhat, which it was suggested the Commission should visit, is an instance in point.

18321. The cultivator is using more improved methods of cultivation?—Yes.

18322. May be using more intelligence?—They use more manure than the ordinary cultivator.

18323. Is that opportunity being seized by educated people to go in for market gardening?—I do not think so; it is nearly all done by the small man.

18324. By the men of the same educational attainments as the men fifty miles away?—Yes.

18325. Are the facilities for transport round about Calcutta sufficient to extend this area?—Cauliflower comes to Calcutta from Patna, nearly 400 miles away. There are various places which have gardens outside Calcutta, which produce their own vegetables. Then there is one farm at Ranaghat, about 40 miles from Calcutta where they produce chowling cress, also vegetables and they sell them in Calcutta. I should say however that, on the whole, vegetable cultivation is in the hands of small men.

18326. Are potatoes grown round about Calcutta?—Yes; there is a big area in the Hooghly district and in the Howrah district.

Mr. R. S. Finlow and  
Mr. K. McLean.

18327. Taking again this Calcutta example, is the food supply per acre derived from the neighbourhood of Calcutta more than from the cultivation of paddy?—I should think so, certainly. There are more crops to grow.

18328. Have you looked into the question of comparative food supplies obtainable from fruits and vegetables as compared with paddy?—Not in detail. I think I have mentioned in some of my notes that it would be possible to increase the number of crops in the course of a year.

18329. *Sir Ganga Ram*: Is there much scope for the potato to replace paddy?—No; potato is a cold weather crop and paddy is a rain crop, except *boro* paddy which grows on land where potato could not be grown. Paddy is either sown in June or transplanted in July or August.

18330. *Professor Gangulee*: You do not grow potatoes in the hot weather?—In the hills it is a hot weather crop.

18331. What do you mean by "hot weather crop;" crops which mature in the hot weather or are sown in hot weather?—In the hill the potato is lifted about September, October and November.

18332. That is in the hills?—Yes; it would be ready for lifting in the plains about February.

18333. *Mr. Calvert*: From your experience can you say whether the people hereabouts, not the Europeans but the Bengalis, are taking to potatoes and English vegetables?—Yes, I think so; especially potatoes, cauliflowers and cabbages.

18334. There is a tendency to a change of diet?—Yes.

18335. *Dr. Hyder*: Among the ordinary cultivators?—I think among the ordinary cultivators too now.

18336. *Mr. Calvert*: On the small holdings you have here, 2 to 2½ acres of paddy, do you think there is any hope of extricating the cultivator from his poverty by any considerable improvement in paddy alone?—If he is just a paddy cultivator and nothing else, it is going to be a very, very difficult problem indeed.

18337. Most of your people are purely paddy cultivators?—No.

18338. About 23 million acres out of 31 million acres are under paddy cultivation?—They sow paddy or jute, reap it, and then follow by transplanting paddy. That is a double figure.

18339. Twenty-three million acres include double crop paddy?—Yes; two crops. Over a large part of the country in Eastern Bengal, over Mymensingh which is the biggest district, and over a great proportion of Northern Bengal there is a rotation. It is either jute followed by transplanted paddy, or broadcast highland paddy followed by transplanted paddy. The jute replaces the broadcasted highland paddy.

18340. Jute is only 10 per cent?—It is one-seventh.

18341. And paddy very much more than that?—Paddy is enormously greater; yes.

18342. We have been having a certain amount of interesting evidence about rural dietary, and we have been told that rice diet has to be helped by pulse. In your last report you have nothing of importance to tell us about your work on pulses?—No.

18343. Do you think the commercial value of jute is distracting attention from the food crops?—I do not think so. It is a different section altogether. The work of pulses and oil-seeds is in the hands of the Second Economic Botanist.

18344. *Professor Gangulee*: He is also doing cotton work?—Yes.

18345. *Mr. Calvert*: There is one final question. Is there anything in the Bengal rice straw which makes it unsuitable for pulping for paper?—I should not think so; but it would never do; if you consume large quantities of rice straw for paper your bullocks would go short.

18346. *Professor Gangulee*: Your point is there is no surplus straw?—I think not. I have not made an exact calculation of the quantity of straw produced.

18347. *Mr. Kamat*: In answer to a question from one of our colleagues, about waste lands, I gather you said that they are not suitable for being brought into cultivation?—Yes.

18348. I find that in this Presidency the land classified as not available for cultivation is extraordinarily high. Out of 49 million acres of total cultivable land, land not available for cultivation is 10 million acres?—That includes rivers, lakes, roads, everything. The actual area of so-called cultivable waste is 6 million acres. I think that is too high.

Mr. R. S. Finlow and  
Mr. K. Melean.

18349. On page 3, Agricultural Statistics of Bengal, 1924-25, you have shown separately 6 million acres as "cultivable waste." You have also shown 4 millions as "forests," and excluding these you give 10 million acres and odd as "not available for cultivation." I want to know how this calculation is done?—The area of 10 million acres not available for cultivation is land which could not be cultivated such as village sites, roads, rivers or anything of that sort.

18350. *Sir Ganqa Ram*. And the area under urban population?—Yes; that also.

18351. That means that there is only 6 million acres of waste land?—Yes, 6 millions of cultivable waste.

18352. *Mr. Kamal*. It is a curious phenomenon in this Presidency, that there should be such an amount of land classed as "not available for cultivation," and you are still having a sort of migration of labour to so called more fertile lands in Assam?—They are more fertile.

18353. So that, they leave alone the lands in their own Province and go to some other Province?—Yes.

18354. *Professor Ganguly*. What is the quality of this waste land?—The typical land would be somewhere near Suri in the Birbhum district; it is high land. That would be one type.

18355. Latent soil?—Yes; it is soil of that kind; acid.

18356. Deficient in phosphates?—Deficient in most plant ingredients.

18357. *Mr. Kamal*. Turning to page 6, Agricultural Indebtedness, you say, "In Bengal too the price of rice has continually appreciated." In these respects the cultivator is probably more fortunate in Bengal than in other parts of India?—That is correct.

18358. Now, in another leaflet supplied to us, the memorandum by the Director of Land Records, about sub-tenancy holdings, we are told, "Taking Bengal as a whole we may take the average net income from agriculture to be Rs. 52 per acre." Your statement is that the cultivator of Bengal is better off than in other parts of India. Taking those statements together I should like to ask you whether you consider an income of Rs. 52 per acre to be so substantial as to be characterised as very favourable to the cultivator?—I regret I have not seen the leaflet supplied by the Director of Land Records. If you take the jute districts, the average ought to be considerably higher than that. If the figures for the yield of rice, for instance, are any thing like correct, it ought to be higher than that.

18359. It ought to be higher?—Yes, taking the yield for rice and for jute, it ought to be higher than that.

18360. Now let me come to my own point. I was asking you if you really considered the cultivator to be well off, why should he migrate to Assam leaving his own lands and his own home here?—He is leaving the worse parts of Bengal for better land elsewhere. There is a tract in Eastern Bengal in the Mymensingh district and also a smaller tract in Sylhet where he is worse off.

18361. *Mr. Hyler*. Is there any large migration of Bengal labour to Assam?—Not of labour as far as I know. It is migration of settlers. The figures were given some years ago as 10,000 a year, I believe, and they have increased since; it has to be remembered that the population of Eastern Bengal is very dense.

18362. You have industries in your Province. The Bengal labourer does not go into the mines?—No; he does not like to do that.

18363. *Mr. Kamal*. To continue my argument, what I am unable to reconcile is this. If you consider the ordinary cultivator in Bengal to be well off, why does he migrate? Is he fond of leaving home?—He does not migrate from the districts where he is well off. The migration is not from Eastern Bengal except from the Madhupur jungle area.

18364. *Professor Ganguly*. You just now said that 10,000 people migrate from Mymensingh; that emigration is from Eastern Bengal?—It is from parts of the Madhupur jungle tract possibly from Sylhet.

18365. Not from the producing area?—No.

18366. *Mr. Kamal*. On the same price dealing with agricultural indebtedness you say that the profits from jute, taking the year 1925-26, were Rs. 200 or more per acre. That is to say, a family of four people with a holding of about 4 acres would make about Rs. 800 net profit, is that so?—If they had 4 acres under jute.

18367. Even taking 2½ acres, which is your average, it would be Rs. 630?—The price of jute last year was very high; it was about Rs. 17 a maund on the average and probably higher in some tracts.

**Mr. R. S. Finlow and  
Mr. K. McLean.**

18368. So the illustration you have taken here is an extreme one?—Yes; it was for last year only and this is definitely pointed out in the note as the effect of record prices in reducing indebtedness.

18369. Will you please give a rough idea of the net profits?—Roughly Rs. 100 as a minimum and Rs. 200 in a considerable number of cases. This refers to 1925 only.

18370. This paragraph gives one an idea that it might be Rs. 200 on an average. Now I come to the next point. You had in this Presidency a Committee appointed to consider the unemployment of the *bhadralog*. What was the finding of that Committee?—One of their recommendations was in regard to agricultural education in schools, so as to bring the people back with an idea of agriculture and there were suggestions for, I believe, a colony in the Andamans.

18371. If in your opinion the net profit from jute is Rs. 100 on the gross return Rs. 200 per acre and if sufficient publicity is given to this fact to the *bhadralog* why do you think jute cultivation is not taken up by the *bhadralog* middle class of this Presidency? Can you explain that?—The year 1925 was granted as a period in which reduction of debt took place and not as an indication of the average profits on jute cultivation.

18372. Therefore in that case a statement like that, that the profits on the sale of jute in a particular year were Rs. 200 per acre, would be rather misleading to the public, or in the alternative you must be able to attract a good many of the *bhadralog* to this industry?—I should like further to examine the figures; but I do not agree that the statement, as made, is misleading.

18373. The Chairman: Perhaps you would like to put in a considered statement as regards the net profits in jute growing for a series of years; it is very little use answering questions of detail without such figures?—Yes\*.

18374. Mr. Kamat: Passing on to another point, you told us that you had here a Department of Fisheries and that it has been closed. Would you give us the reasons why it was closed?—It was closed on account of retrenchment for the same reason as the Agricultural Department was retrenched.

18375. Purely as a result of retrenchment?—Yes.

18376. But till then, till the retrenchment came in, were the trials you made with fisheries hopeful? Did they show signs that this industry would be a successful and promising one in this Presidency?—There was a fair indication that pisciculture might be a very useful subsidiary industry.

18377. I take it therefore that it was a hopeful industry as a secondary occupation, but considerations purely of retrenchment came in the way; it is well worth taking up this question again if the conditions are suitable and if the money is forthcoming?—I think so, yes.

18378. May I know how much in your Presidency you spend on your Department of Agriculture?—The present year's budget is for about Rs. 91 lakhs.

18379. Only for the Agricultural Department and not for the Co-operative Department also?—That is for Agriculture and Sericulture.

18380. Professor Ganguly: What was the figure before the retrenchment came in?—It was approaching 12 lakhs. The last year before retrenchment I think it was over 11 lakhs.

18381. Mr. Kamat: What is the total revenue of your Presidency?—I cannot tell you straight off.

18382. It is about 10 crores, if the Administration Report is to be taken as the authority?—I think it is more than that.

18383. Say about 11 crores. Do you know how much your land revenue is?—That I cannot tell you.

18384. It is about 3 crores and odd. Now in a similar Province, with a similar population, I mean Madras, the land revenue is more, about double yours. I want to know whether the question of fisheries could not be taken up again if you find that you are not spending much on agriculture?—Government does intend to revive the Fisheries Department at the first opportunity. In fact, proposals have already been asked for.

18385. Now to come to your possibility of increased net income by following your agricultural improvements. In this leaflet we are told that the ultimate possible increased net income from jute if improved seed were distributed on a very large scale, would be something like 5 crores per annum. Similarly for rice the extra wealth for your Presidency would be about 3 crores?—Yes.

\* Appendices I and II.

Mr. R. S. Finlow and  
Mr. K. McLean.

18386. I take it that you have made these calculations very rigorously?—We have calculated on the basis of the income which we found would be realized over a large tract of the country; I mean over experiments done in a large number of places throughout the country taking the average.

18387. *Professor Ganguly*. On the basis of net income?—Yes.

18388. *Mr. Kamal*: As a matter of practical experience I ask you, although things look very rosy in the laboratory or on a smaller scale in the field, still as every one who is concerned with district experiments knows, profits are very difficult to realize when you do things on a large scale?—The calculation is not based on calculations made in the laboratory or as a result of trials on small experimental plots but on the results obtained by cultivators themselves who are applying the improved seeds on a very large scale.

18389. Have you calculated the whole thing on a very strict conservative basis?—I think the basis on which we made the calculation was conservative. As far as I remember we put Rs. 7 a maund for jute, for instance, which is a very low price.

18390. I take it then that your calculations are very carefully done. The next question, therefore, is if there are *any* possibilities of increased increment in jute and rice alone and if, on the other hand, you cannot expand your land revenue owing only to the permanent settlement; is there no possibility of having a cess on jute and other things so as to increase your income and improve the Agricultural Department?—There is already a cess on jute.

18391. I know; but is that a sufficiently adequate cess in view of these figures?—If we can get an extra amount, we shall not be very long before we make very rapid progress in that direction.

18392. In some form or other, do you or do you not feel that this Pre-identity is not doing itself sufficiently for agricultural improvement in view of the possibility of 8 crores of wealth which you promise us in the shape of extra income to the people?—The sooner we get the men the better and I suppose men mean money.

18393. *Rai Bahadur Banerji*. In giving evidence this morning you told that the research work was being done at Dacca to a very great extent and at Chinsura to a very little extent in regard to paddy and similar things. Do you not think that for Western Bengal a greater amount of research work should be done at the Chinsura farm?—I do not think that I said that very little was done there. I said that Dacca was the main headquarters station and a lot of work on paddy was being done there and also at Chinsura. The work at Chinsura is the work which is suitable for Western Bengal. I should add that the two farms at Suri and Bankura are now being used to a considerable extent to reinforce Chinsura as far as the work in Western Bengal is concerned.

18394. Do you think that full justice is being done to Western Bengal as regards research work?—I think so. Formerly of course as I pointed out this morning, there were two Provinces, one Eastern Bengal and the other Western Bengal; our department commenced work on Eastern Bengal, and naturally worked on Eastern Bengal problems. When the Provinces were united, Western Bengal was behind Eastern Bengal. Now a great deal of attention is being paid to Western Bengal simply because in the past Western Bengal had to be neglected.

18395. Is it not being neglected even now?—I do not think so; there is a great deal of work being done at Dacca in connection with Western Bengal as well as at Chinsura.

18396. The soil of Western Bengal varies greatly from the soil of Eastern Bengal, and the nature of the crops also varies?—Yes.

18397. Does it not follow from that that the nature of the research work meant for Western Bengal will be quite different from the research work for Eastern Bengal?—Not necessarily. I think that, speaking generally one would say that plant breeding should be done on the spot, i.e., at Suri and Bankura for the high lands and at Chinsura or Burdwan for the deltaic tract. For soil analyses more can be done at Dacca though field tests would have to be made at Suri or Bankura.

18398. Do you think that each district farm in Western Bengal will be a centre of research?—I pointed out earlier in this discussion that each farm had to be used as a sort of local testing station, in order to make sure, before pushing the crops out to the cultivator that they are suitable.

18399. Do you think the present District Agricultural Officers are competent enough for the work?—I think so, under the supervision of the Deputy Director.

18400. In the course of your evidence you have said that in these district farms the villagers round about are supposed to go and see the results of demonstration works and learn improved methods of agriculture for their own use?—Yes.

Mr. R. S. Finlow and  
Mr. K. McLean.

18401. What facilities are being given to them for that purpose ?—The facilities that are being given are that the District Agricultural Officer is not supposed to confine his whole attention to the farms. He and his demonstrators are supposed to go out into the villages and let the villagers know what things are being done, and if he has anything which he can recommend to the villagers, he is entitled to distribute small amounts of seed to reliable persons for trial or, if necessary, to conduct demonstrations on the spot.

18402. Are any other facilities given to the District Agricultural Officer for those objects ?—Yes. Of course. We have to increase the number of competent demonstrators, and then the problem will be simplified considerably.

18403. Where was this *dudsar* paddy, which has just been introduced into Western Bengal and with some success perhaps, experimented upon ?—That was produced in Dacca.

18404. Have you already come to the conclusion that it is well suited to Western Bengal ? It suits the *barind* tract in the Rajshahi Division and the higher tracts of the lateite area ; the results are not definite enough for Western Bengal at the present moment ; but *dudsar* is being tested against other strains now being evolved at Suri and Bankura.

18405. As to the question of the average holding being 5 acres, is that a right conclusion ? If we take all the holdings of the whole Presidency of Bengal into consideration, do you come to the average of 5 acres ?—I do not think I should ; I have not sufficient figures by me to make an average.

18406. The average will be much larger than that ?—Much larger.

*Mr. Calcutt* : The cultivator's or owner's holding ?

18407. *Rai Bahadur Bannerji* : Cultivator's holding in Western Bengal ?—In Western Bengal it is so. Here are some figures in the Director of Land Records' notes ; 2·61 acres in Backarganj.

18408. *The Chairman* : Being the average ?—The average for Backarganj district.

18409. In Eastern Bengal ?—Yes. In fact, it is still less ; 1·30 acres is the size of the ryot's holding.

18410. *Rai Bahadur Bannerji* : Do you not think that a central farm at Calcutta or near about Calcutta at Jadabpur or some such place for the research work that is necessary for Western Bengal will remove a great want of Western Bengal ?—Would you have laboratories there ?

18411. Yes, of course ?—Duplicate the whole thing ?

18412. Yes ?—It will mean very great expense ; we went into this question some years ago ; it amounts to lakhs of rupees.

18413. As far as I know, some lands at Jadabpur were acquired already, and they are lying fallow ?—I do not think land has been acquired at Jadabpur. We are acquiring land at Baraset. The advantage of a farm near Calcutta would be that the Calcutta people could go and see the work that is going on, which of course would be an advantage.

18414. While you were talking of roads this morning, you said that there were many roads in the interior of the districts ; is that a fact ?—I said the main roads ; away from that the roads vary enormously in quality.

18415. In Eastern Bengal perhaps the absence of the roads might be compensated by *khals* and rivers, especially during the monsoon, but in Western Bengal, all throughout the year, you have tracts of land which cannot be reached in any way. Does it not mean absence of roads altogether ?—As far as Western Bengal is concerned, it has not got rivers and roads are few. It is a difficulty that I myself found on tours in the river.

18416. You have said in the course of your evidence that these sugarcane crushing machines are very popular ?—Yes.

18417. But other machines like harrows, ploughs, and tractors are not popular ?—Yes, quite so.

18418. Does it not mean that these machines are not quite up to the requirements of the cultivators ?—It might be that, but I think that an equal possibility would be that a firm like Renwick has not pushed them.

18419. *Sir Henry Lawrence* : About these statistics, do you think they are fairly accurate ? Is this figure of 10 million acres of uncultivable waste correct ?—It is very difficult for me to say so ; I doubt the accuracy of them myself.

18420. Where is the figure obtained from ?—It is obtained from the Collectors.

18421. Does it include all the water wastes in the Sunderbans ?—It includes everything.

*Mr. R. S. Finlow and  
Mr. K. McLean.*

18422. Forest and hills ?—Yes.

18423. You think it may be somewhere near correct ?—Possibly yes ; I have no means of checking it at all.

18424. As regards these millions of acres of waste, is that land that could be brought under cultivation ?—Some of it certainly.

18425. What prevents its being cultivated ?—It is merely the condition of the land ; it is poor land, and it requires a great deal of manure ; it is difficult to cultivate. If you take the portions in Western Bengal, the rainfall is irregular.

18426. *Professor Gangulee* It has no facilities ?—It is a question of water largely.

18427. *Sir Henry Laurence* Is it land where the rainfall is small ?—It is not well distributed, the average is 55 to 56 inches. It is quite a common thing for the monsoon not to break until July.

18428. Is all the land that is capable of cultivation now being cultivated ?—A large proportion, I think, I think these figures are misleading to that extent ; people may think that there is a considerable proportion of the area of the Province which is capable of easy exploitation.

18429. That is not so ?—I do not think that is the case. The difficulty of bringing these areas into cultivation would be very great, in regard to any scheme for placing the *bhadrak* for instance on waste lands ; I think it would be giving them a very, very difficult time indeed.

18430. It would require capital and skill ?—Yes. I do not say these lands are quite uncultivable ; they are more difficult than the average.

18431. Is there subsoil water available ?—Yes, at a considerable depth ; under some of them there is rock.

18432. Have you large numbers of landless labourers in this Province ?—I do not think there are large numbers of landless labourers in this Province. The landless labourers would be very largely, at any rate in Eastern Bengal, people from Bihar ; there is a big importation of labour there ; in Western Bengal there is the labour which goes to the coal fields ; I suppose that would be partly agricultural, and there is a great tendency for the labourer to leave the coal fields and go to the paddy fields.

18433. The Province imports its manual labourer from outside ; for the coal fields it imports, and also for Calcutta ; is that from other Provinces ?—Yes, and to a considerable extent also at times for the jute crop.

18434. You have already stated that the small cultivator in Bengal is in fairly comfortable circumstances ?—Yes.

18435. And these facts, that he is unwilling to go elsewhere for labour, support that view ?—Yes.

18436. To what extent did you suffer in retrenchment ? The figures in the last Budget indicate that your Budget has increased in the last two years from 10 lakhs to over 12 lakhs. What was it before the retrenchment ?—I do not think it is 12 lakhs, that includes other departments. The Budget for this year is just under 10 lakhs.

18437. What does this figure here include ?—You will find that it includes other departments, such as Veterinary and Gardens.

18438. It includes Gardens. Do they not come under you ?—No, they are not under our control.

18439. Whose control are they under ?—Sibpur garden is under the control of the Director of the Botanical Survey.

18440. Excluding that, your figure is about 9 lakhs ?—Yes.

18441. How far have you been reduced ?—I cannot quite remember the figure. I think it approached 12 lakhs in the last year before retrenchment.

18442. Do you see any prospect of getting your grant restored or increased ?—I think there is hope of its increasing now.

18443. You have got schemes put forward ?—Yes.

18444. And you have reason to hope that they will be sanctioned in the next year ?—Yes.

18445. Now, in your farm reports, I see a considerable amount of attention is being given to a number of subjects like sugarcane and so forth. Can you give me any idea

Mr. R. S. Finlow and  
Mr. K. McLean.

as to what is the proportion of work done for paddy as compared to other subsidiary purposes?—Paddy occupies practically the full attention of one section.

18446. What does that mean?—It means that paddy is under the direction of Dr. Hector and his assistants.

18447. What proportion of the budget of your Department is spent on paddy and what proportion on the rest? Is it half and half or one-third?—It would not be half. It would, I think, be a third of the research work.

18448. Paddy represents two-thirds of the agricultural interests of the Province. You accept that figure?—It is more than that.

18449. Have you attended the meetings of the Board of Agriculture in recent years?—I did not attend the last meeting.

18450. Have you attended them in previous years?—Yes.

18451. Has the question of improvement of paddy been discussed there?—Yes.

18452. Are you acquainted with the experiments that have been made in Bombay?—I am not, except what I have read in the reports. I have not seen the work.

18453. Bombay, Madras and you are working on paddy separately without any exchange of ideas on the subject. Is that the position?—That is to a large extent true.

18454. That is capable of remedy, is it not?—I think so.

18455. What has been the obstacle to prevent your being able to see Coimbatore?—I do not think there is any real obstacle.

18456. *The Chairman*: It is not the travelling allowance?—I do not think Government would have any very great objection on that score.

18457. *Sir Henry Lawrence*: Would you have to get special permission to do so?—Yes.

18458. Have you ever asked for it and been refused?—No. I think the main reason why Madras men do not come to Bengal to see the work or why the Bengal men do not go to Madras or to Bombay is because of the difference in the races of paddy. It is possible that some of them may suit all conditions, but generally it appears from our experience with the Madras varieties when they were brought here that they did not behave as a normal rice crop. They did not flower, for instance, in time and so did not give the grain.

18459. There may be great difficulties but you do not know them until you have tried them?—I quite agree that there should be an interchange of ideas.

18460. You accept that the Coimbatore sugarcane is doing you some good?—Yes.

18461. Can you tell me to what extent Coimbatore sugarcane is being spread now?—The acreage of the Coimbatore sugarcane is very small; we have just distributed it.

18462. Only 100 or 200 acres now?—About that.

18463. But you expect to extend it rapidly?—Yes, it should extend very rapidly.

18464. You have this Rangpur farm. Is that under you?—Yes.

18465. It is not under the Veterinary officer?—No.

18466. There you have certain half-bred strains?—There are two strains. One is produced by the crossing of country cows and Hansi bulls and the other is an attempt to improve the *de-hi* breed from within by selection.

18467. When you have these half-bred animals, do you distribute these bulls?—Yes, we have done so.

18468. Have they done any good?—They have been popular in some places and in other places objection has been taken to them on the ground that they are too big.

18469. Are you proposing to continue to distribute them?—We have introduced the Thar Parkar strain in order to reduce the size.

18470. Then you get the double cross. Do you propose to continue their distribution?—We have not done so, so far. We are observing the results.

18471. As to the quality of the calf?—Yes.

18472. I see the offspring of certain bulls were rejected because they had English blood in them. What is the reason behind that?—The question of disease comes in there. Cattle with English blood in them are very much liable to rinderpest and other diseases.

*Mr. R. S. Finlow and  
Mr. K. McLean.*

18473. Have you lost animals in such oases ?—Yes.

18474. You cannot protect them by serum treatment ?—We can for rinderpest but not for other diseases.

18475. You are attempting by the distribution of these bulks to improve the milk supply. That is your main purpose ?—Yes, they serve the dual purpose of work and milk.

18476. *Sir Ganga Ram* : You say that your irrigated area from all sources is a little less than 1½ million acres and the total area is 20 millions. Do you know the famine formula that you must have 1 of an acre per head protected ? It has been recommended by the Irrigation Commission and according to that calculation you ought to bring 16 million acres more under irrigation. Have you pointed out that to your Government ?—No. I do not think it would apply to Bengal; but we nevertheless realise that irrigation can be of great value to Bengal.

18477. Have you studied the Irrigation Commission's report ?—No, I have not.

18478. When you say so much yield of paddy per acre, do you mean to say paddy with husk or without husk ?—It is with the husk.

18479. Then all I can say is that all your yields are miserably poor ?—I think they are.

18480. How do you account for it ? Even in irrigated areas as compared to the yields of the Punjab your yields are miserably poor. I will give you an instance. You say your yield of *toria* (mustard) is 6 maunds per acre ?—Yes.

18481. But your yield is 58 per cent, so it comes to 3 maunds per acre ?—Yes.

18482. Do you think it is worth while for any man to cultivate and get 3 maunds per acre. I will tell you where the defect lies. How many times do you plough the land before you put the seed in ?—Roughly six times.

18483. Both irrigated land and unirrigated land ?—All unirrigated. If irrigation were available the yield might be doubled.

18484. That is one reason for this low crop. Do you not think you can tap the resources of nature which contains 80 per cent. of nitrogen without water ?—That is a point that I have been pressing very strongly.

18485. That is to say, you have been pressing that the land should be turned over and then exposed to the air as many times as possible. Is that right ?—Yes, that is done to a large extent.

18486. Do you teach that process to the cultivators ?—The cultivators already do it to a very large extent.

18487. We never plough our wheat area under 12 times and sometimes even 20 times ?—The Bengal cultivator does not plough so many times.

18488. Have you got any statement of imports and exports of your food produce ?—Our statements cannot be complete because there are no figures for imports and exports.

18489. Cannot you get those figures for your Presidency ?—They cannot be complete because there are no figures for imports and exports by rail, road and river. The publication was abolished as the result of retrenchment.

18490. The publication is no doubt abolished but each Provincial Government has its own records. After all, the Government of India publications are compiled from your records. Can you say that the money that a cultivator gets from jute is saved by him or does it go to import food ?—I think, on the whole, the jute cultivator grows enough paddy to live on it.

18491. And he saves the money that he gets from his jute, or does he spend it on buying the remaining food ?—It goes on other things. He lives in a higher way than the cultivator who does not grow jute.

18492. Is his standing higher than that of the other cultivators ?—Yes.

18493. His standard of life is higher ?—Last year the jute cultivators did make considerable sums of money and they did buy luxuries and expensive food and things of that sort.

18494. *Mr. Gupta* : Last year was very exceptional ?—It was very exceptional; but on the average the grower of jute is better off than his neighbour who does not grow jute.

18495. *Sir Ganga Ram* : What is the scientific difficulty in the way of increasing the wheat area ?—In Eastern Bengal it is climatic. We have tried wheat in Eastern Bengal and it does not do.

Mr. R. S. Finlow and  
Mr. K. McLean.

18496. Is it climatic or is it that the soil is not suitable?—I think it is climatic, it is too damp. What has happened is that the wheat that we have sown has become diseased with rust or smut.

18497. Cannot you find a seed which will resist disease? What kind of wheat do you grow?—We have tried a number of different kinds of wheat.

18498. Have you tried Pusa wheat?—Yes, the Pusa wheat and some of the Western Bengal wheats.

18499. I find from the figures that you do not grow enough food. You import a lot of food. You import Burma rice?—That is a very fluctuating quantity. On the whole, Bengal exports rice.

18500. But you do import rice from Burma?—Yes, in varying quantities. Some cultivators of high class rice sell their produce and buy coarser Burma rice at a cheaper rate for consumption.

18501. You import onions from Madras?—Probably, yes.

18502. I want to know what things you import and what you export?—There is a big export of rice.

18503. Can you tell us any surplus food you export?—There is a big export of rice, I think.

18504. Then why do you import rice?—There is an export of rice up-country from Bengal; people in Chittagong and Barisal, where they grow a fine rice, want a coarser rice to feed themselves; they prefer a coarse rice.

18505. What kind of rapeseed do you grow here?—It is the red variety; *toria* is one, and *rai* is another. Different varieties ripen from January to April.

18506. You know Bengal is a great place for *toria*?—Yes.

18507. A large quantity comes from the Punjab to Bengal?—Yes, but a lot of what comes from the West, *i.e.*, from Bihar and the United Provinces, is exported from Calcutta.

18508. Do you say it is imported from the Punjab and exported from Calcutta?—I think Bengal exports seed from Bihar and the United Provinces from Calcutta.

18509. All the *toria* we can spare we export from Karachi; that is the cheapest way?—Large quantities of seed comes into Calcutta, possibly not from the Punjab, but from nearer tracts.

18510. I know it comes here, because I have been sending it myself, but I do not know that it would pay to re-export it?—They extract the oil in Calcutta.

18511. Yes, I know that. Is there any lift irrigation here from canals or from rivers?—No, very little; but the *done* is used for *boro* paddy and for potato cultivation.

18512. Is there no possibility of that being done?—There are possibilities, yes. That is what we are hoping to do as soon as we get our Agricultural Engineer.

18513. How far down is the ordinary water table?—It varies from about 10 to 25 feet I should think.

18514. What area does a well command?—I am probably wrong there; in some parts of Western Bengal in the very high lands we have sunk a well and not got water at 45 feet, but then that was exceptional.

18515. But ordinarily how many acres can a well command?—Very little.

18516. You could not tell me what is the discharge of a well?—We have not carried out the experiments; I have not got the figures by me but I could tell you what is sufficient to exhaust a well.

18517. Have you or the Irrigation Department made out a list of delta water required to mature each crop?—That has been done, I believe.

18518. Where? In the Irrigation Department?—Yes.

18519. Do you grow tobacco for export?—In Northern Bengal there is a large amount of tobacco grown for export to Burma chiefly.

18520. It is not the class of tobacco from which cigars or cigarettes are made, is it?—No, it is too expensive for cigarettes; it is too good. The Burmese pay up to Rs. 25 a maund for tobacco; it is for the Burmese "torches."

18521. Have you taken a section of soil down to any depth?—The sections have been taken from the sinking of tube wells; we have got none of our own because we have not sunk any tube wells, but sections have been taken.

Mr. R. S. Finlow and  
Mr. K. McLean.

18522. Who has done it ?—The Eastern Bengal Railway could give you sections.

18523. Can you get a copy of them ?—I will try and get a copy, yes.

18524. So you have no subsoil water-supply yet ?—No.

18525. You are quite certain that those sections show that there are possibilities of sand-bearing strata ?—Yes, I think there is every reason to believe it.

18526. And you have laid down a scheme for that ?—There is a tube well about to be sunk on the Dacca farm now.

18527. *Sir Thomas Middleton*: You advocate the establishment of central advisory bodies on the lines of the Cotton Committee. Which crops do you suggest would be most important for such bodies ?—The pulses and the oil-seeds I think would both repay investigation, and possibly also jute and tobacco.

18528. I was wondering whether you had in mind an important crop like rice with the object of getting into touch with the work that is being done on rice in other parts of India ?—I think that would be a very sound thing. Our experience with strains of rice from much more tropical climates than Bengal, like Madras, has not been fortunate; but I think it is probable we should get a great deal of good out of such a committee on rice.

18529. On that point of the possibility of transferring strains of crops to new districts, is it not a general experience that new varieties should be raised in the districts in which they are to be employed ?—I should think so, yes, on the whole.

18530. Is not sugarcane rather an outstanding single exception ?—Sugarcane certainly is; we have no alternative in the case of sugarcane because its flower is not fertile in Northern India. Besides sugarcane is propagated vegetatively and not from seed.

18531. Then you agree that not only must there be research on crops, but research on the same crop in different districts ?—Yes.

18532. You have drawn our attention to the important advances in technical methods and technical results that have been secured in the crops of this Presidency in the past twenty years. Now you are dealing with an illiterate but very sharp-witted peasantry ?—Yes.

18533. And you rightly conclude I think that the quality of the district officer and of the demonstrator is of supreme importance in Bengal ?—I do, yes.

18534. Now let us get to the question of the training required for these men. You have got altogether about 670 demonstrators at the present time ?—No, we have nothing like it; we have only 90.

18535. I got the figure of 670 from one of your reports ?—That is what we are aiming at.

18536. Your object is to get a demonstrator for every 60,000 acres I think ?—One demonstrator for each police *thana*.

18537. There are 28 districts; how many district officers have you got ?—At present we have 31 officers in that grade; I hope, we shall very soon have 40.

18538. You have pointed out that the quality of your demonstrators was not altogether satisfactory ?—Yes.

18539. These demonstrators have had very little scientific training ?—Very little.

18540. On the other hand, you aim in future at getting the district officers up to intermediate standard, and then giving them two years special training ?—Yes.

18541. Would it be possible to grade district officers and demonstrators in the same grade, so that you might begin your young expert in the lower post of demonstrator to enable him to acquire experience, and only promote him to be district officer when he has gained experience? Would it be possible to draw these two groups from the same class ?—I think the pay of demonstrators would be too small to attract men of the type and training of District Agricultural Officers.

18542. What is the pay of a demonstrator ?—Rs. 30 to Rs. 50 per month.

18543. What is the pay of a district officer ?—From Rs. 125 to Rs. 300.

18544. Rather than increasing the number of demonstrators would it not be desirable to aim at a somewhat higher pay, so that the district officer may always have served a time as a demonstrator before he becomes a district officer, so that you might select your district officers from among the demonstrators who have really made good ?—What sort of pay would it be? I mean I do not think you would get District Agricultural Officers at less than the present pay; as a matter of fact, I think their prospects should be still better in order to attract an even higher type of man.

Mr. R. S. Finlow and  
Mr. K. McLean.

18545. The difficulty I see is that a district officer on leaving an institution, however well he is trained, is really not fit for his work until he has got some experience in working a district?—That is true.

18546. And one would like to see a scale low to begin with but showing substantial prospects of advancement?—Yes.

18547. So as to attract into the service men of ambition and good quality?—Yes.

18548. Do you think it would be advisable to introduce such a system for the training of your men?—It is a new idea, certainly.

18549. I should suppose that whatever Bengal may lack it does not lack brains?—No.

18550. You should have a sufficient number of well qualified men if the prospects were good?—Yes.

18551. So far as I can see the prospects should be quite good, because you will have a number of superior appointments?—Yes.

18552. As regards training for your specialists, you take the view that the specialist should have a post-graduate training before he is employed?—I think so.

18553. On the question of extensive and intensive cultivation, I want to ask you whether you have any reason to suppose that under equal conditions of soil, a man cultivating 2 acres in Bengal would grow a bigger crop per acre than a man cultivating 4 acres?—I was not thinking of a comparison between men holding 2 and 4 acres; I was thinking of men holding 2 acres and 50 acres.

18554. Your method of soil survey is by sampling and not by field examination. You were a Bangor student. I was wondering if you had been following the work done in Bangor in soil survey?—I have heard of it; but I have not seen it.

18555. Their method is not confined to soil sampling; there is also field examination?—We should do that too.

18556. You are well aware that this is a slow and very expensive process?—Yes.

18557. You note the effect of bone phosphates in red soils in Bengal, and you point out that rock phosphates produce no results or little result. Have you ascertained whether the value of the bone phosphate is in fact due to the phosphato; may it not be due to the nitrogen?—No; I do not think it is.

18558. Has that point been tested?—It has not actually been put to the test; but the increase has been too great.

18559. To attribute it to the nitrogen?—Yes.

18560. When was water-hyacinth first seen in Bengal?—I cannot say. In Eastern Bengal, I should think, about 15 years ago. It must have been in Calcutta long before that.

18561. Attention was drawn to it 15 years ago?—Yes.

18562. Coming to your statistics, I think you are personally responsible for the issue?—Yes, for the issue of the Season and Crop Reports.

18563. If you take the "area according to professional survey" (Table I. Agricultural Statistics of Bengal) and compare that with the corresponding "area by village papers," the figures are identical. That means the "village papers" area is taken from the professional survey; there are no independent village papers in Bengal?—No.

18564. Are the two figures always identical in Bengal?—These figures are furnished as a matter of routine by the Collectors of districts.

18565. Which they extract from the records?—Yes.

18566. I do not see the object of giving the corresponding area by village papers in your table, although that is a heading adopted in the Government of India statistics. In Bengal the two are identical?—I suppose it is done on account of the Government of India's orders that it should be done in this way.

18567. Now, for some details, take for example, the district of Burdwan. In your cadastral survey table, page 18, the total area is about 500,000 acres; in your agricultural statistics table, page 2, it is given as about 1,700,000. What is the explanation of the difference? What is your area of Burdwan, 500,000 or 1,700,000 acres?—It is down here as 1,700,000.

18568. For Bankura, page 18, the area given is 1,720,000 against 1,680,000 on page 2. The difference in figures is only about 40,000 acres?—Yes.

Mr. R. S. Finlow and  
Mr. K. McLean.

18569. Now, how do these differences arise in the two surveys ?—I could not say ; the figures are given by the Settlement Department.

18570. How are such figures got at in Bengal ?—It is all done by the Settlement Department. They are all obtained by them in the cadastral survey of districts as they are carried out.

18571. Has each village got its complete village books ?—It has got a complete village map and a record of rights.

18572. *Mr. Gupta* In those days the district surveys were not complete in all the districts.

18573. *Sir Thomas Middleton* So that the statistical figures are correct for part of the districts and for the other part they are estimates. Is that the position ?—Yes.

18574. When do you anticipate that the settlement will be complete ?

*Mr. Gupta* We have a programme ; it will take another ten years.

18575. *Dr. Hylar* How many districts are there which do not possess district farms or demonstration farms ?—I think six. I can tell you exactly by reference.

18576. I only wish to draw attention to the fact that you would like every district in your charge to possess a district farm or a demonstration farm ?—Yes.

18577. You speak in your note of the disease of the betel-vine. Do you know whether that disease is peculiar to Bengal or does it prevail in other Provinces ?—It is not peculiar to Bengal. It has been found in the Central Provinces and, I believe, elsewhere also.

18578. Have you ascertained from people working in the Central Provinces or Madras whether they have been able to find out some effective remedy ?—They have not. We have made enquiries. We know the disease in Bengal corresponds to the disease in the Central Provinces.

18579. It is the same disease ?—They are in the same difficulty as we are.

18580. I find from the figures you have given that the price of jute seed is Rs. 30 per maund for one variety and for another variety it is Rs. 20 per maund. Do you not think that these prices are rather high, and the cultivator must have a little difficulty in buying the seed ?—He has to get only 4 seers per acre.

18581. When you say that more money is wanted for the improvement of agriculture and it must come from within the industry, could you give us some ideas, which you probably would recommend to the Finance Member of Bengal, for raising more money from within the industry for the benefit of the industry ?—Is that for jute ?

18582. It applies to all crops, jute, paddy, sugarcane ?—The only two ways are the ones which were suggested this morning, either by an export cess or by an acreage cess, so far as I can see.

18583. Export cess or acreage cess. Let us take acreage cess. You know that Bengal is permanently settled. I do not want to refer to that because that is not within our Terms of Reference. Would you like to saddle both the cultivators and the landlords with that acreage cess ? What is your idea ?—I have not really considered the matter of an acreage cess, but I presume it would be collected, if it were imposed, with the ordinary revenue.

18584. *Professor Gangulee* : What happens to the jute tax, now ?—It goes to the Government of India.

18585. *Dr. Hyder* : You say there is a difference between the requirements of Calcutta and Dundee in the matter of jute. What is the difference ?—Dundee does rather finer work than Calcutta.

18586. About fragmentation of holdings I understand the difficulty is the existence of numerous sub-interests. You might have a plot of land in which five people might have an interest ?—Yes ; about fifty.

18587. Your problem is not the same as the problem in other Provinces, where for one plot there will be four or five sharers ?—In other Provinces it is only between Government and the man actually connected with the land.

18588. Speaking of irrigation, you say that the cultivators do not now clear up the jungles. Why is that ? They used to do it in the old days ?—There seems to be some doubt about the real reason why these irrigation tanks have fallen into disrepair. They certainly have gone into disrepair. We do not know whether it is because the landlord used to take more interest in the old days than he does now. I have been told that the old landlords exercised more arbitrary power than the British Government allows. It is difficult to explain ; but the fact remains that the tanks have gone into disrepair.

*Mr. R. S. Finlow* and

*Mr. K. McLean.*

18589. In regard to cattle, if you had a good cow, could you tell me if you would slaughter that cow?—No.

18590. Why is it then that some people say that in Bengal good cows are slaughtered? It could not be that the people of Bengal do not possess common-sense. One of the reasons given for the scarcity of cattle in Bengal is the practice of slaughtering good cows. I asked you the question whether you would kill a good cow, if you had it; and you said "No." I cannot believe that Bengalis would slaughter good cows; I would credit them with the same amount of common-sense as is possessed by ordinary human beings?—I should think so. I agree with you.

18591. About agricultural associations, I want to ask you whether the Collector really possesses a great deal of influence in the districts?—I think his official position gives him a great deal of influence.

18592. As a Magistrate he possesses a great deal of influence?—Yes.

18593. Now in regard to agricultural associations, you know that when these matters were under the control of the Collector he had his agent in the village and the agent was carrying out his orders. Now with regard to matters connected with Local Self-Government, these bodies, by whatever name you might call them, Agricultural Associations or Union Boards or Village Boards, seem to be hanging in the air. There is no one in the village, no functionary, to carry out the orders or instructions given by these different bodies?—You mean the District Agricultural Associations pass resolutions and they are not carried out in the villages?

18594. *Professor Gangulce*: Who is the moving spirit in the District Agricultural Association?—The Collector.

18595. Even to-day?—Yes.

18596. They have nothing to do with the District Board?—No; not seriously. In the 24 Parganas the District Board last year subscribed a considerable sum of money for the distribution of departmental seeds.

18597. You consider these are effective non-official organisations?—They are if they are properly worked; but if they are not properly worked, they are no use at all.

*The Commission then adjourned till 9.30 a.m. on Wednesday, the 1st December, 1926.*

Mr. R. S. Finlow and  
Mr. K. McLean.

no x 13-5a

Wednesday, December 1st, 1926

**CALCUTTA**

**PRESENT :**

**THE MARQUESS OF LINLITHGOW, D.L. (Chairman).**

Sir HENRY STAVELEY LAWRENCE, K.C.S.I., I.C.S.	Mr. H. CALVERT, C.I.E., I.C.S.
Sir THOMAS MIDDLETON, K.B.L., C.B.	Raja Sri KRISHNA CHANDRA GAJAPATI
Rai Bahadur Sir GANGA RAM, Kt., C.I.E., M.V.O.	NARAYANA DEO of Parlakimedi.
Sir JAMES MACKENNA, Kt., C.I.E., I.C.S.	Professor N. GANGOULEE.
	Dr. L. K. HYDER.
	Mr. B. S. KANAT.

Mr. J. N. GUPTA, I.C.S.  
Rai A. C. BANNERJI Bahadur. } (Co-opted Members).

Mr. J. A. MADAN, I.C.S.  
Mr. F. W. H. SMITH. } (Joint Secretaries).

**Mr. R. S. FINLOW and Mr. K. McLEAN**

**Further Oral Evidence**

18598. *Mr. Gupta* : As Director of Agriculture, what would you consider to be the chief obstacles in the past to more rapid progress in the administration of your department ?—At the present moment, I think it is really a matter of men; the immediate cause is lack of men whom we can trust to develop our programme.

18599. In order to employ these men you want money ?—We want money.

18600. Do you think you have enough money ?—Last year we did not spend the whole of our budget; there was a certain sum returned to the treasury. That was largely because, although we had a programme, we were unable to spend all our money intelligently owing to lack of men, and we decided that it was better not to throw the money away, but at the same time, we pressed for more staff.

18601. For demonstration and for research, besides these farms at the headquarters of the districts (and I understand you have not yet got farms at all the headquarters of all the districts) you have not got anything in the way of sub-divisional farms or village farms ?—There are seven districts in which there is no farm, out of which Midnapore is one.

18602. It is very desirable to have farms for demonstration work ?—Certainly.

18603. But even if you demonstrated to the agriculturists these better methods of cultivation, do you not think it is very necessary to help them financially, to enable them to put these methods into practice, having regard to the condition of the average ryot ? Do you not think they would probably want advances for purposes of manure ?—On the question of pure seed, I do not think he will require financial assistance, but he would require aid at every further step, i.e., for manure, implements, etc.

18604. The District Boards are of very great assistance to you; in the 24 Parganas, we were able to give you money for purposes of seed last year ?—Yes.

18605. In some places we have been able to help you to set up seed stores ?—Yes, that is a great help.

18606. In the District Boards of the Burdwan Division, we appointed additional agricultural officers ?—Yes, they still exist in Midnapore.

18607. And I believe also in Hooghly ?—Yes.

18608. That point, therefore, about the legal possibility of District Boards helping agriculture is important ?—I did not know it had occurred.

18609. It had arisen in connection with the possibility of District Boards helping irrigational schemes. It was pointed out by some legal authority that for sanitary irrigation schemes the District Boards could give money, but for agricultural schemes they could not. It would be unfortunate if this opinion prevailed ?—Yes.

**Mr. R. S. Finlow and  
Mr. K. McLean.**

18610. There is not much difference between an agricultural scheme and sanitary irrigation scheme, because an agricultural scheme helps sanitation?—It all comes under rural improvement, which is exactly the object we are aiming at.

18611. I hope your department will take up the matter about the possibility of District Boards helping agriculture?—I will certainly take it up.

18612. As you know, the District Boards get all their income from agriculture, from the ryots, and therefore it would be very anomalous if the District Boards could not help agriculture?—Yes.

18613. On the question of research, I was not quite clear about what you want the provincial departments and the central department to do in this matter. You accepted the position, in answer to the Chairman, that this question of the delegation of agriculture to the Provinces is a permanent arrangement?—Yes.

18614. And you do not want to depart from that?—No.

18615. Of course you would not take away from the provincial department research in such matters as jute or paddy?—I do not think any scheme as far as I realise it, contemplates taking anything away from the local Government, the whole object is to help the local Government to deal with urgent problems which they may not have sufficient money to tackle all at once; then you have co-ordination of the work. Yesterday, time after time, that was brought up.

18616. From that point of view, would you agree or recommend a system by which there will be annual meetings of all the heads of the Agricultural Department in the different Provinces?—That would be involved in the scheme.

18617. You will recommend it?—Yes.

18618. Perhaps you would also recommend that either you or your subordinate should be free to go and visit any special work that might be going on in any Province?—Yes, that also would be involved in the scheme.

18619. If the things were allowed, you would not require any other form of co-ordination? You do not want to prevent a Province from carrying out a piece of work in which it is interested?—In any subject in which the Province feels itself competent to carry out all the necessary work, it would not be necessary for any help from an outside source.

18620. Turning to agricultural education, of course you realise and you agree that mass education in any form of literacy is most important?—Exactly.

18621. And we discussed yesterday the methods by which we may be able to find the funds for such education?—Yes.

18622. An acreage cess on land was suggested; you would not like to add to the burden of the agriculturists themselves? Would it not be better to have a scheme in which the landlords, who get most of the money, had to pay a good share of it?—Most decidedly; there has been some proposal of the kind.

18623. Such commercial crops as jute are already taxed, but the tax is diverted to urban purposes; do you not think that a greater part of that ought to go to agricultural improvement?—Yes; it would be very wrong if it does not.

18624. And the State also ought to contribute towards agriculture larger amounts than it does?—I think it would always pay the State to contribute as much to agricultural research and propaganda as its experts advise. Whatever the sum, I believe that sound scientific work, and the intelligent application of the results of that work, will always pay, and if that is the policy of the State, I am sure the State will never go wrong.

18625. Perhaps you are aware that there are suggestions to have an education cess, and we want an agricultural cess for agricultural purposes. You probably know that there is a scheme for sanitary work. But all this work is more or less interconnected, because after all it is an organic whole. If you want to reconstruct the rural areas, you must look to the health of the people; without health no activity is possible. Instead of having the various cesses, would you not like to have one cess for rural reconstruction?—I have not thought about it, and I do not know if my remarks would be of very much value. It seems to me that one cess for rural improvement and rural reconstruction would be the best thing. However, I do not know whether there would be any difficulty in apportioning the cess for different objects.

18626. It would be an amount for all the three objects; you will have to take part of it for agriculture, part for education, and part for health and sanitation. They have already to pay the road cess, and in areas where village self-government has been introduced they have also to pay another cess. In addition to that, do you think there is room in

Mr. R. S. Finlow and  
Mr. K. McLean.

Bengal for a third cess?—It seems to me, on the face of it, that a single cess for rural reconstruction would be better than three separate cesses and that a single cess would be liable to create less discontent.

18627. *Dr. Hyder* : Is the idea to add these on to the existing road cess?—That would have to be done; road improvement comes under reconstruction.

18628. For local purposes there is a cess already, and you want to add all these items on?—I am really not competent to express an opinion.

18629. *Mr. Gupta* : If a cess of half an anna or an anna was imposed, and that anna was divided among these three objects, would it not be a good thing?—That would furnish a large amount of money.

18630. It is better to proceed slowly in these matters?—Yes;

18631. That is about mass education, but as we are talking about education for the agriculturists, I suppose you are aware that only about 20 per cent of the boys of school going age in rural areas attend school nowadays?—Yes.

18632. That is about the figure, is it not?—Yes.

18633. And out of these, I think I am right in saying, 4 or 5 per cent go back to their ancestral occupation, agriculture?—I do not think I can give you any exact figures for that.

18634. It is a very small percentage. If you were to devote all your attention to the children of the agriculturists, you will neglect improving the intelligence of those people who are actually engaged in agricultural industry, because, first of all, you are devoting your attention to their children. Even as far as the next generation is concerned you can only teach about five people who are doing agriculture in the rural areas. My point is this that you have got to do something to improve the intelligence of the agriculturists. Do you not think that if you had village farms where you could actually demonstrate better methods to the agriculturists, that would be a much more effective method of improving the intelligence of the agriculturists?—Your idea is to demonstrate to them on the spot.

18635. In convenient areas as far as possible. Do you not think that that would be a sound scheme?—I do. I suggest that the school areas which we have proposed in our adaptation of the Punjab scheme would become very convenient units for a beginning. Their number could be increased later, if necessary. For the present and as a beginning these school areas might be very good centres.

18636. As the Chairman asked you yesterday, you would not insist on every school having a farm of its own. As it is, it is very difficult to have even one farm in the Union Board. That is not a practical proposition?—No, it is not.

18637. Would you be satisfied if you could only have one farm in each Union which is an area of about six square miles?—It would be ample to begin with.

18638. Turning to vocational education, I find that you say that generally it is known that real demand for vocational agricultural education could not be expected before the masses of the people are aware not only that there are facilities for such education but also that it is likely to do real good. Do you not think that the object of making agricultural education vocational in order to help people to earn a living is the most effective way of popularising agricultural education? Do you follow exactly what I mean?—No.

18639. If you take a dozen boys and put them into the school and give them some training in agricultural practice or in the theory of agriculture, then they go out either as *amins* or demonstrators. That is one way of doing things. On the other hand, you actually teach them to earn a living, so that, while they are in the school, they are also being taught a profession by which they could earn a living. Would you turn them out if they are able to combine these things together, and make them start farms of their own? That point I also discussed when the question of vocational schools came up. Would you be against a scheme like that?—Certainly not. I think it is quite a sound scheme. My feeling however, is that at present it would be difficult to multiply these schools all over the country-side. Eventually, I believe, there would be a big demand for them.

18640. *Mr. Calvert*. What age do you contemplate?

*Mr. Gupta* : We had a scheme for younger boys of 10 or 12 years of age. For urban areas like Calcutta we had the Matriculation standard.

18641. *Mr. Gupta* : On principle you would not object to the scheme?—I should not object to the establishment of one school in order to gain experience.

*Mr. R. S. Finlow and  
Mr. K. McLean.*

18642. *Mr. Calvert* : Is it a kind of agricultural college ?—It is a farm where not only agriculture is taught but there is also a workshop, an engineering class, and things of that sort.

18643. Is it an intermediate college ?—Yes. I believe that the demand for it will grow in the future as a result of the intensive application of the Punjab scheme.

18644. *Mr. Gupta* : Taking up that point of considering all rural problems as one and working from different directions. That is a point on which I would like to ask your opinion. Do you think there is sufficient co-ordination between these departments, namely the Industries, Irrigation, Education and the Co-operative Departments ? Have you got facilities for meeting periodically and discussing rural problems together ?—There is an arrangement by which the heads of all these four departments do meet each other.

18645. Do they do so in practice ?—The idea was that they should meet once every six months. I do not think we have met yet. This has been rather a special time but it is intended that they should meet. I think it is very advisable that they should meet.

18646. It would be a great advantage ?—Yes.

18647. You know that most of these departments are Transferred and some are Reserved. Irrigation, for instance, is Reserved ?—Irrigation was included in the joint scheme.

18648. You know, of course, that under the present system of Reforms, Ministers change. Ministers come in after three years and of course they take some time to get the hang of the work of their departments. Would you, therefore, be in favour of the appointment of a Development Commissioner to co-ordinate the activities of the scheme ? It was recommended by the Administration Committee and also by the Committee on Co-operative Societies in India and I believe in Burma and in other Provinces they have accepted this scheme. Would you be in favour of the appointment of a senior officer as a Development Commissioner to co-ordinate your activities ?—My impression at present is that much more co-operation can be arranged between the departments without appointing such an officer.

18649. Would not there be a danger of any executive order remaining a dead letter unless there is somebody to see that it is actually carried out ? As things are, if you want to pursue any particular policy, you will have to come and see the Secretary, who, in his turn, will consult the Minister. As I said, the Ministers change every three years. Of course from the practical point of view, I do not want to make any aspersions, he must take a little time before he understands exactly what the requirements of your department are. But if you had a senior officer of administrative experience he would be able to keep you in touch if he had also some powers as was suggested in the scheme to which I have referred. Would not that be an advantage ?—Would the Development Officer replace the Secretary ?

18650. The scheme was not worked out in any detail, but if you had such an officer would not that be a great help ?—I am not sure.

18651. Do you think it might create difficulties ?—At present you have got the Secretary and the Ministers for the four development departments.

18652. I do not think there is as much connection between all these nation-building departments as there should be. The only link now is the district officer and even he has not got any definite orders from the Government on the subject. That is a point to which I will come presently. I am for the moment referring to the suggestion of the Administration Committee and of the Committee on Co-operative Societies which distinctly suggested that for each Province there should be a Development Commissioner. This suggestion has actually been accepted in Burma, I do not know with what results. For the better co-ordination of your work and of these departments would you not favour such a scheme ?—I would like to think over the matter before I express any definite opinion. So far as I remember there was one point in the scheme and that was to do away with the heads of departments. I have forgotten the scheme.

18653. Would you like to consider that matter and give your considered opinion on the matter ?—Yes.

18654. Now, with regard to the co-ordination of your department with the officers of the general department, namely, the Collectors, the Sub Divisional Officers and also the Circle Officers. Do you think that you get a lot of help from them ? Do the district officers take interest in these matters ?—I think we certainly get help from district officers. If the Collector takes an interest in the work in his district, it immediately makes more progress than it would otherwise do. The mere fact of the Collector's association with the work raises its prestige and that is a great asset.

*Mr. R. S. Finlow and  
Mr. K. McLean.*

18655. Do you think that an executive order of the Government directing the attention of the Collectors to this important matter and laying down that agriculture is one of those matters to which they must give special attention would be a great help?—Certainly. I think it will do a lot of good. It would make the propaganda work in the district very brisk if the Collector were to take interest in agriculture in proportion to his ordinary duties.

18656. And he might also ask one of the Deputy Collectors with special knowledge of agriculture to take an interest in it. I do not mean to say that the Collector will do the work of the Agricultural Department but he will consider that as one of the most important duties of the district?—Yes.

18657. I am going to be even lower. Do you not think it would be a good thing if the Circle Officers were also brought into the scheme?—Yes, it would be a good thing.

18658. Would you like to see the Union Board a sort of centre where the sanitary work, the agricultural work and the co-operative work might be done? If you had the money, would you like to appoint the Union Board a rural officer to look after your demonstration farms?—That is part of our programme which was sanctioned by Government in 1919.

Of course, retrenchment interfered with it, but it has not been rescinded.

18659. *Sir Henry Lawrence*. You say that the issue of such an order by Government would do some good?—I think so.

18660. An order to what effect?—Asking the Collectors to regard the work of agriculture in their districts as part of their ordinary normal duties.

18661. Have you not got that order already? Is it not already a part of your regular routine?—The Collectors are willing to help whenever they are asked to do so. Some go a little further and take their own initiative.

18662. Have you not got a definite order to that effect issued by the Government of Bengal only last March? It is dated 15th March 1920, paragraph 7?—There was an order issued in 1919 about the help of the Collectors in the districts. It is this is the Resolution on the annual report. Paragraph 7 runs as follows, "The Governor in Council agrees with the Director of Agriculture that the District Officers are in an especially favourable position to exercise their influence in controlling the agricultural policy of their districts in the matter of propaganda and demonstration and in organising work among non-officials and agricultural associations and co-operative societies."

18663. You want orders more definite than that?—Probably this Resolution may not have reached every District Officer. If a copy of the order were sent to each District Officer, that would be quite sufficient.

18664. *Mr. Gupta*. Drawing the special attention of the District Officer in this matter?—Yes, but I do not want to burden the Collectors any further.

18665. *Sir Henry Lawrence*. Does not a resolution of this character go to every District Collector?—I do not know.

*Mr. Gupta*: It does.

18666. *Professor Garjole*. Do I understand correctly that copies of these resolutions are not sent to the district?—I think they are.

18667. *Mr. Gupta*. But in any case you have a matter of principle that some Collectors take a lot of interest, while other Collectors do not take the same amount of interest. Of course, you are not in a position to say what the executive orders of Government are, but if the special attention of District Officers were drawn to this matter, it would be an advantage, would it not?—I think it would be an advantage, yes. I would not like to say that some Collectors do not take much interest in agriculture.

18668. They do not take as much interest as others do?—I have always found every Collector I have approached ready to help.

18669. But do you get the same assistance from all Collectors?—Some Collectors do take the initiative, as I say.

18670. Do you not think that circulation to all District Officers would be advisable with regard to any executive orders based on a resolution?—I think it would be advisable, yes.

18671. With regard to statistics, several questions were put to you as to the average income from various sources, and some of the figures did not tally exactly. You do not deny that the average cultivator in Bengal is very poor?—Yes, compared with some standards, but there is one thing that is quite certain; that is that his income is increasing, especially in jute-growing districts.

Mr. R. S. Finlow and  
Mr. K. McLean.

18672. But there is room for a much greater increase, is not there?—Yes, I mean there would not be any object in our appointment if we knew we could not increase the yield.

18673. Even in jute-growing districts, in years when there is very little demand for jute, as in the present year, for instance, it is at once reflected in their economic condition, and they go to the *mahajan*?—I am not sure that it would be necessary to go to the *mahajan*.

18674. Of course, you would not be opposed to the collection of laborious and elaborate statistics, but, it being accepted that they are poor, do you not think the energies of your department would be better devoted to increasing the wealth derived from agriculture than in collecting elaborate statistics which will vary from year to year, and which would not be really complete unless an enormous amount of money is spent? For instance, if statistics as to agricultural indebtedness of the ryots were to be collected, that loan would mean the expenditure of 20 lakhs if anything of value is to be produced?—Yes.

18675. Do you not think those 20 lakhs would be better employed in helping the agriculturist to improve his conditions?—My opinion is that we are too small a department to spread our energies very much. That is why we have had to say "We do not know", in answer to so many questions that have been asked us by this Commission. All along, we have felt that, if we did not concentrate, we should produce no appreciable result whatever. Therefore I agree absolutely with what you say as regards concentration. It is just possible that we may be able to help, but I think it would be folly to detach any considerable proportion of our men or to attach any considerable proportion of the present staff's time in obtaining statistics, if the propaganda work, which would mean increasing the wealth of the cultivator, had to suffer.

18676. For instance, Mr. Momen says they are very poor; Major Jack says they are not so poor; they are two very able officers?—Of course they are speaking of two different districts. Mr. Momen speaks of Jharkhand which is what is called a "diving" district.

18677. It is very difficult to obtain statistics for the whole Province, and those statistics will not remain up to date for more than a year or two?—Yes, that is so.

18678. I suppose you agree that irrigation is one of the most important problems in the whole sphere of your administrative work?—I do.

18679. As far as I could gather, up to now your department has not been able to do very much in that connection?—Practically nothing up to the present.

18680. That is unfortunate. That is one of the directions in which, if you had money you could do much more, is it not?—Yes.

18681. That is where your department is starved for want of money; this is very much to the point, is it not?—Yes.

18682. I want to draw attention to the actual way in which irrigation works are being carried on in this Province. You may not have a very intimate knowledge of these matters, but I should like to have your opinion. You know that irrigation works in Bankura and Midnapore are being carried out through two agencies, by co-operative societies and under Act VI of 1920?—Yes.

18683. In the co-operative system we are assessing the value of the lands which are likely to be benefited, getting the parent societies to lend money and then taking up the work. Under Act VI of 1920 unfortunately only one scheme has been taken up; you probably know that is the Swahidchaka scheme. We have a very elaborate procedure laid down. It has been suggested that minor schemes which relate to one district only should be freed from the elaborate procedure laid down in this Act and made over to District Boards, the Chairmen of which might have the authority to initiate such schemes and carry them through. Would you not favour such an idea with a view to doing away with all the difficulty that exists? At present you have to consult the Irrigation Department, the Agricultural Department and the Sanitation Department?—Yes.

18684. All the Collectors are agreed that this is a procedure which practically prevents the initiation of any such scheme?—Yes.

18685. It is now proposed that with regard to small schemes the District Board and the District Engineer should be able to initiate and carry through these schemes; would you be in favour of that?—I should be inclined to accept the opinion of the Collector on the matter; if he considers it is advisable, I should agree with him.

18686. Unless the Collector thinks it is necessary, you would not require him to consult the sanitary engineer, the irrigation engineers and the agricultural officers in every case; unless he requires such assistance you would not make that a sort of legal requirement, would you? Perhaps you are not quite familiar with all the requirements of the Act?—I was wondering whether the Collector would not very often, if not always, want to

Mr. R. S. Finlow and  
Mr. K. McLean.

know whether a particular scheme would likely be of the value at which it is estimated. It would not take long; if he merely had to consult the three departments concerned, it would not take more than a week, or two at the outside I should think.

18687. As the irrigation officer is coming, perhaps that point had better be left until he comes; but you would be in favour of a simplification?—Anything which would simplify it and keep it safe.

18688. Since 1920, when this Act was introduced, only one scheme has been undertaken; if that is the fact, you would certainly be in favour of simplification, would not you?—All the information I have had is to the effect that Act VI is too cumbersome.

18689. In view of the fact that paddy seed in bulk cannot be transported except at great expense, you think it would be a great advantage to have seed farms?—Yes.

18690. Would you not connect these seed farms with the village and Union farms which have been suggested?—Yes, certainly, you would have a seed farm near every school where you have anything like agricultural classes.

18691. In the union you would have that?—Certainly. Probably your school farm would be a seed farm, to some extent at any rate.

18692. As the Chairman said, the problem of improving the cattle and also encouraging dairy-farming and cattle-breeding is probably the most important question connected with the industrial development of Bengal?—Yes.

18693. For instance, you have a cattle farm at Rangpur and one at Dacca?—Yes.

18694. I have not seen the Dacca one. Central Bengal and Western Bengal have not got anything?—No.

18695. We have acquired, as you know, 400 acres of land in Krishnagar, and you have seen that?—Yes.

18696. Is not that admirably suited for the purpose of a cattle farm?—With irrigation that would form a very fine farm. That scheme has been sent up to Government and is before Government now.

18697. Your department is in favour of that scheme, I hope?—Yes, we sent the scheme up.

18698. Has anything been done with regard to letting District Boards, and even Local Boards and Union Boards, have your breeding bulls free?—We are just developing that policy of sending out available bulls in the first instance to District Boards or other bodies, and to some extent also to responsible private individuals who would undertake to look after the bull and allow it to serve cows.

18699. Have you a sufficient number of bulls to go round?—We should certainly not be able to deal with a very large number at present.

18700. There again you are handicapped for funds; if you had more money you could do it?—Yes, but we have got to go a little further in investigation before we go out on a very large scale with these bulls. That is why we are so anxious to get a Cattle Expert.

18701. With regard to that matter of Western Bengal which my friend the Rai Bahadur brought up, of course you would admit that Western Bengal agriculturally is the part of the Province which requires most attention?—I think it is the poorest part of Bengal.

18702. You have seen Dr. Bentley's figures by which he shows that agriculture has gone down in parts of the Presidency extensively?—Yes.

18703. And your own experience would bear that out?—I think so, certainly.

18704. It requires your attention, and your department headquarters being at Dacca, could you not give special attention to Western Bengal? As the Rai Bahadur suggested, you would be in favour of having a rather large farm near Calcutta which is an important centre of the brains of Bengal, if there is no difficulty as to acquisition of land?—I think there are points in the scheme of having a farm near Calcutta, if it is only to demonstrate to the public what we are actually doing.

18705. At Jadabpur we are able to acquire about 600 bighas for a lakh of rupees only, which is very small?—Yes.

18706. If we elaborate a scheme like that, your Department would help in putting it through?—I have a doubt about the farm at Calcutta if it is intended to benefit agriculture in Western Bengal. In Western Bengal I have always had in mind the upper parts; I believe that it is in those tracts that there is a very large scope for improvement. I doubt whether a farm in Calcutta or near Calcutta would be of very much benefit to these particular tracts.

Mr. R. S. Finlow and

Mr. K. McLean.

18707. Those districts are going to have district farms ?—Yes.

18708. You know Calcutta is really the centre of the brains of Bengal ?—Yes.

18709. People from Bankura, and everywhere else, come to Calcutta ?—Yes, I realize all that, and the advantage of having a farm of substantial size near Calcutta as a demonstration of what the department is doing. But my ambition is to enlarge a farm like the Suri farm, for instance, and eventually to try and establish a cattle farm there, because all the indications that we are getting at the present moment are to the effect that we shall be able to produce fodder crops on a considerable scale in a good many of the highlands in that particular tract; certainly from a climatic point of view I think it is more suitable for cattle-breeding than either Eastern or Northern Bengal. It is a question of funds and which is the most urgent thing; but I do regard the development of a new farm somewhere in the highlands of Western Bengal as being a matter of very great importance.

18710. But you would not be opposed to a farm near Calcutta, would you ?—No, I would not oppose it; but I think we should have to consider it in the light of this other scheme which I have.

18711. It is a question of funds again ?—Yes, it is a question of funds.

18712. If you had more money, would you probably do it ?—I have no objection in principle to a farm near Calcutta.

18713. If in this farm, we had parts of the farm, small commercial farms, in which a certain number of students are trained, for instance in elementary engineering and if at the same time you put up machinery and buildings, they will be in touch with the requirements of a big city like Calcutta and those farms could be run on co-operative principles and you will be taking a certain number of young men and opening up a very profitable vocation for them; do you not think it is an experiment worth trying ?—I think we have to consider all that. What I should like first of all would be to see the farm divided into plots and actually doing demonstration work and then I think we could gradually add on the teaching part of it practically, take the boys in and give training in practical agriculture possibly with a little engineering. It is a very big scheme.

18714. But would you like to see how it works ?—Yes, I think we should have to proceed gradually and go step by step.

18715. You know the University and the District Board have all agreed to help such a scheme ?—I know there is a very considerable public support for an idea of this kind.

18716. And your department more than any other department should be in touch with public opinion in such matters ? Do you not think so ?—Decidedly. On the other hand we also have responsibility.

18717. Undoubtedly ?—Advisory responsibility; and we should have to think about a scheme of that sort very carefully before we give it the seal of approval, because, supposing we take say a lakh of rupees of public money subscriptions and then the scheme failed, the department would be very unpopular.

18718. But have you any particular reasons for thinking that the scheme is likely to fail ?—We have got to consider all sides.

18719. You have not got any special reasons but you think as a matter of policy, as a matter of precaution, it will be necessary to carefully examine the scheme ?—Yes; that is all that I wanted to say. I have no antagonism to that scheme.

I make a present of that scheme to you.—Thank you.

18720. *Sir Ganga Ram*: You have got about 22 million acres under paddy ?—Yes.

18721. And paddy will not grow without water ?—Quite true.

18722. Do you know what quantity of water is required to mature the paddy crop ?—We estimate it at about 36 inches annually.

18723. No; 36 inches will not do. Eight waterings of 6 inches and the first watering of 9 inches, that is what we have found out to be necessary ?—You have got a different climate, the loss by evaporation is much more in the Punjab than in Bengal.

18724. Never mind. Even admitting that it is 36 inches you have only got under irrigation a million and a half acres ?—I think it is much less than that.

18725. Can you give me information as to how much rainfall is certain ?—In Bengal ?

18726. Yes ?—It varies widely. In Western Bengal on the borders of Chota Nagpur it is about 65 inches.

Mr. R. S. Finlow and  
Mr. K. McLean.

18727. No, no; what area can be safely counted upon as protected by rainfall?—Eastern Bengal and it would really be the salt portions of the Province. I am afraid I cannot tell you definitely.

18728. Roughly?—Say at least half; something like that.

18729. That means to say that if rains fail, then 11 million acres will be without any crop?—Not at all.

18730. You say 22 millions altogether?—I mean you never get a complete failure.

18731. That is exactly what I ask. How much is the complete failure?—None.

18732. None whatever?—None.

18733. You get sufficient rain to irrigate 22 million acres?—We do not irrigate at all excepting.....

18734. By rainfall or by artificial irrigation; that is a different matter. You want water all the same?—Of course, yes.

18735. So I say how much area out of the total do you consider rather risky?—I should say that the crop is liable to be reduced by uncertain rainfall over the districts of Midnapore, Bankura, Burdwan, parts of the Dacca district, parts of Mymensingh, Malda, Rajshahi and Rangpur.

18736. How much is it?—Say, half. We have not got all the figures here; we could give you the reference.

18737. That means to say that you must secure Bengal with certain irrigation extending over half the area?—I quite agree.

18738. You mean the problem of Bengal is to bring at least 10 million acres under irrigation?—We want to have water so that we can make any crop grow.

18739. You understand what I mean? 10 million acres is the very lowest figure which ought to be brought under irrigation to call it a protected area?—We had better not put it in figures; I would rather put it down as a very large area.

18740. How much?—I cannot tell you exactly.

18741. I want to carry on that question to the Irrigation Department?—I would agree to have it as a large area, a considerable proportion of the total area of transplanted rice.

18742. I want only what you consider as the minimum area which can be called a protected area in Bengal?—I would like to say a very considerable proportion.

18743. Because I want to carry on that question to the Irrigation Department?—I would let you have that after the meeting is over; it can only be a rough estimate.

18744. What are the functions of your demonstration farms? You do not teach them the proper lines of cultivation?—I think we do, most decidedly.

18745. If you do not teach them that three crops of paddy taken away from one and the same field is ruinous to the soil what else do you teach?—We do not grow three crops.

18746. Do you take two crops of paddy?—Very often. Then you simply waste the soil, that is all. I can guarantee twice the yield from one crop of paddy.

18747. *Sir Thomas Middleton*: Mr. Finlow, yesterday I put some questions to you on Tables I and II of your Agricultural Statistics. I want you to refer to Table IV which gives the area sown with different crops in each district—Agricultural Statistics of Bengal for the year 1924-25—page 6. Would you compare also the Season and Crop Report of Bengal for the year 1924-25, Appendix III, page 8? The first question I want to ask you is whether these two volumes are issued annually?—Yes. The Season and Crop Report for 1924-25 was published by the Director of Agriculture in May 1925. In Agricultural Statistics for 1924-25, tables 1-5 were compiled by the Director of Agriculture and submitted in proof to Government in October 1925. The remaining tables are compiled by the Director of Land Records and the whole is published by Government as soon as possible. Therefore, as a rule, the volume of Agricultural Statistics appears about six months later than the corresponding volume of the Season and Crop Report. Corresponding volumes are labeled with the same year.

18748. That is what I wanted to get at. Now to come back to the Agricultural Statistics of Bengal for the year 1924-25. We have on page 6 your Table IV. On page 30 we have the corresponding Table IV of the Director of Land Records. Now, if you compare districts in these two tables, you get very wide discrepancies. You have already Mr. R. S. Finlow and Mr. K. McLean.

indicated to me in a general way how these discrepancies arise. But it is very difficult for a stranger to Bengal, when these two documents are put into his hands, to determine what is the correct figure to use for Bengal. I get three sets of figures. What I would like you to do is, to indicate how statistics in Bengal are compiled. Do you think you can furnish us with that?—I think I told you this morning that I discussed this matter with the Director of Land Records for a few minutes last night over the question of areas that was raised yesterday. About the district of Bardwan, which was referred to, only a portion was cadastrally settled, and the discrepancies between the figures were due to that. In the second table were included only the areas which had been actually cadastrally surveyed, and these figures were just a portion of the whole district, whereas in the first table the whole of the district was estimated.

18749. I would make a further suggestion that there might be a short introductory note to your statistical publications warning the reader of the pitfalls which exist?—I think that is advisable, and I will undertake to have a note put in.

18750. *Mr. Culbert*: I would just like to clear up a point which arose from your replies to Mr. Gupta's questions on the value you attach to accurate detailed information on rural conditions. Might I ask, have you found Major Jack's book at all useful?—Yes. It will be useful to have a sort of economic study of tracts in which you propose to work.

18751. Would you go so far as to say that before setting out to alter village economy it will be useful to have a very careful study of the existing state of affairs which you propose to alter?—I think so. All I wanted to say is that it is necessary to carry on with the question of agricultural improvement, that is increasing the income of the cultivator and doing other work at the same time. It would never be sound policy to stop the process of increasing the cultivator's income in order to make an estimate of what he is really worth at the present moment. That is all I wish to say. I agree that the more detailed information you can have about the cultivator the better.

18752. One of the points raised in other Provinces has been the small amount of loans taken under the Land Improvements Act for wells and other improvements. You find in Mr. McLean's report on the Punjab consolidation work that fragmentation was a very potent cause preventing the sinking of wells, and he has pointed out that with consolidation a very large number of wells were promptly sunk. Do you not think that kind of information will be useful to you as a guide?—Yes; undoubtedly.

18753. Another question which has always come up before us is, why the people will not take the advice you offer them. Do you not think that a very careful study of the economic conditions would reveal the reasons why they do not?—Very probably.

18754. Any propaganda may be a failure because apart from fragmentation of holdings, debt is very often an obstacle in the way of people adopting your advice. Do you not think a very careful enquiry would be useful in showing the means of relieving them?—I agree with all you say.

18755. Do you think that a very detailed inquiry into the rural economy of an Indian village will be very valuable in your efforts to improve the conditions?—Yes.

18756. *Professor Ganguly*: Mr. Finlow, I desire to ask you one or two questions with regard to the line of organising research on crops. You mentioned in answer to Sir Thomas Middleton that you would like to have research on pulses?—Pulses were mentioned as an instance.

18757. Yes. Supposing you had the facilities, what particular line of the problem would you tackle with reference to pulses?—I do not know what you mean.

18758. What line of research on pulses do you think is most important?—It is altogether on the same lines as the research on cotton.

18759. Is there any particular problem awaiting solution with regard to pulses?—I think most certainly that there is just as much possibility in pulses as there is in cotton or jute.

18760. With regard to pulses would you aim at breeding high yielding varieties or at manual experiments?—Everything.

18761. You have nothing definite in your mind?—Everything is perfectly definite; anything that you do in the improvement of any crop would apply to pulses. We have detailed them with regard to rice and jute, and all the work on pulses would be exactly the same.

18762. There are various kinds of pulses grown in Bengal?—Each crop of pulse would receive attention. We would give attention not only to the yielding capacity of the various types, but also to the market value, the commercial side, manure, and so on.

*Mr. R. S. Finlow and  
Mr. K. McLean.*

18763. In regard to fodder crops you say that several crops, including millet from Manchuria, *rheana* from Bombay and Guinea grass have been introduced. Can you give us an idea of the acreage of millet from Manchuria, *rheana* from Bombay, and Guinea grass ?—Millet was only imported 2½ or 3 years ago. It is grown in all our farms in the districts and seed is being given out to people round the farms.

18764. Could you give us an idea of the extent it has spread ?—It is still in the demonstration stage.

18765. With regard to cattle, the Rangpur and other farms were started during the time of Mr. Blackwood. Do you think there has been continuity of policy in respect of cattle-breeding since then ?—Speaking generally, yes.

18766. Who is in charge of cattle investigation ?—At the present moment ?

18767. Yes ?—Mr. McLean and myself. There is a Deputy Director whose headquarters are at Rangpur, and he carries out the orders of the Assistant Director and myself. In the course of the next week or two, I hope we shall have a Cattle Expert who will devote special attention to Rangpur.

18768. Do you approve of having Government demonstration farms or do you approve of the idea of demonstration on the farmer's own lands ?—It would be impossible to multiply Government demonstration farms indefinitely.

18769. You have already 19 ?—We have got 19, and we hope to have 30 altogether in the end. It may be that in addition to that, according to the present policy, there will be small farms attached to various schools.

18770. Those of course will be Government farms ?—They will be more or less Government farms because they are subsidised by Government.

18771. I am aiming at Mr. Knapp's method practised in the Southern States of America, i.e., demonstration on the farmer's own land ?—Yes, we do that.

18772. Do you not think it will be more useful ?—As far as staff is available we certainly do it, but wholesale demonstration on the farmer's land means a very large staff. That is why we resorted to the free distribution of small packets of jute seed and of paddy seed, a system which has produced excellent results.

18773. Do you see any change in the farming practice in the neighbourhood of your farms ?—Certainly.

18774. In what direction ?—Crops grown on Government farms spread into the neighbourhood.

18775. They take to them very quickly ?—Yes.

18776. Do you think that the Rajshahi larn has affected the farmers in the neighbourhood ?—The last time I visited Rajshahi cultivators were coming to take paddy seedlings from the farm.

18777. With regard to finance, you have been telling us that retrenchment has mutilated your department. I shall now turn to the figures of your expenditure. In 1916-16, your expenditure was 67 lakhs; in 1916-17, it was 10 lakhs. Then came the retrenchment, which reduced the expenditure by two lakhs. In 1924-25 it was 8½ lakhs, and the budget for this year is Rs. 12,31,000 ?—No; it is under 10 lakhs now. You are including the gardens.

18778. The present figure is 9 lakhs, yes. Have you an Entomologist ?—There is an Assistant Entomologist, a man in the subordinate service.

18779. Then with regard to artificial manures, are you aware of commercial firms in this Presidency trying to introduce artificial manures ?—Yes.

18780. Are you in touch with them ? Are you in touch with Messrs. Shaw Wallace and Co., in their propaganda campaign ?—Yes. We are doing experiments in collaboration with them.

18781. The British Sulphate of Ammonia Federation proposes to spend £20,000 in propaganda ?—I am told so.

18782. Are you in touch with that propaganda ?—Yes.

18783. Are you aware of any complaints made by commercial firms dealing in manures in this Presidency that they are not getting sufficient help from the Department of Agriculture ?—I have heard of no such complaints.

18784. Do you exercise control over agricultural education yourself, or is it controlled by the Department of Public Instruction ?—You mean the school at Dacca ?

18785. Yes ?—It is entirely in our hands.

Mr. R. S. Finlow and

Mr. K. McLean.

18786. That is entirely under your control, not under the control of the Director of Public Instruction ?—It is entirely under my control.

18787. With regard to implements, do you take any credit for the work done by Messrs. Renwicks, in the introduction of their sugarcane mills ?—None at all.

18788. On page 11 of your memorandum you say, "One great difficulty with the demonstration of implements is the belief of the cultivator that his cattle are not strong enough to draw the implement. It will take time to overcome this prejudice." Is it really prejudice ?—Yes, it is prejudice; in order to overcome it, at the various small cattle shows that we have, which are subsidised, we stipulate that before we can subscribe to the show or help it financially there shall be a ploughing match.

18789. Do you think this belief of the cultivator that his cattle are not strong enough to draw the implements that you recommend, is a prejudice ?—I think it is a prejudice. In some places the cattle are too small, but in many places they are not too small for a comparatively small implement. There is another side of our work, which is to improve the cattle, and produce a dual purpose animal.

18790. With regard to your administration, one of your Deputy Directors, Mr. Smith, has sent us a précis in which he states "We have too much pettifoggery work to do." Could you say what he is referring to ?—I have no responsibility for what is written by Mr. Smith.

18791. Mr. Kamal : There was a committee appointed in this Presidency to examine the question of hydro-electric possibilities ?—Yes, I believe there was but I know very little about it.

18792. Do you know that they recommended that there is very little scope for such schemes in this Presidency ?—I believe they did, but I have no very positive knowledge about it.

18793. About this idea of a Development Commissioner, because the Ministers change every 3 years, are you in favour of stereotyping a policy, or having a change of policy every 3 years ?—I think new ideas are always valuable, but I do not think it would be wise to reverse a policy every three years. I think there should be a certain permanent object in view. One Minister may think that perhaps the means used might be altered a little, but I think there should be a sort of general continuity.

18794. Are you also in favour of centralising in the hands of one Development Commissioner various departments ?—I would rather not express any very definite opinion on it.

18795. On the question of the jute cess about which you spoke yesterday, is the jute cess at present levied here absolutely an Imperial asset ?—Yes, I believe it is.

18796. You do not derive a penny out of that for the improvement of Bengal agriculture ?—None.

18797. You stated yesterday that jute was a paying crop, taken as a whole ?—Yes.

18798. You also admit that, compared with the other Provinces, your land revenue in this Province is very much less ?—It must be; the expenditure per head in this Presidency is very much less than it is in Bombay.

18799. Therefore, if you want money for the improvement of agriculture, there is a large scope for enhancement of the cess on jute, and allocating it to the Bengal Presidency ?—Yes, I think so.

18800. Dr. Hyder : Do I understand that you are in favour of a policy which would give the proceeds of export duties to particular Provinces ?—In regard to the jute cess ?

18801. Jute, I understand, is not purely a Bengal crop : you have got it in the United Provinces, and in Bihar. So, that would be a difficult matter ?—Of course. What has been proposed, I think, in regard to Bengal is that the Government of India should be a little more generous to Bengal, on account of the fact that it derives such a large income from the jute cess in Bengal.

18802. If the Government were to impose export duties, surely other Provinces will complain ?—They should not be enriched by Bengal.

18803. There is one more point arising out of the replies which you gave to Mr. Gupta. Do I understand you to say that you would be in favour of the location of an agricultural farm, for the improvement of agriculture in Western Bengal, at Calcutta ? Surely such a farm should be located in the highland tracts like Bankura or Birbhum which represent the bulk of the area. ?—My wish is that we should improve the agriculture of Western Bengal by enlarging the farms at Bankura or Suri.

Mr. R. S. Finlow and  
Mr. K. McLean.

18804. *The Chairman* : On this matter of the possibility of a Provincial Development Commission or a central body designed to bring departments together and to keep them in touch, co-ordination need not mean rigidity in the matter of policy, need it?—No, I should think not.

18805. You know the story of the very large family who occupied one bed and when father said, 'Turn,' they all turned. It did not mean there was any lack of adaptability; they all turned together. If really there is a change of policy, it might be just as well that all the departments of Government were informed in such a manner as to make the new policy workable?—Yes.

Rather than lack of direction in the matter of co-ordination and lack of interaction.

18696 I do not know whether you wish to say anything, before you leave the witness's chair, about cattle disease and the desirability of, either by legislation, or by administrative steps not requiring any further legislation, making some attempt to prevent the invasion of uninfected areas by epidemic diseases?—I do not think I can express any definite opinion as regards the details of the subject, because the Veterinary Adviser to Government will give evidence before this Commission. I would like to say that there is an appalling amount of cattle disease in Bengal, and any measures which can be taken which would tend to diminish the disease are very highly desirable.

18807 And cattle disease in a country of small owners, where cattle represents so large a part of the cultivator's capital and of his tractive power, would inflict, I take it, great distress?—Yes. The loss of bullocks through disease means the loss of an appreciable proportion of his capital, and it is the loss of bullocks which is one of the important causes of a cultivator getting into debt.

18808 The death of his working bullocks means a calamity of the first order?—Yes.

18809. You are probably familiar with the broad arrangements in America as between the Central Department of Agriculture and the States?—I have no detailed knowledge of it, but I understand there is a Federal Department of Agriculture in the United States and that each separate State of the Union has its own Agricultural Department too.

18810. And in fact the Central Department of Agriculture in America is one of the most powerful, probably the most powerful, and the most active Ministry of Agriculture anywhere in the world?—That is true.

18811. And, so far as it is possible to judge, I think no one who has studied the question supposes that the effect of a powerful central department has been anything but stimulating to the State departments?—I believe that will certainly be the effect.

18812. The idea of the central department being unnecessary was very much before American politics, and I believe that Hamilton gave it as his definite view that no Central Department of Agriculture would ever be required, but experience through the last century has changed opinion in the States a great deal, and now the arrangement which you told the Commission you are broadly familiar with, is coming into being?—Yes.

18813. You have told the Commission, in answer to a question by myself that you would wish to say something *in camera* about the monopolistic position of India in the matter of jute; but I understand that there is no reason why you should not tell the Commission what you wish to say in public, and if you do that it would be much better?—There is very little I have to say. In regard to jute, Bengal, or rather North-East India, one had better say, has enormous advantages in climate, in man-power and in the matter of the general conditions which are necessary for the production of jute. A great deal has been said about the possibility of competition in other countries which might be able to produce jute at a figure which would compare with that at which Bengal can produce the fibre. In regard to that, we know that very good jute has been grown in a number of countries of the world. But the rocks on which their efforts have split have always been either that there has been lack of retting water or, as in nearly every case, labour has been too expensive; it has been one or the other of these causes which has caused their efforts to fail. Now, of course it is common to say that because experiments in the past have failed, Bengal is absolutely secure in its monopoly. I think there is a certain amount of reason in this attitude as regards the immediate future. But we have the case of indigo before us, and we never know what may happen. All I would say in regard to this is that we should not sit down and assume that we are absolutely safe, but that we should take up every means of developing the jute crop, as far as its agriculture is concerned—making it as efficient a plant, and the fibre as good and as economically produced, as it is possible to do. That is all.

18814. And also to watch over the conditions of marketing and so on?—Yes.

(The witnesses withdrew.)

Mr. R. S. Finlow and  
Mr. K. McLean.

## APPENDIX I

## Note by Mr. R. S. Finlow on the average price of jute during the last 25 years

The average (overhead) prices of jute actually paid by two large baling firms in Nwaim-ganj, one from 1900 to 1925 inclusive and the other from 1907 to 1925 inclusive, are given below. I have averaged the figures in 5-year periods, viz. .

1900-1904 inclusive.

1905-1909 „

1910-1914 „

1915-1919 „

1920-1924 „

I have not taken account of the last two years, partly because 1925 was a year of abnormal prices and partly because the present year is not yet finished as far as the jute season is concerned. I may however remark that, up to date, the estimated average price of jute received by the cultivator for the last two seasons so far as they go is about Rs. 12-12-0 per maund.

The following are the estimated prices per maund received by the cultivator for the periods detailed above :—

					Rs. a.
1900-1904 inclusive	..	..	..	..	4 1
1905-1909	..	..	..	..	5 2
1910-1914	..	..	..	..	6 8
1915-1919	..	..	..	..	6 15
1920-1924	..	..	..	..	8 8

## APPENDIX II

## Note by Mr. R. S. Finlow on profits of jute cultivation

In regard to the discussion on Question 6 and the statement in my written evidence regarding the profits from jute cultivation, I would draw attention to the fact that the paragraph in question was written with regard to indebtedness, and the effect of a year of high prices in reducing it. It is obvious from the context that it was not intended to convey the idea that the average profits on jute cultivation over a series of years amount to Rs. 200 per acre.

As regards the actual profits made in 1925, I consider the statement made in the written evidence, with the accompanying qualifications, to be substantially correct; and that net profits of Rs. 200 per acre were not uncommon, especially in Eastern Bengal. I have already submitted a note—*vide* Appendix I—showing that the average prices of jute have doubled in the last 25 years.

As regards average profits. These are increasing with the price of jute because the cultivator still does the bulk of the work himself. Taking an average price of about Rs. 10 per maund for the last 7 years, and an average crop of 15 maunds per acre, also an average cost of production at about Rs. 5-8-0 per maund, the net return comes to Rs. 67-8-0 per acre. Most jute land bears either transplanted paddy or a *rabi* crop in the same year; so the net return is enhanced by, say, Rs. 25 per acre in addition to the above.

Mr. R. S. Finlow.

MO 13-6

**Rai A. N. DAS Bahadur, Officiating Chief Engineer and Secretary to the  
Government of Bengal, Irrigation Department**

**Replies to the Questionnaire**

**QUESTION 8. (a) (i)** New irrigation schemes for irrigation by perennial and non-perennial canals are desirable in all districts of Bengal west of Long. 85°, i.e., districts Midnapore, Bankura, west of Burdwan, Birbhum, Maldah and Dinajpur.

The staff in the Irrigation Department is now very short and it has not been possible to make investigations to any extent towards the preparation of projects.

(ii) For irrigation by tanks or ponds there is no great probability now.

(iii) For irrigation by wells, there is a small scope but this has not yet been adopted systematically to any extent.

(b) Yes. The question of any large wastage by evaporation and absorption in the soil is not acute in the present irrigation works, as the area commanded lies in the flat delta region, where ordinary rainfall keeps up the subsoil water level, and the humidity prevents rapid evaporation.

The present method of distributing canal water (Midnapore Canals) at the tail end to cultivators is by direct discharge from distributaries through masonry outlets, or through village channels supplied through such outlets.

**QUESTION 9. (a) (i)** Improvement of soil by flooding and flushing is possible in many low lying areas in Bengal and it is worthwhile investigating schemes which will permit of this being done as soon as the requisite staff is available. In the Province of Bengal a contour map has not yet been made available.

**QUESTION 10. (c)** Deforestation should not be undertaken in the Terai as also in the plateaus near the source of the hill streams. They should be maintained as river flood retarding agencies, as also for a better supply in the rivers during the dry season.

Deforestation should not be undertaken along the areas on the sea face in Bengal. A belt of at least ten miles should be maintained to prevent the occasional but very destructive sea waves approaching inland with fury.

For protection against damage from floods, I would advocate afforestation of areas at sources of rivers and also the flood and flush (bonifrazione) projects in the areas where the conditions are now such that left to itself the river will spill over its banks even in moderate floods. This system may now be adopted in a very large area in the Midnapore as also some areas in the Burdwan and Hooghly districts.

**R. A. N. Das.**

Oral Evidence

18815. *The Chairman* : Rai Bahadur Das, you are Chief Engineer and Secretary to the Government of Bengal in the Irrigation Department ?—Yes.

18816. You have provided the Commission with a reply to those questions in our Questionnaire which touch the work of your department and may I assume that you are also familiar with the note on well irrigation which has been in the hands of the Commission for some months ? Have you seen that ? It is a memorandum\* prepared by the Director of Agriculture, I understand ?—No, I have not seen that.

18817. Do you wish at this stage to make any statement of a general character or shall I proceed to ask you one or two questions ?—I have got no statement to make.

18818. I should like to ask you whether you think there is sufficient touch between your department and the Department of Agriculture ?—Yes.

18819. Would you agree that no irrigation problem is without its agricultural problem, and that it is most important that the two departments should be in sympathetic and active touch and should interchange opinions ?—That should be the case. I think they are already in touch.

18820. Are you also in touch with the Forest Department ?—No.

18821. The Forest Department, in so far as that is the department in whose hands would lie the duty of re-foresting areas, may play a very important part in matters touching your department ?—Yes.

18822. And yet you are not in touch with them ?—Occasionally references are made, when necessary.

18823. I rather gather that the problems of denudation, erosion and of the sweeping down of large masses of soil, very often to the detriment of land lower down, are a very real difficulty in this Presidency ?—Yes.

18824. Is it your view that there might be some advantage if there was closer touch between the Forest Department and the Irrigation Department in these matters ?—Yes.

18825. Do you think that would be desirable ?—Yes.

18826. So far the Commission has been presented with irrigation problems very different from that which you have, if I understand you aright, to deal with in this Presidency. Here there is no question of the storage of water on a large scale, is there ?—Not in the bulk of the areas of the Province.

18827. Do you classify your schemes at all ? You talk about productive and unproductive schemes and major and minor schemes. What is your classification ?—This productive and unproductive classification is laid down by the Government of India. When the schemes pay a certain amount of interest after the tenth year of initiation, they are classed as productive.

18828. What is the percentage ? Is it 6 per cent. after the tenth year ?—The percentage is varied from time to time according to the rates of the loan. At the present moment it is 6 per cent. I think.

18829. So that any scheme which pays interest after the tenth year at the rate of 6 per cent. or over is a productive scheme ?—Yes.

18830. And all other schemes are unproductive ?—Yes.

18831. Have you any productive schemes in this Presidency ?—There is none existing. As a matter of fact one scheme has been sanctioned on which work has been started this year.

18832. What is the title of that scheme ?—It is called the Damodar Canal Project. It has only just been started this year. The railway siding to the proposed headworks is being constructed and arrangements have been made for staff quarters. The scheme started only very recently.

18833. What is the essential feature of the scheme that you have mentioned ? Is it an Anicut scheme ?—Yes, across the river Damodar. The cost is estimated at about 78 lakhs and the irrigable area is about 125,000 acres *kharif*. I can furnish you with exact figures if you wish later on.

18834. Is that the only productive scheme that you have in mind ?—Yes, that is the only productive scheme.

18835. All other schemes will be, technically speaking, unproductive ?—Yes.

\* Not reprinted.

R. B. A. N. Das.

MO x 13-6a

18836 It does not mean that they would not be of great advantage to the people of the Presidency?—They are an advantage in a way.

18837 I do not wish to take you into the technical or engineering details of irrigation in this Presidency because I am not competent to do so nor do I think that that particular aspect is within the purview of this Commission. But perhaps you would wish to tell us whether you have any projects in mind which are likely to materialise in the near future?—We have a few minor schemes. There is one on which we are going to address the Government of India immediately. It is a small river scheme, the river is a very small one. The cost would be about 5 lakhs of rupees. It is situated in the Birbhum district.

18838 You have no unproductive schemes on which work is actually being carried on?—We have got now two unproductive irrigation schemes.

18839 But they are completed?—Yes.

18840 So you are not actually at work on any unproductive scheme?—No.

18841 Then you have these other schemes, one of which you think is likely to be taken up. Are you aiming at any broad general policy? Are you concerned to irrigate an important area of the Presidency which is not at present irrigated?—Not at present I am afraid the staff that we have at present in Bengal is not enough to investigate schemes. We have only two circles of superintendence and about six executive divisions, out of which one is more or less concerned with the work of the dredging plant. So we have five executive divisions which are engaged with the urgent needs of the Province, mostly concerned with drainage. That is a very serious problem in Bengal.

18842 Am I right in thinking that these deltaic irrigation schemes require a great deal of preparatory survey and consideration before they can be co-ordinated and linked up into one whole?—I do not think they require more than the usual schemes.

18843 I gather from these memoranda that the tendency of the deltaic rivers at this stage of their journey to the sea is to attempt to change their courses and for that reason the problem is both complicated and liable to develop in unexpected directions from time to time. Is that not the case?—In that way it is, but it is not more difficult than in places like the Indus valley.

18844 The technical difficulties are known and are not greater than in the ordinary perennial canal irrigation?—That is so.

18845 Does it appear to you that the fact that the problem here is in some degree a changing one suggests the need for some Standing Commissions or Committees, each concerned with one district of the country to which irrigation and hydrostatic problems in general apply?—I do not suppose they will be able to do anything unless they are in possession of the data, and the initial thing that is wanted most is the collection of the data. As I have said somewhere, we in Bengal do not possess a contour survey of the Province. We are not in a position to initiate schemes unless we take surveys of those particular areas. I understand in other Provinces contour surveys already exist.

18846 You have not got contour surveys of the areas that might be irrigated?—No.

18847 Would you suggest an extension of your own department to carry on that work or should it be done by some other department?—I would suggest the expansion of the Irrigation Department. I think that is the only way in which the information can be collected.

18848 It is quite impossible, I take it, to formulate any general scheme of irrigation until these essential data are available?—Quite so.

18849 Is the question of clearing waterways from silt and weeds and so on in the hands of your department?—Yes.

18850 Does that make a heavy call on your staff?—Yes.

18851 You spend a good deal of money and time on clearing water-hyacinths from navigable channels?—We have not been able to do much at present. We are trying to make a beginning, which is on a very small scale; we are going to see what a small plant can do; it is in the experimental stage at present.

18852 What I am really concerned with is to discover whether the duties of clearing up these navigable channels not only consume part of the funds at your disposal but also a portion of the time of the superior staff?—They do. As far as the silt clearance question in navigable channels is concerned it is very important in Bengal.

18853 Do you have the superintending of that?—Yes.

R. B. A. N. Das.

18854. How far down the river?—We do it in the main navigable channels, what we call the declared channels. We have a Canals Act in this Presidency and certain channels which are considered important are brought under the purview of that Act by notification. Our duty at the present moment is the maintenance of those arterial means of communication which are declared under the Canals Act.

18855. Have you dredgers working under you?—Yes, we have.

18856. What is the deepest channel that you are clearing at the moment?—Our usual standard is 10 feet below low water.

18857. So that you are really clearing silt from tidal waters for large ships and at the same time you are supposed to be responsible for irrigating the cultivator's land; is that the position?—With regard to irrigation there are only very few projects already carried out: the Midnapore and Eden Canals are the only works we have now.

18858. Can you tell the Commission what the total annual maintenance charge of your budget is?—It varies from 10 to 15 lakhs for irrigation and navigation works.

18859. Can you break that up at all for our information?—For irrigation proper it is about 3 lakhs.

18860. That is, 3 lakhs out of 10 or 15 lakhs?—Irrigation is practically fixed.

18861. About 3 lakhs a year?—Yes.

18862. That includes drainage schemes, does it?—No, that is irrigation only.

18863. It does not include drainage schemes in cultivable areas?—No.

18864. Where does the remaining 7 or 12 lakhs, as the case may be, go?—That goes to maintenance of tidal rivers and channels.

18865. How much for tidal rivers? That is more or less a constant charge, I suppose?—No, that has varied a good deal according to the requirements, and not only the requirements but what funds we could get.

18866. Would you tell the Commission whether you think there is a great opening for the irrigation of cultivable lands in the Presidency of Bengal?—No, I do not think so; the incidence of rainfall here is so heavy that irrigation is looked on more as supplemental; in the Midnapur Canals irrigation in most years is adopted for taking in the silt rather than for irrigation itself.

18867. Building up the land by carrying the silt-bearing water?—It is for fertilising and they get a better outturn next year.

18868. It is more for its manurial value than for filling up hollows; is that the idea?—Yes, they get about 20 to 25 per cent. greater yield in the irrigated areas as compared with the unirrigated areas, even in a year of seasonal rainfall.

18869. You are in touch, you say, with the Agricultural Department and with the Director of Agriculture. Have you heard any of the evidence which he has given before the Royal Commission?—I only heard the evidence of Mr. Finlow for the last three or four hours.

18870. You know that Mr. Finlow attaches great importance to the growing of fodder crops as a means of improving the cattle in the Presidency, and he has told the Commission quite definitely that he associates the growing of these fodder crops with further irrigation. Are you familiar with his ideas in that direction?—No.

18871. Does not that suggest to your mind that the touch between the Director of Agriculture and yourself is not quite as complete as it might be?—It may not be absolutely complete; the present position is that whenever there is anything in one department on which another department wants technical advice, the advice is given and we collaborate together, if necessary, by meeting.

18872. Or by the familiar method of a mutual bombardment of minutes; is that the alternative? Which do you think is the most effective method of getting the work done, passing minutes or getting round a table and discussing the matter?—They both have advantages as well as disadvantages, but I think a combination of both is best.

18873. No one who has been in a department and who has any knowledge of departmental work supposes that minutes and red tape can be done without; they are essential; but, on the other hand, there is great value to be derived from a meeting round a table?—Yes, certainly.

18874. You have told the Commission you do not think there is great scope for the development of irrigation, and I shall leave it at that. So much for large irrigation scheme, what about minor schemes of irrigation carried on very often by the cultivators

R. B. A. N. Das.

themselves? I refer to the digging of small tanks and bunding of small streams where that is possible. Is there a future for that in the Presidency?—There is.

18875. And for further terracing?—Terracing and also the harnessing of small streams and tanks.

18876. So as to make the most of the drier seasons of the year. Now, although the cultivator as a rule carries on remarkably well by traditional methods, do you not think that engineering advice is very helpful to him when he is considering the carrying out of some such scheme?—Yes, and an attempt is being made in that direction, we are going to have a new executive division to tackle problems in two of the districts in which conditions are favourable for small schemes, the two districts of Bankura and Birbhum. We have put a special officer in those districts, and we have worked out certain preliminaries. As we find that is appreciated, a division is going to be formed from next year.

18877. What is the division going to be called?—It will be the Bankura Division.

18878. Are both these areas served by one expert officer?—Yes.

18879. What is the suggestion, that these projects should be financed by Government, or what?—No, these will be taken up either by co-operative societies or under the Agricultural and Sanitary Drainage Act, VI of 1929.

18880. And in every case the cultivators themselves are to bear the first charge?—Yes.

18881. In the matter of well-digging, what skilled advice or engineering assistance is there available for the cultivators in this Presidency?—In the major portion of the Province we have surface wells; in that matter they do not want advice.

18882. Do those wells give an ample supply throughout the year?—Yes.

18883. The water table being far below the surface?—The subsoil level in the cultivation season, the *khari* season, is within about 3 or 4 feet of the surface.

18884. Do you call the *khari* season the cultivation season here?—Yes.

18885. Is that the season when you most want water from wells?—No in Bengal really irrigate from the rainfall, which is ample.

18886. Is it not in the *rabi* season that you want irrigation from your wells?—In the *rabi* season the subsoil level goes down to about 20 feet.

18887. *Sir Henry Lawrence*: When does your *khari* season begin?—The *khari* season begins from the end of June to the middle of July. The crop is harvested in December.

18888. What is the *rabi* crop season?—The *rabi* season begins just after the *khari* is over.

18889. *Dr. Hyder*: It begins in December?—Yes, halfway through December.

18890. *Sir Ganga Ram*: That is not as it is shown in the glossary?—*Khari* is not the winter season crop.

18891. *The Chairman*: I am looking at the Annual Report of the Department of Agriculture, Bengal, for the year 1924-25, and at appendix 40, which is the glossary. It says "*khari* season; English name, winter season". Is that a mistake?—I believe so. *Khari* refers to the staple paddy crop which begins in July; it is what we call in Bengal the *aman* crop. It begins in July and is harvested in December. That is the *aman* paddy.

18892. *Mr. Gupta*: The winter crop is called the *khari* crop in agricultural language. Is it not the monsoon crop that you are referring to; that is the *rabi*, which is sown in June or July?—*Khari* is taken as the rainy season crop, the monsoon crop.

18893. *Rai Bahadur Banerji*: *Rabi* crop begins in Western Bengal, at any rate, by the end of October or the beginning of November, when they sow the seed of potato, wheat, barley and tobacco?—*Khari* is the crop which commences from the beginning of June and is harvested either in October or in December according to the nature of the crop.

18894. *Sir Ganga Ram*: If the crop is sown in April and May, what do you call it?

*Mr. Gupta*: That is *khari*.

18895. *Sir Ganga Ram*: Then the *khari* begins in April?

*Rai Bahadur Banerji*: Some of them do; others do not; that will depend upon the amount of moisture in the soil.

18896. *Sir Ganga Ram*: How do the Revenue papers show these things?

R. B. A. N. Das.

*Rai Bahadur Bannerji* : I cannot say that; I am just saying what is the custom in my part of the country.

18897. *The Chairman* : I think it will be best to avoid both terms and speak of months of the year. In what season, in terms of months, does the water shortage where it exists, begin? That is to say, when does the rain-water shortage begin and the need for irrigation by canal, lift or well irrigation commence?—I suppose that has to be divided into two sections. For the monsoon irrigation we have plenty of rainfall except in a few districts.

18898. Which months please, because I cannot follow?—June to October.

18899. From June to October, you have plenty?—We have plenty.

18900. In all districts?—In practically all districts.

18901. *Rai Bahadur Bannerji* : Is there shortage of water in October in Western Bengal?—That depends on the rainfall; the rainfall may not be seasonal. The October rains certainly help; the final rains are wanted for maturing the crops and fail in some cases; but ordinarily we do expect and we do get them except in some districts such as yours.

18902. *The Chairman* : Broadly speaking, at any rate, until the middle of September you are well off for water?—Yes.

18903. Your shortage begins towards the end of September or early in October, and how long does it go on?—From the end of October the rains stop absolutely.

18904. And you get no more rain until when?—Until well on to the next monsoon again in June.

18905. That is what I wanted from you. You have no intermediate period of storms here which gives you rain showers?—That is very occasional; last year was an extraordinary year in that respect. They are rare exceptions.

18906. Nothing you can rely on?—No.

18907. What proportion of the Presidency, speaking very generally, is short of water between the month of October and the breaking of the monsoon in the following June?—I would put it down at about one-fourth.

18908. Of that fourth what proportion is irrigated at the moment, if you include the irrigated section at all in your estimate?—None of that area is irrigated now. The project we are working on will take up a portion of that area. The Damodar Canal project will be in that area where they want water.

18909. Do you not think that irrigation as regards that one-fourth of the Presidency does offer very considerable advantages if it can be carried out?—Yes; but those districts in a normal year get good crops.

18910. Under a scheme of efficient irrigation, would it not be possible to take not merely the crops that you get at present but another crop of the land?—Yes.

18911. Is not that a considerable attraction to the cultivator?—Yes.

18912. Are you in touch with the Co-operative Department?—Only as far as rendering technical advice.

18913. Are they clearing silt from channels by co-operative arrangement in any districts or are you doing all that?—Clearing silt from main channels is being done by the Irrigation Department; I am not aware what the co-operative societies are doing about small schemes. In that matter they do not take the advice of the Irrigation Department.

18914. Cuts between *jheels* and that sort of thing?—No.

18915. Are you carrying out any irrigation research?—Yes.

18916. Have you any views to lay before the Commission as to the advisability of fundamental problems in research being dealt with by a Central Institute for all India?—No, I have not thought about that.

18917. Then I will not ask you about it. We are specifically debarred from considering the actual charge, but will you explain to us the methods of charging for water in this Presidency? Take first your productive schemes; how do you charge for water?—In productive schemes we charge for the area irrigated.

18918. On the acreage basis?—Yes.

R. B. A. N. Das.

18019. For water taken?—Yes; on the acreage irrigated.

18020. But you see the difference. You may either charge for water taken according to the acreage of crop irrigated, or, as an alternative method, attach a definite charge per acre to the land commanded, to be paid whether the water is taken or not. Are you familiar with the latter arrangement in this Presidency?—Yes; we assess on the area leased.

18021. Have you experimented with the volumetric system of charge at all?—No.

18022. Have you thought about it at all?—As far as that is concerned our supply is regulated through pipe outlets which correspond to a certain discharge for each area, and that is calculated at 80 acres to the cubic foot per second.

18023. In the matter of hygiene, are you in touch with the Public Health Officers of the Presidency?—Yes, we are, as in the case of agriculture.

18024. Mostly, I suppose, on the problem of malaria in its relation to irrigation?—Yes. Whenever there is any scheme we send it to the Public Health Department for their opinion before we come to a final conclusion.

18025. It is held by many persons that the attempt to prevent by artificial means the natural tendency of river in the delta to change their courses has, on the whole, been disadvantageous from the cultivator's point of view. Do you agree with that contention?—Yes, I agree with that view and we find that to our cost. We have got embankment systems and now in some cases the beds of the rivers have risen to the level of the land.

18026. So much for the theory. Is it really practical politics to consider the possibility of removing these obstructions that have been placed by the hand of man between the river and its natural tendency to wander about across the plains?—I suppose we could do it in some places. The question of cost has not been worked out, but I believe some of the circuit embankments could be removed, particularly in the Midnapur district.

18027. How about the danger of flooding villages, railway embankments and other works of that nature which have been constructed since the rivers were dammed?—There are small circuits which it would be best to take over at once and we must remove the existing habitations from there and go in for rapid bonification of the area. I would rather go in for rapid silting up than have these occasional spills. As I have said, in some cases the bed of the river is higher than the land level and the river is being held between the embankments.

18028. Gradually raised?—Gradually raised. Of course, it has become impossible to hold the river within embankments and the embankments breach very frequently in high floods; but the effect of those high floods spilling over the land is not much; the deposit of silt is very little.

18029. Perhaps you get the higher sections of the water which do not carry as much silt as the deeper sections; is that the point?—No; the bulk of the discharge is carried by the river down below.

18030. When a river is carrying silt, is there just as much silt in the upper six inches of water as there is in the lower six inches of water, is there not?—Yes.

18031. So that it is really a question of the size of the breach?—Yes, but if we could remove the embankments and let the whole place be evenly flooded, the land would be reclaimed very fast, and after reclamation it could be sold at a higher value. Probably it would be a good financial proposition.

18032. Is a scheme of that sort within the limits of what you could do with your present departmental strength?—I believe we could make a start in small areas, in the Midnapur district for instance.

18033. Have you ever placed any such projects before Government?—No, not at present; they have not been worked out yet.

18034. There are no schemes in your office of that sort?—No.

18035. Have you water-logging problems in the Presidency?—Yes.

18036. Are you carrying out any investigations or research?—Yes.

18037. Where?—In most of the districts we are investigating the causes of water-logging.

18038. You mean physically or chemically or how?—It is physical only.

18039. With a view to drainage?—Yes.

R. B. A. N. Das.

18940. Has there been deterioration of the soil as the result of water-logging?—Yes, many areas have been thrown out of cultivation owing to water-logging.

18941. But when you remove the water or lower the water table by drainage, do these areas recover their fertility or are they permanently damaged?—They recover.

18942. *Professor Ganguly*: Could you give us some idea of the total area water-logged in this Presidency?—I put it down at about one-tenth of the area. But probably half the area that is water-logged does not require drainage, for after the monsoon is over, the river levels go down and they drain out themselves.

18943. *Sir Ganga Ram*: First of all, I want to refer to the answer you gave to the Chairman, that you have no contour surveys. Have you applied to the Survey Department?—It is a question of funds; the Survey Department do not undertake to do this work.

18944. Have they not got them? Have you applied to them?—They have not got them.

18945. Are you quite sure?—Yes.

18946. In all other Provinces they have a contour survey?—I know that.

18947. In Bengal they have left it out?—Yes.

18948. That is the point. Really Bengal is the Province which most wants it, but Bengal has not got it. Are you aware of the hydro-electric scheme?—Yes.

18949. Where did they get their contours from?—They have only the result of the running levels.

18950. What do you mean by running levels?—They have two lines of trunk routes.

18951. They have contours only 50 apart?—They have not got it in Bengal.

18952. I mean the hydro-electric people; they have got a survey?—They must have got it out only for the local areas.

18953. What do you call a water-logged area; up to what level should the water rise before you would call an area water-logged, four feet, five feet, or what? What is the definition?—I put down an area as water-logged if it is filled up with water before the area can be reaped and the water level goes up so fast that the crop cannot keep pace with it.

18954. That is no answer to my question. By how many feet should the water rise before you would call it water-logged?

18955. *The Chairman*: Within how many feet of the surface?—Anywhere between two and ten feet.

18956. *Sir Ganga Ram*: Is your water-logging due to rainfall or due to your canals?—It is due to rainfall, it has nothing to do with our canals.

18957. Does that water-logging cause capillary action and bring salt up?—We have not got that trouble.

18958. Then, how does the water-logging injure you?—They cannot put in the crops.

*The Chairman*: The witness has stated that there is no permanent damage; as soon as the water level is lowered, they can cultivate.

18959. *Sir Ganga Ram*: Are you aware of the fact that in the Punjab we have considerable water-logging due to canals? What we have to do is to pump out the water and put it in the canal. Are you aware of that?—I have heard about it.

18960. Cannot something of that kind be done by having a canal at a higher level and pumping up the water into the canal?—It would be expensive and financially unsound here.

18961. But you have not calculated it yet?—We have made a calculation for one or two areas, and we have found that it is not financially sound. But there is one area in Sahang where it can be done.

18962. Supposing a man's land is a little higher than the river or canal, or whatever it is, do you pump the water up by lift irrigation?—No.

18963. Has nobody attempted it?—The cultivator on his own initiative has done it.

18964. Have many cultivators done it?—Yes. A good deal of lift irrigation is done from the rivers in the Budwan district particularly, but only by small lifts.

18965. You told the Chairman that the rains stop in October?—Yes.

R. B. A. N. Das.

18906. There are three important crops of paddy. It is stated that the *aman* or the winter paddy is harvested from mid-November to the end of February. It is the most important crop, because 16 million acres are under it. How do you irrigate it?—The final irrigation is over by October.

18907. You say *aman* paddy is sown in mid-June and is harvested at the end of February. Do you say that you do not give any water to that paddy?—None.

18908. Does this *aman* crop grow without water?—Yes, it matures. The final watering is about the middle or end of October. There is a break in the rains during the *Puga* time in September; after that they have the *muga*, when they get the soil absolutely dry; then they have the final watering in October; and there is no further watering.

18909. And that water lasts for six months? I thought paddy was a three months crop?—All that crop is removed by December or early January. It may be harvested from December to January; just now all the paddy crops have ripened, but they have not been out. February is late; generally they finish by January.

18970. *Sir Henry Lawrence* When is *aman* rice sown?—*Aman* is sown about June or July according to the rainfall.

18971. They begin to cut it from mid November?—Yes.

18972. *Sir Ganga Rain* Have you any navigable tidal channels?—Yes.

18973. Do they pay?—We have the Calcutta Eastern Canals. They do not pay interest. I have got the figures, and I can give them to you.

18974. I only wanted to know whether you had them. At one time, I know, Irrigation Engineers had a mania for navigation canals. They do not pay, and are now being given up everywhere. They have only ordinary canals now?—They may not pay directly.

18975. After the advent of the railways and other means of locomotion, it is found that navigation canals do not pay?—There may not be any direct financial result, but the ultimate result is beneficial.

18976. What do you mean by ultimate?—I refer to the growth of trade owing to the facility of navigation.

18977. Would trade suffer if navigation were stopped?—Yes.

18978. Do you mean that in those districts there are no railways?—There are railways but they are expensive. The tidal canals are a very cheap method of transport.

18979. Do you suffer sometimes from floods?—Very often.

18980. Have you read my article in *Indian Engineering*, "Floods: their Root Cause and Remedy"?—No.

18981. Do you not read *Indian Engineering*?—I had no occasion to read your article. I have read Mr. Garta's papers. It may be that I was on leave at that time.

18982. You have not taken up hydro-electric schemes here?—No.

18983. None of those recommended by the Meares Committee?—I do not think so. Hydro-electric schemes are dealt with by the Commerce Department.

18984. Not by your department?—No.

18985. Are you in charge of buildings and roads as well?—No.

18986. You are in charge only of irrigation?—Yes.

18987. You have irrigation of only one million acres?—I am in charge of irrigation, navigation and drainage. Irrigation is a very small part of the present problem in Bengal.

18988. What is the annual maintenance budget for your department? Twelve lakhs?—In the neighbourhood of twelve lakhs for irrigation and navigation.

18989. What percentage does your establishment cost you for work done?—The establishment charge is now somewhere in the neighbourhood of 20 per cent.

18990. Only 20 per cent.?—In the neighbourhood of 20 per cent.

18991. On finished canals?—Twenty per cent. of the expenditure on maintenance.

18992. Not expenditure on finished works?—Expenditure on all works.

18993. Tanks are not in your charge?—No, there are no tanks in my charge.

18994. You said that there was a scheme costing 5 lakhs which you have referred to the Government of India?—We are going to refer it.

R. B. A. N. Das.

18995. Is it not within the powers of the Local Government to sanction works up to 50 lakhs?—Yes but we want to finance it from loan funds, and not from provincial revenues. That is why we are going to refer it to the Government of India.

18996. For permission to raise a loan?—Yes.

18997. You told the Commission that silt was the same at the top as at the bottom. I thought silt would be much more at the bottom than at the top?—That is so; there will be more silt at the bottom.

18998. Therefore if you made regular outlets in the banks you would take the bottom water and clear it of silt?—Yes. There is not much difference between the top and the bottom in the small rivers I am speaking of, however.

18999. Are your canals new? Have you adopted Mr. Kennedy's system of non-silt velocity?—We have not any new canals.

19000. Do you not remodel the canals to get that velocity?—No, we have not done so.

19001. What is the velocity in your canals?—1·5, 1·6, 1·7.

19002. Is it because they are navigable?—Yes.

19003. Is that the reason why you have to keep the velocity very low?—We can increase the velocity, but I think the re-grading would cost a great deal and it is not worth it.

19004. What I mean to say is, 1·5 is not the proper velocity; non-silt velocity is very much more. You know Mr. Kennedy's formula. You are obliged to keep the velocity so low on account of navigation; you cannot raise your velocity, therefore, to the proper non silt velocity. Is that so?—That is so.

19005. That is the reason why silt is accumulating?—We have one proposal to have an escape in the first reach of the canal, that is in the Midnapore canal.

19006. You say you supply tail water by masonry outlets. Have you not studied the design we have finally reached in the Punjab? With varying heads we supply the same water?—I do not think that we could adopt it here for sometime.

19007. Do you know the design?—Yes.

19008. Have you got a copy?—I have seen the model.

19009. What is the objection to your adopting it?—I cannot say; our present design has worked fairly well.

19010. How long have you been officiating Chief Engineer in charge of Irrigation?—Six months.

19011. Who was in charge before?—Mr. Addams Williams.

19012. Are you permanent now?—No; he has gone on leave, and I am acting for him.

19013. You must have heard the previous witness, Mr. Finlow, saying that the lowest figure for land which is not cultivated on account of lack of irrigation and failure of rainfall is 10 million acres?—Yes.

19014. Have you thought of any schemes for that?—No.

19015. Have you studied the Irrigation Commission's Report of 1901-03?—Yes, I have read it.

19016. They have recommended many works for that purpose?—They recommended certain schemes for Bengal as then constituted, and you will probably find that all those schemes fall in Bihar and Orissa.

19017. They have all gone to that side?—Yes.

19018. None of them relates to your Province?—None.

19019. How do you propose to irrigate these 10 million acres? You do not feel the necessity for it?—As I have said, the staff in the Irrigation branch is now quite busy with maintenance work, and we have not had time to collect data for fresh irrigation projects but it is very desirable that an investigation should be made.

19020. What is your system of making your irrigation charges? How much is it per acre?—In the Midnapore canal, for long leases, it is Rs. 3 per acre.

19021. For paddy?—Yes, for paddy.

19022. How much is it for sugarcane?—We have very little sugarcane.

19023. And how much is it for other crops? You can give me the figures later on. What is your principle of giving water? Do you give them a measured quantity of water?

R. B. A. N. Das.

Supposing a man had 1,000 acres of land, how much water would you give? Any amount that he would like to use?—We leave the outlet open to an extent which would let him have the quantity corresponding to 80 acres to the cubic foot.

10024. Your duty is to 80 acres?—Yes.

10025. Whether *rabi* or *khari*?—That is for the *khari*; for the *rabi* we have to give him any water he wants.

10026. If you have any?—Yes.

10027. Do you collect the charges or do you ask the Revenue Department to charge a consolidated rate?—We have a special officer collecting the irrigation cess.

10028. Who makes out the bill?—That special officer.

10029. It is your department that makes it?—We give him the certificate of area irrigated, he makes out the bill and collects it.

10030. Under the heading of Land Revenue which is shown in the budget, are your irrigation profits also shown?—I do not think so; irrigation receipts come to irrigation proper.

10031. In your protective works are you credited with the indirect charges of the enhancement of settlement?—We have no protective works.

10032. All your works are unproductive?—They are unproductive, but not protective.

10033. What is the difference?—They have been classed as unproductive because they are unproductive.

10034. Is the Revenue Department giving you any credit for the enhancement that they get due to the water?—No.

10035. You have no such system as that of indirect charges?—No.

10036. With regard to the ordinary surface wells, how far does the surface water go?—About 15 to 20 feet.

10037. How do they draw it up; by bullocks?—They usually use the *lata*.

10038. A *lata* is a beam?—Yes.

10039. How many acres does one well command?—They have not done it systematically; it is merely supplemental.

10040. For how many acres is one well sufficient?—We have no information on the point.

10041. Can you tell me the discharge per hour, how many gallons for each well?—I cannot say.

10042. The Chairman: You have nothing to do with wells at all, have you?—No.

10043. Sir Thomas Middleton: You told the Chairman that your annual maintenance budget for irrigation was about 3 lakhs?—For irrigation only.

10044. What is the annual maintenance budget for navigation?—Between 0 and 10 lakhs.

10045. Have you under your department any canals which are navigation canals only?—Yes, the Calcutta canals are an example. The tidal rivers of course are maintained as navigable channels.

10046. Have you any canals which are of value both for drainage and navigation purposes?—The Calcutta canals serve for drainage purposes to a certain extent.

10047. And navigation purposes?—Yes.

10048. In the answer which you gave to the Chairman that 3 lakhs was the amount apportioned in the budget for irrigation, did you allow any value on the benefit which you got for irrigation purposes from these navigable canals, which cost you about 9 lakhs? You told us, I think, that under navigation you spent 9 lakhs?—Yes.

10049. And on irrigation 3 lakhs?—Yes.

10050. Does the figure of 9 lakhs include any sum which can be debited to irrigation?—No.

10051. You have apportioned the figures 9 and 3?—That is roughly. It is perhaps the other way and a portion of the 3 lakhs ought probably to be apportioned to navigation.

10052. Dr. Hyde: What is your total outlay on all the canals for all purposes?—It varies from 10 to 15 lakhs.

R. B. A. N. Das.

19053. And the total amount of public money sunk in their construction and maintenance runs into crores?—The Midnapore canal is somewhere about 80 lakhs, the Madaripur Bhalouta about 72 lakhs, the Calcutta and Eastern Canals about 85 lakhs.

19054. What is the return?—The return is 1 per cent. odd, taking the total.

19055. *Mr. Gupta* : Would it be correct to say that the main duty of your department up to now has been to look after communications open to navigation?—No, I do not think so.

19056. In your report about two years ago, is it not definitely stated that the keeping up of the communications is the only important work of this department? It was probably not in your time; if you look up your report for the year before last, you will see that it is stated there that the keeping up of communications is the main function of this department. Anyhow, from the figures that you yourself quote, namely, that 9 lakhs is spent on keeping up communications and only 3 lakhs on irrigation, it is obvious that the major portion of the money available to your department is spent on keeping up communications?—Yes.

19057. For how long have you been spending 3 lakhs on irrigation?—For some years; the expenditure is mostly on the Midnapore canal maintenance.

19058. Have you done any new irrigation canals since the construction of the Midnapore canal?—The Eden canal is the only other work.

19059. When was that constructed?—I think it was constructed in Sir Ashley Eden's time.

19060. Besides these two, no money is spent on any irrigation canals; so that, when you say that Rs. 3 lakhs is appropriated for that purpose, it means that it is spent in keeping up these two canals?—Yes, on maintenance.

19061. In answer to a question by the Chairman, you said that schemes were classified as productive and unproductive, and the only productive scheme was the Midnapore canal?—No.

19062. Which is the productive one?—We have no productive canals.

19063. My object in asking you that question is that that is only a technical term; you will not describe these minor schemes which are going to be taken up and for which you have opened up one Division in Bankura, as unproductive schemes, except in the technical and the interest-bearing sense adopted by the Government of India?—That is so.

19064. In a general sense, you would not call them unproductive?—No.

19065. Did I understand you correctly to say that there was not much scope for irrigation in Bengal? Do you mean to say that?—Not in the major portion of Bengal.

19066. But in Western Bengal?—In Western Bengal there is scope.

19067. In the whole of Western Bengal is it not a crying problem, in the district of Bankura for instance?—Yes.

19068. In Central Bengal, perhaps, the question of drainage is very important?—That is so.

19069. Referring to Act VI, to which you have referred, you know there has been considerable difficulty in working that Act?—Yes.

19070. But you are aware that that Act was formulated to simplify the process in the previous Acts, namely, the Sanitary Drainage Act and the Bengal Embankment Act, and this Act was made purposely to simplify the process further. I suppose the idea that you have is that the delay is due to consulting the different departments. I was going to ask you if it has simplified the process. As you know, there are three departments which we consulted, namely, the Agricultural Department, your department and the Sanitary Department and the question is now before the Government to simplify it still further. Would you agree with me that minor schemes in a district, such as tanks, cutting small channels and so forth, might be made over to the Collectors and to the District Boards entirely, so that they might deal with them, making a reference to your department or to the Department of Agriculture as occasion might warrant? Are you in favour of that scheme?—I would certainly be in favour of that scheme, but the delay is due mostly to the procedure for allocation of cost. The time taken in obtaining the opinion of the Health Department or the Agricultural Department or the Irrigation Department is not much. The delay does not lie there; that is my idea.

R. B. A. N. Das.

19071. Do you mean the preliminary cost of making the scheme or apportioning the cost after the scheme has been executed?—Both the preliminary cost and the apportionment after the work is executed. The opinions of the local people interested have got to be taken and the procedure laid down appears to be simple but it is not so. It does take time.

19072. A scheme sometimes looks very feasible but after expert examination it is often found down. If you require the people to pay the preliminary cost, it is rather hard on them to find that their money is all gone. If local bodies do not have the money, do you not think it would give an impetus to get such schemes brought under the Act? Do you not think it would be better if the Government or the District Boards or the Union Board, advanced the preliminary cost?—That would be better, but the difficulty is that people would not like a bonus to be thrust on them. The people may ultimately say that they do not want a scheme which the Collector says that should be investigated.

19073. Quite so. But they are chary of paying the cost of the preliminary survey because they do not know whether the particular scheme is going to be of any use or not. It is by you or the Agricultural Department or the Sanitary Department. They are not at all about the future of the scheme. At this stage, do you not think, if Government wanted this Act to be more largely used, it would be a great advantage if the preliminary cost were paid either by the Government or by local bodies or by both jointly?—Yes, suggestion is that the preliminary cost should be borne by Government and that it should not be borne by the parties concerned?

19074. Yes?—There is one objection to that. What I have found in many cases is that, although there is a real need, the people do not pay it because they do not know for it. The result of any suggestion from them would be that they probably want to spend money on investigating schemes which are not obviously necessary.

19075. Of course you might require the Collector's sanction and a Collector will not be in a hurry to send up schemes to Government for expert examination which he did not, from a layman's point of view, consider to be sound. Otherwise, do you not think that there will be this great difficulty, that people will not come forward to pay money for those schemes because they do not know whether the schemes are going to go through or not?—It would be a good thing to encourage them. But I would rather suggest that Government should pay a part and not the whole of the cost.

19076. In answer to the Chairman, you said that the cost was paid by the people only. You know, of course, that under section 18 of the Act, the cost is to be apportioned between the Government and the local bodies and the parties concerned. You do not mean to say that the Government is not to pay any portion of the cost of all voluntary Government pay voluntary contributions.

19077. It is not voluntary, because under the provisions of sub-clause (1) of section 18 the Collector can apportion the cost between the parties. For instance, in the case of the Gangakhele scheme Government is paying about 5 lakhs and the voluntary contribution is going to cost about 7 lakhs?—It is a voluntary contribution and not an apportionment under the Act as the Government share of the cost.

19078. Whatever you may like to call it, the Act provides a Government contribution and the Government is actually paying. I suppose there is nobody to compel Government. But do you not like the idea that in the case of such schemes Government should pay a portion of the cost in order to encourage the people?—Yes.

19079. The question before the Government now is how to nullify this Act, which is so beneficial in my view. The greatest encouragement that Government could give would be to pay part of the cost. Do you agree with that?—Yes.

19080. One point about this reservoir. Is there any scheme to give up the Dam for reservoir?—There was one proposal for retaining the flood.

19081. On which Mr. Glass was put on special duty?—Yes. That has been found to be unworkable as it was financially unsound.

19082. From what you have said to the Chairman you do not mean to suggest that there is not much scope for irrigation schemes or that it is not the work of the Government and therefore it should not receive the strenuous attention of Government? That is not your intention?—What I said to the Chairman was that for the bulk of the area in Bengal, irrigation was not a crying need.

19083. It depends entirely on rainfall. Can you be absolutely certain of the rainfall in any part of Bengal?—If it is certain anywhere, it is in Bengal.

R. B. A. N. Das,

19084. Is it not a fact that every three or four years there is either unseasonal rainfall or a shortage?—That is so.

19085. And if we had irrigation facilities, either large schemes or small tanks or wells, we would save about 30 per cent. of the crops. For instance, for want of one shower, do not you lose about 6 annas on the crop? Does not that happen very frequently?—That is so.

19086. *The Raja of Parlakimedi*: You say that the department is short of staff. May I know to what extent your department has suffered in retrenchment?—We have suffered in that we had a scheme of expansion sanctioned but we could not give effect to it. The Government of India sanctioned almost the doubling of the existing cadre, but we have not been able to give effect to it owing to lack of funds.

19087. May I know what your departmental strength was before the retrenchment was effected?—The retrenchment has not affected us in the least. It was only to the future that I was referring.

19088. Can you give an idea of the programme of your investigations with regard to irrigation works during the past years?—We have of recent years only had the investigations regarding the Damodar canal project which has matured. We have also got some of these minor schemes under investigation. I think we now have these investigations carried out in three districts, Midnapore, Bankura and Birbhum and about 100 other schemes are being investigated.

19089. Do you go in more for productive schemes or schemes that are more beneficial to the ryot as a whole?—Owing to the stringent financial conditions in Bengal, I do not think any scheme for the mere improvement of the ryot would be voted funds by the Council. We have not got money to spare from provincial revenues. If we have a productive work then we can have the money advanced from loans. That is why we can now push on with productive work in preference to works of public utility.

19090. Your work is entirely confined to productive schemes?—At the present moment, yes.

19091. Under what heads do you want to increase your staff?—My idea is that we should have a staff to collect data so that we would be in a position to indicate schemes of drainage, irrigation and such like things satisfactorily.

19092. Has any specific proposal for departmental changes or increase in any direction been made?—There is a proposal for increasing the staff by about 100 per cent. It has been sanctioned by the Secretary of State but it cannot be given effect to owing to lack of funds.

19093. What extra expenditure will that involve on the department?—I cannot say off-hand but I think it would be about three lakhs per annum.

19094. What is the actual impediment in the way of having more tank irrigation schemes?—We have not yet dealt with tank irrigation in the Irrigation branch. As the rainfall here is quite sufficient, we have not investigated any of these tank irrigation projects. It is not a crying need and, as Mr. Finlow said, the small schemes dealing with existing tanks are being proceeded with.

19095. Take, for instance, the irrigation of *rabi* crops. Would it not be better if you had tank irrigation for these crops?—Yes.

19096. So it would be useful if you had more tanks in Bengal?—Yes.

19097. *Sir James MacKenna*: I think you said you had some dredgers?—Yes.

19098. How many have you?—We have got three suction dredgers of the bigger type, 42 ins. and one smaller one, 20 ins.

19099. What are they being used for?—Two of them are laid up at the present moment. One was brought out for a proposed work, the Grand Trunk Canal, which was not eventually sanctioned; so that that dredger is lying idle. The second dredger is also lying idle at the present moment because we have not got funds to work it.

19100. Have these dredgers functioned before this, or have they always been laid up? Have they worked at all since they were bought?—They have worked.

19101. What do they do with the spill material?—They are all suction dredgers, and the spill material, the sludge, is laid on the land alongside, on the banks of the channels that are dredged.

19102. Has any scheme been considered for utilising this dredged material for the purpose of raising the level of villages or towns along the banks of creeks?—No, not from

R. B. A. N. Das.

that point of view, but in certain areas where we have done the dredging raised lands are being sold and they will be very suitable for village sites.

19103. I ask the question because a great amount of work of that kind has been done in the delta of lower Burma. The malodorous tracts have been improved by raising the level. Is your system of embankments double or single?—Single.

19104. That means that the one side takes the whole spill?—No, I mean double.

19105. Both sides?—Yes, I thought you referred to the double embankment system which we have on the Gaudak river; there on each bank we have two.

19106. I mean that each side of the river is banked?—Here we have both banks except in certain places.

19107. The system of double embankment has a very deleterious effect on the mouth of the river?—Yes.

19108. So that any double embanking system is very carefully watched by the Port authority as affecting the Hooghly?—Yes.

19109. I take it the general drift of your evidence is that Bengal agriculture depends a great deal more upon a beneficent Providence than on the skill of man as represented by irrigation engineers?—Yes.

19110. *Professor Ganguly*. In recent years you have had a number of co-operative irrigation societies in this Presidency. What are your relations with those societies?—Morely giving technical advice with regard to schemes which are considered as important.

19111. When they draw up a scheme they ask your technical advice?—Yes, or when they propose to do something to a certain area, even when they have not got a scheme, they ask us to draw up the scheme.

19112. And these co-operative societies pay for such advice?—No, in practically all these cases we have remitted the establishment charges.

19113. Is your technical adviser responsible for such schemes in any way?—No. How can he be made responsible in that respect? I mean to say an employer employing an expert adviser can merely get what he can from him; the technical adviser is not responsible for the scheme.

19114. Perhaps I should make my point clear. Supposing a co-operative society undertakes a scheme following your technical advice and that scheme fails, are you not responsible to the co-operative society for that failure?—No, I do not hold that view; Government has got some expert services and those services should be made available for what they are worth. I do not think Government can be made responsible for failure to give ideal advice.

19115. Suppose a co-operative society undertook a definite scheme, acting on your advice; in the event of the failure of that scheme, whom would the co-operative society hold responsible?—Anybody doing the work will have to take the risk himself.

19116. You have in this Presidency the Bengal Drainage Act of the year 1880, the Bengal Sanitary Drainage Act of 1895, and, in order to simplify those two Acts, you have the Agricultural and Sanitary Improvements Act of 1920. Could you tell the Commission the total area reclaimed by drainage through the operation of these Acts?—The only work done under the Sanitary Drainage Act is the Magra Khal drainage, which is about 600 square miles.

19117. That is all?—That is all.

19118. So that these Acts are there but they do not function?—No.

19119. When you have any drainage scheme, do you consult the Public Health Department?—Yes.

19120. Do you often meet the Forest Department?—No, the Forest Department we do not meet. The attention of the Irrigation Department with the staff which it has at its disposal has been concentrated on the more important areas near about Calcutta; we have not really tackled problems where the forest question also comes in.

19121. You will agree with me that forests have a great deal to do with your problem?—Yes.

19122. And therefore in this note you have given me you have something to say about afforestation?—Yes.

R. B. A. N. Das,

19123. That is why I ask whether at any time you sit round the table and discuss these matters with the forest officers of the Presidency?—I cannot say; it is quite possible that they may have met.

19124. *Rai Bahadur Bannerjee* : You said in reply to a question put by the Chairman that the people wanted irrigation for silt more than for water for the crops. When you gave that reply, what part of the Presidency had you in mind?—Midnapore canal. In fact, that is practically the only irrigation work I have, so that I had that in view.

19125. But supposing in the month of October when they have no rainfall and for want of a single shower perhaps they will lose one-quarter of the outturn of their crop, Midnapore being one of the high level districts of Bengal, will not the people of Midnapore care to take the water from the canal for the benefit of the crop, rather for the sake of water than of silt?—Not only do they care to, but they are supplied. That is why they pay; but what I am referring to is the fact that they value silt most.

19126. You have an Irrigation Act by which you can take up irrigation schemes which have to be provided for from your loan fund. Is that always essential; may it not be provided for from the provincial fund if available?—It can be met from provincial funds. The Irrigation Act does not touch the question of finance at all; it is an Act to legalise the use of canal water and gives the canal officers power to levy water rates and so on.

19127. Cannot the Government of Bengal, if they care, supply more funds from the provincial revenues than they have been doing up till now for the benefit of the irrigation of Bengal or parts of Bengal?—I cannot say; it is really a question of finance.

19128. You must have travelled a good deal through the districts of Burdwan and the Presidency Division, and in the course of your tour you must have come across the innumerable tanks and ponds in the fields where they grow paddy, most of which have silted up. You are certainly aware of the fact that during the last six or seven years co-operative irrigation societies have been formed which have been raising capital from the neighbouring central bank or rural co-operative bank, and the excavation of these tanks is going on. Is not that a very fruitful source of irrigation for these paddy fields?—That is a fruitful source of irrigation no doubt, but I think the abandonment of these tanks is due largely to the improved method of transportation. Formerly each unit in a district used to live on their own product; they had to depend on their own product; but now an area which ordinarily gets good rainfall can save on three years good crops; they can keep the product of the fourth year for sale; since they can get whatever they want in a famine year in that area by quick transport, they do not store any grain, and they do not take the trouble to grow their own crops by any little protective works like these tanks.

19129. Well, whether there is sufficient means of transport for the alternative crop or not, is it not a fact that if these tanks and ponds were re-excavated they would supply to a very great extent water for the irrigation of these paddy fields?—Yes.

19130. As matters stand now in the Province, there is no system of irrigation by tube wells?—No.

19131. But cannot that be conveniently introduced into the country?—Yes; research work in that direction should be done, I think.

19132. *Sir Henry Lawrence* : Did you say you were in favour of the re-excavation of tanks?—Yes.

19133. Is that a better system than raising the embankments?—The loss by seepage would be more if the embankment were raised than if the silt were cleared leaving only a puddle line. I think the raising of the embankment leads to great loss of water by percolation.

19134. *Sir Ganga Ram* : Would you excavate by manual labour?—Yes; the silt is cleared by manual labour.

(The witness withdrew.)

**Mr. P. J. KERR, M.R.C.V.S., I.V.S., Veterinary Adviser  
to the Government of Bengal**

**Replies to the Questionnaire**

**QUESTION 1.—RESEARCH.—(a) Veterinary Research.—**

Expand the Imperial Institute of Veterinary Research, Muktesar.

Reorganise its administration.

Establish provincial research laboratories in each Province, and appoint a specialist officer trained in this work in each.

Co-ordinate the work of all these under a Senior Veterinary Officer with the Government of India.

This officer would also be the administrative officer in charge of the Institute.

**Finance.** The opening of a Veterinary Research Fund to assist Government of India and Provincial Governments in finding the money necessary for this work.

(b) In Bengal we have 1 small well equipped laboratory in the Bengal Veterinary College, but no specialist officer with European training in this work to take charge of it. There is difficulty in finding money for extension of this work.

(c) Tuberculosis, bilharzias in cattle, parasitic diseases of all animals, including hookworm in dogs. Rabies in dogs, *bersati* in horses. Rinderpest in cattle, and its treatment and cure. The above are few of the diseases which call for thorough investigation in Bengal.

For the advancement of work of control of contagious disease of animals in India I advocate the formation of a "Central Veterinary Bureau" under the Government of India with the Veterinary Adviser to the Government of India in charge.

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.—(a) and (b) The Co-operative Milk Union in Calcutta has been successful in inducing cattle owners to take a keen interest in their cattle, and so be willing to accept advice as to their improvement by better keeping, feeding, and breeding. The formation of such milk societies in all places where there is a ready market for milk or its products would be a great incentive to improved methods of animal husbandry. This was not the main object for the commencement of this Union, which was originally started in the attempt to solve the problem of a pure milk-supply for Calcutta. On this account latterly, it has received very considerable financial aid from the Corporation. My official interest in it is from the point of view of the improvement of cattle which results. The members of these milk societies have been willing to accept advice on the feeding of their cattle, the purchase of better cows and bulls, and lately have evinced a desire to have their cattle "permanently immunised" against rinderpest, at a cost of Re. 1-5 to Re. 2 per head. The societies' show at Baraset has increased in a few years from a gathering of a few heads of cattle to quite a large show, two hundred or more attended last year, and the condition and class of the cattle have greatly improved.**

I would exploit milk production in Bengal to its utmost, and where it is not possible to sell milk as such, I would like to investigate the possibility of factories for milk products.

**QUESTION 4.—ADMINISTRATION.—(a) Veterinary Administration.—**

1. Government of India can assist in this work by:—

(1) The appointment of a superior veterinary officer with the Government of India as "Veterinary Adviser."

(2) By the creation of a Central Veterinary Bureau, to advise the Government of India and local Governments on the control of contagious disease.

(3) With such central arrangement much valuable advice could be given to Provincial Governments, and veterinary advisers on all veterinary matters, education, administration and research. In the last, in particular, the work of the local research laboratories could be directed, co-ordinated, and amplified.

(c) I am not satisfied with the services at present rendered by the Veterinary Department in Bengal in regard to the cattle improvement side of agriculture. I have dealt with this in Question 15 Veterinary.

In my opinion the control of contagious disease must be under the absolute charge of the Provincial Government, and not under multiple control as at present in Bengal. Under this system Government have only advisory powers over the District Board Veterinary Assistant Surgeons.

All Provinces should voluntarily agree to work under the advisory control of the Government of India, so that this subject may be treated uniformly throughout India.

**QUESTION 15.—VETERINARY.—(a) The Civil Veterinary Department should be independent of the Agricultural Department, under its own departmental head, "The**

**Mr. P. J. Kerr.**

Veterinary Adviser to the Government of India." This officer should also be the Director of the Imperial Institute of Veterinary Research, Muktesar.

(b) (i) In Bengal the dispensaries and itinerant Veterinary Assistant Surgeons are under the control of District Boards. This system does not work well.

(b) (ii) The need for expansion is not being adequately met.

(b) (iii) I have already submitted a proposal to the Government of Bengal advocating the transfer of control of veterinary work to the Provincial Government. In brief my proposal is that the local Government should take over control of the whole of the "contagious disease staff" and all district headquarter dispensaries, other dispensaries to remain under the control of and in charge of the local authority.

I hope eventually to meet the need for clinical dispensaries by working through the Union Boards in co-operation, and get them to maintain a Veterinary Assistant Surgeon and dispensary at each *thana*. The cost of such a scheme is beyond the means of any Government, or District Board, it must be financed by the people themselves.

(c) (i) Cultivators do not make full use of existing dispensaries. The use made of them is yearly increasing, and is strongly influenced by the ability and energy of the Veterinary Assistant Surgeon in charge. It is handicapped by:—

(1) The Veterinary Assistant Surgeon being absent on tour for a number of days a month. And so being absent when people have come, may be a long distance, to consult him.

(2) Insufficient accommodation for "out," and usually none for "in-patients."

(3) Where there is in-patient accommodation, lack of an attendant to look after the animals. The owner is too poor to afford an attendant, nor can he supply food for the animal while in hospital. His home is often many miles off.

(4) Scarcity of dispensaries, animals have to be brought long distances entailing a loss of a day's labour in addition to the fatigue.

(5) Out-patients are not brought sufficiently often to get full benefit from treatment, for the above reasons.

(c) (ii) We have no touring dispensaries. Itinerant Veterinary Assistant Surgeons treat cases on their way, carrying a box of medicines with them and advising the use of drugs available in the bazar. The benefit again varies according to the energy and resources of the Veterinary Assistant Surgeon. Many cases are treated thus, and some benefit results, but the cases are only seen once, and most owners are too apathetic to take the trouble to get and use the medicines prescribed; at times, also too poor to buy them.

At present treatment must involve the minimum of trouble to the owner.

#### *Suggestions to remedy this state of affairs.*

1. Stationary Veterinary Assistant Surgeon in charge of each dispensary.
2. Enlargement of dispensaries, providing accommodation for "in" and "out-patients."
3. Provision of a free attendant.
4. Feeding free, or at cost price, perhaps by means of co-operative finance.
5. Establishment of more dispensaries (one in each *thana*), again by co-operative finance.
6. Adequate supervision to keep the average Veterinary Assistant Surgeon up to his work.

#### *(b) Obstacles in dealing with contagious diseases.*

1. Delay in reporting.
2. Delay in Veterinary Assistant Surgeon visiting to diagnose disease. This is largely due to the shortage of staff. One Veterinary Assistant Surgeon has such a large area under his charge, and in many districts means of transport are slow and primitive.
3. Delay in arrival of serum after it has been wired for, due in some cases to the order having to pass through the District Board office, and to the usual delays on an Indian railway, and difficulty of transport from the nearest railway station.
4. Delay, in that owners have to be persuaded to have their animals done. Also to be persuaded to help in carrying out the work. Inoculation usually means the loss of a whole day's work to the whole of the village.
5. Shortage in the amount of serum allowed by the District Board.

Legislation presents manifold difficulties, and would need to be discussed by a committee of District and Veterinary Officers with experience of conditions all over the Province and knowledge of methods employed in other Provinces (Veterinary Adviser to the

Mr. P. J. Kerr.

Government of India). There are no means of carrying out effectively legislation re notification, segregation, disposal of carcasses, inoculation of contacts, and prohibition of movement.

An enormous increase of Police would be needed, and this enforcement would bring the inoculation of cattle into dispute, and raise opposition.

*Compulsory inoculation would tend to stop voluntary notification.*

*Proposals*

*Notification* to distribute O.H.M.S. postcards to approved persons, such as:—Sub-Divisional Officers, District Board Officers and members, Local Board Chairmen, Union Board Chairmen, Police Officers, Presidents of panchayats, and punish *Chowkidars* who fail to report disease in their area to the above. Some means of penalising the above officers should be devised if they delay or fail to send on the report.

*Segregation* is almost impossible in the district on account of the trouble and cost, and the consequent unwillingness of owners to co-operate on this account. There is added the loss of time and work of the animals (in contacts) so segregated until they are inoculated.

*Movement of animals* by rail and main road might be controlled if there are police available. But even so, the animals would go by side roads, or country boat, to avoid this.

*Methods other than legislation to improve conditions.*

(a) To have a consultation of all classes of Government officers to devise means to improve reporting. To give effect to their recommendations, and take steps to see that all concerned carry out the intention of Government in this respect. The measures adopted for veterinary diseases can also be applied to human diseases.

(b) To have a sound scheme for dealing with disease when reported, i.e., adequate money, staff, and emergency staff, arrangements for prompt supply of serum to the seat of outbreak so that our efforts to check loss may be conspicuously successful. The only cost to the owners being in time and labour, which is unavoidable. This alone will give a strong impetus to inoculation treatment for the control of contagious disease, and stimulate voluntary reporting by the owners themselves.

(c) It has been found in the case of co-operative milk societies, that once the profit to be derived from accepting Western advice and help has been demonstrated obstruction ceases and the people ask for more advice. I propose through the propaganda departments of the three departments concerned, Agriculture, Veterinary and Co-operative, to seek out every possible avenue by which cultivators can add to their income. These possibilities vary in different districts, and need to be experimented on in each district, and then demonstrated, and finally the local cultivators organised to finance them for themselves. Milk and milk products open a wide field in themselves, to these may be added poultry and eggs for which there is a large market, provided these products can be readily conveyed there at a reasonable cost. Each department should have its own propaganda staff to investigate and take charge of the branches of this work which concern it. The Veterinary Department in Bengal has no propaganda branch, on account of lack of funds.

If this department can demonstrate the value of its advice in rupees, it will be popular. I want to find ways in which the value can be quickly demonstrated so that advice on breeding and feeding will be more readily accepted, as there take years to show much appreciable benefit. For example, in the case of cattle, once the owner really values his animals he will do his utmost to find the money to have them permanently immunised from rinderpest. The milk societies are asking now to have their herds done.

The improvement of the 25 millions of cattle in Bengal cannot be achieved without the expenditure of much money by Government in the first instance and the people themselves in the second.

(e) We have so far experienced no difficulty in obtaining the serum we require, from Muktesar.

(f) Fees for inoculation.

Government do not countenance charging fees for inoculation, but nevertheless some District Boards charge fees, either to the owner direct or as a levy from Union Boards, in spite of Government protest. Government are not now in a position to insist that their wishes in this matter are carried out. This practice is a very serious handicap to inoculation. The supply of serum at the cost of provincial revenue will overcome this. This has been under Government's consideration for the last 16 months. Finance is again the difficulty, as the cost in Bengal would be from 60 to 100 thousand rupees a year.

(g) Provision for further research into animal disease is most desirable. In Bengal we have a small well-equipped laboratory but no specialist officer trained in this work.

Mr. P. J. Kerr.

Each Province should be fully equipped for research, and its diseases studied, in the first instance, in the climate and under the conditions in which they naturally exist. The work of these laboratories should be collected and co-ordinated by Muktesar, and amplified and checked by the Government of India experts. For this purpose Muktesar itself requires extension.

(h) See my answer at (g). Much overlapping and waste of time could be avoided if the work of these laboratories were under the advisory control of the Director of the Muktesar Institute, and also work which they were unable to carry out could be undertaken at the central laboratory.

(i) I do advise the appointment of a superior veterinary officer with the Government of India, provided he is an officer with long experience in India and conversant with the conditions, problems, and difficulties of the work in India. He should visit the Provinces on request. He would then be in a position to give very valuable advice to officers in charge of Provinces. He would be an independent expert to whom Local Governments could refer when in doubt as to the projects of their own Adviser. He should also be the administrative officer in charge of Muktesar. I believe the need for such an officer, distinct from the research staff, has been demonstrated. Research requires whole time work. In this capacity he would direct the work carried on there into the channels most required by the country as a whole, and in consultation with his expert staff co-ordinate the work of the district laboratories. He would also be in charge of the serum production, and distribution side of the Institute. He would be the Adviser to the Government of India on all veterinary matters. He would be head of the Central Bureau.

The post would be the one prize in the whole of India for Veterinary Officers, and would perhaps act as an inducement to men to stay their full time.

QUESTION 18.—ANIMAL HUSBANDRY.—(a) This matter has only just been taken up, seriously in this Province, and the post of Cattle Expert created. An officer has been selected and his appointment is pending.

(i) The formation of a Cattle Improvement Committee of experts, in which the Agricultural and Veterinary Departments combine with the Cattle Expert appointment of a sufficient number of men under the Expert to take charge of the various breeding farms, and centres, and look after the health of the stock. I would suggest Veterinary graduates for this work.

The establishment of several large breeding farms in the Province where the experimental work can be carried out, and from which the smaller centres can be stocked.

As nearly all jails in Bengal have small herds of cows to provide milk for the sick, I propose to utilise these and increase the size of the herds up to the full number the jail will accommodate, replace the present cows which are unsuitable for breeding improved stock, with suitable ones from the large farms, provide for the supply of suitable bulls, and the interchange of these when necessary and use them as distributing centres for improved bull calves for the district in which the jail is situated.

This will be an economical arrangement as the lay staff and labour are all provided free, and in some cases the present buildings are sufficient. In others they would have to be improved and extended.

Veterinary supervision and attendance is provided by the Veterinary Assistant Surgeon in charge of the headquarter hospital.

As funds permit district agricultural farms can be utilised in the same way. But here more expense will be entailed. Extra labour and buildings will have to be provided. In the jail scheme the district farms would be utilised to grow fodder and grain for the jail herds, and probably some help in the matter of labour might be given by the jails.

In this way 26 district breeding centres can be established at a minimum cost.

(ii) Dairy work under scientific methods could be carried on in each of these centres, as well as at the central farms. There is a market for milk and ghee, if not butter, at each district headquarters.

Demonstrations of these methods could be arranged at suitable times for cattle owners, also these herds could be shown locally at *melas*, as an example of what may be achieved by good feeding and keeping of improved stock.

(iii) Feeding is the most essential factor in improvement of stock. In my opinion, we need, in Bengal, a whole-time Physiological Chemist to investigate the value of various crops grown in Bengal as food for cattle. I believe there is only one such officer in India, at Bangalore. The results of his work on crops grown there are not reliable for Bengal where the crops, climate and soil are entirely different.

(b) (i) In my opinion, pastures in the Province can never be looked upon as anything but exercise grounds. Cattle should get a full ration of grain and fodder, the amount of grass they can get while out at exercise should be disregarded.

(ii) Plantain leaves are eaten extensively by cattle. I would like their food value to be ascertained. If they are good, I would suggest that they are grown round the

Mr. P. J. Kerr.

margin of cultivated fields. In many parts of Bengal they grow wild and thrive without any attention whatever.

I also wish to carry out further experiments with "dry silos."

(iii) The shortage season varies in different parts of Bengal. In the West, food except straw is short from early cold weather (December) until the rains break in June.

In East and North Bengal the shortage is more marked during the rains when the whole country is inundated, the time of plenty being from the time the water goes down, well on into the cold weather.

(iv) Work required by an expert on fodder.

(c) I do not think the cattle in Bengal, which depend on grazing for their existence, ever look well-nourished.

(d) The growing of Guinea grass and plantains, and other suitable green food and using them with paddy straw, for dry silage.

(e) The only way to teach the cultivator these things, is to demonstrate the money value of our advice at his very door. If our crops are better than his, produced under similar conditions, and the extra cost is more than covered by the extra profit, he will be willing to adopt our methods. But he will expect everything necessary to begin with, to be given to him. With cattle he will expect the service of the improved bull free, and the bull stationed near his home. Also every cow he has to be served by this bull whether fit to breed from or not, etc. The only way to show him is to induce one or two more enlightened neighbours to adopt our methods. To find out some way in which he may make a quick profit in rupees through taking our advice. He will then be ready to accept more advice even if the profit is slower in materialising.

QUESTION 22.—CO-OPERATION.—Without going into details, I am convinced that the only way of financial improvement in all the works and methods of the cultivator is through co operation. The sums involved for agriculture and animal husbandry alone are so enormous that no Government could face them. These do not take into account the money required for public health, education, etc.

Mr. P. J. Kerr.

## Oral Evidence

19135. *The Chairman* : Mr. Kerr, you are Veterinary Adviser to the Government of Bengal ?—Yes.

19136. You put in a note of the evidence which you wish to give before the Royal Commission, and my colleagues and I, are greatly obliged to you for that; and you have also handed in various supplementary documents. Have you anything to say in amplification of the written material which you handed in ?—An explanation, should any be required.

19137. No statement of a general nature which you wish to make ?—About organisation. As regards Central organisation as well as Bengal organisation, my proposals for reorganisation are on the same lines as those of Mr. Waite. He passed through Calcutta on his way to the Government of India in February and, with the Commission in view, we discussed practically all the central portion. I have seen a copy of the note he submitted to the Commission and I am in complete agreement with his views expressed in that note. Here, in Bengal, we feel the need of a Central Advisory Body. In Bengal, as I have stated, I think in my note, I am not satisfied with the arrangements of the Veterinary Department, nor with the amount of help which it gives in the matter of cattle improvement. Prior to my knowing that the Commission was coming, I was already formulating proposals for the Bengal Government and those proposals have been under consideration now for at least twelve months. The first proposal, the major one, is that all infectious diseases staff and measures should be under the complete control of the local Government.

19138. And not under the District Boards ?—No; arrangements for treatment of ordinary clinical cases should be regarded as local matters. On these lines, my proposals have already gone up. The most urgent one I put up, was that the Government of Bengal should pay for the cost of serum from the Provincial revenues, because the present system which is that the cost is recovered from local bodies and supply controlled by them is a great drawback. At present the serum supply is indent ed for by me under a general allotment from the Government of Bengal, and then it is distributed to the Boards as they indent on me for it. They have to bear the cost of the serum which they indent for; and that is objectionable both from the difficulty of the Boards finding the money for the requisite amount of serum, and the delay which is caused through requisitions coming through that channel.

19139. Perhaps before we go any further, Mr. Kerr, you would just let the Commission have a very short statement of your own training and any past posts that you held ?—I qualified from the London Veterinary College in 1906 and applied a year afterwards for a post to the Indian Civil Veterinary Department. As no post was vacant at the time, I went on in private practice as an Assistant and practised at home in Northern Ireland. I worked for a year in Enniskillen in Aberdeen nine months, Salisbury one year and Warwickshire, London one year. When in 1910 a post was vacant in Bengal, I was given a second post-graduate training. It was a college post; I had already taken one post-graduate course to render myself eligible for the Civil Veterinary Department. In January 1911, I arrived here. I was for about eight or nine months in Bengal and was then posted to the Central Provinces for training for six months and spent that time touring. From there I was posted to Madras for six months in the leave vacancy of Mr. Ware, and spent practically the whole time in touring. I then returned to Bengal and took charge of the district work, from 1912 to 1925. In July 1915 I went out on Military Service, eighteen months of which I spent in Mesopotamia and the balance in Northern India, on the frontier, S. Waziristan, Baluchistan and Ambala. I returned after the War in 1920, and took up a college post and in 1922, I took charge as Veterinary Adviser to the Government of Bengal.

19140. Now a question or two on what you have written for us, about your idea as to the Central organisation and on what you said in amplification of that a moment or two ago. I take it from your note that it is your view that if an officer was appointed in the position of a Veterinary Advisor to the Government of India and in general charge of Muktesar, he could not at the same time take any part in research work; is that your view ?—Yes.

19141. You would relieve him of all responsibility for the general direction of research ?—No; I think from his knowledge of the needs of the Provinces, he would consult with his expert staff and in that way advise and direct all research. Otherwise problems which are not of first importance may be given a great deal of time to the detriment of more important ones.

19142. And the initiative in a good deal of research ought to come from the districts where the problem is actually being faced ?—Yes.

Mr. P. J. Kerr.

19113. I suppose you contemplate some one responsible for research as a whole?—Yes.

19114. And your view is that the Veterinary Adviser to the Government of India would be in touch with the needs of the Provinces and he would say to his Director of Research "this is the problem which requires your attention; arrange to go into it"?—Yes, it may be necessary. It may be impossible to carry it on in Multan at all, it may be necessary for the Central staff to depute whichever officer is competent, to come down to the district concerned and investigate on the spot. Requirements for material (virus) were made from Provincial Officers when Sir John McIndoe came to it years ago to investigate foot and mouth disease. Materials were collected in Bengal, according to instructions given, but the virus was dead by the time it reached Multan.

19115. I assume from what you said in your note that you are quite definitely of opinion that the Central Veterinary Services should be under the Veterinary Adviser and not under the Agricultural Department?—Yes; I am. I think both are whole-time jobs. The Agricultural Adviser has not time to give necessary attention to the work, and we have more than enough for one man on whole-time duty.

19116. Do you contemplate any teaching being given at Multan?—I have given a personal opinion about it and we have also discussed that as a department and it needs further discussion.

19117. You do not wish to go any further now than that?—Not at present. I have said that, as regards direct recruitment to the Provincial Service in Punjab, such thing as a suitable course is provided in India, I want to maintain the M.B. V.S. degree as the standard for direct recruits to the Upper Provincial Service.

19118. Now you have interested yourself a great deal in the cattle problem?—Yes.

19119. In your view is it likely that a cross between an imported bull and an indigenous cow will make any contribution towards the cattle problem in the Presidency as a whole?—Yes; I think it will in the matter of milk production only. But we have not had sufficient experience of it in this Province. All cattle imported into this Province degenerate. If you are not very careful, degeneration commences at once and in 1924 in each succeeding generation.

19120. Leaving out the question of milk-supply, the problem is to discover the dual purpose animal capable of providing strong draught oxen and also of providing cows capable of giving remunerative yield of milk?—Yes. But the difficulty is that most of the milk breeds in India are large animals and their bullocks are too large for the average cultivator. You have seen the red Sindhi animal, it is of fair size for Bengal. We are experimenting to see whether the Sindhi animal will thrive in Bengal. We have an experimental Sindhi Herd under the Director. It has been here for about four or six years now, but not long enough to give an opinion as to its suitability.

19121. What are the local conditions that make it necessary to have a small draught animal?—First of all deep ploughing is not required and the plots are very small. Bullocks are used to a certain extent but the objection to them is that they are too slow and too large. A small light animal (bullock) gets through the work more quickly, is more easily handled and is sufficiently strong for the depth of ploughing required.

19122. Is it your view that the oxen in this Presidency are on the average strong enough for the work?—No; the indigenous cattle are too small.

19123. Something between the large up-country beast and the weedy bulls working in the fields; that is what you have in mind?—Yes, we buy an enormous number of the smaller Bihari cattle; they come to us in thousands every cold weather from Sonpur and other parts, trainloads of them pass through from Bihar to Bengal.

19124. Do I understand that you think an animal with a European strain in its veins is likely to provide the cultivator with what he wants?—I do not think the importation of European or Australian stock will meet the case. No importation has proved a success so far.

19125. The two problems are separate in your mind?—For milk production in bulk it does pay; it is not a proposition for the whole of the Province.

19126. So that, leaving out the alternative of buying from outside the Presidency, the alternative left is either to proceed by selection to improve the breed or to cross two or more indigenous breeds?—I have thought of importation of indigenous Indian breeds to improve the strain, but we have not had sufficient experiment here to decide what strain to import.

19127. So, you are now on the eve of tackling this problem?—Yes.

Mr. P. J. Kerr.

19158. You are not doing any breeding work here at all; you are importing your animals from areas in India where they are bred. That is really what is going on at the moment; you are not breeding your own animals?—They are bred, but not to any great extent. If people want good cattle, they buy imported ones and sell them as they become useless.

19159. What is the total number of cattle in this Presidency? I do not know the figures of the latest census; they are in proof at the moment?—I too have not the latest figures, but the last census figures were 25 millions.

19160. I want the number that is imported?—That I have not got, but it runs to many many thousands.

19161. Can you give any approximate figure?—No. Many thousand come in annually by road and rail from Bihar.

19162. Can you say that half the animals that come into work for the first time in the Presidency in each year are imported?—I cannot give figures as to that.

19163. Apart from improving the breed, what is the most important contribution that could be made to the improvement of cattle in the Presidency?—First of all feeding those we have, and secondly protecting those that are worth protecting from being carried off by infectious diseases.

19164. Take the first point first. What is your view about the best way of solving the feeding problem?—I think the only way is to grow forage crops, and to adopt a satisfactory method of saving those forage crops, from the time they will grow in plenty and with the least attention, until the time of shortage.

19165. Have you thought out this problem in relation to irrigation at all?—No, not in connection with large irrigation. I know for a fact that these crops will grow if they are irrigated by primitive methods. We have a fairly large garden crop at the college here irrigated in this way. All the crops grow there satisfactorily with tank irrigation. For many years we used basket lifting. A number of crops are grown for feeding animals in the hospital.

19166. Having persuaded your cultivator to set apart part of his land, for a part of the year, to growing fodder, what means would you suggest of preserving fodder?—Silage has not so far been very helpful in Bengal but I do not think it has been tried sufficiently long either to approve or to condemn it. The old Danish method was the one I wanted to try, and the Agricultural Department are now trying it on their farm at Dacca. That is what I call dry silo. That is merely chopping up the straw and green food together, adding a little salt and storing it.

19167. You do not get fermentation?—The salt prevents fermentation. It is the method advocated in Sheridan's book, and it is being tried here. I thought it might be experimented with to see whether it was a success or not. It is a method that the cultivator can adopt, inexpensively, himself, if it is satisfactory.

19168. You do not yet know whether that silage will withstand the climate?—The dry silos were filled about three months ago; so, I cannot say.

19169. What are the special conditions which made the ordinary silos difficult to manage?—As far as I can understand they require a little expert knowledge, as to the right time to cut the crop, and the right way to fill the pits. It is not very much, but it seems more than the average cultivator can manage. They are very haphazard in all matters. There is also the water problem. Pit silos in a large number of Bengal districts are not a success because almost invariably they form wells instead of silos. To build a pucca silo for the silage is too expensive for the ordinary cultivator. That is why I propose dry silage. I propose keeping the grain in a sort of matting shed built on posts, *gola* they call it. These are already being used for storing paddy in some districts.

19170. Which people are talking of improving the breed they generally stop short at the good bull. Do you not think the condition of the cow is very important too?—It is very important indeed.

19171. Do you think the cultivator has any idea of improving the cows?—I wanted to point that out. If we give them a good bull, they expect it to serve every cow they have, irrespective of whether the cow is fit to breed or not. Elimination of the unfit is a difficult problem in cattle improvement in Bengal, one-third of the cattle in Bengal would be better without. These weedy animals eat up the little food there is, that would better be given to the more valuable animals.

19172. I take it if there is any shortage of fodder, the working beast gets a very much better ration than the cow can hope for?—Yes.

Mr. P. J. Kerr.

19173 As long as the cow gives some milk the cultivator does not worry about it?—If it continues to give milk, they give it a little food; when it ceases to give milk, they leave it to pick up what it can by grazing. In many parts of Bengal, milk is not valued.

19174 On the matter of dispensaries and Veterinary Assistant Surgeons who, according to your note are under the control of District Boards, would you like to tell us some of the ill effects of that system as you have experienced it in practice?—The first point is that the District Board finances are limited; they have many things to do with their money; roads, public health and so on. A large number of members of the District Boards do not appreciate the need for veterinary work. They look on veterinary work as a luxury which is desirable but not essential; and there seems to be a general tendency to economise, when times are hard, first of all on the veterinary staff. At present, we have only half the number of staff approved, half of what I regard as the minimum cadre for infectious disease work; these men, in addition to coping with the infectious diseases work, have to do dispensary treatment and routine tanning in the districts.

19175 The approved number of officers being the number approved by the Provincial Government?—Yes, approved by the Provincial Government originally in thinking out what their Veterinary Department should have.

19176 Are they actually under the administration of District Boards?—The local bodies have to create the post; they ask me to supply the man; they contribute his average salary to Government, and Government pay the man.

19177 The picture presented to my mind is that the local bodies are saddled with more responsibilities than they have funds to discharge; do you think that is a true picture?—Yes, but I am not quite certain that if they had more money, we should get a share of that money. In the cadre which was originally laid down, it was proposed to have two V. A. S. in each sub-division, one in charge of the dispensary and the other to do the slaughter work. In very few sub-divisions have we got two men now; in few districts only do we have a stationary man as well as an itinerant one.

19178 Does the devolution of responsibility to the local bodies affect the question of discipline?—It does. In a number of cases, the veterinary assistant works one master against the other. He either blames the District Board for having misinterpreted or contradicted one of my orders or *vice versa*.

19179 Have you had trouble with your subordinate staff in the districts in the matter of corruption?—I have; but it is very difficult to detect. I have accusations occasionally that they try to charge fees for their work. The corruption that is very difficult for me to check relates to their attendance at the outbreaks, the number of animals inoculated and the serum they use. I have had a case in which a man poured away the serum without overhauling inoculated any animals. This is an extreme instance. One finds *budmashees* in every service, generally speaking I have little complaint of corruption among my veterinary assistants. I think, however, that they need thorough inspection to keep them to their work.

19180. Have you an adequate inspecting staff?—No. I am asking for more, an average of one inspector for ten veterinary assistants. I need more superior staff.

19181. Your idea is to extend your clinical dispensaries by getting the Union Boards to maintain a Veterinary Assistant Surgeon and a dispensary at each *thana*; is that the idea?—That is the ultimate aim. That will give one dispensary to every four or five Union Boards. In the only district in which it is contemplated at the moment, four or five Union Boards are co-operating to maintain a dispensary at the *thana*. That will give ample work for one veterinary assistant.

19182. I want to be quite certain what a Union Board is. Would you describe it shortly?—I am not quite certain about the actual constitution of a Union Board; I think Mr. Gupta could tell you. It is a small unit of Local Self-Government under the District Board. A sub-division may contain seven or eight Union Boards.

19183. You attack the principle of part control by District Boards in a professional service on the ground that the District Boards have not sufficient funds to cope with the work. I wanted to be certain that you did not mean to put your clinical dispensaries on the rates, as it were, through the avenue of the Union Boards?—My object is this, that the work should be attempted to be done on a co-operative basis by the Union Boards.

19184. On a voluntary basis?—Yes.

19185. Is there any question of local taxation?—No. In the district in question on account of the very heavy losses from cattle disease, all the Union Boards have agreed to subscribe and to have their own veterinary assistant. He will

Mr. P. J. Kerr.

not be a Government servant; he will be lent to them so long as they want him; if they do not want him, his post will lapse. In regard to the infectious diseases staff which I want Government to control, the position of the District Board is not quite clear; it will have to be thought out, as the Union Board men multiply. In the district in which it is proposed to have these men, there are seven *Manas*, and they propose to start that experiment with seven men in the sub-division, and see how it works before going any further.

19186. Given adequate staff, I take it your ambition would be to advertise the value of efficient feeding in relation to the general constitution of the animal, its capacity to work, its capacity to produce milk, and its capacity to resist disease. You would also use the staff to control, so far as possible, epidemic diseases and to administer prophylactic measures?—Yes; it will be both a preventive and propaganda staff; that would be the function of the Government provincial staff; for clinical treatment my idea is to use the local employee of the local body.

19187. Apart from that, have you in view some group of officers whom you could mobilise and move to some point where infection was beginning?—I have already applied for an emergency staff.

19188. What will you do with them at other times?—I can post them out on propaganda work quite easily; they have a very wide field for propaganda, and I could use them the whole time. I should not keep them in Calcutta; I should have to have two or three at Dacca, working in the Dacca areas and others at other headquarters.

19189. If any serious epidemic disease breaks out, you would concentrate those men on the point of danger?—I would call them from the nearest post to the place of outbreak.

19190. In connection with prophylaxis, rinderpest, I suppose, remains your most formidable disease?—Yes.

19191. Have you experience of the simultaneous method of inoculation in the Presidency?—Yes, so far the Government animals have been done, and also, the half-bred English cattle of the Kaliapong Homes Dairy. It was done 18 months ago; up to now the results have been very satisfactory, and we had no fatalities as a result of the inoculation.

19192. Partly owing to its cost and partly owing to the fact that it means disabling the beast for a short period, it is very difficult to have any general adoption of the method of simultaneous inoculation for the cultivators' animals?—There are periods when they could allow their animals to be inoculated if they were willing, but they are not willing. As far as the milk-producing side of it goes, it does not seem to interfere with them in the least.

19193. Are you concerned with the popularisation of the simultaneous method?—Yes, wherever people can afford to pay for it themselves. I think the Milk Unions are desirous of having their animals done; the Co-operative Milk Society people have approached me to arrange to have their "improved" cattle done. They are going to find the money, which will be roughly Rs. 1-8 per head, that is the actual cost of the serum used; the cost of the staff necessary to do it, and all other costs will be a Government charge.

19194. Have you over charted on a map of the Presidency the movement of rinderpest as it spreads?—No, I have not.

19195. Do you think that the sources of infection or entry of the epidemic into the Province are more in some districts than in others?—It is difficult to accuse any particular avenue, because we have got rinderpest with us always, and it appears to increase in cycles; every three or four years we have an epizootic increase in the incidence of rinderpest.

19196. Appearances of cyclic tendencies and periodicity have always to be interpreted in the light of the fact that, for every year rinderpest is absent in a district, so many more animals have extreme lack of any resistance to the disease?—The main avenue for infection is on the roads from the western fairs.

19197. Has it ever occurred to you, that if expenditure is the difficulty, it might be worth at least considering whether you could not spread bands of immunised villages across the district, so as to prevent the spread of the disease? Do you think it would be a feasible operation?—It is very difficult, because our population is not gathered in communities, but spreads throughout the countryside. There is also the difficulty of getting them to agree; they can only be induced to agree to inoculation when they see cattle dying all around them. When there is no danger, they are not willing to have their animals done.

19198. If you had blocks of territories with animals which had been immunised, it would be extremely useful in dealing with an outbreak?—I do not think it is practicable from the financial point of view. Also we have got rivers running through the country

Mr. P. J. Kerr.

in all directions, more or less, and they can get past your barrage of inoculated cattle, conveying the cattle by river.

19209 Are you recommending any legislation?—I am not prepared to give an opinion one way or the other, because it wants so much consideration. At present, we have no means of enforcing any legislation, even if we had it.

19200 Do you lean towards provincial legislation or an All-India Act?—I think an All India Act, which can be applied to the different Provinces and given effect to according to their different needs would be required but it would be difficult to draw up an Act which would apply to all Provinces without making it cumbersome.

19201. Are you familiar with the work on animal nutrition being carried out at Bangalore?—No, I am not. I know there is a Physiological Chemist there; I have met him at Pusa, other than that I have no knowledge of what he is doing.

19202 Do you regard that as a very important problem?—I do. I made several suggestions to him verbally, but whether he has done any thing about them or not I have no information.

19203 To whom?—To the Physiological Chemist.

19204 In Bengal?—I met him when he was up at Pusa last year at the Conference.

19205 *Professor Gangulee* Did you tell him about your silage experiments?—I told him about them and asked about the value of plantain leaf as a food for cattle. Plantain leaves are eaten by cattle in many parts of the country, and it does not seem to do them any harm, I wanted to know whether it was any good as a fodder.

19206 *The Chairman* But the trouble is that each of these experiments takes so long to carry out, and it is not possible to get through all the possible foods?—I think it is possible, if taken up in each Province. There may be a number of jungle plants fit for feeding, but at present we do not know whether they are fit or not. Bamboo leaves, for instance, are eaten in quantity in the hills, by the hill cattle, and in the Terai where they grow. Plantain leaves are only used as a ration when other things fail; plantain trees grow as jungle plants in many parts of Bengal without any attention whatever.

19207. Do you form the view that you have much to learn about the type of fodder crop that can best be grown?—I think we have still much to learn as to what is the most economical crop distinct by district.

19208 Is it a local problem?—It is a local problem which has to be solved by the district agricultural farms. It needs to be the best crop which can be grown with the least amount of labour, because, though the cultivator has much spare time at his disposal, it is usually in the non-cultivating season that he has it. In the cultivating season he will not take up any other work until he finishes his work in the fields, and almost all his time is taken up with cultivation of revenue crops; it is difficult to get him to take up any thing which calls for time and labour.

19209 Have you had much experience of the co-operative organisation in the Presidency?—The only organisations of which I have any knowledge are the milk societies round about Calcutta, and so far as I can see they are doing extremely well.

19210. Are they co-operative organisations embodying groups of persons engaged in dairying to meet the urban demand?—It is a subsidiary occupation; most of these people are cultivators as well. They keep cows and they are organised into local societies under the Co-operative Milk Union in Calcutta. They agree to keep their cows up to a certain standard of cleanliness, and all the cows are milked by the Union's milkers under much improved conditions, the milk is brought in improved cans into Calcutta, where it is supplied to the consumers by the Union; the Union finds the purchaser.

19211. Are they milked on the cultivator's own holding, or are they driven to the co-operative sheds for milking?—For the most part it is done on the owner's own premises. They have tried to get all the cows milked in one place, but the owners are unwilling to drive the animals to a common shed, the milking is done very early in the morning, and the owner is unwilling to get up so early. What happens now is that the Union milker goes round the premises, without the owner knowing it, milks the cows, makes a mark on the record stick and goes away. The milk is then taken to the Union's lorry or depot.

19212 Who arranges the marketing of the milk?—The Milk Union.

19213. You have had close experience of this organisation?—Yes.

19214 Is it working well?—I think it is working well. They have good customers in the shape of a number of hospitals and a number of hotels. Those customers they have to keep satisfied, because they take many maunds of milk. They have, also, retail

Mr. P. J. Kerr.

depôts in one or two big markets in Calcutta, where their milk can be purchased retail. They are under a contract with the Corporation not to sell it at a higher rate than 3 seers a rupee.

19215. Is it capable of expansion?—I think it is capable of much expansion. The actual Union itself has expanded enormously; they are bringing in about 120 maunds of milk a day, and are under an obligation to the Corporation to increase that to 200 maunds in 12 months and to 400 maunds in four years from the time they got their loan. The Corporation has financed them.

19216. Are any of the prize milking cows of indigenous strains?—They are a mixed herd. Some of them are local but a desire is arising for up-country heavy milking cows.

19217. Is that with a view to getting a market for the bullocks?—No, it is with a view to increasing the milk.

19218. Is there a market for the male animals for working purposes?—There is a certain sale for cart bullocks, but most of the people buy these direct from the Bihar markets. They go to the *melas* in Northern Bengal and buy their big heavy cart animals from there. So if you are going to produce heavy cart animals, you would have keen competition. So far, I do not think there is any great market for the large bullocks bred in Bengal.

19219. Do you think it might be possible to build up a dairy industry, apart from the demand for milk, that is to say, an industry resting mainly on milk products?—I think the difficulty at the moment for milk produce is that you must be in a district where milk is really cheap to make it pay. *Ghi* is the most saleable article and it commands a price of Rs. 90 to Rs. 100 a maund. But you need to have milk at the rate of 8 to 12 seers per rupee before *ghi*-making will pay.

19220. Unfortunately there is a sentimental objection to making or eating cheese?—They do eat curd, but *ghi* is the most easily produced product but it is an expensive article. The poor man makes it himself if he has enough milk to do it, or goes without.

19221. Are you in touch with the Heads of the co-operative movement?—Not in close touch.

19222. You have no other experience of the co-operative movement in this Presidency?—No.

19223. *The Raja of Parlakimedi*: You wish to have a research fund to carry on research work?—Yes.

19224. How do you propose to raise it? Do you propose to raise it by a special cess or by what other method?—I am afraid I did not study the financial side of it deeply, but Mr. Ware has done so; I have accepted his proposal, namely, that the profits which are made by the biological sales at Muktesar should be credited to this fund. The Provincial Governments should also contribute towards this fund. We can also open the fund to subscription. Any department that may wish to avail itself of the researches of this fund should also contribute towards it. The medical people would also contribute to it; in fact, they have shown a willingness to do so. If we only organise a fund, the Medical Department will welcome co-operation at once. I can speak of Calcutta and Madras as I have met the medical research men of both these places.

19225. As regards the field of research, would you not also include food?—I have looked on food as a problem coming under the purview of the Agricultural Department and their Physiological Chemist. The general welfare of the animal depends upon its food. An animal that is not given good food and is not healthy is more liable to disease of any kind.

19226. For instance, coming to the cakes, do you not think they should be thoroughly investigated to find out whether they are really good?—It is an economic matter. We all realise, for instance, that mustard cake is the poorest of all cakes and the best is linseed cake; cotton-seed cake is also good, but as we do not grow cotton here, it is out of the question. Linseed cake is expensive and the universal cake is mustard cake. I have at various times heard it accused of causing sterility and causing abortion in cattle and reduction in milk, but I have no evidence to support the accusation.

19227. Has any comparative experiment been carried out anywhere?—Not to my knowledge.

19228. Has the gentleman in charge of the livestock at Bangalore anything to say about these cakes?—He did not say anything at the Conference.

Mr. P. J. Kerr,

19229. Are there any local breeders of cattle in this Presidency?—There is a local breeder at the Kalimpong Homes Dairy but he is not breeding indigenous cattle. Ayishiro cattle are kept and crossed with the hulk cows. The object is milk.

19230. So in this Presidency there is no popular breeding of cattle at all?—As far as I know there are no breeders, such as you have in many other parts of India whose sole business is breeding. Our chief difficulty in this Presidency is that none of the real owners have any knowledge of cattle. If you sell them a fat and badly shaped cow, they will be content. But they would not like a lean well-built one.

19231. Have you made any experiments about the suitability of these different Northern India breeds of cattle for this Presidency?—We are running a farm of Sindhi cattle in Dacca as an experimental measure. You will see that when you go to Dacca. They have been in Bengal for five years and they have so far borne the climate quite well. I have not seen a sufficient number of their half-breeds to tell you whether the cross between them and the indigenous cattle is a good one or not. We have been using in Rangpur the Hissar type large bull and putting him to the country cow. We have got a cross-bred herd and it is a distinct improvement on the originals. We have also there a country herd which is purely selectivc. That also is an improvement on its original. One can improve the country beast from giving one and a quarter seers of milk to two and a half by feeding and selection. This country herd has been running for about ten years.

19232. What about the Sindhi cattle?—We have not had them long enough to give you a definite opinion about them. The first result that one can judge from is obtained in ten years, although it generally takes fifteen to twenty years to come to any definite conclusion.

19233. For these rural areas would you not suggest a dual purpose animal?—On that I have kept an open mind. We hope to have an expert who knows more about cattle in India than we do. We have been asking for the services of a Cattle Expert for a number of years.

19234. You wish to start cattle farms in jails. Would you undertake selection or cross breeding?—It depends entirely on the amount of money we are given. We must start with the best we can; and start as high up as we can. The jail cattle now number 500 roughly. We must select the best cattle we can find and put them in the jails. As far as possible we would use cattle of the central farms but the present herds in the central farms would not stock the jails. We will have to buy bulls also to begin with; we cannot breed them in sufficient numbers.

19235. Of course, you are aware that cross-breeding between Indian cattle and English cattle is a practical failure?—I believe so, except from the milk point of view for the first generation.

19236. Even then, they are susceptible to all the local diseases. Are they not?—That is so.

19237. So, if funds permit, you would rather like to have crosses with indigenous Indian breeds?—For India you must have Indian cattle. We can, however, permanently immunise the English cattle against rinderpest, but there are other diseases which cause heavy loss among them. We have had three bulls imported for Bengal; they were immunised against rinderpest. But the inoculation is not free from risk as you cannot sterilize the blood used as virus, or guarantee it free from pyroplasmosis. We have only saved one out of three bulls so immunised. These bulls cost Rs. 2,000 each. So out of Rs. 6,000 spent on bulls, Rs. 4,000 have been lost.

19238. *The Chairman*. If you could grow the virus of rinderpest on some other medium, your difficulty would be solved?—That is one of the problems which is being investigated at Muktesar. If we could only get virus from some other country free from pyroplasmosis our difficulties would be overcome.

19239. *The Raja of Paralimedi*. Is the foot and mouth disease also very serious as in the case of English cattle?—It is not as fatal. The death rate from this disease is something like 5 per cent. Most of such animals are young cattle or cattle which are worked while suffering from the disease; the latter die of septic poisoning.

19240. Can you get serum in time? How would you solve that difficulty?—If the hospitals at district headquarters are under my charge for the purposes of serum, each district would have its own serum cellar for its own requirements. The moment the stock is depleted in the district cellar it would be replaced from headquarters. To do that, I have got to get money to build cellars, I have been able to persuade two local authorities only to build cellars, according to my specification.

19241. It has not yet been done?—We have a cellar in Dacca at the Government hospital. We have also a cellar at Barisal and the District Board of Mymensingh is

**M<sup>r</sup>. P. J. Kerr.**

contemplating building one there. Both these districts are outlying districts and there is great delay in the serum reaching there from Calcutta. In order to reach Mymensingh it has to go by train and then by boat and train again so that between these towns and boats there is a great delay in getting the serum to the spot where it is required. From the nearest railway or steamer station it may have to travel 30 to 40 miles by country boat or by road. This applies to Mymensingh and Barisal and many other districts.

19242. Then with regard to your answer to Question 16 (b) of our Questionnaire, will you please say in what directions you wish the improvement should be effected?—First of all there should be a dispensary in each sub-division in charge of a stationary assistant; that is what is laid down in our stereotyped cadre. The sub-divisions I have left out of my scheme on account of expense. I have only insisted in my scheme on having at least the district headquarter hospitals under me.

19243. How are they supervised at present?—They are financed by District Boards and supervised by my inspecting staff.

19244. At what periods?—The Inspector is the first officer; he inspects at present about once a quarter, to half every year, and either myself or my Assistant Director in the range concerned see them once a year. But in this again, we are hampered for want of funds.

19245. You cannot travel about?—It is a matter of allotment. The sum allotted to me now which I have to share with two officers who travel second class is Rs. 5,000 whereas prior to 1913-14 the budget allotment was Rs. 6,000 for myself alone; also since then we have had a 25 per cent increase in railway fares. So this retrenchment and shortage of funds hamper our superior officers touring. The same applies to Inspectors, for example, the money allotted this year has been spent already. I have to ask for extra grant. If I get it, they can tour; if I cannot get it, they have to sit still.

19246. Then with regard to your proposal on page 99, do you not think that at least at the initial stage half the expenditure should be borne by Local Boards and Government? You suggest that it should be entirely borne by the local people themselves. You say "I hope eventually to meet the need for clinical dispensaries by working through the Union Boards in co-operation"?—Yes; for clinical work, which in England is done by the ordinary private practitioner who attends to cases of all descriptions.

19247. But things are quite different here?—I want these Union Board veterinary assistants to do the work of the private practitioner in India. If the locality does not want them, it does not engage them. That is their local interest. The only thing we cannot allow the district to arrange for itself is as to whether it takes any steps against contagious diseases or not. That affects all the districts round about and if it is a district in which there is a main road it affects the whole Province. It may send infection throughout the whole Province. It should be under provincial control, so that whatever may be necessary in the district is carried out. If they wish to have veterinary assistants for the clinical treatment to treat their cattle, they must arrange for them and finance them; if they do not want that treatment, then it is no use my posting the men.

19248. Just at the initial stage do you not think the Government or the District Board should meet such expenditure, just to interest the people?—A beginning has already been made. There are dispensaries at most district and many sub-divisional headquarters maintained by District Boards. The latter, I suggest, should be a local District Board charge and if the District Board wishes to show the people what should be done they should do it in that way. The fact that people want it, if they are really shown how much benefit it confers, is exemplified in Rangpur district, in this Presidency where the request of the local people is backed up by an interested Chairman. They have seven local dispensaries, the money for which they have found themselves. One or two of the dispensaries are in *pucca* buildings; some of them are in *kutcha* buildings according to the funds locally available; in some cases they have to hire the building. At any rate, there, they have realised the need for, and benefit from the work; once they realised it they have gone ahead and arranged matters themselves and I do not think we should take it entirely out of their hands. We need 700 or 800 veterinary assistants to meet the needs of my *thana* scheme, each assistant costs roughly Rs. 2,000 a year and I think that is too big a burden to ask any public body to shoulder. The necessary staff for infectious disease should be Government's concern.

19249. Sir James MacKenna: I think you said that the total cattle population of the Presidency was about 35 millions?—25 millions.

19250. And your total mortality from Table II of last year's report is only slightly under 32,000?—That is what has been reported.

Mr. P. J. Kerr.

19251. Exactly; you do not have much faith in those statistics?—No.

19252. What was the medium of collection, the police constable?—The police notify to a certain extent; but the *chowkidar* of the village notifies the Local Board or the District Board.

19253. You have not much faith in them?—I have not.

19254. As being probably very far from the truth?—A number of outbreaks are not reported, let alone deaths; and isolated deaths are put down to snake bite or poison, and not reported at all.

19255. What you really want is a strong veterinary police if I may call it so?—I want a strong notifying agency. We can never have a sufficiently strong body to notify until we get one Veterinary Assistant Surgeon in each *thana*; then you would get your statistics with much more accuracy.

19256. One more question. Are grazing grounds in this Presidency reserved?—No, to the best of my knowledge there is no reserved grazing ground.

19257. So there is no control over them at all?—I believe it is the option of the landholder to break up or let land for cultivation; and I believe a large amount of Government land has been purchased little by little and cultivated.

19258. *Professor Gangulee*: When was the laboratory in the Bengal Veterinary College started?—By Colonel Raymond who was the first Principal of the College, about 1904.

19259. What researches are being conducted in this small well-equipped laboratory?—The problems that present themselves are largely cases for hospital treatment. They have a large amount of dog work there.

19260. We are mainly concerned with cattle, you know?—Yes; but I am telling you the work they are actually doing. In cattle work they diagnose all cases sent up in addition to hospital cases. In the case of an outbreak, the veterinary assistant diagnoses and wires for serum, if it is rinderpest. If he suspects anything else, he puts up a horse for diagnosis.

19261. The laboratory at the present time is utilized for diagnosis more than research?—This department has for long been looked upon as merely an adjunct to the Agricultural Department for the preservation of cattle. We do a great deal of work on other animals besides cattle. Dogs carry human diseases and this is quite a serious problem. We also carry out work on elephants, camels and military horses, so that we have all here to consider. We have a number of elephants in this Province so that even elephant problems should be taken up locally and their parasitology for instance, be investigated. Cattle form only a part of our work, the most important part; but the other animals are also important and should not be neglected.

19262. Have you a parasitologist?—No.

19263. How do you teach cattle disease or animal disease without a parasitologist?—We have parasitology. Our course is an abbreviated one and our well-qualified Veterinary Surgeon who has taken the course of parasitology himself can teach up to the standard required at present.

19264. Has any cattle disease survey been undertaken in this Presidency?—No.

19265. So we have no data with regard to the infectious factor or any other factor in relation to the incidence of disease?—No.

19266. Do I understand that the Co-operative Milk Union is a federation of a number of societies?—Yes.

19267. How many societies?—I cannot tell you the exact number.

19268. These societies are in the neighbourhood of Calcutta?—Yes; they are within 40 or 50 miles of Calcutta. I do not think they go beyond that at present.

19269. And this Union received very considerable financial aid from the Calcutta Corporation?—The Calcutta Corporation laid down certain conditions and primarily financed the installation of the plant here in Calcutta. They gave Rs. 50,000 or 60,000 at least, if not more.

19270. So without that financial aid from the Corporation, this Co-operative Milk Union would not have existed?—Certainly it would have existed because had the Corporation failed to grant this assistance the Government was willing to advance the money on loan. The Milk Union is now on a sound financial basis and in a position to go into the market for a loan. The Corporation have taken a mortgage on the plant to the extent of the loan they have given.

Mr. F. J. Kerr.

19271. Are you of opinion that such Unions should be multiplied throughout the Province near the cities?—Yes; they have actually started some in Dacca. They should exist wherever there is a market for milk; there should be many more round Calcutta.

19272. In your answer to Sir James MacKenna, you have said something about reporting agencies. At the present time what are your reporting agencies in the case of an outbreak of a disease?—The *chowkidar* is supposed to report to the *thana* and the *thana* is supposed to report to the Chairman of the Local Board.

19273. The *chowkidar* comes to the *thana* and then?—The *thana* reports to the local authority.

19274. Does it?—To the Local Board or the Sub-Divisional Officer or the District Board as the case may be.

19275. And then?—Then the report eventually gets to the veterinary assistant. Sometimes it is reported direct to me.

19276. What time does it take? Suppose an epidemic breaks out, shall I say, in the Merganaj district?—Sometimes it takes three weeks before the report is received or longer.

19277. With regard to the Veterinary Department, are you satisfied with the existing method of education in the Belgachia college?—I think the present system of education wants revision; but I am not prepared to alter our present arrangements until it has been fully considered, because I think it is a question of all-India importance; I think in this we should move in line with all the other colleges and all should be brought up to the same standard; therefore I am not prepared to make any alteration at the moment in the Belgachia system of teaching.

19278. You agree with me that the curriculum also is deficient?—It is deficient. I agree with the curriculum laid down for Lahore and the methods in Lahore. For that want money and staff, and until the Local Government can give us that, we cannot grade up to the standard that is adopted in Lahore.

19279. You agree that the Lahore curriculum is superior to the curriculum you follow?—I am of that opinion.

19280. Is it your considered opinion that the District Boards have not fully realised the importance of the Veterinary Department?—Some District Boards have, but not all. Speaking generally, the District Boards have not fully realised the need for it.

19281. Do you find that the people appreciate the operations of your department?—When they get help they do.

19282. I presume they do get help?—The number of cases which are brought to the existing dispensaries is going up every year, and if we had more dispensaries we should have many more treated. The drawback at present is that so many of the people live beyond the distance from which they can conveniently bring their cattle to hospital.

19283. If it is within their reach they fully appreciate the help?—To this extent; if the animal gets better they are pleased, if the animal dies they are not. At any rate the dispensaries are increasing in popularity where they exist.

19284. I find from the Administration Report of Bengal that the charges under the Veterinary head is increasing. The expenditure by the District Boards has increased from Rs. 1,71,000 to Rs. 1,81,000. So the District Boards are fully alive to the needs of the Veterinary Service?—Not fully alive; some are waking up.

19285. But it is a good sign. Do you carry on any propaganda?—Only the propaganda that our men can do in the course of their other duties. I have no propaganda staff and so far the total amount allotted for propaganda work has been Rs. 1,000.

19286. You cannot possibly organise propaganda work on Rs. 1,000?—Finance is the stumbling block whenever one wants to do it.

19287. Mr. Kamat: In this note on the improvement and care of cattle in Bengal, you have given us some figures about the cost of fodder crops?—I am afraid the cost of fodder crops and all that have been worked out by the Agricultural Department.

19288. Are you quite sure that it has been worked out quite carefully?—That I cannot guarantee. I do not know on what basis they calculated it. That relates to the agricultural side of the problem.

19289. I believe this note bears your name as one of its authors. Do you share the responsibility?—I share the responsibility, but I cannot guarantee the accuracy of those figures.

19290. I would like to know how far these figures are correct. What is your experience of the yield of milk of cows fed on grazing and on fodder crops? Does feeding on fodder

P. J. Kerr.

MO Y 13—8

crops raises the yield by 100 per cent. or 200 per cent?—I should not expect more than double the milk from a particular animal in one lactation. Even with good feeding for a series of years, I do not think you can get much more than double. That has been our experience with the country-bred bul fed on fodder grown here.

10201. As a veterinary officer you will say that by feeding on fodder crops the utmost difference it makes in the yield of milk is double. We are told here (*The Improvement and Care of Cattle in Bengal*) that four cows fed on common grazing ground yield milk worth about Rs. 125; six cows fed on fodder yield milk worth Rs. 247.50. I find it works out to five times the yield?—I do not think it is intended to imply that. The point is the crops grown on that area would feed six cows which would give that amount of milk. I do not think there is any suggestion that you are going to convert a 2½ cows into a 12½ cows cow.

10202. But the practical effect of that statement comes to that. I believe when agricultural officers or veterinary officers give to the public information affecting the crops they ought to be more careful to see that their figures are fairly correct. You state that in no case would the yield of milk be more than double. Here, in a book on propaganda for the raising of fodder crops, it is stated that the yield will go up five times. It seems to be an extraordinary proposition? That is an interpretation which could be put upon it, but not the intention of the note.

10203. What is not the intention?—It is not the intention to convey that you can get a 2½ cows cow to give 12½ cows by feeding it on fodder.

Sir Henry Lawrence. Where are you quoting from?

10204. Mr. Kaurt. From the note issued for the public (*The Improvement and Care of Cattle in Bengal*) we are told, "Four emancipated cows on grazing ground will produce 1,000 warrs of milk per annum, valued at 5 seers to the rupee, Rs. 125. Six cows fed on fodder crops with 3½ seers of grain a day in addition will produce 7,500 warrs of milk per annum valued at Rs. 247.50." Which means five times as much per cow. The witness says that an ordinary cow, even with fodder feeding, would not yield more than double. I think that is misleading the public, and requires modification?—It requires modification if it can be interpreted in that way; certainly.

10205. Rai Balabur Bannerji. These cattle-breeding farms are under the management of the Department of agriculture. If it be placed under the Veterinary Department, will it improve matters?—It is difficult to say that. We have only one Province, the Punjab, in which cattle-breeding is under the Veterinary Department, and there it is certainly prospering. But they have had an Expert Officer there from the very beginning, Colonel Farmer, and after him Mr. Bransford, also a Cattle Expert, for many years, they also had the benefit of plenty of funds. I think it is more a matter of the individual officer directly responsible than the department. At present we have not the necessary staff. I think you will be rather duplicating your agency, because the farms now belong to the Agricultural Department and are used for agricultural purposes as well as cattle breeding. In this Presidency the Veterinary Department and the Agricultural Department help each other as much as they can, and my suggestion, when the new Cattle Expert comes, is to work still more closely together. I am not, therefore, prepared to advocate transfer of cattle-breeding.

10206. As regards your *thana* scheme, all the Unions in the *thana* will co-operate to maintain a veterinary assistant and a dispensary?—That is actually suggested in the Faridpur district of which I am speaking. The members of the Union Boards held a meeting at the headquarters about three months ago, and they all agreed to open a dispensary at the Police headquarters. They asked whether we would help them to carry out the project. They arranged that the Union Board where the *thana* is situated should pay a higher contribution and those more remote should pay less and those most remote still less. Roughly they have to find Rs. 2,000 per annum between them, and I think it worked out to subscriptions varying from Rs. 200 to Rs. 300. Such proportions are feasible only where the Union Board funds are sufficient to devote Rs. 250 or Rs. 300 per annum to this work.

10207. When the Union Board funds will not admit that, do you think the District Board or the Government should come to their aid?—I think in this matter the District Board should come to their aid.

10208. And not the Government?—No. I have looked on this clinical work as of local interest and if the Union Boards are unable to carry on, it is of district interest, and they should apply to the District Board for help; they will also probably require the District Board to help them with their sub-divisional veterinary officers and with such appliances as the poorer Union Board hospitals will not be able to afford. I propose

Mr. P. J. Kerr,

that they should work mutually helping each other, and they should appeal to the next Local Self-Government unit above them, either the Local Board or the District Board as the one may be for assistance.

19299. Supposing a District Board, although it has a very strong desire to help an institution like that, has not the funds at its disposal, should not the Provincial Government come to their aid?—I am not altogether sure of that, because I have never been able to fathom the District Board finances. The District Boards have funds for one thing and not for another, and I should leave it to Government to decide whether the local authorities have put forth their best efforts and if they are unable to do more, I think Government should come in and help if Government are convinced that the local authorities can do no more.

19300. *Sir Thomas Middleton*: On the question of the yield of well-fed and badly grazed cows, to which Mr. Kamat referred, I take it that no actual experiment was carried out add that the figures were only illustrative figures?—They are illustrative figures.

19301. Now, if we take your illustration it amounts to this, six cows which are reasonably fed would give 2,500 lbs. of milk each per year. We have had a good deal of evidence in going round the country that you can pick out, from most ordinary Indian breeds, animals which if reasonably fed will produce 2,500 lbs.; we have also had evidence that selected animals from these will rise to 5,000 or even 7,500 lbs. per year. So you have used an illustration which is not unlikely, viz., that from six cows you can get the quantity of milk which you have put down here. We have no information yet as to what the yield of milk may be of starved cows. I should not expect over 500 lbs. ?—Starved cows give half a score, 1 lb.

19302. The point is that your figures were not based on experiment but were given as an illustration?—It is only an illustration.

I think Mr. Kamat's point is a good one, that it would be very desirable that you should have experiments indicating the increase that was got under improved feeding and publish the actual results of the experiment rather than illustrations which might be challenged.

19303. I have read with much interest this pamphlet (*The Improvement and Care of Cattle in Bengal*), and there is one question on it which I wish to ask you. You are referring to the feeding value of grasses on the average grazing ground in Bengal. You say, "Such sustenance as there is in the grasses is consumed in the effort of digesting them; there is no surplus available for body building or milk producing". What is the basis for that statement?—There is so little grass that they have to walk miles and miles to feed; that is the idea that is meant to be conveyed. They have to graze over perhaps five miles to get a feed, or spend the whole day in collecting one feed, when they ought to have had two.

19304. You are referring to the quantity?—To the quantity and the amount of work they have to perform in order to get sufficient food, and that is the position for the larger part of the year. Just after the rains there is plenty, but it does not last long enough for the cattle to put on condition. You will see that for about two months they are well-gorged animals, and the owners can collect to carry home a sufficient quantity for the night feed; as a result not a few of them look well nourished, but very few of them get good feed long enough to enable them to put on any lasting improvement.

19305. I understand your point. I thought you were referring to the quality of the material?—Some of the grass here is very good; *dhub* grass is very good and there are other kinds which are also quite good; but they do not last long enough; they flower quickly, after the rains and once they flower their nourishment is gone.

19306. Would you agree that there is no grass of which, if enough of it were consumed by the animal, there would be no surplus available after the digestive process had taken place?—Grass of that quality can be grown for a short time, and if irrigated you can grow it for a longer time, but if you have irrigation facilities, it is not worth while making pasture. During the monsoon there is plenty of grass, indeed more than the cattle can eat, but after the monsoon it dies down; if it were possible to save it, then you could keep a cow all the year round on it.

19307. I do not know whether you are familiar with the terms used in connection with the valuation of these fodders, but your statement here amounts to the assertion that the starch equivalent value of the grass is zero?—I am not actually acquainted with food values.

I understand the sense in which you are using the expression; I was not clear on that point.

Mr. P. J. Kerr.

19308. You have referred to the possibility of using the jail herds for improving the breeds of cattle. Are not these jail herds kept exclusively for milk production?—That is the idea, to provide milk for invalids and so on in the jail; there is hardly over any surplus of milk for ordinary prisoners; it is for the sick, the weakly, and so on; there are 10 to 12 animals in a jail.

19309. For these herds, the ordinary dairy type of bull would be wanted, so that you would not breed good draft animals?—At present they are an absolutely mixed herd; you will see cross-bred English, the Montgomery and indigenous cows. Any good cow that they could procure they got. You will find cows varying from 500 to 1,000 lbs in weight standing side by side. Size has no relative value from the milk yield point of view; they give a seer and a half to two seers and a half whether big or small.

19310. What is your idea of the type of bull that should be used in connection with those herds? Is it the Sindhi?—My opinion is that that is the type of animal which we want down here. It serves for average labour purposes, and it is one of the good milking breeds of India; and if we can only benefit by that, we could possibly get a dual purpose animal. Whether we can produce a dual purpose animal or whether we will have to have two kinds of animals for the two different purposes still remains to be worked out in this Presidency. The objection to the Sindhi breed, from the veterinary point of view, is their susceptibility to rinderpest; susceptibility is as 60 to 20 as compared with the plains animal.

19311. I think you mentioned the fact that a certain amount of breeding of dairy cows was going on in the hill districts in Bengal?—Yes.

19312. What is being done there, are they using the cross breeds?—They are pursuing no very definite policy up there. The Kalimpong Home for children, which is a charitable institution, has about 700 to 800 indigent children. The institution is trying to run its own dairy. They had presented to them, some years ago, six Ayrshire cows; now there only two remaining. From these they had a number of bull calves, which they distributed or sold locally to the hill people, and you can see the effects of these bulls on the local cattle; you will come across the Ayrshire colouring and in many cases humpless animals. They have been breeding a mixed herd of good milking hill cattle which they have crossed with the Ayrshire bulls; they retained the heifer calves to see whether they would come up to their requirements; if they were poor, they sold them to the local inhabitants round about.

19313. Are they making any systematic attempts at improvement?—No. As far as I understand, their idea is to keep going a half-bred milking herd.

19314. You suggest that in connection with these cattle farms it would be desirable to employ veterinary graduates to look after the stock?—That is rather a loose statement. With regard to the farms which are now under the Agricultural Department, I would leave them there. My point was that I would like to have a veterinary surgeon to look after their feeding and their treatment in health as well as in sickness.

19315. One veterinary surgeon for about how many cattle?—In Rangpur the farm has about 200, and I think in the Dacca farm it is about 100; I do not know actually the number of the Dacca herd.

19316. Are there any special conditions in India which make it desirable that a practice we have not adopted in Europe should be adopted here?—My impression is that the Indian who has spent three years learning about animals would much more easily learn animal husbandry than the man who has had a general agricultural training, plus dairy training, and perhaps a further course on animal husbandry.

19317. I think that is rather a special condition which does apply to India?—The point is that we cannot draw on men from the hereditary breeder class, who know a good animal when they see one, and understand cattle generally.

19318. Hereditary breeders do not exist here?—No, not in Bengal.

19319. There are other points which I would suggest to you. The incidence of disease is relatively much higher here than in England?—Yes.

19320. The difficulty of getting professional assistance is very much greater here?—Yes. In Dacca for instance, there is a veterinary assistant in charge of a hospital, he is always at the call of the farm there, but as a matter of experience we found that the officer in charge of the farm has not appreciated the necessity of calling him in except for emergencies. He does not always do so for minor things. He does not see the necessity of taking action except in case of emergencies.

19321. *Sir Henry Lawrence*: In connection with the control of contagious diseases, you recognise, I think clearly that the question of notification is the trouble?—I have found

Mr. P. J. Kerr.

that trouble not only in Bengal but in every other Province; it is almost universal in India. If there is a delay of three or four days in notification, no penalty attaches; or, if they lose sight of it altogether and never send up any notification, again there is no penalty attached. It is a matter which wants taking up thoroughly, I believe the same absence of notification of disease and death is found in the Medical Department. That is why I have put in a note that the agencies used for the notification of cattle disease may equally well be adopted for human disease.

19322. I have some difficulty in understanding the means by which you would penalise people like the Chairman of Local Boards and Unions, etc. What machinery would you suggest?—It is for Local Self-Government to devise some methods of penalising; I cannot possibly do that.

19323. It is perhaps fortunate for you that you have not to devise methods for the purpose?—The difficulty under Local Self-Government is that, however essential a measure may be, Government are not in a position to insist upon it and enforce it; it is more or less moral persuasion.

19324. What is the system of notification in England, for instance?—The agency at Home is the local Veterinary Surgeon; if he fails to notify any scheduled infectious disease, he is penalised. He has to report to the local police, the local veterinary inspector is sent and has to diagnose the case, and after he has diagnosed, if it is more than one case, the whole matter is taken out of his hands and dealt with by the central authority.

19325. *Dr. Hyder*: You import a large number of Montgomery cows and Sindhi cows from the Punjab?—A large number are imported privately; we have a large market for them in Calcutta.

19326. Has the Milk Union got any of them?—It has got some Sindhi bulls, not many; they have been bought as an experiment, and were selected by the Imperial Dairy Expert; they come of a milking family. The experiment has only started, their first batch of calves are to be shown in January next year, 1927, and we want to see the effect of the cross with the local animal.

19327. It is alleged that the calves of those cows which come from the Punjab and Sind do not thrive in the climate of Bengal and Calcutta; is that true?—The Montgomery breed has given trouble at times, but one cannot make a sweeping statement like that. They must be kept under good conditions before an opinion can be given. There are Europeans who keep these animals, but even so conditions are not ideal, as a rule they are over-fed. The other accusation against the Montgomery breed is that it milks heavily but for a short period, and that there is a long dry period. I have had numerous complaints from people that they could not get the cows to hold to the bull again; they take the bull but they seem to have gone barren for no reason that one can give.

19328. Have you come across any disease, or dysentery from which their calves suffer?—Diarrhoea in some cases, sometimes white scour. The former is usually a result of wrong feeding.

19329. Over-feeding?—I should think it is usually from under-feeding; so much milk is wanted for sale that the calf is kept fasting too long, and then gets a large feed.

19330. Tell me as an educated man what you think of these indigenous cow doctors; do they know anything or are they purely bogus?—My general impression is that the whole lot almost without exception are rogues. They are very much like the camel doctors of whom I had experience as a military officer. They practise firing the rump of an animal to cure it of disease affecting the head.

19331. *Sir Henry Lawrence*: You mention that the susceptibility of Sindhi cattle to rinderpest is 16 to 20 per cent. greater than with other cattle?—Yes.

19332. Where do those figures come from?—They are issued from our headquarters, Muktesar. Where 20 to 40 c.c. serum would be a sufficient dose for an ordinary plains animal, a Sindhi beast of the same size requires 60 to 80 c.c.; to a hill beast 90 to 100 c.c. and a European beast of the same weight one would give 250 c.c. (i.e., per 600 lbs. body weight). That gives a relative idea of their susceptibility.

19333. Where are those figures collected from?—I cannot tell you how they were worked out. They have been issued to us for five to six years now as a guide for the serum-simultaneous method.

19334. Do you regard those figures as a satisfactory guide?—They are all the guide we have and I have found them satisfactory. I have no cattle in my charge with which I can experiment; in doing this inoculation my tendency always is to overestimate the protective dose of serum rather than underestimate it.

Mr. P. J. Kerr.

19335. Toko the case of the susceptibility of the European animals; on what number of cases would that figure be based?—A large number of military dairy cattle has been done. I cannot say how many. Pusa has also been importing cattle.

19336 You think the results are carefully collected at the source and communicated to Muktesar?—The method of their collection I do not know; I have never been stationed at Muktesar.

19337. As experience has increased, have you had the percentage table altered?—We have not so far, but the results of further experiment are sent down to us periodically. For instance, at first they told us it was not safe to inoculate an animal after she was three or four months pregnant later this was modified. It may still be so with European stock. With country cattle you can inoculate an animal that calves during the ten days it is in the inoculation pen without any ill effect; it has happened several times here. We tried it with Government animals to see whether it was safe; a number of animals that were due to calve within a fortnight were given the usual dose, there was no disturbance at all and they calved perfectly all right.

19338 Do you find that these doses are in fact suitable?—Yes, they are. There were very few reactors in the pure plains animals. The doses advised are calculated to blot out all reaction and it does so in most cases, save perhaps a slight febrile reaction at the third or fourth day after the virus is given.

19339. *Mr. Kamat*: Can experiment as to fodder feeding be of value unless it is conducted on the same strain of cattle; it is no use telling the cultivator that some other breed of cattle gives a large quantity of milk when fed on a particular fodder. Do you agree?—Certainly.

19340 My point is that it is no use for purposes of comparison telling the milkmen that some other herd of cattle gives as much as 5,000 lbs of milk per head. What you must prove by your experiment is that the same strain taken on dry common grazing may give that quantity of milk if put on fodder feeding. Do you agree?—Yes, I see your point.

19341. For purposes of comparison you must take the same strain of cattle?—Yes.

19342. You also agree that agricultural propaganda suffers in the eyes of the cultivators by over-statement and by giving as instances the most favourable cases?—I see the point.

19343 *The Chairman*: You know that it is proposed to appoint an animal improvement officer in this Presidency?—A Cattle Expert.

19344. Yes, if you like to call him that?—Yes.

19345 Do you yourself think that a Cattle Expert ought to be under the Agricultural Department or under the Veterinary Department? I do not think it matters which.

19346. You do not hold any strong views on the matter?—No, I have no strong views on that matter.

(The witness withdrew.)

**Mr. PRABHAT CHANDRA CHAUDHURI, Deputy Director of  
Sericulture, Bengal, Berhampore (Murshidabad)**

**Replies to the Questionnaire**

*(Answers have been dealt with from the point of view of Sericulture)*

**QUESTION 1.—(c)** Although the present programme of the Government nurseries about the issue of disease-free seeds of indigenous multivoltine varieties of silkworm is essential to success in silkworm rearing, it is nevertheless true that the production of cocoons to be successful for any industrial use, is controlled to a large extent by the natural limits of climatic conditions in the rearing areas. From a sericultural point of view it has been observed that even localities situated at a distance of 30 to 40 miles apart exhibit marked difference in climatic condition and the rearing of the same variety of silkworm during the same season will imply a good crop in one locality and failure in the other area. To utilise the productive capacity of each variety of silkworm to the fullest advantage it may be useful to undertake the following investigations in addition to the present programme :—

(1) Climatic survey of the different rearing areas to study the variation in temperature, humidity, rainfall, directions of wind, etc., with a view to determine the best periods of rearing.

(2) The production of cocoons of the different breeds of silkworm—indigenous and exotics,—during different seasons with a view to determine the best yielding variety of silkworm for each season for that particular locality.

**QUESTION 2.—**Since 1910 the Sericultural Department has been providing one year's course on sericulture to the sons of professional silkworm rearers at the Berhampore Sericulture Nursery and the Rajshahi Sericultural School. The Bengal Silk Committee has recommended the transference of the Sericultural School at Rajshahi to the Pasbari Sericultural Nursery in Malda as it has been found that the boys trained in the nurseries are better equipped for taking up the profession of silkworm rearing.

(i) Yes; training in Government nurseries will require only a small additional staff.

(ii) Yes; in all silk-rearing districts, owing to the demand for training, primary classes have been started in most of the Government nurseries for training the younger sons of the rearers up to the lower primary standard with practical training in sericulture. These classes are receiving contribution from the District Boards.

(iii) A literate rearer who has served in a Government nursery may be preferred for teaching in rural area, but I do not think that any restriction will be useful.

(iv) The attendance in the sericultural classes is less numerous than in the past owing to rise in wages of labour. With a stipend of Rs. 10 per month as is now paid to the sericultural students, the boy is not contributing towards the income of the family. Recently the Bengal Silk Committee has recommended the taking of sons of rearers as labourers in the Government nurseries at the rate which is paid to the higher type of labour now employed. These students are made to work in the nurseries and to perform all the work involved in running the nurseries. The demand for such training will be greatly increased if a guarantee for loan free of interest for three years and thereafter at 6½ per cent. interest may be given to the successful students for the improvement of their rearing houses and starting model nurseries for seed-growing in their villages.

(v) The grant of a reward of Rs. 400 to each successful student as is paid at present for the construction of rearing houses and working as seed-growers. Service in a Government nursery is also an attraction.

(vi) Pupils in sericultural schools are mainly drawn from the rearing classes.

(vii) I do not think that the present course of study in the sericultural schools requires much modification.

(ix) The majority of students who have studied sericulture are working as silkworm seed-growers in their villages.

(x) Sericulture to be made attractive to middle class youths should offer them employment in Government nurseries. If a few seats are reserved for middle class youths in the sericultural classes in the Berhampore or Pasbari nursery they may compete for the reward of Rs. 100 or loans free of interest for a period of three years and thereafter at 6½ per cent may be granted to the successful students to start seed-rearing nurseries. Even then, the middle class youths are not likely to succeed if they take up sericulture as a profession unless the department undertakes the supervision of their work and also arranges for the marketing of their produce. This has been experienced in the case of several gentlemen who have started nurseries for silkworm rearing.

**Mr. P. C. Chaudhuri.**

(xii) The adult rearers are mostly illiterate. They should be taught by demonstrations and observations. Lantern lectures on sericultural subjects will be useful. This department has already prepared a series of lantern slides on sericulture with reference to rearers' needs and demonstrations on these lines will be shortly introduced.

QUESTION 3.—(a) At the Bengal Silk Committee meeting held on the 6th May 1926, Mr. Peddie (Collector of Malda) emphasised the need of taking up demonstration and propaganda as he considered that the department was performing only half its function if it merely confines its attention to the production of disease free seed which is taken to houses infested with disease and thereby lost in the first generation. Although this has been keenly felt for a long time, no steps could be taken to improve the rearing in the villages and to demonstrate the improved methods excepting in the case of the seed-growers who are growing seeds under departmental supervision. In view of the urgency, work was started since May 1925 in a few villages through the staff in the nurseries. The enquiry of the Director of Agriculture, Bengal, and the Collector of Malda showed that the demonstration was highly successful as in several villages where the rearers had complained that they had failed previously to get any crop, the crops reared under departmental supervision were highly successful. Similar tests in different areas showed that the output of cocoons may be increased by 25 to 40 per cent. through proper guidance during rearing and the adoption of preventive measures against outbreak of diseases. In view of these striking results nine posts of demonstrators and one District Inspector have been sanctioned for the district of Malda during this year and the work has been started since August 1926. The silk area in Malda has been divided into nine blocks under one demonstrator in each centre. The duties of these officers consist in the training of the rearers and supervising their rearing to adopt timely preventive measures.

As a result of these demonstrations, many rearers have now fitted up the doors and windows of their rearing houses with wire nets to prevent the attack of flies and at the same time to have proper ventilation which was a serious defect in the past. The sale of sulphur disinfectants and wire nets in these areas are increasing. Each demonstrator has under his charge sufficient stock of these articles for sale amongst the rearers. The Collector of Malda is considering the question of granting licences for local sale of sulphur as at present a rearer has to travel a distance of several miles to secure a piece of sulphur from the town.

(c) The rearers are quite eager to follow departmental advice and instructions. The improvement in sericulture will depend considerably on the improving of their rearing houses and appliances. The grant of loans through co-operative societies for purchase of materials or the sale of these articles on the hire purchase system will probably be helpful. Several societies have been started and arrangements have been made to secure wire nets direct from the Calcutta dealer so that they may get these articles in Malda at Calcutta price.

(d) In 1921 the Collector of Bankura requested the Director of Agriculture, Bengal, to take up investigation on the improvement of silkworm rearing as the industry was practically getting extinct and the rearing areas were proscribed under the "Criminal Tribes Act." By supply of disease free seeds from the nurseries and supervising the rearing in each rearer's house the yield of silk from the same area under mulberry was raised from three seers of silk to six seers. The rearers were very unwilling in the beginning to follow the instructions of the officers and even refused to take seeds free of cost. The success attained in one village has now been extended to other villages and at present the rearers in 27 rearing villages in this district are purchasing departmental seeds at the usual rates. In view of the striking success of demonstration in Purnasole village the Superintendent of Police requested the Director of Agriculture, Bengal, to start demonstration in Siromouipur as he apprehended that the rearers would take to crimes through decline of their silk trade. The moral effect of demonstration in Bankura is evident from the decrease in crimes in these villages. In cases where failures have been noticed it has been due to neglect in observing instructions and keeping the worms poorly fed to rear more worms than is desirable. In fact in most of the rearing centres, the silk-worms are given less nourishment than is necessary.

During my recent visit to the village Dharampur in Malda on the 16th November 1926 one rearer Janeswar Das told me in the presence of other rearers that his worms had an attack of muscardine at the third moult and the crop was saved through the timely precautions adopted by the demonstrator. By fumigation with sulphur, washing the rearing appliances with copper sulphate solution and by daily cleaning of litters with threadnets this rearer could get three maunds of cocoons where previously, if a similar occurrence happened, the crop was a total failure.

Similar cases have been successfully remedied in the demonstration centres in other areas in Malda, Murshidabad and Birbhum, etc.

Mr. P. C. Chaudhuri,

QUESTION 6.—(a) (i) The survey of the silk industry in different silk rearing districts has only been started since September, 1926. Up to date we have not been able to survey more than one-third of the actual area in the district of Malda and Murshidabad. The figures given by the rearers about their income and indebtedness are seldom reliable. Some may show their indebtedness to be more than is actually the case in the hope that they may get some special loans at concession rates from the Government. Others may on the other hand conceal the real facts in the apprehension that they will lose their credit. From the surveys made upto date I am inclined to consider that the indebtedness amongst the silkworm rearing population is much less than in the case of the reeler and weavers. The causes of borrowing may be attributed to:—

- (1) Social custom, e.g., marriage dowry. Amongst the rearing classes—the *poundarikas*—the man willing to marry has to pay a certain amount to the father of the girl. This value is less for a little girl than a grown up one. Consequently in the start of his life a rearer has in most cases to begin with debts unless he has sufficient savings. The high interest also increases his liabilities.
- (2) Illiteracy of the rearer and the want of foresight to meet his expenditures within his income. The rearers in the villages adjoining towns are taking to indulging in luxuries which they could have easily avoided if they had a little less credit to borrow from the village *mahajans*.
- (3) The debt of the rearers is mostly a running debt incurred for the price of seeds and purchase of leaves repayable at the end of the harvest. If he has a good harvest and can sell his cocoons at a fair price he pays the total dues with interest. Otherwise this is carried over for two or more crops.

(ii) The sources of credit are mainly the village *mahajans* excepting in places where the people have organised rural co-operative societies. Many rearers also get credit from the reelers in advance for their crop.

(iii) The village *mahajans* are to a great extent responsible for the non-payment of the debts as until they know that it is not safe to continue lending, they will seldom give reminders for the payment of the capital. In many cases interest is allowed to accumulate so that the whole property mortgaged may be secured at nominal value. The rearers who receive advances from the reelers usually have to sell the cocoons at a very cheap rate in comparison to market price, thereby reducing his profit.

QUESTION 17.—(a) The system of mulberry cultivation as bush plantation prevalent in Bengal enables a rearer to get from four to five crops in the year. He can get work for the whole year if he carries on silkworm rearing on a large scale and produces all the leaves required in his plantation and maintains his paddy lands and other agricultural crops for his family consumption. In view of the fluctuating condition of the silk market and also owing to the need of great watchfulness and practical experience in the management of the silkworms, it is not wise to recommend such a step. It is safer to take up sericulture as a subsidiary industry unless one has sufficient experience in this work and capital to lay out for the purpose. In Malda, sericulture may be considered to be the major occupation of many cultivators specially in areas where there are high lands without facilities for irrigation. But even in such cases after a mulberry plantation is four to five years old, mango plants are set in such plantations and the mulberry plantation abandoned after the mango trees are grown to a height to make mulberry growing impossible in the shade. Similarly old mango gardens are reclaimed to be set in for mulberry plantations.

The female members in a rearer's house usually spin *matka* yarns from the pierced or rejected cocoons as a subsidiary occupation. Many rearers have also one or two reeling basins to utilise the spare hours for reeling.

(b) It can be stated without hesitation that silkworm rearing is highly suitable for introduction as a subsidiary occupation by growing mulberry as trees or for making hedges marking boundary lines on lines similar to what has been adopted in Japan. It is estimated that one-fourth of the entire quantity of mulberry leaves used in the silkworm industry in Japan, i.e., about five million pound worth of raw silk is produced by this means. Spinning of pierced cocoons (*matka* yarn) and the reeling of cocoons may be introduced in these areas after silkworm rearing has been sufficiently extended. Growing of mulberry tree will imply at least a period of four years and as hedge plants three years before silkworm rearing can be taken up. This period may be reduced by supplying two years old plants for trees and one year old ones for hedges. It is doubtful if the extension can be done without free distribution of plants and also giving loans for making fences to guard against cattle. Hand spinning of pierced cocoons (*matka* yarn) and reeling of cocoons may be introduced after the silkworm rearing has sufficiently extended in the area. This will solve market difficulties regarding the sale of cocoons.

Mr. P. C. Chaudhuri.

(c) The obstacles in the way of extension of sericulture in areas where silkworm is reared are :—

- (1) High rent of mulberry land in comparison to agricultural crops; e.g., in Murshidabad the rent of mulberry land is from Rs. 5 to Rs. 10 per *bigha*.
- (2) The gradual disintegration of the joint family system in villages.
- (3) The heavy cost of cultivation under the bush system—higher wages of labour and the increase in the price of condung for manures.
- (4) Disunion in villages as compared to the past. Many rearers have complained that they are losing their silk crop through fly-pests as all the rearers in the same village are not rearing the same stock of the same dates of spinning with the result that the fly-pest is able to find a ready host throughout the year. There are many such salutary measures in village life which are greatly neglected in the present day.
- (5) Scarcity of labour for cultivation and rise in wages. Many big rearers are experiencing this difficulty.
- (6) Want of commercial organisation and proper marketing facilities.

In the extension of sericulture in new areas although the mulberry plants may thrive well in these localities, the first determining factor should be the tests with silkworm rearing. If worms can be grown successfully and the economic factors are also suitable, the chief obstacle will be the marketing of the cocoons until there is local manufacture of silk yarns and fabrics.

(e) The starting of silk-weaving factories in areas where silk reeling is prevalent will give them subsidiary occupation and also induce them to reel better silk according to the requirement of the weaving concern. If weaving factories are established in areas where silkworm rearing is extensive, it may induce the silkworm rearer to reel the cocoons to be able to sell yarns direct to the weaving concerns. The unemployed boys in the village may find employment in the weaving factory.

(f) Yes; I would suggest particularly the need of introduction of improved hand-spinning appliances for *malla* spinning, improved appliances for reeling and twisting of silk, improvement of handlooms.

QUESTION 20.—(a) The existing market facilities for selling silk cocoons and yarns are very unsatisfactory and the rates are always fluctuating according to the terms offered by the middlemen.

The sale price of silk cocoons is controlled by the price offered for silk yarns. In the absence of an organised local market for silk yarns through the decline of the silk-weaving industry, the bulk of the silk yarns reeled in this Province are sold to other Provinces through the Marwari businessmen who have practically the monopoly of the silk trade in the present day.

The Marwari merchants offer a rate to the reelers who depute their agents to the silk rearing villages to secure cocoons at a rate not exceeding a rate fixed by the reeler. The agent will no doubt keep something for his profit and offers as low a rate as possible to the rearer. Where the cocoon rearers have reeling in their neighbourhood, the profit of the reeler's agent can be reduced by dealing direct with the reeler.

In his dealings with the Marwari merchants for the sale of his silk yarns, the reeler cannot always place confidence on the rates offered as it has been found that in many instances after he has brought his silk yarns to the godown of the Marwari merchant, the latter tries to force the reeler to part with his goods at a much lesser rate than he had originally offered. In this passage of sale from the cocoons to the silk yarns it often happens that the goods have to pass through two or three intermediaries to the loss of the actual producers. Of these the village sub-agent for collecting cocoons and the agent of the reeler are superfluous intermediaries.

A proposal for the establishment of a silk union is now under the consideration of the Registrar of Co-operative Societies so that the reelers may sell their yarns direct to the weaving concerns in other Provinces and secure loans on cheaper interest to be able to carry on their reeling and rearing concerns without negotiating through middlemen. If this silk union is started it will probably result in the starting of similar organisations on co-operative lines to the improvement of the industry. The extension of silk-weaving will also help to remove the marketing difficulties.

(c) (i) The Indian market is principally concerned with the use of the silk yarns by the handlooms and is carried on without any rigid restrictions as regards grading of the yarns into proper sizes.

Mr. P. C. Chaudhuri.

(ii) The export trade is entirely dependent on proper grading. For the development of the export trade the establishment of a Silk Conditioning House in Calcutta will create confidence in foreign markets.

QUESTION 22.—(a) (i) The Government departments may help the co-operative movement by propaganda work and demonstration of improved methods.

(ii) Educated non-official agencies may start societies including a certain percentage of illiterate members and if they work with a real desire to do good to these backward classes, they can help a great deal towards the movement.

(d) Speaking of the silk societies, I am of opinion that these societies have been of great help towards the improvement of the condition of the members. Through the efforts of the sericultural officers many proposals for such societies were sanctioned by the Registrar of Co-operative Societies. At present, the Sericultural Department is concerned only with the submission of the proposal for the silk societies. If the sericultural officers were associated with the supervision and working of these societies much more improvement could be introduced than is possible under the present arrangement.

## Oral Evidence

19347. *The Chairman* Mr. Chaudhuri, you are Deputy Director of Sericulture in the Presidency of Bengal?—Yes.

19348. You have put in a very interesting and complete note on this important topic and I have very few questions to ask you. Do you wish to say anything to supplement what you have written, before I proceed further or shall I begin to examine you at once?—My difficulty is that the Questionnaire deals mostly with agricultural matters, and I had to answer those questions with reference to sericulture.

19349. I think you did it very aptly if I may say so. I do want to get from you, if I can, your estimate of what sericulture is capable of bringing in as net revenue, or as gross revenue, whichever way you like to give it, per acre to the sericulturist. Have you got those figures?—Yes. I have the figures for representative villages of the rearing districts.

19350. Let me ask you one or two preliminary questions first. In this Presidency, is the land on which the food plant is grown irrigated?—As regards mulberry there is seldom irrigation, those lands which have no facilities for irrigation are especially taken for mulberry growing.

19351. Is any mulberry grown on irrigated land?—Very seldom. The rearers here use for mulberry growing those lands they cannot cultivate for agricultural purposes.

19352. Is not the ordinary rainfall amply sufficient for mulberry in the silk-growing districts?—No, irrigation will improve it; but the rearers have so arranged their crops that they do not suffer much in that respect.

19353. You mean they have so arranged their other crops?—No, we have crops four or five times a year, and so it is continuous all through the year, unlike Europe where they have only one crop.

19354. I do not understand how that arrangement makes the cultivator less dependent upon the season?—As regards the mulberry production I think they are less dependent upon the season, whereas with regard to worms they are very much dependent upon the season. It so happens that at the time when they have the largest outturn of mulberry leaves the worms suffer most from diseases; that is the time when the worms will do very badly.

19355. So that matter even themselves out and it is the case that over any ten years the cultivator is more or less independent of the season; is that the position?—Yes.

19356. I am not sure I have understood your point?—My point is this, that with regard to mulberry cultivation the rearers of course arrange their crop in such a way that when they get most mulberry leaves they rear. They get from the same plant five crops a year. From the same unit of leaf consumed, the silkworms are seen to yield more silk in March-April than in July when there is more rainfall and the yield of leaves is greater.

19357. *Rai Bahadur Bannerji*: What is the custom when a cultivator commences growing mulberry? He gets the cuttings and puts them in his field, say, in the month of July?—He plants the cuttings in September.

19358. Now this plant which is put in the field in the month of September grows to the stage when it will admit of the leaves being cut by the month of December?—The first pruning will be in 6 months.

19359. Do they get only one cutting out of it then?—Yes, there are five crops. If the first crop is in March the second crop will be in May-June, and the third crop in July.

19360. *The Chairman*: What happens in a bad year when the rains fail?—The leaves turn yellow, and have to be rejected.

19361. Now, can you give us these estimates of profits per acre?—I have taken one village in Malda where there are 32 rearers on a total area of about 133 bighas; the net income per acre is Rs. 200.

19362. Is that dry land?—Dry land.

19363. It is interesting to notice that that is precisely the same figure as that which we got in Mysore from the expert in that State, except that in that case it was an estimate of the money yield per acre on dry land as a part-time industry. Is this a part-time industry or not?—It is difficult to say, it is practically part time, because when they feed the worms they have not got to do other work.

Mr. P. C. Chaudhuri.

19364. Can you give an estimate of the difference in net profit per acre between this industry carried on as a whole-time industry and the same industry carried on as a part-time industry?—I think as regards the Malda figure, that can be taken as a part-time figure.

19365. You do not think it makes much difference?—No.

19366. They get the full amount of crops?—Yes.

19367. When you are talking about net profit, are you subtracting from the total gross profits an allowance for the cultivator's own labour?—I have deducted the cost of manure, the cost of cultivation, the price of leaves (sometimes they have to purchase leaves), the price of seeds and the rent of land; the rent of land is usually about Rs. 15 per acre here.

19368. You have deducted nothing for the cultivator's own labour?—That comes under the cost of cultivation.

19369. The labour charges are included under cultivation, are they?—Yes.

19370. The whole of the labour charges?—Yes, except the feeding of the worms; that we could not calculate, because all the members of the family join in and feed the worms early in the morning at 3 o'clock, and then once again at 1 o'clock in the afternoon and again at 9 o'clock at night. That does not come in the daily labour; that is the only thing that we have not calculated.

19371. Is the practice here to do a certain amount of reeling in the cultivator's house?—There are many cases like that. In fact, that is the way in which the industry is carried on at present. We made a survey in 1922 and we found steam filatures had got 2,000 working basins, that is on a factory basis. The cottage working basins numbered 5,000.

19372. You have you organisations dealing purely with reeling?—No.

19373. Have you commercial concerns doing reeling only?—Yes. They purchase cocoons from the rearers and reel them.

19374. They do not weave?—No; they sell it as raw silk.

19375. Have you many co-operative societies conducting sericulture?—We have got about 52 co-operative societies.

19376. How do they do? Are you satisfied with them?—There is no doubt that the members of those societies have been greatly benefited by this movement. We are not directly concerned. We submit a proposal and the Registrar of Co-operative Societies sanctions it.

19377. The Co-operative Department sanctions it?—Yes.

19378. Does your department keep in touch with the Co-operative Department?—Of course, we are helping by propaganda. We do not keep in touch exactly because the audit and other things and the work of the societies are entirely under the control of the Registrar of Co-operative Societies.

19379. Do you think you know enough about these co-operative experiments to tell the Commission anything about them, or would you rather not?—My experience so far as silk societies are concerned leads me to think that our department should be associated with the work of the Co-operative Department. At present we merely submit proposals. It is technical work and I doubt whether the co-operative people will always be able to keep a proper watch over them. Our people have to go to those places and I think our staff should be the supervising officers of the co-operative silk societies also.

19380. In the meantime are the co-operative societies providing any technical advice apart from your department?—No, not much.

19381. None?—Not much.

19382. A certain amount?—Very little with regard to demonstration of improved methods. In Malda, there is a proposal to start a silk union as a federation; the Collector of Malda and the Registrar of Co-operative Societies have taken up the question.

19383. Is it your opinion that this industry is capable of being extended to any important extent in the Presidency?—I think so; but the extension in new areas practically entails supervision by the Government department entirely. In new areas where there is no sericulture Government will have to do the marketing of the produce.

19384. There will be no marketing organisation?—No.

19385. How about the competition from artificial silks? Is that a very important consideration?—I do not think artificial silk is competing much with our silk.

19386. You do not worry much about it?—No.

Mr. P. C. Chaudhuri.

19387. How do you account for the fact that it is not competing?—Because we have not got much export trade. Our silk is mostly taken up by the other Provinces.

19388. But is there not a large and growing quantity of artificial silk being imported into and sold in India?—It might have had some effect on the fall in the prices of silk.

19389. There is nothing more you want to say on that point?—No. I heard that in Nagpur they tried artificial silk but the weavers did not take it up.

19390. Have you any silkworms domesticated in this Presidency feeding on any plant other than mulberry?—Yes, on castor leaves to a very small extent; but it is mostly in Assam.

19391. Do they do well on them?—Yes.

19392. *Ras Bahadur Bannerji*: You said that irrigation was not wanted for these plants; but I have seen in certain parts of Birbhum as well as Murshidabad, there are dry seasons in the summer months, April and May, when these cuttings which were put in some months before were actually irrigated?—It is only in the beginning when a mulberry plantation is newly set up. They seldom do it except in special cases. This may be a special case in Birbhum when the weather is dry they may do it. The total area here in Bengal under mulberry is 25,000 to 30,000 acres and I think we are having  $2\frac{1}{2}$  crores worth of silk. In Birbhum and such tracts, there are about 2,000 acres irrigated out of the 30,000 acres.

(The witness withdrew.)

*The Commission then adjourned till 9-30 a.m. on Thursday, the 2nd December, 1926.*

Thursday, December 2nd, 1926

## CALCUTTA

## PRESENT :

The MARQUESS OF LINLITHGOW, D.L. (*Chairman*).Sir HENRY STAVELEY LAWRENCE, K.C.S.I.,

Mr. F. W. H. SMITH.

} (*Joint Secretaries*).Rai J. M. MITRA Bahadur, M.A., Registrar of Co-operative  
Societies, Bengal.

## Replies to the Questionnaire

QUESTION 1.—RESEARCH.—(a) (i) For the proper organisation and administration of agriculture I am of opinion that each Province should have a complete expert scientific staff of its own but that there should be an All-India Research Board to co-ordinate the activities of the various Governments and to prevent overlapping and consequent dissipation of energies and funds. The Research Board should meet periodically and each Province should present before it subjects for research and the Central Board will allocate the subjects to different Provinces which are favourably situated to study them and to produce results from which other Provinces may be benefited. The Board should act as a clearing house for research and should also arrange for research work in conjunction with Universities. Grants should also be made to private individuals to carry researches on their own farms.

It is very desirable that a proper research should be made into the scientific value of the indigenous theory and traditional methods of agriculture. Even superstitions connected with agriculture have a scientific value of their own. This is particularly true in the case of sericulture where behind a series of superstitions with regard to cocoon-rearing are concealed scientific truths of very high order.

(ii) The All-India Research Board should also co-ordinate veterinary research in the same manner as has been suggested for agricultural research.

As regards financing, I am of opinion that agricultural research is a matter of such vast importance to this country that Government should allot funds from its revenue. If, however, such a course is not practicable, I suggest that a small export duty on goods going out of this country should be levied for research purpose and the proceeds should be earmarked for the object. The levy should be so small as not to affect trade in any way, particularly the interests of the producers.

Government should supplement such levy by means of annual grants but such grants, if not spent within the financial year, should not be allowed to lapse at its close. In this matter the administration of the fund should be modelled on that of the Indian (Medical) Research Association.

(c) One of the most urgent needs of the Province is to make proper research into the subject of salt water resisting paddy. I do not think that there has been sufficient research on the subject of potato cultivation. Jute also requires further research, particularly in the matter of evolving a seed, which will produce fibres that will suit both Dundee and the Calcutta mills. Water-hyacinth is another subject which requires research not only with a view to discovering how it can be eradicated but also to explore

R. B. J. M. Mitra.

its possibilities as manure and as fodder. There should also be a proper soil survey which is long overdue in Bengal.

I am further of opinion that a committee of medical experts should be appointed to determine a standard of diet to keep individuals in a minimum state of efficiency. There is a general impression that in many parts of the country agriculture suffers from a lack of proper diet on the part of those engaged in the pursuit.

**QUESTION 2 — AGRICULTURAL EDUCATION.**—(i) The main incentive to lead to seek agricultural education is Government service.

(ii) I am not in favour of school plots in connection with primary schools but such plots and farms may be attached to middle and high schools in rural tracts. Nature study should be insisted on as a means of giving agricultural bias to rural education.

(x) Agriculture can certainly be made attractive to middle class youths if it can be shown that it would pay them to take to it. But I do not like to lay too much stress on interesting middle class youths in agriculture as a solution to middle class unemployment. As I said in a speech at a Co-operative Conference, there is not enough land to go round all the unemployed middle class youths and the density of population compels rural Bengal to leave the land and move to cities or to migrate to other Provinces in order to earn a living.

(xii) Adult education may be popularised by means of night schools. In this connection I would mention that some of our co-operative night schools have been very successful. Magic lanterns and cinematographs are likely to play a useful part in popularising adult education.

(xiii) Administration of such schools as may be started should be in the hands of local bodies and the managing committees should include representatives from rural areas. It seems to me a mistake to insist upon the provision of good buildings for schools in rural tracts. I think that such funds as may be available should be more profitably employed than in putting up good-looking buildings. Some sort of school-houses may always be found in villages. In any case our students from time immemorial are accustomed to take lessons from their gurus under the shade of a tree.

I have a scheme under consideration to open primary schools in well developed co-operative areas, which will be financed out of the profits made by co-operative societies in the areas. The gurus in charge of these schools will be required to open night classes for adults and to assist secretaries of village societies in writing out their accounts.

**QUESTION 3.—DEMONSTRATIONS AND PROPAGANDA.**—(a) Demonstration of actual results before their eyes.

(b) To increase the real effectiveness of field demonstrations, it is necessary to induce cultivators themselves to undertake experiments on their own fields and for this purpose demonstrators should be allowed to advance improved seeds and manures on condition that the cost is paid after the harvest, if experiments prove successful. The use of improved implements should be allowed on easy terms. Such demonstrations on the fields should be carried on in the interior of the district and as near to *hats* as possible.

(c) Periodic lectures will be of the greatest use towards the adoption of expert advice. On the qualifications of the lecturers, on their power to approach the masses, will depend the success of these lectures. A good method of inducing cultivators to approach them is through their co-operative societies in which they have entire confidence.

Considerable success has been achieved in jute seeds, *kalia bombai* and *Chin-ura green*; paddy seeds, *katahm* and *indrasail*; and *tanna sugareana*, and potato, Nalital and Darjeeling varieties. The success is primarily due to the efficacy of these seeds though in the case of *tanna* cuttings there is a feeling that the outturn of *gur* is not very satisfactory. As regards *kalia bombai* jute, it is liked by the Calcutta mills but not by the Dundee mills and a feeling has arisen that it takes too long to mature, that the ryots are unable to cut it and utilise the land for paddy. Ryots like short crops. In many areas, on account of the failure to supply seeds at proper time, people have not taken to them and have lost confidence. But in this matter, there has been considerable improvement during the last two or three years.

**QUESTION 4.—ADMINISTRATION.**—(a) I have already made suggestion, regarding this in reply to question under Research.

It is very necessary that each Province should have a complete scientific staff of its own though it is desirable that there should be an agency to co-ordinate their activities.

(c) (i) These services are under-staffed and therefore they are not in a position to be serviceable and efficient.

R. B. J. M. Mitra.

(ii) The ryots have not derived any benefits from the rivalry between steamer companies and railways. The steamer companies so long as they are able to supply space against the interest of railways invariably do so. When combined service comes into effect charges or freights are always increased because these are arranged jointly between the two. In Northern Bengal, as there are no steamer companies the railways realise that all jute must be sent down through them. In consequence at a certain period when Eastern Bengal shipments are large the railway companies to obtain their share of profits and to compete favourably with steamer companies divert a large portion of their wagons to the Eastern Bengal system and in consequence Northern Bengal suffers. About that time big baling firms who have sufficient command of capital often purchase jute at ridiculously low rates and stock them for transport when wagons become available.

I believe there are instances when the Railway Board have insisted on steamer companies raising their rates in order that the railways might get a portion of the traffic. The railway service—I refer more specifically to Eastern Bengal, such as Dacca, Mymensingh, Jaggannathganj, Bahadurabad and also Western and Northern Bengal—is not very successful in the booking of goods traffic to Calcutta. Their present system of registration is by no means a success and can generally be evaded or infringed by questionable methods. There is far too much red tape in the railway administration with the result that members of the staff entrench themselves behind these regulations and hinder rather than assist the consignor.

It is desirable that small feeder lines, both railway and steamer, should be opened to help cultivators to market their produce. But in cases where feeder lines are not a financial success, Government assistance might be of great help for the first few years.

Unfortunately road services are very ineffective and there is ample scope for more roads. In late years owing to paucity of funds and the claims of other objects on available funds roads have been greatly neglected. The recent heavy influx of motor cars and buses on roads never intended for this class of traffic has only tended to make matters worse.

(iv) *Meteorological Department.*

The Department is too much centralised and there should be a wider diffusion of warnings than at present.

(v) *Posts and (vi) Telegraphs.*

Post and Telegraph Offices ought to be more efficient. With code telegrams the percentage of mutilated telegrams is too high.

QUESTION 5.—FINANCE.—(a) I think the only satisfactory way of financing agricultural operations is by the wider extension of the co-operative credit movement. Credit societies should be linked to Central Banks which should in their turn be linked to the money market through their Provincial or Apex Bank. Co-operative societies are in an excellent position to cater for short-term and intermediate loans, while for long-term loans there should be land mortgage banks, preferably on co-operative basis.

(b) I do not think it is desirable to make fuller use of the Government system of *taccari* which is seldom resorted to in this Province except in years of agricultural scarcity.

QUESTION 6.—AGRICULTURAL INDEBTEDNESS.—(i) The main causes of borrowing are—(1) agricultural needs, (2) insufficient production, (3) social ceremonies and (4) litigation to which most people resort for lack of amenities of village life.

Fluctuations in the price of jute are also a very serious cause of agricultural indebtedness in Bengal. When there is a rise in the price of jute, the standard of living goes up and the jute growers are badly hit in a year when the price goes down. The speculative element which is so strong in the case of jute makes the cultivators rather extravagant and tends to lower their moral fibre.

(ii) *Sources of credit.*—Local moneylenders, loan officers which are joint stock concerns engaged in receiving deposits and loaning out on mortgages, and co-operative societies.

Some of the merchants are also moneylenders and they take unfair advantage to buy produce at a very cheap rate from the agriculturists. One of their tricks is to give necessities of life on credit and thus to bring the cultivators more under their control.

(iii) *Reasons preventing repayment.*—The same causes which lead to borrowing often operate against repayment in time. The high rate of interest in the case of moneylenders is also another reason. The anxiety of moneylenders not to press for repayment so that their money may earn interest and a tendency to let interest swell and fabrication of accounts also stand in the way of repayment.

(b) I do not advocate special measures to deal with rural insolvency. Nor would I enforce the application of the Usurious Loans Act. I think the spread of the co-operative

R. B. J. M. Mitra.

movement and the establishment of land mortgage banks on co-operative basis will in due course lighten the agriculturist's burden of debt.

(c) I do not advocate any measures to restrict or control the credit of cultivators such as limiting the right of mortgage and sale, but I would place restrictions on non-terminable mortgages.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—(a), (b) and (c) In Bengal the question is not so important as in other Provinces as the Bengal ryots live very near their lands. At the same time there cannot be any doubt that excessive sub-division of holdings is a source of loss in agricultural efficiency. The question has recently been studied by Mr McLean, Deputy Director of Agriculture, and Rai Sahib N. C. Bose, Assistant Registrar of Co-operative Societies, Burdwan Division. One of the serious obstacles in Bengal is the system of land tenure. There are other difficulties too, such as, the extreme reluctance of the people to give up their ancestral holdings. But an experiment should be made to enable us to see whether any of these difficulties would make the consolidation of holdings an impossible proposition. Government have therefore sanctioned a special Inspector of Co-operative Societies to enable this department to make an attempt to start co-operative societies for the purpose. It would be an advantage if the experiment of consolidation of holdings be attempted at the time of survey and settlement operations with such special legislation as may be necessary. It is proposed to try the first experiment in Government *Lhas mahals*.

**QUESTION 8.—IRRIGATION.**—(a) (i) Irrigation proper is sadly neglected in Bengal. The problems with which the Irrigation Department is mainly occupied are the improvement of navigation and of sanitary conditions and the control of flood water. There is a great need for the adoption of new irrigation schemes by means of perennial and non-perennial canals in the districts of Bankura, Midnapore, Birbhum, Hooghly, Burdwan, Malda, Dinajpur and Rysahi.

(ii) There is also considerable scope for irrigation by means of tanks and *bunds* in Bankura, Birbhum, Midnapore, Hooghly and Burdwan. As a matter of fact these were a very useful means of irrigation in old times, but owing to sub-division of interests in the lands, these tanks have been neglected and allowed to fall into decay and become unfit for the purpose for which they were originally intended. In the case of minor stream schemes where there is a cohesion among persons to be benefited, as also in the case of tank and well schemes, there is a great scope for co-operative irrigation work. In fact, considerable progress has been made in this direction in Western Bengal. The first co-operative society was started in the year 1916 at Khelar in the district of Midnapore and societies of this class have since been formed in the districts of Bankura and Birbhum.

These irrigation schemes fall under the following heads:—

- (1) Excavation and re-excavation of tanks.
- (2) Erection of irrigation embankments for the storage of water flowing down higher levels.
- (3) Construction of masonry weirs across small perennial streams and conserving water for irrigation purpose.

Very great progress has been made under heads (1) and (2). Progress has been retarded under head (3) owing to the failure of the Irrigation Department to provide proper plans and the delay in execution of the weir schemes taken up.

(iii) Wells. There is scope for well irrigation in the districts round about Calcutta for the cultivation of potato and also in some districts in Northern Bengal.

(b) Though I have not much experience on the subject, I think that the present system of distribution of canal water is susceptible of improvement. I doubt whether temporary outlet leads to economical and equitable distribution of canal water. Sufficient care should be taken to see that just the requisite quantity of water is allowed along the distributary channels to the cultivators. Cultivators paying irrigation cess should be compelled to maintain ails sufficiently high to contain enough water to avoid frequent irrigation and wastage of water. Tanks of suitable dimensions with high embankments should be excavated at the tail end of distributary channels and of branch canals to prevent wastage of water by overflow which does great damage to the crops and creates much inconvenience to the cultivators at the time of harvesting.

**QUESTION 9.—SOILS.**—(a) In parts of Khulna and the 24-Parganas districts, the land is still below the high water level and as a result embankments are necessary to prevent the ingress of salt-water which is inimical to the growth of crops. But the zamindars on whom this duty has been sometimes placed in the temporarily settled estates and in the Sunderbans lots often neglect their duty and in other areas where the duty has been

R. B. J. M. Mitra.

placed on the tenants they are unable to combine for the purpose. The landlords also offer considerable opposition to any attempt at such combination. Recently, it has been possible to organise one embankment society for the purpose of putting up an embankment for an area of 1,200 *bighas* in Bhil Durbandanga in Kaliguni Police Station of Khulna district. If this society proves a success, it would greatly assist in the formation of similar societies in the locality.

The policy of making effective embankments to prevent the ingress of salt-water is not approved of by several irrigation authorities, the idea being that the prevention of ingress of flood water causes silt to be deposited in the streams which result in the bed of rivers being raised. The question therefore requires investigation.

The problem of drainage in the Burdwan Division has special features of its own. The Division is intersected by a number of rivers which have their sources in Chota Nagpur plateau and which have to discharge a large volume of storm water after comparatively short courses. This makes the Division peculiarly liable to floods. Erection of extensive river embankments will in many places lead in the end to unsatisfactory results, though it would afford temporary immunity from floods. It prevents the enrichment of soils by deposit of silt from flood. Large areas which used to be enriched and benefited by such silt discharge are now dry waste lands. There are also many areas now in the Division in which embankment schemes are pending execution. It seems that a better solution of the whole problem would be by constructing reservoirs in the higher reaches of Damodar and Barakar rivers. The scheme will not only serve the purpose of ensuring the safety of the embankments which are in existence or may be erected, but will also ensure the constant supply of water from canals which may be taken off from the Damodar. In the Presidency Division, owing to the silting of small rivers there has been a great agricultural deterioration especially in Jessore, Nadia and parts of Khulna. The control of the entire river system in the Presidency Division is one which should be seriously taken up. What is needed is a comprehensive irrigation policy in Western Bengal not only to prevent agricultural deterioration but also to improve sanitary condition of the area. In many low-lying tracts in Eastern Bengal improvement of soil by flooding and flushing is possible and there should be a comprehensive survey.

Erosion is especially noticeable in Bunkura, Birbhum and Midnapore. Afforestation in these districts might possibly help in preventing erosion.

QUESTION 10.—FERTILISERS.—(a) I think there is undoubtedly scope for more profitable use of natural manure and artificial fertilisers. Bonemeal and sulphate of ammonia can be profitably used in Bengal. Unfortunately the high price of bonemeal due to export to Java and other foreign countries stands in the way of extensive use of bonemeal. I think that the export of bonemeal should be stopped. Tank silt may also be profitably utilised as manures.

(b) I do not see how fraudulent adulteration can be prevented except by legislation. But if ryots obtain their supply through co-operative supply societies these organisations might arrange for testing the supply before distribution.

(c) By demonstration.

(d) Oil-cakes are now extensively used in potato growing tracts; sulphate of ammonia is used in the Natore and Naogaon sub-divisions of the Rajshahi district.

(e) I do not think that sufficient investigation has been made. I think that bonemeal was tried in many places though it has now come into disuse in circumstances already indicated.

(f) It is very difficult to discourage the use of cowdung as fuel unless some other suitable and cheap fuel is substituted.

QUESTION 11.—CROPS.—(a) (i) I have already suggested that special steps should be taken to evolve a variety of jute, the fibre of which will be acceptable both to Dundee and Calcutta mills and which will take less time to mature than the *kukya bombai* variety.

(ii) As far as possible seed distribution should be done by private agencies. An attempt should be made to develop seed industry through agricultural co-operative sale and supply societies.

(iii) I think there ought to be liberal rules for the grant of gun licenses to cultivators. In some areas wild animals cause a great havoc to crops. I have come across suggestions at Chittagong that the Forest Department have stringent rules operating against the destruction of wild animals and consequently cultivators are at a great disadvantage. Monkeys are a source of very great trouble in certain areas in some of which there is a feeling even among Hindus not to offer any resistance to anybody who undertakes to kill monkeys.

R. B. J. M. Mitra.

Y 13—9a

**QUESTION 14.—IMPLEMENTS.**—(a) I have no suggestions to offer. I think that the existing machinery has not yet been improved upon. In connection with the introduction of agricultural implements, particularly ploughs, one thing should be borne in mind, namely, that in most parts of the Province land is easily tilled and that cattle are very weak.

(b) If it can be demonstrated to cultivators that improved implements will pay, the cultivators will undoubtedly adopt them and will even borrow money to get them. In fact, through their co-operative credit societies they can obtain loans and through co-operative sale and supply societies they can obtain implements. The question is whether we are in a position to recommend such implements. Another important thing is that the implements should be such as can easily be repaired in villages unless the supplying firms are in a position to establish agencies for the purpose in different rural centres.

(c) Foreign manufacturers ought to be able to obtain agents who understand the peculiar circumstances of this country and who would be in a position to utilise the agency of the existing co-operative societies for the distribution of their implements.

**QUESTION 15.—VETERINARY.**—(a) Although, theoretically, it would seem desirable that the Veterinary Department should be under the Department of Agriculture, the former has, as a result of experience, been given the status of an independent department. I think the existing arrangement might continue, there being close co-ordination between the two departments.

(b) (i) Yes. I have no direct personal experience.

(ii) No.

(iii) No, I would not go so far, though I would take special powers for provincial department to interfere in cases of clear necessity. Also Government might give some sort of subvention to local bodies with a view to encouraging multiplication in the number of dispensaries.

(c) (i) No. No improvement in this direction can take place unless more dispensaries have been established and veterinary assistants should also investigate the possibility of using indigenous medicines.

(ii) No. Not to a great extent.

(d) The obstacles are the disinclination of villagers to adopt such advice as might be given to them and which the Veterinary Department have at present no power to enforce. I think legislation in the direction suggested will alone enable effective action being taken.

If such legislation is followed up by the formation of cattle insurance societies with strong Government backing and if Government provide for the payment of compensation for the first few years for loss of cattle through epidemic diseases in cases where proper precautions have been taken such legislation will not be unpopular.

(e) I am not aware of any.

(f) The main obstacle is that cultivators have yet to be convinced about the efficiency of inoculation. A fee is also charged and this also acts as a deterrent.

**QUESTION 16.—ANIMAL HUSBANDRY.**—(a) (i), (ii) and (iii) Cattle in this Province are perhaps the worst in any country and are least cared for. This is probably due, in part at least, to the fact that the soil over the greater part of Bengal is easily tilled and does not require a strong breed of cattle for the purpose, but it cannot be doubted that it is responsible mainly for the present paucity of milk-supply. The question of the improvement of cattle is closely connected with the betterment of the dairying industry. The dairying industry must be improved and developed and by securing larger outturn of dairy produce and better return for it, it must be proved to the cultivator that proper cow keeping is a paying proposition before he will interest himself in the matter. Experience suggests that this can perhaps best be effected through co-operative organisations. An instance in point is the co-operative milk societies round about Calcutta which are federated into the Milk Union in Calcutta. These organisations have been successful in inducing cattle owners to take a keen interest in their cattle and to accept readily advice for improvement of cattle by better breeding, better feeding, and better keeping. These organisations maintain pedigree stud bulls at different centres and have taken up the growth of fodder crops by way of demonstration. Already there has been improvement in the condition and class of cattle of these societies and an increase in the outturn of milk. A multiplication of these societies and their extension to other areas would secure a great improvement in methods of animal husbandry. In areas where there is not much demand for whole milk the possibility of starting factories for milk products should be investigated.

R. B. J. M. Mitra.

(\*) (i) Overstocking of such common pastures as still exist and have not been encroached upon for the purpose of cultivation is the rule in this Province with the result that grazing is poor both in quantity and quality.

(ii) There are doubtless small grass borders known as *ank* between tilled fields but these show a continued tendency to shrink and are not always available as pastures. The quality of grazing these afford varies with the locality, these generally abound in unpalatable grasses and not in *dhub* grass.

(iii) There is generally an insufficiency of such dry fodder, the cultivators being tempted by high prices to sell off their stock.

(iv) In some of the districts of the Bardwan Division, there is a scarcity of green fodder in the dry season, January to June. Over the greater part of Bengal, cattle suffer from insufficient grazing from July to November or December when there are crops on the land.

(c) *Vide* answer to question 6 (iv).

(d) By the introduction of fodder crops and by supplementing them by concentrated foodstuffs such as pulses and oil-rakes for feeding cattle. I think that the whole question should be investigated and experiment with silage should also be taken up at potential centres.

QUESTIONS 17.—AGRICULTURAL INDUSTRIES.—(a) The number of days done by an average cultivator on his holding during the year depends on the nature of the soil. In areas where only *aman* paddy is grown the cultivators work for six months and very often they are occupied for another one or two months for threshing, etc. Where *aman*, *bhadai* and *rabi* crops are grown the cultivators are engaged almost throughout the year. As to what an average cultivator does in a slack season it is also difficult to generalise. In Backarganj, he practically sits idle except doing a little boating and making repairs to his house and looking after his homestead fields. In slack season in Tippera, Chittagong and Faridpur, the cultivators migrate to other districts to work as non-agricultural labourers and sometimes to act as petty traders. In the districts of Hooghly, Howrah and Dacca, they take to embroidery. Basket and rope-making are also resorted to in some of the other areas. Poultry-keeping on a small scale is also taken to.

(b) Cultivators will take to subsidiary industries if they are educated up to a better standard of living. To stimulate subsidiary industries it will also be necessary to devise arrangements for the supply of raw materials and the marketing of finished products. Jute spinning and weaving will be a very profitable form of industry during the slack season and in some parts of Northern Bengal jute weaving is still very popular with the women-folk of the cultivating classes. Rope-making is another profitable industry which might be introduced. Knitting and lace-making are already in existence to a certain extent. Perhaps one of the most important subsidiary industries which have already been introduced and a wider extension of which should be encouraged is spinning. The simplicity of the spinning wheel (*charla*) which with a little practice can be taken up by any one and which entails practically no physical labour points it out as one of the most suitable subsidiary industries which ought to be widely extended. If the people can grow tree cotton on homestead lands and also as hedge plants, the saving which a cultivator may effect by employing his family members in this way will be considerable.

(c) Apart from lack of organisation people here are averse to take to occupations which are not customary in their funds. But I think this can be overcome by little propaganda and provision of proper facilities especially in the way of marketing of produce. The prejudice against taking to pursuits other than those hitherto followed by the community or family is gradually going away under the stress of economic pressure and demonstration as to the suitability and profitable nature of the industry as also education will gradually complete the process.

(d) I think Government should take active step to promote such industries.

A co-operative rice mill is being put up by a co-operative paddy sowing society in an exclusively *aman* growing area and it will be watched how far during the slack season which will correspond to the busy season in the rice mills the agriculturists would take to working in the mills.

(e) I am not sure how far it is possible to move industrial concerns from their present grouping or location nor how far such industrial concerns should be able to deal with seasonal labour. But I do consider that it is possible to start such industries in connection with the agricultural produce.

R. B. J. M. Mitra.

(f) I do not think there is any need for intensive study. I think there are sufficient materials already available and the question now mainly resolves itself into the utilisation of such materials as are already available rather than into further investigation.

(g) Apart from seasonal unemployment I do not think as a matter of fact there is much rural unemployment.

(h) I think by making Union Boards more effective and inducing them to take more interest in sanitation and also by supplementing their activities by the operation of voluntary organisations on co-operative basis.

QUESTION 18.—AGRICULTURAL LABOUR.—(a) (i) I do not think any special measures are necessary to attract agricultural labour from areas in which there is a surplus to areas under cultivation in which there is a shortage of labour. There is already migration of labour.

Seasonal migration of agricultural labourers is noticed every year in large numbers, particularly from the districts of Noakhali, Chittagong, Tippera and Faridpur, during the transplanting and the harvesting seasons of paddy and jute, to neighbouring islands such as Hatiya, Swandip, Dakhin Shabajpur (Bhola) where *char* lands are constantly being formed, to the now reclaimed areas of Sunderbans. These labourers also over to Arakan and Burma proper, where usually a bumper crop is reaped. They get better wages in these places and free lodging and boarding. They practically save all what they earn. These are the attractions of the seasonal exodus of agricultural labour to places where area under cultivation is abundant and shortage of labour is experienced. There is also migration of Santhal labour to paddy-growing areas at harvest time.

(ii) In areas however in which large tracts of cultivable lands remain uncultivated I think land might be settled on easy terms with *bona fide* cultivators from districts in which land is fully cultivated.

(b) Except seasonal shortage of labour there is not much shortage of labour in main land. Sometimes there is an influx of upcountry labour in this Province with an exceptionally large crop. It may also be noted that where agriculture is particularly good, the cultivators are averse to working themselves employing outside labourers.

(c) I think grant of land on suitable terms will be the best means to induce labourers to migrate to places in which there are large tracts of cultivable land. The large exodus of the people particularly from the eastern districts of the Bengal to Assam and Cooch Behar during recent years are illustrations of the migration of agricultural labour from congested areas to districts practically undeveloped.

QUESTION 19.—FORESTS.—The forests in Bengal are confined to the hill tracts of Sunderbans, some parts of Chittagong district and Chittagong Hill tracts. The administration does not therefore much affect the everyday life of the people of the Province.

(b) One of the best means of adding to the fuel supply of the Province would be to plant unculturable waste in and around the village and to make over the management of these forests to Union Boards or co-operative societies.

QUESTION 20.—MARKETING.—(a) The existing markets and distributing centres are determined by the facilities for transport provided by the railways and steamer service. and I think there should be extensions of railway lines as well as of feeder steamer service.

(b) I do not consider that the existing method of marketing agricultural produce is satisfactory and a separate note on the subject is enclosed (*vide* Appendix).

(c) So far as the Indian markets are concerned, I would not advocate any special measures. In regard to jute there is undoubtedly a need for ensuring purity and proper grading, but if the Calcutta mills which are the biggest buyers of jute insist on good packing they are likely to get it. As the trade appears to be satisfied with the existing arrangements, no special steps in the matter seem necessary. As regards export trade, the position is different. I certainly think that where Indian produce is likely to come into competition with produce from other countries, Government certificate about purity and packing will considerably improve the position of the Indian produce in the international market.

(d) I think information about market condition ordinarily does not filter down to the cultivators to the same extent as is desirable. Some crop returns, e.g., jute forecasts have been more of a disturbing factor in the market so far as cultivators are concerned. There is a general impression that the cultivators keep themselves acquainted fully with the market of jute but this information is confined to certain localities and to

R. B. J. M. Mitra.

intermediaries who use them to the disadvantage of the cultivators and also to deceive their agents. I think crop return statistics should be more generally available to cultivators. It is also necessary that returns as to possible demand of the trade for commodities should also be circulated.

**QUESTION 22—CO-OPERATION.**—(a) (i) and (ii) I think there is ample scope for encouraging the growth of the co-operative movement both by Government and non-official agencies. Non-official agencies should be encouraged by every possible means and particularly co-operative institutions like the Bengal Co-operative Organisation Society should be encouraged to do propaganda and organisation, while Government agency should, in addition to assisting non-official agencies in propaganda work, carry out the statutory duties, so that the societies which are started are not only co-operative in character when established but retain their character, and do statutory inspection and audit. The staff of the Registrar should be adequate to enable him to discharge all these functions. The abolition of the post of the Deputy Registrar and the withdrawal of travelling facilities of superior officers have seriously interfered with the expansion of the activities of the department. Further, there is need for strengthening the staff of the departmental officers and to employ the full audit staff which can be maintained out of the present collections of the audit fees. It is a serious grievance of the societies that although they pay audit fees the full staff of auditors is not maintained. The non-official agencies should also be given increased grants to do their share of the work effectively.

(b) (i) It is now generally recognised that the only possible extension of credit facilities to the agriculturists is by co-operative credit societies. The credit societies in Bengal have on the whole fulfilled their functions and have been successful in effecting a marked reduction in the prevailing rates of interest. The main defect of the system of agricultural finance through the medium of co-operative societies is its rigidity. Very often members of village societies are unable to obtain loans at the particular moment when they badly require them, especially if at that time societies have no funds. A member wanting a loan urgently will have to apply to his society for it, and the Managing Committee of the society will take some time to deal with the loan application, and by the time the Central Bank sanctions the loan and money is brought to the village for disbursement, the need for borrowing on the part of the applicant may disappear. Another disadvantage of the present system is that loans are very often brought to the village from the Central Bank in a lump sum and distributed immediately to the members. Some of the members may not require loans at that particular time, but all the same, they anticipate their requirements and take their share of the loan. Another defect of the system is that it does not attempt to distinguish properly between loans for crop requirements and loans for other purposes. Loans for such widely divergent purposes as normal crop requirements, which should be repaid at harvest time, and for the liquidation of debts or for land improvements, the repayment of which naturally takes a much longer period, are lumped together in one transaction. The system of long and short-term loans, which corresponds to a real distinction in the needs of members and which would enable the societies to keep an effective watch over the proper use of loans, and their repayment is being pressed upon and is being gradually adopted by the societies. The aim is that the entire requirements of members in respect of short-term loans should be met from cash credit account which should be given by the Central Bank to its societies and which should cover such requirements, the Central Bank in turn receiving similar accommodation from the Bengal Provincial Co-operative Bank. The members of a society should operate by means of cheques against the cash credit account allowed to the society by the Central Bank.

It is hoped that the adoption of the system of allowing cash credits to village societies will remove the inelasticity and the piecemeal character of the present system of agricultural finance through the medium of co-operative societies.

(ii) All the agricultural purchase societies are doing useful work, but my own experience is that these societies in order to be more useful should handle large quantities.

(iii) Societies for the sale of produce have been very successful but they are limited in number. This year, however, a wide extension of the sale movement has taken place. An excellent beginning has been made in the co-operative sale of jute. The jute sale societies have within a very short time been successful in establishing a good reputation in the Calcutta market and their packing fetches the same price as European packing.

What the co-operative movement aims at is to develop a really complete sale and supply organisation on a national scale. Our aim is to have a net-work of sale and supply societies and to link them into a wholesale society with headquarters in Calcutta. The wholesale society will work on a departmental basis, each department dealing with the commodity it is entrusted with. Such a federation will not require an enormous capital, it can work largely on *contra* accounts and its trading capital may be used by each department when it requires.

R. B. J. M. Mitra.

(iv) Irrigation societies for the construction of *bunds*, tanks, etc., have been highly successful in Bengal. These societies are a special feature of co-operative work in Bengal. They are largely appreciated though their organisation takes a little time as it is necessary to bring into the scheme all persons interested in it and there is no legal means to compel a small minority who refuse to come into it. For the success of these societies it is very necessary that proper engineering advice should be available to them and that Government should for some time to come provide such engineering advice free of charge but in a manner not calculated to make Government in any way responsible if their advice is not properly followed.

(v) No such society has yet been started in the Province but the question is being investigated.

(vi) One of the sale societies has invested some money in pumping machines and they are highly appreciated as it has effected a saving in irrigation charges. The difficulty is that the local *mistries* are unable to repair such machines. The sale society has now employed three apprentices to learn the repair work in Calcutta under the firms who supply the machines. The great difficulty in forming such societies is that there are very few improved agricultural implements which can be profitably used by the agriculturists. If we are in a position to recommend such implements, there will be no difficulty in their getting a supply of them through the agency of sale and supply societies. This will in fact be a branch of the supply work.

(vii) We have a few very small societies for joint farming. They can hardly be regarded as societies for joint farming but they are really formed for inducing the members to take leases of lands to reproduce seeds supplied by the Agricultural Department. Only one of the societies is doing good work. In all the farming is done by the sons of the members who are pupils in a local school.

(viii) We have no such societies in this Province.

(ix) Anti-malarial and public health societies come under this class. They have been very successful in stimulating interest in sanitation and in improving health conditions of rural areas. What is wanted is that these societies should have an economic basis and that there should be some arrangement to secure continuity of interest on the part of all concerned.

(x) I think it is very necessary that legislation should be undertaken to compel persons to join for the common benefit of all, but that they should not be compelled to join as members of co-operative associations against their wishes. Nor should co-operative associations be compelled to take any one and give them equal rights and privileges. But powers should be given to co-operative societies to apply to Collectors to compel persons who may derive any benefit from the operations of the society to contribute to the funds of the society and to continue to enjoy such benefits.

(xi) On the whole societies have achieved their objects.

QUESTION 23.—GENERAL EDUCATION.—(a) Agricultural bias should be given to the system of education throughout all the courses.

(b) (i) This can only be done by correlating their education to their natural surroundings and giving it a distinctly agricultural bias as has already been suggested.

(ii) There is no compulsory education in rural areas.

(iii) Because their parents generally take them away from schools to help them in agricultural work as soon as they grow up. Sometimes also the parents cannot afford to pay school fees.

QUESTION 24.—ATTRACTIVE CAPITAL.—(a) This can only be done by demonstrating that farming is a paying proposition. But at the same time I deprecate the introduction of large scale farming which can only end in expropriating a large number of men having small holdings, as the amount of cultivable waste is very small.

(b) To a certain extent the system of land tenure and the Bengal Tenancy Act is responsible and in many cases a number of persons having interest in land are so numerous that any combined action by them in this direction is not possible.

QUESTION 25.—WELFARE OF RURAL POPULATION.—(a) Pure water-supply is one of the urgent needs of rural areas.

(b) I am in favour of conducting economic surveys in typical villages with a view to ascertaining the economic position of the cultivators, but I am not in favour of Government conducting such enquiries. These enquiries should be conducted by economic societies and by mixed boards specially constituted for the purpose, which should be liberally subsidised by Government.

R. B. J. M. Mitra.

## APPENDIX

## Note on marketing of agricultural produce

It is difficult to make any general remarks with regard to marketing of agricultural produce. Conditions vary with regard to different crops, and even in the case of the same crop, marketing is carried on under different conditions in different localities. The middlemen play a very important part in the business. There are different grades of middlemen in the case of different crops, the number of middlemen varying according to the nature of crops. In the case of commercial crops the number of middlemen is larger than in the case of ordinary food crops. There are the village *farias*, who collect the produce and sell it to *beparis*, who take it to *arath*, where it is sold through either the *arathdars* or brokers. Then it is exported to the principal distributing centres for sale very often to another set of middlemen, through whom the consumer ultimately gets his supply. Very often cultivators obtain *dadans* from the middlemen and sell their produce to them at unfavourable rates.

2. I shall now deal with some of the crops about which I possess some information.

**Paddy.**—Paddy is often collected by *beparis* or *paikars*, who move about in the villages at harvest time collecting the crop from the houses of individual cultivators and also from local marts. The *beparis* sometimes purchase paddy on their own account and sometimes as commission agents of merchants who finance them and take the paddy either to Calcutta or to other important selling centres. The *beparis* who carry their paddy to Calcutta cannot sell it to the mills direct, but have to do so through *araths* or godowns. The proprietors of godowns or the *arathdars* sell the paddy either to the shipper for export or to the mills which convert it into rice. The *beparis* are absolutely at the mercy of *arathdars* in the matter of the disposal of their produce. The *arathdars* levy not only their usual charges, but also a commission for the sale of paddy, it being stipulated that the sale has to be effected through them. The *arathdar* very often gives false accounts of transactions to the purchaser and also cheats the *beparis* in respect of these. Occasionally the *arathdar* purchases crop and sells it on his own account, and he often does it when he is certain that there would be a rise in the price. In Backarganj district the system is somewhat different. Here the major portion of the paddy is exported after being husked, while a very small portion of it is taken away by boats and sent to some of the Eastern Bengal districts. With regard to the rice that is exported, the system that prevails there is that the small *beparis* in boats go from door to door or to *hats*, and there they purchase the paddy which is carried by them to the big centres of rice trade, such as Angaria, Boga, Chamtia, Ncamati and Jhalakati. The huskers at those places purchase the paddy in one *hat* and sell the husked paddy at the next *hat*. The rice is then purchased by traders who either stock it or export it to Calcutta according to the demand. In many places where paddy is not stored in *arath*, it is sold to local *dalals*, who are generally paid Rs. 3 as *dalal* or commission per 100 maunds sold. Very often paddy dealers advance money on condition that the principal and interest are repaid in kind. The rate of interest charged on these transactions is generally very high and the value of paddy in such circumstances has no relation to the market price.

**Jute.**—The number and variety of middlemen is larger in the case of jute than in the case of other crops. This might be due to two reasons—either to the high value of the crop which requires larger funds for its movement, and hence a larger number of middlemen to finance or to the special processes of baling which have given rise to a special class of middlemen, viz., the baler and his agent. The number of intermediary agents who handle the jute is about five. The number of course varies with the nature of communications between the village and the mill. There is also a subsidiary class of *beparis* generally known as *paikars* in Northern Bengal and as *farias* in Eastern Bengal. The *bepari* is a local dealer who is sometimes, but by no means always, a moneylender. He buys direct from the cultivators either at the latter's house or at a village market. Between the baler and the *bepari* there is often the *arathdar* or the broker who is commonly known as *dalal*. The *arathdar* is very often not the owner of the jute which passes through his hands, but he charges a percentage from the *beparis* who make use of his *arath* or warehouse for depositing their jute before selling it to the baler's agent. The baler's agent is a paid servant of the baler, and does not become the owner of the jute which he buys, but as his salary is not fixed on the principle that it represents the whole of his remuneration, he is in a sense another intermediary between the cultivator and the baler. Various tolls are levied on the producers by middlemen. Dryago allowance known as *dhalta* is often deducted in calculating the weight of jute sold. Various other charges are levied also by baler's agents, such as *mutti*, *kabari* (staff allowance), *mulli baset*, *birti* or *newaji*. A baler makes great profit in the manipulation of the scales by *koyal* or *weighman* which means a good sum extracted from the original producer and which

R. B. J. M. Mitra.

swells the profits of the haler. On the variations of the local weights, balers often make large profits. For instance, the local weight at Chandpur is 83 *sica*. It has been calculated that on 100 maunds of jute of 80 *sica* weight the baler would get 20 *sica* of jute extra.

**Tobacco**.—Every tobacco growing village abounds with *paikars* and *dealers*. *Dalals* have big godowns of their own. Agents or merchants from Chittagong, Akya and Rangoon and also Marwaris flock to tobacco growing areas in the season and purchase tobacco through *dalals* in whose house they put up. These *dalals* again procure stocks through *paikars* and also direct from growers. *Paikars* sometimes advance money even at seedling time and enter into contracts with the growers for the purchase of their crop at very low rates. The most important centres for local distribution are Manikganj in the district of Dacca and Hajiganj in the district of Tippera. In Hajiganj, the merchants seem to make great profit on the difference of local weights. In Jalpigiuri, the local weight is 93 *sica*, but the weight of Hajiganj tobacco is only 80. Manikganj is a bigger centre than Hajiganj, and sometimes Hajiganj traders get their supply from Manikganj. The following figures give an idea of the volume of export trade in tobacco leaf from Chittagong port:—

				Rs.	Rs.
1925-26	Buena	..	..	1,674,002	4,13,115
1924-25	"	..	..	2,316,179	6,70,548
1923-24	"	..	..	2,399,018	6,61,906

**Cardamom**.—Cardamom is grown in Darjeeling and the trade is entirely in the hands of Marwaris. They give advances on a very extensive scale, and they manage to get the cultivators to sell their produce to them. Last year, although the price of cardamom varied from Rs. 60 to Rs. 87, I found an enquiry that the cultivators on an average did not get more than Rs. 30 per maund. I have even come across instances in which cultivators sold their cardamom at Rs. 12 per maund against advances received by them.

**Turmeric**.—Turmeric is another crop which is largely financed on the *dadan* system. Raw turmeric is purchased by local *mahajans* from the cultivators to whom *dadars* are made before. The *mahajans* fix the price at the time of giving advances. The *mahajans* sell dried turmeric direct to the Calcutta merchants.

**Vegetables**.—The marketing of vegetables presents a specially difficult problem chiefly on account of their perishable nature. A lack of uniformity in their price levels and in the conditions obtaining in different markets as also the extreme variability of their prices from time to time add considerably to the difficulty of marketing of vegetables. The potato crop in the Darjeeling district is also extensively financed on the *dadan* system.

**General remarks**.—The marketing of agricultural products is mainly in the hands of middlemen who are in the present state of things very well established. Any measurement of the profits of middlemen and a true estimate of the services rendered by them can be made only by a wide and detailed comparison of the prices as charged by the original producer and the prices charged at each stage in the process up to that of final disposal to the consumer. The means of communication and transport are also a determining factor in the profits of the middlemen.

## Oral Evidence

19393. *The Chairman*: Rai Bahadur Mitra, you are Registrar of Co-operative Societies in the Presidency of Bengal?—Yes.

19394. You have favoured this Commission with an interesting note of the evidence which you wish to give. Do you desire at this stage to make any statement of a general character or shall I proceed to ask you questions?—I do not wish to make any observations of a general character now.

19395. I turn then to the note of your evidence as printed, and I propose in the main to confine my questions to that part of your evidence which touches a co-operative organisation. I will ask you to turn to page 128. You say there that some of your co-operative night schools have been very successful. Who teaches in those night schools?—They employ their own *gurus*, and some officers of the Co-operative Department go and lecture to them.

19396. Ordinarily it is the village school masters?—They are special school masters.

19397. Have you whole-time *gurus* for these night schools?—Yes.

19398. That is their sole occupation, I suppose; or do they do other work?—They do a little cultivation.

19399. They are educated cultivators?—Yes.

19400. What sort of classes have you?—It varies; sometimes it is 30 or 40, sometimes 10 or 12.

19401. Do females attend these night schools at all?—No.

19402. Is there any demand in this Presidency for adult female education?—I have not come across any.

19403. It does not exist in your experience?—No.

19404. Then you say on the same page, "I have a scheme under consideration to open primary schools in well-developed co-operative areas, which will be financed out of the profits made by co-operative societies in the areas." Are you hopeful that that scheme will mature?—I think that scheme will mature. This was discussed at a conference and an attempt was made to rouse enthusiasm and interest. It will be further discussed at other conferences, and as soon as we have done some propaganda work we shall make an experiment in that direction.

19405. On the same page, you say "Ryots like short crops." I want an interpretation from you of "short crops": do you mean they are sown and reaped in a short period?—Yes, sown and reaped in a short period, so that the land can be employed in growing another crop.

19406. You say that considerable success has been achieved in the distribution of jute seeds and various other seeds, and the success of the movement is primarily due to the efficacy of the seeds. Where do these seeds come from?—From the Agricultural Department.

19407. Entirely?—Entirely.

19408. Is the co-operative organisation making any net profit on the distribution of these seeds?—Not much; they are allowed a rebate of Rs. 2-8-0 per maund.

19409. So that you are only just covering your working charges, or perhaps a little more?—We just cover the cost and get a little more. When the co-operative societies take up the work on a commercial scale they must of course have a margin of profit. At present they are trying to assist the Agricultural Department.

19410. On page 129, you are dealing with Posts and Telegraphs, but you do not mention there the savings organisation conducted by the post office. I want to ask you on that, have you any savings deposits in your societies?—Almost all our co-operative societies accept deposits. I think, on the whole, if you analyse the savings bank work done by the post offices, you will find very few cultivators actually putting in their savings there. On the other hand, the co-operative societies do attract a lot of savings from the cultivators. I think in a few years all the savings will come to the co-operative societies instead of going to the post offices. We have introduced home savings boxes among the cultivators, and it is likely that these will attract more savings.

19411. Do they bring the savings in the box for deposit in the society?—Yes. That is the idea. When a man becomes a member he is given a box. As soon as the box is full, he brings the box to the society; the box is emptied and the amount is entered in the pass book; the box is then locked and returned to him.

19412. The earning capacity of accumulated savings is something which the cultivator has hardly appreciated yet?—He has begun to appreciate it. I think the introduction of these home safes has given a great impetus.

19413. And the habit of accepting interest?—Yes. Then we have a system of collecting paddy. They put by paddy in small quantities and the collection becomes a fairly large one in time.

19414. Would you regard the co-operative movement as in any sense working in competition with the post office savings system?—I expect that the post office will very soon

R. B. J. M. Mitra.

be unable to get deposits; all the deposits will come to the co-operative societies. If the bigger people go to the post office, the smaller people will go to their own co-operative societies.

19415. I gather from page 130 of your note that you are in favour of making an attempt to attain consolidation of fragmented holdings by voluntary, and if possible co-operative, methods. Nothing has yet been done?—No; nothing has been done as yet.

19416. Probably you have studied the experiment in the Punjab?—One of my assistants and Mr. McLean went over to the Punjab and studied it. Government have now sanctioned a special officer. We want to do it on the Punjab lines.

19417. From your long experience of rural public opinion in this Presidency, do you think there is any hope of success in that line?—I do not commit myself to any opinion, but the experiment is worth trying.

19418. In the matter of irrigation (page 130), I see you are quite clear in your mind that there is an important field for minor irrigation schemes in the Presidency?—I am absolutely certain of it. We have got about 400 irrigation societies in the Presidency.

19419. Already?—Yes, already.

19420. Are they having difficulty in financing themselves?—Absolutely no difficulty; our difficulty is to get plans and estimates.

19421. And technical advice?—And technical advice.

19422. We have been told by the representative of another department that there is an officer in this Presidency whose business it is to provide technical advice in matters such as minor irrigation schemes. Have you ever come across that officer?—That minor irrigation officer formerly worked under me. Now, under the new arrangement, he has been taken over by the Irrigation Department and he has been made a member of the regular staff of the Irrigation Department, so that he can no longer be regarded as a special officer for advising on minor irrigation. Of course in the place where he is posted there is nothing but minor irrigation work.

19423. Do you mean to say that he can no longer be regarded as a special officer for advising on minor irrigation works attached to the Co-operative Department?—He cannot be so regarded. He is posted to a particular district and his work is connected with that particular district.

That is not what we were told.

19424. *Sir Ganga Ram*: Do I understand that your co-operative societies never obtain technical advice from the Irrigation Department?—Yes, they obtain it from the Irrigation Department, but we want more facilities for obtaining it.

19425. You do obtain it?—We do obtain it.

19426. *The Chairman*: Would you give the Commission the name of the post held by this officer?—Originally he was called an Agricultural Engineer, and now I think he is called Irrigation Sub-Divisional Officer.

19427. What is his name?—Mr. A. C. Chatterji. He is no longer exclusively connected with co-operative irrigation work.

19428. Apart from initiating new schemes of minor irrigation, you are also employing the co-operative organisation for clearing tanks and repairing works that have fallen into disrepair?—We have done a good deal in that direction.

19429. I take it you attach the utmost importance to technical advice in these matters, do you not?—Yes. So far as tank schemes are concerned we do not require technical advice, but as regards other minor schemes we do require technical advice.

19430. And terracing?—Yes, and terracing. As a matter of fact for tank schemes, we have managed without technical advice.

19431. Would you pick out the Bankura and Birbhum schemes as particularly successful?—Yes.

19432. How many members are there in the schemes?—There are many schemes. In the Bankura and Birbhum schemes there are about 350 societies and you can take an average of 30 members for each society. In Birbhum there are 168 and in Bankura about 150.

19433. Two different districts and two groups of schemes?—Yes. I can explain that to you. There are three schemes; pure tank schemes; then, what we call ombankment schemes, where we store water coming down from catchment areas; and thirdly stream schemes, where we put an embankment across a stream and preserve the water that flows out and then by means of channels take it to the cultivators' fields.

19434. I suppose you have lift schemes as well?—We have no lift schemes within our co-operative organisations.

19435. No lift schemes at all?—None.

R. B. J. M. Mitra.

19436. How long have the best of these schemes been running?—The first society was formed in 1916; it has got on very well. Then from 1921 the movement began to spread. The first scheme was in Khelar in the district of Midnapore. It is a stream scheme for the embankment of a stream.

19437. Did it begin to flag in 1916?—No, it has been successfully working since 1916. From 1916 to 1921 we did not pay special attention to it.

19438. Is the scheme of 1916 still flourishing?—Yes.

19439. So that it looks as if these schemes have got real staying power?—Yes, they have staying power.

19440. Have you any figures which you could lay before the Commission showing the improvement in fertility as the result of these schemes?—I can give you figures\* from my files.

19441. Could you get them and send them into the Secretaries? If you give figures for two or three typical schemes, I think that would be very useful?—Yes.

19442. On page 131, you say, "The policy of making effective embankments to prevent the ingress of salt water is not approved of by several irrigation authorities?"—That is so. As a matter of fact in the matter of irrigation a real comprehensive irrigation policy is needed.

19443. Is it your suggestion in the paragraph just above the one I have been quoting from, that the attitude of landlords is unreasonable?—I think to a certain extent it is unreasonable.

19444. What do you think is at the back of that position?—To get the ryots more into their power.

19445. That is your view; not a question of concern about the general drainage in the district?—No.

19446. On the same page you say, "As far as possible seed distribution should be done by private agencies." I suppose you include co-operative societies?—Yes; as a matter of fact I mention it in the next sentence.

19447. Yes, you say, "An attempt should be made to develop seed industry through agricultural co-operative sale and supply societies." But I wanted to know whether you had any other private agencies in mind?—I had other private agencies in my mind, because co-operative societies cannot cover the whole Province.

19448. You mean the distribution of improved seeds should be carried out on a commercial basis?—Yes; there should be private seed distributors.

19449. I take it the prime difficulty of extending that principle in this country is that, in the main, commercial distributors of seeds are also moneylenders; is that the difficulty?—That is a difficulty too.

19450. So long as they are meeting the demand for loans at reasonable rates, that of course is not a disadvantage, but the trouble begins when extortionate rates are claimed?—Yes.

District	Number of irrigation societies	Irrigable area	Increased production
Bankura ..	107	50,612 <i>bighas</i> ..	151,800 maunds of paddy, vegetable and <i>rabi</i> crops. The value of crops is about Rs. 70,000.
Birbhum ..	108	17,134 " ..	34,270 maunds of paddy. The value of crop is Rs. 1,10,938.
Midnapore ..	1 (the society is about 15 years old)	400 acres ..	Rs. 4,000 every year.

The increased production in Midnapore is not due to any improvement in the productive power of the soil but to the elimination of losses which people used to sustain prior to the construction of scheme for want of sufficient rain in proper time. Owing to this factor the sale price of lands irrigated has increased by more than 50 per cent. in comparison with lands of similar quality but not within the area of operations of the society.

R. B. J. M. Mitra.

19451. I take it that there is very strong sentiment against destroying monkeys ?—I am glad to say that this sentiment is gradually disappearing. Originally there was a class of people who ate monkeys; some villagers used to get them and keep them there; the monkeys know that these people were dangerous to them and they disappeared when they came. But this class of monkey-eaters is now disappearing. I come across cases where Hindus actually pay money to people to kill them, but will not kill them themselves.

19452. I wonder whether the monkey-eaters were of great value to the village ?—They were. Sometimes they used to come from Chhota Nagpur to Birbhum.

19453. Did you ever come across cases where monkeys were taken away to a great distance and left there ?—No.

I am told the monkeys often got back to the village before the people who took them away.

19454. Do you think there is scope for organising animal improvement societies on a co-operative basis, for the provision of veterinary advice for instance? Has that been attempted at all ?—We have not attempted it, but our milk societies get plenty of veterinary assistance.

19455. You probably agree that an improvement in the cattle of the Presidency would be an immense contribution to the agricultural problem ?—Yes.

19456. What about silage, or preservation of fodder by the method of the silo ?—I think it has not been tried much, and from what little I have heard of experiments in that direction, it has not entirely succeeded in Bengal.

19457. That is a matter which ought not to be turned down without careful investigation ?—I think so.

19458. I see in your note that you mention tree cotton as likely to be useful. Do you think it is of any commercial value ?—No, I am not thinking of the commercial value but as a subsidiary industry for the people; if they can grow their own cotton and spin it with a *charla*, it would be of great economic value to them. I have seen tree cotton being grown in many places, and they are using it, but I have never discussed it with the people or considered its commercial aspect.

19459. *Sir Thomas Middleton*. Does it grow on tall trees ?—It is a particular kind of cotton; tree cotton is rather perennial.

19460. Is it of the variety with pink flowers ?—I do not know. It is not *shimul* cotton; it is tree cotton; *shimul* cotton is used for upholstery.

19461. *Sir Ganga Ram*. For how many years does the tree last ?—It lasts for about twelve years.

19462. And every year it goes on giving cotton ?—Yes.

19463. *The Chairman*. Has co-operation touched the life of the agricultural labourer at all ?—Not much, except that some of the agricultural labourers who are permanent residents of the village often join societies and get small loans.

19464. Have you any labour societies ?—No.

19465. I want to ask you a question or two about your own work and experience in co-operation. Do you feel that your machinery for watching the activities of your existing societies is sufficiently efficient to enable you to see which society is doing well and which society is failing ?—It is efficient, but not sufficient.

19466. So far as it goes, you think you have a pretty good idea as to whether a society is being conducted in a proper manner ?—Yes. We want more staff; for instance, our audit staff ought to be strengthened; even the societies paying the fees are not yet getting the full audit staff.

19467. Credit societies form the greater part of your total ?—Yes.

19468. Who manages these credit societies ?—The village panchayats; the societies have their committees of management.

19469. How much expert advice or assistance do they get ?—There is the annual audit. They are usually affiliated to the central society; the central society has got staff to go round and assist them in book-keeping and so forth, and tries to teach them the principles of co-operation; then there is the inspection by the superior officers occasionally.

19470. You have the supervising union organisation ?—We do not call them supervising unions here; we have practically no supervising unions; it is our central banks which supervise.

19471. You have got your primary societies; are they grouped ?—They are federated into Central Banks.

R. B. J. M. Mitra.

19472. Straight to the Central Bank without any intermediate organisation?—Yes, because the area of operation of a Central Bank is very limited.

19473. Territorially?—Territorially it is very restricted; it will come down probably to a *thana* limit; for each *thana* limit we will have a Central Bank.

19474. How many Central Banks have you?—About 120.

19475. Above the Central Bank, have you a central organisation?—We have got the Provincial Bank.

19476. Is that the apex bank?—Yes. Then, on the propaganda side, we have got the Bengal Co-operative Organisation Society, which is a federation of all the societies in the Presidency doing propaganda work; it has just been reorganised.

19477. That is the head of the whole movement?—Yes.

19478. *Professor Gangulee*: On its propaganda side?—Yes, giving them advice and so forth; the propaganda and organisation side.

19479. *The Chairman*: Do these Central Banks call meetings of representatives from the primary societies to discuss the movement?—Yes, they do so very often.

19480. To discuss the movement in general, or only on its financial side?—To discuss the movement in general.

19481. So that they are, in a sense, in the position of supervising unions?—Yes, combined with banking duties.

19482. In what language are the meetings of the Central Banks carried on?—In Bengali.

19483. Entirely in the vernacular?—Yes.

19484. Never in English?—Never in English.

19485. *Sir Ganga Ram*: In what language are the accounts kept?—The majority of them are kept in Bengali. Some of them are in English, but the tendency is to revert to Bengali.

19486. *Professor Gangulee*: Their accounts are kept in the vernacular?—In the case of the majority of the Central Banks, yes.

19487. Is it Bengali accountancy?—Yes.

19488. *The Chairman*: How about the Provincial Bank; does that provide a centre for discussion apart from financial matters?—Our Provincial Bank is mostly financial.

19489. You go from the Central Bank to the central organisation?—Yes.

19490. Are the discussions of the central organisation carried on in the vernacular or in English?—In the vernacular.

19491. So that you do get representatives of the primary societies at your annual meeting?—Yes; they are taking a very intelligent interest in it. Yesterday I heard that some primary societies were trying to get rid of townsmen and trying to manage their affairs themselves. In one or two Central Banks there is a little domination of the townspeople, but the recent tendency is for the members of the primary societies to assert themselves. It is a very satisfactory feature, to see how intelligently they take an interest in the proceedings.

19492. Are you yourself glad of this tendency to send back the townsmen to the town?—We encourage them in that; that is the policy of the department.

19493. *Professor Gangulee*: What is the attitude of the town co-operators towards that tendency?—Sometimes it is not satisfactory; they resent it. Yesterday I was told that there was a discussion in a society about the dividend to be paid; the village people insisted that the dividend should be paid at 6½ per cent whereas the townspeople said "We will sever our connection with the society if it is not paid at the rate of 6½." Sometimes the townspeople resent it.

19494. *The Chairman*: Do you attach great importance to the educative value of this movement as compared with its purely economic value?—I place more value on the educative side than on the economic side.

19495. Have you seen any tendency on the part of the credit societies to degenerate into machines for the provision of easy credit?—Yes; all our assets are not of the same standard; in many areas they are degenerating into credit machines, but we go there and try to infuse new life into them.

19496. Have you noticed any tendency on the part of moneylenders to work their way into the societies and get to the head?—No, but I have noticed undoubtedly a

R. B. J. M. Mitra.

tendency on the part of moneylenders to reduce their rate of interest, and they try to induce people not to join co-operative societies. In our well-developed areas throughout the Presidency one result of the co-operative societies has been distinctly to lower the rates of interest charged by moneylenders.

19497. Do any of the moneylenders come freely into the societies yet?—In one or two areas no moneylenders exist, they have put all their money into co-operative societies, but in many other places moneylenders do exist in spite of co-operative societies, it is all a question of propaganda and efficient supervision.

19498. Are you of opinion, then, that sufficient official supervision is essential now and will be necessary for some time?—Our supervision should be confined to the statutory duties imposed on us by the Co-operative Societies Act; that is sufficient for our purpose.

19499. Who carries out super-audit here?—We have Inspectors to do it.

19500. How many of them?—There are about 60.

19501. What is their pay?—Rs. 125 to Rs. 300.

19502. Do you ever have audit by superior officers?—Some of the Assistant Registrars do the audit.

19503. Do they find that the work of the Inspectors is good?—They are not all of them good; there are some inefficient men, but on the whole we have got an efficient staff of Inspectors. It is not sufficient, as I have said, but it is efficient.

19504. Have you come across cases of members having borrowed from society and then re-lending the money at higher rates of interest?—It is mostly common in urban areas; I have come across many instances where people have borrowed for that purpose; not in village areas.

19505. Could you say just a word or two about the constitution of the Bengal Co-operative Organisation Society?—Out of a total of 12,000 societies, 6,000 are affiliated to it. We have got a scale for election of delegates; every 100 village societies, on invitation, elect one delegate; that constitutes our general meeting. Every central society sends one delegate, and those delegates appoint a central board; the central board meets twice a year and settles the policy; there is a working committee of eleven members which meets every month and conducts the work of the society.

19506. Are there representatives of all the Central Banks?—Yes; a Central Bank is a Central Society.

19507. Apart from this organisation which you have been describing, are there any land mortgage banks in the Presidency?—There is one land mortgage bank in this Presidency which started about a year ago; we are watching its work.

19508. Is it affiliated in any way to the co-operative movement?—Yes; it is a co-operative land mortgage bank.

19509. What is its name?—The Naogaon Co-operative Land Mortgage Bank. It has converted itself into a land mortgage bank, but it was originally started as a credit society. They decided by a resolution to convert themselves into a land mortgage bank, and now they confine their work in land mortgage; they have made a change in their by-laws; it is in fact, if not in name, a land mortgage bank.

19510. Confining itself entirely to the provision of long term credit?—Yes, and also the provision of ordinary credit by means of cash credit. The idea is that if a member takes a long term loan for clearing his prior debts, he gets a cash credit for his ordinary agricultural operations.

19511. So that this bank is dealing with both classes, long and short-term credit?—Yes; but even short-term credit is based on the mortgage of the land, and it is operated by means of cash credit.

19512. Have they issued debentures?—No. They are now taking long-term deposits, and I am making a proposal to Government that Government should subscribe a portion of their debentures.

19513. Are those debentures founded on the collective credit of all the mortgage, or by blocks?—On collective credit.

19514. Are they offering shares to the public?—No, it is only to the members concerned.

19515. In your view, is this scheme likely to meet the requirements for long term credit among the rural population?—I think so; but our difficulty in this Presidency is the Bengal Tenancy Act. In some places the ryots have not got the power to sell their lands without the permission of the zamindar, and the uncertainty about this matter is the real stumbling block.

R. B. J. M. Mitra.

10516. It affects credit ?—Yes, and especially of the land mortgage banks.

10517. By reason of the fact that the tenant is not in a position to offer mortgage ?—He can offer mortgage, but the mortgage cannot be foreclosed if the landlord proves obstructive.

10518. On page 135 you say, "Another disadvantage of the present system is that loans are very often brought to the village from the Central Bank in a lump sum and distributed immediately to the members." Do you mean that the representatives of the primary societies go and get a large bag of cash ?—They make an application and bring, say Rs. 2,000. Particularly one member may require the money at that time; another may want it after a month, but that is the time for distributing money, and if he does not take it then, later on he is not able to get it.

10519. Is there anything to prevent these primary societies operating by cheque ?—That is what I am trying to introduce in one or two village societies. I am advocating that, and I think I shall succeed. The whole idea is that the Central Bank should give a cash credit to the village bank, and the village bank will also give cash credit to the members; or, even if it does not do that, when any member requires an emergency loan it can hand him over a cheque, and he can take it himself to the central bank and cash it. I think eventually the time will come when the member will be able to cash such cheques in his own village.

10520. I should think that would be the ideal arrangement, because the safe keeping of cash must be a very difficult matter ?—That is the ideal arrangement. It takes a long time to teach these people, but we are doing our best.

10521. Is any *taccari* given through the co-operative organisation ?—No.

10522. Would you like to see that done ?—No. I do not think *taccari* is popular in this Presidency.

10523. You would like to keep clear of Government loans under the Acts ?—Yes. We do not require much Government finance. Our difficulty is to invest our surplus funds.

10524. On the same page, you refer to societies for the sale of produce, and you say a promising beginning has been made. On what basis are your societies paying for the produce of their members ?—They pay the full market value.

10525. They pay the full market value as they take the stuff in ?—Yes.

10526. In no case is the selling society asking the producer to take the trading risks ?—The members collectively take the trading risks, because they supply the share capital.

10527. Obviously, as members of the society ?—Yes.

10528. Are these societies confined entirely to the sale of produce grown by their members ?—Yes, and on the supply side they also supply the necessaries of life.

10529. Do I understand that in no case do these selling societies handle produce grown by persons other than their members ?—In some cases they have to, because they enter into contracts for the delivery of a certain quantity of goods, and that may oblige them to purchase outside.

10530. I am sure the point is in your mind, but of course when you come to that stage you reach a position where the sellers who are not members have all the advantages of cash down and take none of the trading risks ?—But they do not get any bonus.

10531. They get no bonus at all ?—That is so.

10532. Do most of these societies succeed in paying bonuses ?—Some of the paddy societies have succeeded in doing so. This is the first year of our jute societies.

10533. You have hardly had time yet to assess the possibilities of this movement ?—That is so.

10534. You said something about these societies purchasing the necessaries of life for their members. Do you believe in and advocate the principle of mixed-purpose societies, or do you prefer single purpose societies ?—So far as sale and supply are concerned, I believe in the mixed-purpose society. We find it difficult to get a double set of men to run two societies, and by having dual-purpose societies there is a quicker turnover of capital; when the jute is finished, you can buy paddy and supply that. Moreover, less capital is required. If you ask the cultivators to subscribe for shares in sale societies and supply societies they will find it difficult to get the necessary money, and they will probably think it is all nonsense their being asked to subscribe to this and that and the other.

10535. You mentioned quicker turnover of capital. What capital do you mean, the share capital of the society ?—Yes, supplemented by the borrowed capital also.

R. B. J. M. Mitra.

MOR 13—10

19536. Take the case of a jute society; what capital is involved? It is very small, surely?—One of the jute societies has a share capital of Rs. 1,00,000 and it has borrowed Rs. 3,00,000 and will handle Rs. 10,00,000 worth of jute.

19537. They have godowns?—Yes, and bulking machinery.

19538. Most of their capital will be tied up in those?—No. Bulking machinery does not cost much.

19539. It is working capital, is it?—Yes. In some cases they do not own their buildings, but lease them.

19540. It looks as though your idea was to have a jute selling society converted into a purchasing society during that season of the year when it is not selling jute. Is that the idea?—Yes. I ask these societies to take up all agricultural produce that goes from the area in bulk and all the necessities of life which come into the area in bulk. We are not setting up grocery shops doing a small business, but dealing with articles which are handled in bulk.

19541. The multiple-purpose society involves complication in accountancy and is apt to lead to a loss of direction in management, is it not?—I do not think so, if you have working committees for the different articles you deal with competent accountants.

19542. *Dr. Hyder*: Working committees in the same village?—A working committee for each class of commodities dealt with.

19543. *The Chairman*: I am interested by what you say on page 136 about anti-malaria and public health societies. Is this work connected with the work of Rai Bahadur Dr. G. C. Chatterjee at all?—Yes.

19544. You have not mentioned his name?—I do not think I have mentioned any names.

19545. Has he been instrumental in initiating this movement?—He was responsible for initiating the movement. The first society started was in his own village. We had to load our officers for organisation purposes, but he has been the life and soul of the movement and undoubtedly has succeeded in interesting the people in rural sanitation.

19546. How long has he been at this work?—Seven or eight years.

19547. There again you have had a long enough period to be fairly certain that these societies are going to survive?—I am not at all certain about it, because the movement is based too much on the personal enthusiasm of one or two persons. It is not on a proper economic basis, and as a matter of fact I have stopped the registration of these societies until I can get Government to declare their policy with respect to them.

19548. What exactly do you mean by that?—The central organisation is in Calcutta and is not in touch with the societies in outlying districts and cannot exercise proper supervision. I want to set up a committee in every district which will assist the central society. One central organisation in Calcutta cannot look after the large number of anti-malaria societies which exist, especially when they are situated in outlying districts, and many people say it is the duty of the Union Boards to look after sanitation, and that if you set up another agency there will be friction. There ought to be a definite declaration of policy in the matter, and I have suggested to Government that a conference should be held.

19549. What is your advice as between the two principles you have mentioned?—I would emphasise the importance of the Union Boards taking up sanitation; but when there is a genuine, and not an artificial demand for them, I would register voluntary organisations. The difficulty is that, in the case of several societies, the demand is artificial; there is no proper economic basis.

19550. Let me put it in this way. Do you not think the demand for work of this sort may be perfectly genuine without being founded on any economic basis?—That is so; but they cannot be registered under the Co-operative Societies' Act unless there is an economic object.

19551. That may be the fault of the Act?—I think they ought to have a special Act for these societies.

19552. I do not see how you are going to put an anti-malaria society on what you are pleased to call an economic basis?—We have another type of society, recently started, with which the Rai Bahadur has nothing to do, called public health societies. They are trying to put them on an economic basis.

19553. In what way?—By taking leases of tanks and stocking fish, raising adequate share capital, clearing tanks and removing sources of malaria in that way.

R. B. J. M. Mitra.

19554. Putting fish in so as to make some money, or to eat the mosquitoes?—Both, and then they get a return on their share capital. At present one of the difficulties is that societies are started with a very small share capital and depend mostly on subscriptions. When once inspecting a society I asked them what they did if people did not pay their subscriptions, and they said "We just write it off." I told them that would not do. They are not on a proper economic basis.

19555. Is there at the back of your mind the feeling that real interest on the part of the members is not likely to be permanent unless they have a financial stake in the organisation? Is that your view?—So far as co-operative societies are concerned, I would insist that there should be a permanent financial stake. The ordinary work of sanitation can go on without that, of course.

19556. I should have thought a society designed to prevent the spread of malaria by putting kerosene on the water in tanks had better leave fishing to other people?—There is scope for these societies.

19557. On page 136 in answer to sub-section (c), you say, "I think it is very necessary that legislation should be undertaken to compel persons to join for the common benefit of all, but that they should not be compelled to join as members of co-operative associations against their wishes," and later on you say, "But powers should be given to co-operative societies to apply to Collectors to compel persons who may derive any benefit from the operations of the society to contribute to the funds of the society and to continue to enjoy such benefits." Do you really think that is a practical suggestion?—I do not see how you can make progress with these irrigation and other societies if a small minority of people say they will not join in the scheme and will not subscribe or pay their quota towards the execution of works. I have mentioned in the course of my evidence the progress which has been made with irrigation societies. We could have made greater progress, but we have to take in all the people who are benefited by a scheme.

19558. You see how far the principle is going to take you? Your credit societies have reduced the rate of interest, so that, applying this principle, you would have to compel everybody who borrows money from a moneylender who has reduced his rate of interest as a consequence of the existence of the credit society to join the credit society or make some contribution?—I do not think there is much analogy between the two.

I think you will have difficulty in carrying out your plan.

19559. *Sir Henry Lawrence*: With regard to the distribution of jute seed, what proportion of the jute seed derived from the Agricultural Department is distributed through your co-operative societies?—I cannot tell you the exact proportion, but a large quantity of the seed is distributed through the co-operative societies.

19560. Is the distribution at its very beginning now, or have you had some years' experience of it?—Two or three years' experience.

19561. Is it the seed which goes through the co-operative societies which reaches the ryot too late to enable him to use it at the proper time?—That happens in some cases. One of our greatest drawbacks in popularising the seed has been the delay in the supply of seed in some areas; but I think the Agricultural Department is taking up the matter and has been able to effect an improvement.

19562. Is the delay due to the fact that the seed is not available?—I do not know. We send our orders to the Agricultural Department, and in some places we have found it does not come in time.

19563. So far the Agricultural Department is only in a position to supply a comparatively small amount?—Yes.

19564. I think the figure in the report was 3,000 maunds. How many acres does that represent?—About 50,000 acres.

19565. Fifteen or sixteen acres to the maund?—Yes.

19566. *Professor Gangulee*: What is the total area under jute?—I think 5,000 square miles.

19567. *Sir Henry Lawrence*: 3,200,000 acres?—Yes.

19568. Out of which about 50,000 are covered?—Yes.

19569. Do you hope to expand that very much in the near future?—I think it is capable of expansion and I hope it may be expanded.

19570. On page 131 you ask for a seed which will involve a fibre acceptable both to Dundee and Calcutta. Is not the quality of the fibre which these two sets of mills

R. B. J. M. Mitra.

pp. x 13—10a

require very different?—There is some difference, but I think it possible to produce a fibre which will suit both.

19571. What is the object of having one seed to suit both sets of conditions?—Sometimes it is possible to get a better price from the people who export to Dundee and at other times a better price is obtained from the Calcutta mills; but if the fibre can be used by one set of mills only you are not a free agent when you come to sell.

19572. What you want is to get a composition between the two mills, so as to get a better price for the ryot?—Yes.

19573. That is your object?—Yes.

19574. *Sir Ganq Ram* Those societies undertake irrigation schemes?—We have got special irrigation societies for that.

19575. Do they devise the schemes themselves, or act on the advice of an engineer, or what?—Small schemes like tanks they do themselves.

19576. Without any advice?—Yes, except that provided by our co-operative staff. I do not think they require advice; ordinary people know a good deal about these things. In the case of stream schemes and so on, they require technical advice.

19577. Whose advice do they take? That of a Government or a private engineer?—Of a Government engineer.

19578. Suppose a scheme involves taking water from a river, do they pay any royalty to Government for the use of the water?—I have not come across an instance where a royalty has been paid.

19579. You have instances where water is taken from rivers?—From small streams. We have not any co-operative schemes connected with rivers.

19580. Do you apply to Government for sanction in taking the water?—No, I think they have prescriptive rights in most of them.

19581. Is not the water the Government's?—I do not think Government claims royalties. I know of no instance of that.

19582. Have they not got a claim?—I do not know; it has never been asked for.

19583. You say the societies sell and buy produce?—Yes.

19584. The society sells it. Who stands the risk of fluctuations?—The society.

19585. But one man must buy and sell; all the members cannot do it?—The ultimate financial risk is borne by the society, but the society appoints its own agent and brokers to sell.

19586. Sometimes in jute and cotton there is selling power, and sometimes there is hedging; who does that?—The society's agent; it has an agent in Calcutta.

19587. If it goes against the society, can they claim they have been hoodwinked?—The society has only itself to thank if it appoints an agent who cannot do his business properly.

19588. It is a serious risk?—There is a serious risk.

19589. The rate may fall from day to day?—The society has got its agent in Calcutta and its manager in local stations to advise it; they are in constant telegraphic communications with each other.

19590. In jute purchases have all the mills some pooling system?—I really do not know the inside working of the mills.

19591. Is there no regular pooling? Sometimes in cotton and jute they adopt the pooling system and agree not to pay more than so much or so much per maund goes into the pool?—There is a general impression that there is a pool. But I do not know of any actual instances.

19592. Do you mean to say that they pool in private? The pool is always publicly known?—It is not publicly known.

19593. The agreements are drawn up?—I have not come across any such case. I do not think there is such a pooling system. But I believe mills do take counsel with each other and decide about the lines of buying and the prices offered, but then it is not known to the public.

19594. I am surprised to hear that. Now suppose some people take it into their heads to take water from the river, they do not take anybody's sanction to do it? Can they touch public rivers?—If they want to put up an embankment?

19595. No, I am not talking of embankments, but in other Provinces the consent of the Government is required before water can be taken?—I think in Bengal nobody takes

R. B. J. M. Mitra.

any sanction. Government allow free use of the water. But if you ombank a river or throw a weir across then you want sanction.

19596. Sometimes taking up the river on the up-stream side may damage the interests of the people on the lower side, and there is a law in our Province that nobody can take river water without Government sanction?—It is possible that if in the upper reaches you throw up an embankment it will restrict the supply of water lower down.

19597. Embankment is allowed in any case at all?—They often have a weir. They often throw out a *kutchra* weir. If it interferes with others, the man applies to the Collector.

19598. Do you mean a sand weir?—An earthen dam.

19599. How long will that stand?—Year by year they replace it. That is in the case of small rivers.

19600. *Sir Thomas Middleton*: You have said that your Inspectors of co operative societies get salaries of Rs. 125?—Rs. 125 to Rs. 300.

19601. Is Rs. 125 the initial salary?—Yes.

19602. What do they rise up to?—Rs. 300.

19603. Are there prospects of going further?—They become Divisional Auditors and they are also sometimes promoted to Sub-Deputy Collectorships.

19604. If they become auditors what is the salary in that case?—Rs. 300 to 500.

19605. At what age is a man appointed as an Inspector? What amount of experience has he had before you take him?—There are two methods of recruitment, by promotion from auditorship and by direct recruitment. If direct recruitment is done he gets a training and he must be below 25 years of age. He gets a training and then he is put in.

19606. How long is he trained, for a year or two years?—That depends. It is for five or six months and then he is put in charge of the area. That area is constantly supervised by District Auditors and Assistant Registrars and in this way he gets experience.

19607. Say a man is directly recruited, will he be 25 or 26?—Yes.

19608. If he is promoted, it will be about what age?—That varies from 35 to 40.

19609. So they are mature men?—They are mature men.

19610. You have pointed out in connection with agricultural education that there is not enough Government land for unemployed middle class youths, and that is obvious, I think. Are you of opinion that the middle class youth would be a suitable officer for agricultural work?—I think he will be, because most of our middle class youths come from villages; their relations are employed on the land; they are not entirely town-bred people.

19611. You think suitable candidates could be found?—Yes.

19612. You would agree, of course, that to be suitable he must be properly trained just as your own men are?—Yes.

19613. What kind of training do you think would be necessary in order to make this middle class youth suitable for agricultural work?—I would first of all give him a good grounding in science connected with agriculture, and then give him a two years' practical course on a farm.

19614. *Sir Ganga Ram*: Science?—A good grounding in science on which agriculture is based; chemistry, botany and such things.

19615. *Sir Thomas Middleton*: Supposing I make the statement that his agricultural grounding should be got by studying science up to not less than the Intermediate stage, then two or three years of technical training and that then in order to make a good district officer he ought to have something like five years' experience or more of agricultural work; would you or would you not agree?—The more experience he has of agriculture the more likely he is to make an efficient agricultural officer. That I quite admit.

19616. Would you agree with me that directly he leaves a teaching institution he is not likely to make a satisfactory district officer?—I quite agree with you. But if you keep him too long on the farm he might lose his administrative ability.

19617. The point is this. At present the pay he gets as a district officer would be comparable with the pay which you offer, Rs. 125 rising to 300. But, just as your men have got to get experience somehow, this man has got to get experience. He can only get experience of the right kind by doing some subordinate type of work in the districts. We cannot expect him to earn a considerable salary at that stage. I want to know what

R. B. J. M. Mitra.

your view is of the salary that would have to be offered to a young man trained in the way I have indicated, to attract a sufficient number into a subordinate grade in the Agricultural Department? He will ultimately get the pay of an Inspector.

19618. I am assuming that he will be a satisfactory officer who will rise to be an Inspector and who may go further just as your officers do. What is wanted in order to induce the trained man to offer himself?—At least Rs. 75 to Rs. 100, I should say.

19619. That is your estimate. That is my estimate, if you want really to attract a good class of men.

19620. *Dr. Hyler*. In regard to this question of State aid to co-operation, tell me how much are you spending out of provincial revenues on co-operation?—About 3 or 4 lakhs. Our audit staff is practically supported on audit fees. We refer to the Government the audit fees.

19621. Do you know how much they are spending in the Punjab?—No, I know it; but I cannot recollect it now.

19622. I find from a comparison of figures that these Provinces, the Punjab, Madras and Bombay, are spending much more on co-operation than the Presidency of Bengal?—Yes, that is so.

19623. And surely they have not got to deal with a larger population than this Presidency?—We get more local non official assistance and there is another thing, as I have told you, our staff is under-manned. We do not even get full staff of auditors which the societies are entitled to get, because they themselves pay for them.

19624. In regard to this question of supervision and audit, how many societies are there for one Assistant Registrar?—Well, we do not go by the number of societies; we go by territorial limits. We have one Assistant Registrar for each of the Commissioner's Divisions and that varies from 2,000 to 3,000.

19625. Do you not think that this is a large number? You have got five Divisions, I understand, and the number per Division is about 3,000. Do you think one man can manage 3,000?—He has Assistants under him. But I do not think that Government can indefinitely extend the staff of the Co-operative Department. I think the strength of the staff must be determined territorially; except the audit staff, because the number of societies which a man can audit is limited. My own idea is that there should be fixed territorial staff and the staff of auditors should automatically increase with the increase in the number of societies.

19626. How many societies do you have at present per one auditor?—One hundred.

19627. That is the ideal of the MacLagan Committee?—Yes, but I do not think they can go beyond 100.

19628. And you are following that ideal?—I am following the ideal; but my staff is not according to that standard, but is less than that.

19629. When do you have periods of surplus money in the co-operative movement?—Our period of surplus is from October to February.

19630. That is to say when the crops are being sown?—We get money from the jute crop and the paddy crop and from January the money for financing the jute crop begins to go out, but the surplus period is from October to February, I think.

19631. Does this period coincide with outside stringency?—The period certainly coincides with stringency in the Calcutta money market.

19632. Are you able to invest?—We are investing through exchange banks, we invest a lot of money with exchange banks in this period.

19633. When is your period of stringency?—My period of stringency starts in May and extends to June, July, August and September.

19634. Were you in charge of this movement last year?—Yes.

19635. When we were in Madras, we found that you borrowed 5 lakhs from the Central Provincial Urban Bank of Madras. Was that during this period?—Last year, yes, during this period; and similarly we lend out during our surplus period to other Provincial Banks.

19636. With regard to these irrigation societies; are you quite satisfied with the help that you obtain from the Irrigation Officer or the Irrigation Department of the Government of Bengal?—I am afraid I am not very satisfied.

19637. To what is the dissatisfaction due?—They change their plans. I do not think the Irrigation Department have been able to give us satisfactory plans. The Irrigation

R. B. J. M. Mitra.

society sends it to the Government in the Irrigation Department and there it is often changed; and there is one society which started in 1921; it has not yet been completed. We have not got the completion certificate yet and within this period the estimates have been raised about five times and it is very difficult to get the confidence of people when you are continually changing your plans and estimates.

19038. *Sir Ganga Ram* : Have you no private engineers here to give you advice ?—We have not sought the help of private engineers.

19039. Never ?—We have never sought it; but you see the societies here are too poor yet. When they are strong enough they may have a federation of their own and then employ their own engineer; but in the initial stage the societies require technical advice from Government.

19040. *Dr. Hyder* : Do I understand then that they are optimistic when they go to them for advice in the matter of estimates but become pessimistic when they have given their estimates to you and increase them ?—Yes.

19041. With regard to your societies, as Registrar are you quite satisfied with the soundness of this movement, as measured by the number of A class societies ?—I am quite satisfied with the soundness of the movement as a whole; but I am not satisfied with the soundness of the movement in every area. The very fact that people who live in the villages and know the work of the societies are depositing their money shows they have entire confidence in the movement.

19042. Which is your most promising Division or area ? Chittagong ?—Chittagong and Burdwan. One or two had areas existing in almost every Division.

19043. *Mr. Gupta* : Do you resent the co-operation of district officers and other Government officers in advancing the cause of your department in any way ? I am asking that question because I saw in the papers that some officers were of opinion that it was rather disastrous. Is it your feeling ?—My feeling is to welcome the assistance of every District Officer who is willing to give advice and assistance, and as a matter of fact the department are trying to seek the advice of the District Officers. But unfortunately as a system, I strongly deprecate the system of placing definite responsibilities on District Officers to further the co-operative movement. As a matter of fact, this system has worked very badly in Bengal.

19044. What system ?—That system of placing the district officers definitely into the scheme; it has worked very badly.

19045. Is there any such system ?—When Sir Nicholas Beatson Bell was Member, he compelled me to make every District Officer *ex-officio* Chairman.

19046. But that is not the system now, is it ?—I do not advocate the system because I find that the majority of the district officers take no interest in anything except law and order.

19047. It is very disappointing to hear that ?—I can give you hundreds of instances.

19048. How did these irrigation societies to which you have referred in your report come into existence ?—They have come into existence with the help of the District Officers; but, then, even if the District Officers had not helped, the movement would have come into existence.

19049. That is a different matter ?—As I have said we are very anxious to get assistance of District Officers.

19050. You do not want to make it a rule ?—Quite. As a matter of fact, some of the District Officers have done excellent work; but once you make it a system, you get a class of officers who take no interest in anything but law and order, and you get a class which is very enthusiastic in promoting the welfare of the people.

19051. Just as you have black sheep amongst your societies ?—But I think the number of black sheep is increasing in that way.

19052. What about those jute sale societies to which you have referred ? For instance, in my Division there is a most promising jute society. Is that due entirely to the efforts of the Sub-Divisional Officer ?—Not entirely. I do not call that an A class society.

19053. It is the only society in this Division ?—The Sub-Divisional Officer has taken great interest in it, but he is a friend of mine and of my Assistant Registrar, and so I could get him to do so, but if you ask me I can give you many instances of what Sub-Divisional Officers have done about their chairmanship, I believe, under instructions from the District Officers.

R. B. J. M. Mitra.

19654. Let us not go into these details. I only want to know whether you resent their assistance?—We do not resent it, we welcome it in every way. We will gladly take it when it is given in the proper spirit and we think it leads to excellent results.

19655. *Professor Gangulee* But do you make any effort to get their co-operation?—We make an effort; but we cannot go on always asking them to give us assistance.

19656. *Mr. Gupta* About the indebtedness of the agriculturist, of course the primary object of this movement is to help the agriculturist and relieve agricultural indebtedness. Have you any figures to show exactly how it has worked from year to year and what amount of indebtedness is being wiped off?—We collected statistics some years ago, but we cannot collect statistics every year.

19657. Would it not be a good thing if you had some sort of reliable figures?—It would be a good thing; but I want staff for it. I think if that staff is employed in organisation and propaganda, it will produce more useful results.

19658. But that is one of the most important objects we have in view. For instance, in connection with some question, I asked for figures and I was told there were no statistics. Do you not think that it is desirable to have figures?—It is desirable if we get the staff.

19659. I wanted your opinion?—It is desirable, undoubtedly.

19660. What about agricultural associations? Have you got any? Are they making good progress?—Agricultural associations to supply agricultural necessities, such as manures and seeds, we have.

19661. Have you got many?—We have five or six of them; two of them are doing good work.

19662. Are they doing any other work?—Our latest effort was to start supply societies to take up agricultural work also.

19663. It is of the complex type you mentioned to the Chairman?—Yes.

19664. In case you do that, would you like to have closer co-operation with agricultural officers?—We are co-operating with each other. It will help us undoubtedly to achieve our object if we have closer co-operation.

19665. Turning to your remarks about the private anti-malaria societies and the work of the Union Boards, do you think there is any conflict in both working in the same areas?—The question of conflict arises in everything.

19666. What is the conflict?—In your Division there is no conflict.

19667. It is not a personal matter?—It is not a personal matter at all; it is a question of working the system.

19668. Under the system we have been trying to get co-operation; so far from their being any conflict we want co-operation?—Many officers of the Union Boards think that they ought to look after sanitation. If you take away this work from them, they lose their importance.

19669. About putting the anti-malaria societies on an economic basis, do you realise there is no economic object? All they do is to pry the money to employ a doctor and to clear the tanks with the object of killing the mosquito larvae; that is all. I suppose as far as your own department is concerned you are not encouraging the idea that they are starting these societies in order to make money. Can that be their idea?—No.

19670. As regards irrigation societies, your suggestion is that there ought to be some sort of compulsion to make members join. Do you think we should go in for compulsion?—Not compulsion to become members of the societies, but compulsion to contribute towards the cost of a project.

19671. Do you not think that compulsion will militate against the fundamental principles of co-operation?—My method will not militate against the principles of co-operation. Supposing a co-operative society takes up a work and a small minority remain out. All that I want is that the Collector should assess the cost of the scheme and compel the minority to pay a proportion of the cost of the work to the society.

19672. In connection with most of the irrigation societies, the Collectors have helped their formation by persuading people to join them?—Sometimes they have; sometimes they have not.

19673. In Birbhum and Bankura they have?—I am talking of the whole Presidency, in many cases the Collectors have failed.

19674. Rai Bahadur Bannerji will tell you all that happened in his district. But I ask you, would not such compulsion militate against the principles of co-operation?—

R. B. J. M. Mitra.

It would not. If a majority of the people form a society, they should certainly be able to apply to the Collector to compel the others to pay a proportion of the cost.

19675. If they do not join ?—Yes.

19676. *Sir James MacKenna* : What rate of interest do you offer for savings deposits in the Provincial Bank ?—It varies according to season. At times we get loan on Government paper at  $1\frac{1}{2}$  per cent, ordinarily we offer 4 to 5 per cent but there is no fixed rate.

19677. Between 4 and 6 ?—Between  $1\frac{1}{2}$  and 6. Of late there has been a reduction in the rate of interest.

19678. Practically you follow the prevailing rate of interest ?—Yes.

19679. Is there any Government money in this bank ?—Absolutely none.

19680. Government's contribution is limited to payment of the staff ?—No ; they have no Government staff in the bank.

19681. I mean in the movement ?—Yes.

19682. You state the Central Banks operate in small territorial areas. You have got a very large number of Central Banks. To what extent do you attract money to the Central Banks from their territorial areas ?—Some of them have succeeded remarkably well in tapping local money.

19683. What proportion of their capital does it form ?—A large proportion of their capital.

19684. What is the capital of the Central Banks ?—It varies from Rs. 50,000 to Rs. 2,00,000.

19685. Nothing more than two lakhs ?—That is in small territorial areas ; of course, in bigger places it is different.

19686. Are you satisfied with the repayment of principal and interest ?—It is susceptible of improvement, but of late years there has been improvement.

19687. Is your Provincial Bank satisfied with it ? Ultimately, they are the people most concerned ?—The Provincial Bank is satisfied. Last year they got repayment in full, and sometimes they got repayment even before maturity. The Provincial Bank gets repayment all the time. It is the Central Banks with small capital that suffer.

19688. It is the Central Banks that suffer ?—Yes. The Provincial Bank will get repayment ; there is no doubt about it.

19689. Is there a feeling in Bengal that Government stand behind the co-operative movement ?—Absolutely none. I will give an instance. A Sub-Divisional Officer was Chairman of a Central Bank and there was defalcation to the extent of Rs. 80,000 and people knew very well that they could not make Government responsible. However, they feel this, that there is Government supervision, and there is restriction, just as people feel about the Imperial Bank. They know that the co-operative societies work under the restrictions of the Co-operative Societies Act.

19690. You have got very large charges, you told us, for your Assistant Registrars. Do you consider that the amount of touring your officers do is adequate considering the size of the charges ?—I do not think it is adequate. Unfortunately owing to the curtailment of travelling allowances, I cannot insist on their touring more frequently, because they lose money consistently.

19691. They actually lose ?—Yes.

19692. They reduced the Assistant Registrars from first class to second class ?—Yes. It is all right for a man who has got extensive touring but a man who has to go into the interior loses.

19693. The Registrar himself does not tour very much ?—That is also because the Deputy Registrar's post has been abolished. Last year I was able to do some work.

19694. Curtailment of travelling allowances affects junior officers who lose ?—Yes. And they have taken away facilities for travelling under the recommendations of the Retrenchment Committee so that the Registrar finds it very difficult to do efficient touring.

19695. You have been connected with the movement for a long time now ?—Except for an interval of five years when I was connected with the Government of India.

19696. Do you think that the movement is making solid progress, in spite of mistakes ?—I am personally satisfied that the movement is making satisfactory progress, in spite of mistakes.

R. B. J. M. Mitra.

19697. You feel that?—I have been connected with the department for a long time. For five years I was out of the job, and when I came back, I found that after all the movement was on a sound basis. It ought to be extended now, and that is the only way in which you can really assist the cultivators.

19698. You know a feeling of depression often comes over Registrars. You do not feel depressed?—No. I have been reading the Burma report, and I have felt depressed over it.

19699. You really feel depressed?—In reading the Burma report I felt depressed, but I do not feel that as regards Bengal.

19700. Do you think that the development of business habits is a very important matter?—Yes.

19701. Almost as important as co-operation?—Yes.

19702. You think that the repayment of principal and interest in time should be rubbed in?—I feel there ought to be more punctuality. My figure of overdues is 24 per cent and I want to reduce it to 10 per cent.

19703. *Professor Gangulee*. Following your answer to Sir James MacKenna, with regard to the basis of your co-operative movement you say you are quite satisfied with the soundness of the basis. Can I take it that it has become a people's movement?—It has become a people's movement in Bengal.

19704. Not spoon-fed by Government?—No; in this Province very little spoon-feeding is done by Government.

19705. You must have started a large number of societies since you have been connected with the movement for a long time. You have started many societies between 1905 and 1926. Could you give us an idea of the life and vitality of the offspring of your efforts?—Some of them are thriving. The society in Khulna is the most flourishing in the Midnapore district.

19706. Are societies organised as credit societies developing other branches of co-operative work?—They do a lot of arbitration work and social welfare work. There are really live societies who take much interest in their work.

19707. From credit societies do they develop other activities such as education, sanitation, etc.?—Yes; they are engaged in educational activities.

19708. Have they started schools?—They have started schools and they subsidise schools.

19709. Could you tell us the causes of liquidation of your societies?—Unsatisfactory organisation is one.

19710. What are the chief causes?—The chief cause is the appropriation of the bulk of the loans by office-bearers.

19711. In the event of liquidation, what are the methods you follow?—The methods are these. First of all we hold an enquiry and we ask the society whether they object to the liquidation. Then we consult the central society to which it is affiliated, and generally liquidation is settled upon the advice of the central society. Then we appoint a liquidator. The society can make an appeal to the Commissioner against my order of liquidation.

19712. And what is the result of this liquidation over that area?—I think the result is pretty good; it is a warning to the other societies.

19713. It does not act as a deterrent to the spread of the movement?—The people know that these are being liquidated for their failure to pay their dues. Most of our liquidation is not on account of insolvency, but on account of bad management. It ceases to be co-operative if one or two of the people in the society manage it.

19714. These liquidations do not act as a set-back to the movement?—No. As a matter of fact, I would not feel the slightest hesitation in liquidating a Central Bank if it is doing un-co-operative investments. It would not affect the movement.

19715. What about co-operative disputes?—Disputes cannot be co-operative.

19716. I mean disputes among co-operative organisations, say, between a primary society and a Central Bank, or a primary society and a district bank?—Well, there have been disputes. There was a dispute recently between a primary society and a central society. The primary society requisitioned an extraordinary meeting and passed a resolution.

19717. There are then disputes among the co-operators?—This sort of dispute comes up to me for arbitration.

R. B. J. M. Mitra.

19718. In the note which was submitted by you sometime ago as Registrar of Co-operative Societies, it is stated "The main defect of the system of agricultural advances through the medium of co-operative societies is its rigidity." Can you amplify that?—I have done so in reply to a question by the Chairman. A member may be in need of money at a particular time. He goes to the village panchayat, the village panchayat has to recommend the loan, the society then applies to the Central Bank, and the Central Bank has to hold a meeting and sanction it. I would recommend a system of cash credits to avoid this.

19719. How long does it take?—It depends upon the nature of the Central Bank. If the Central Bank has got an able Secretary it takes about ten to twelve days, it sometimes takes a month. You cannot generalise on these things.

19720. As regards co-operative finance, what is the difference between your borrowing and lending rates?—Here again the rate varies. The primary societies usually borrow at 9½ per cent and lend at 12½ per cent; and societies in Eastern Divisions borrow at 10 per cent and lend at 15 per cent.

19721. Even at that rate the loan is popular?—Yes.

19722. Do you have any system of penal rates of interest?—Some Central Banks have penal rates, but we do not advocate that, and we are trying to put a stop to the system of penal rates of interest.

19723. Who is the authority to sanction loans in a primary society; is it done by a committee or a secretary or any of the office-bearers?—It is the village panchayat; the committee as a whole meets and sanctions them.

19724. It is the committee that considers the application; it is not done by any particular individual?—In primary societies, it is the committee.

19725. In other societies?—In the Central Banks the Board of Directors delegate that function to a working committee.

19726. What is the procedure to deal with loan applications? When a member of a primary society wants a loan how would he proceed?—The member of a primary society has got to go and tell his panchayat he wants a loan and the panchayat then submits the loan application to the Central Bank. The Central Bank sometimes makes enquiries by sending its supervisors, and then sanctions. If the Central Bank is in want of funds, it applies to the Provincial Bank.

19727. What time does it take?—I think there are particular seasons when applications for loans come in largely. The Central Banks know that and they forecast their requirements and apply accordingly, but I have come across instances where it has taken a longer time than it ought to have taken.

19728. Is joint responsibility enforced?—In the case of liquidation, very often it is enforced.

19729. In the case of granting loans, is it enforced?—How can it be enforced in the case of granting loans?

19730. Only in the case of liquidation it is enforced?—Yes; you cannot enforce it in any other way.

19731. How is your reserve fund built up?—It is built up out of the margin between the borrowing and the lending rate.

19732. How is it utilised?—Most of the societies invest it separately, but there is a little reluctance on the part of primary societies to invest it separately; they would like to see it invested in the movement; a large part is invested in Central Banks and they are supposed to pass it on to the Provincial Bank.

19733. With regard to management, you have a committee of management?—Yes.

19734. There is no paid staff employed in the Committee?—Generally speaking, there is no paid staff; about half a dozen societies in the Province may have a paid secretary, on Rs. 3 or Rs. 4 a month. I would not place the number of such societies at more than a dozen.

19735. Do you find that the want of education is a serious handicap to the proper development of the co-operative spirit?—It is, to a certain extent, a handicap.

19736. Is there any plan for improving the educational standard of the members?—It cannot be done except by night schools and so forth, but then you cannot start night schools in connection with every society.

R. B. J. M. Mifra.

19737. Your Inspectors go and inspect the books of accounts, do they hold a class to teach co-operative principles, or to explain difficulties and so on?—Yes; the Auditors, after audit, are expected to hold a general meeting to explain to the members co-operative principles.

19738. I wanted to know whether it is done?—It is done; I do not think it is done as well as it ought to be done, because we are not fully staffed.

19739. You have about 12,000 societies here, including credit and non-credit?—Yes.

19740. Do women take part in your credit or non-credit societies?—There are some women members.

19741. Is that in credit or non-credit societies?—Both credit and non-credit societies.

19742. Have you started any special societies for women?—We are experimenting with women's societies, we have got five of them, and I have asked Government for an Inspectress, as they have in the Punjab.

19743. With regard to non-credit societies, you are convinced that they are capable of expansion?—They are capable of indefinite expansion, there is a genuine demand for them, but we cannot meet the demand.

19744. In what direction is the demand for non-credit societies?—There is great demand for sale societies.

19745. The tendency is for sale societies?—There is a great demand; last year we were doing considerable propaganda with regard to sale societies.

19746. There is more demand for sale than for purchase societies?—Yes.

19747. Are these non-credit societies connected with credit societies?—No.

19748. Are they financially independent, are they financial from sources other than co-operative credit organisations?—I think some of the sale societies get loans from Provincial Bank.

19749. Some of your non-credit societies obtain their loans from the Provincial Bank?—Yes, and some from the Central Bank.

19750. They are not independent?—The management is quite independent and also the liability.

19751. Are there any grain banks in this Presidency?—In the district of Bankura; they have not been much of a success.

19752. Why?—Management is difficult, account-keeping is difficult.

19753. With regard to co-operative irrigation societies, you say that you obtain technical advice from the Irrigation Department; what do you mean by technical advice? Do they draw up the scheme?—We point out the scheme, and they give us the plan and estimate.

19754. They give you a plan and estimate?—Yes, and sometimes they take upon themselves the task of executing it on behalf of the society.

19755. *Sir Ganga Ram*: What do they charge?—I think there is some fixed charge, which is included in the estimate.

19756. How much is it?—I do not remember the exact figure.

19757. *Profer or Gangulur*: The execution is sometimes done by the societies and sometimes by the Irrigation Department?—The whole idea now is that we give a plan and estimate and the societies will execute it under the supervision of the technical officers, but the technical officers should not in any way be responsible for the safety of the plan or the manner in which it is executed.

19758. In the event of a failure, who is responsible?—The society ought to be responsible; but in Bengal things have been managed in such a way that it has made it possible for societies to make Government responsible for it, but it ought not to be so.

19759. The management is wrong?—The way in which co-operation between the Irrigation Department and the Co-operative Department has been managed is not quite satisfactory.

19760. You agree there?—Yes.

19761. How many Inspectors have you?—Originally we had two but last year our staff was strengthened by the addition of ten more Inspectors; their total strength is now twelve.

19762. What are their duties?—The starting of societies, explaining the benefits of co-operative irrigation and, above all, bringing recalcitrant people who do not like to  
R. B. J. M. Mitra.

join the movement round to become members of the society, and seeing that they keep their accounts properly.

19763. Their work is chiefly concerned with propaganda ?—Propaganda and supervision of the existing societies.

19764. How about your relationship with other departments ?—It is quite cordial.

19765. How is it with the Agricultural Department ?—It is quite cordial, we often consult the Director of Agriculture, and he and I often take counsel together.

19766. Do you distribute manure ?—One of our societies has taken up distribution of manure ; generally there is no demand for manure, except that which can be had easily and for that you do not require a co-operative society.

19767. Do they distribute bonemeal ?—In Bengal, the price of bonemeal is beyond the capacity of the ordinary cultivator to pay ; bonemeal is exported out of the country.

19768. There is a demand for bonemeal ?—The Agricultural Department has been successful in creating a demand for it in certain areas.

19769. *Dr. Hyder* : What is the destination of the bonemeal exported from this country ?—Java ; it is used there for sugarcane.

19770. *Professor Gangulee* : There is a demand created for bonemeal by the Department of Agriculture, and because it is exported the people here cannot purchase it ?—It is exported to Java, of course, people who can afford to do so purchase it at a high rate, but our ordinary cultivators cannot do so. I think it is wrong to export bonemeal out of the country.

19771. *The Raja of Paralimedi* : Have you tried to store sufficient bonemeal in your co-operative societies ?—About ten years ago, some of the co-operative societies in the red soil areas used to keep a supply, but the prices went up suddenly during the War and it is now beyond the reach of the ordinary cultivator.

19772. *Professor Gangulee* : Was there any suggestion at any time before Government to stop export ?—About six or seven months ago we strongly brought it to the notice of the Government that the export of bonemeal should be prohibited.

19773. Was any action taken by Government ?—I do not know.

19774. Besides this work of manure and seed distribution, are there any other points of contact between your department and the Agricultural Department ? For instance, do you participate in their propaganda work or do they participate in yours ?—I do not think either of us has got sufficient staff to participate in each other's propaganda, but we do help them sometimes in propaganda work ; and sometimes their officer suggests that a co-operative society should be started. In this way, we do mutually help each other.

19775. Do you occasionally meet round a table and discuss matters ?—Very often we do that.

19776. What about industrial societies ? Are there many of them here ?—Yes.

19777. How many ?—About 400 or 500.

19778. How do they work ?—The main idea is to supply raw materials and take over the finished products.

19779. Do they get any assistance from the Industrial Department ?—Yes.

19780. Are there any cattle insurance societies ?—I would not risk one unless there was Government backing behind ; the cattle are not looked after properly.

19781. Under the heading of Research, you say, "there should be an all-India Research Board to co-ordinate the activities of the various Governments and to prevent overlapping." Have you any specific instances of research overlapping ?—I cannot tell you, but overlapping often happens.

19782. You make this statement without any specific instance of overlapping in your mind ?—I cannot tell you at the present moment, of any overlapping.

19783. On page 127, you suggest the levy of a small export duty on goods going out of this country. Have you any particular commodity in mind ?—Wheat.

19784. You would prefer to put on a small export cess ?—Yes ; it may also be imposed on oil-seeds and other things.

19785. *Sir Ganga Ram* : Did you say that a cess should be levied on wheat exported ?—Yes, exported from India.

R. B. J. M. Mitra.

19785. Exported from Calcutta?—Generally speaking, exported from India.

19787. *Professor Ganguli*. Would you like an export cess on paddy?—Yes. Some of that must be found out for raising the money. If Government cannot provide it justly funds for research, it is my suggestion that there is a possibility in that direction.

19788. With regard to Agricultural Education, you state that the administration of such schools as may be started should be in the hands of local bodies, and the managing committees should include representatives from rural areas. Have you any experience of such schools being managed by local bodies?—At present all the schools are managed by District Boards.

19789. Have you yourself visited any of these schools?—I have visited them in the course of my tours.

19790. Do you think they are running aucter fully or efficiently?—I have not studied the question from that point of view; my own impression is that it is capable of improvement in many directions.

19791. In the adult schools, do they teach co-operative principles?—Not much.

19792. In the adult schools to which you refer, is there any arrangement for teaching co-operative principles?—Yes, when it is run by co-operative societies.

19793. But, when it is organised by the Agricultural Department?—I do not know of any instance where the Agricultural Department has run an adult school.

19794. You have stated here that the primary schools will be financed out of the profits made by co-operative societies?—That is a scheme under consideration; it has been discussed with co-operative societies.

19795. So you have a scheme under consideration; I want to know what portion of the profit you would allot for the purpose?—It will require to be more than what can be allotted under the Co-operative Societies Act; we shall have to ask for the special sanction of Government to exempt such societies from the operation of that section.

19796. Are there any cases where the profits accruing from co-operative societies are being used in that manner?—Plenty of them.

19797. But that portion is not enough?—It is not enough; under my scheme it would be different.

19798. At the present moment it is quite workable?—It is quite workable; they make small grants out of the proceeds.

19799. *Mr. Calvert*: On this last question of Professor Ganguli's, is not the proper body to provide primary education the Local Board or the District Board?—Yes.

19800. Are you not under the new scheme you mention, rather penalising your societies by making them pay for a school for which the Local Board is responsible?—As a matter of fact, under that scheme, it is quite possible that the co-operative societies might like to manage the entire thing themselves. I am referring to ordinary education; it is quite possible, as I have said, in connection with the scheme under consideration that the co-operative societies themselves would like to manage the whole show; they will not require any assistance either from the District Boards or from Government. That is the scheme which is being discussed with co-operative societies.

19801. Is that because the villager does not like the Government system of education?—In what way?

19802. Because there is a rigid curriculum?—They do not like the curriculum, and they do not like to pay the fees; under the scheme which I have in view they will not be required to pay any fees.

19803. Is not primary education free?—No.

19804. What are the relations between you and the Education Department? Do you formulate any schemes in conjunction with them?—No.

19805. Do you not think they could help you with the adult schools?—No.

19806. Do they themselves organise co-operative societies among the teachers?—I do not think they organise any, but the teachers sometimes organise themselves into co-operative societies.

19807. Is not the Education Department actively assisting you?—There is not much point of contact between us except in the matter of giving grants to educational institutions.

R. B. J. M. Mhra.

19808. Do they invite you for lectures in the training colleges?—Sometimes my officers do lecture on their invitation.

19809. Practically, the Education Department is not throwing its weight on the side of co-operation actively?—No. I would not advertise the co-operative movement too much, because even now you cannot cope with the demand which has been created. If you want to expand the movement, and have not got sufficient stuff, then you will do more harm to the movement than good.

19810. On the question of Agricultural Indebtedness, you say that when there is a rise in the price of jute, the standard of living goes up; that is to say, borrowing is very largely due to prosperity?—I do not exactly mean that; what I mean is that when the prices of jute go down, they find it very difficult to reduce their standard of living. It is the uncertainty of the jute price which creates a gambling instinct. They sow the crop thinking that possibly they will get good prices; they cannot anticipate their income, and when the crop is ready they do not get proper prices; I think the prices ought to be on a more stable basis.

19811. In the world of commerce, when business is brisk, the banks find it hard to meet the demands for loans?—Yes.

19812. That means large borrowings; I thought perhaps you were referring to a similar phenomenon in the rural areas?—I am not referring to that phenomenon.

19813. You also refer, among the reasons preventing repayment, to the fabrication of accounts. Do you find that wrong account keeping by moneylenders is a very serious cause of debt?—I cannot say it is a very serious cause; it is undoubtedly one of the causes.

19814. Then you rather hesitate to support the application of the Usurious Loans Act?—Yes, because it can be evaded; probably it will increase litigation.

19815. Do you know of any example of rural debt on a large scale being relieved from the savings of agriculture?—I can tell you that Eastern Bengal got rid of a good portion of its rural debt last year when the prices of jute rose phenomenally; many of the ryots paid even on their time-barred debts.

19816. Was that shown in a reduction of current debt?—I do not think it is shown in that direction, because it happened towards the end of the year. This year, they have been badly hit; the prices of jute have dropped down suddenly, and the price obtained is not enough to cover the cost of cultivation.

19817. You think there was reduction of debt?—There was a substantial reduction last year.

19818. Will it be 5 per cent.?—I should put it at more than 5 per cent.

19819. You have no estimate of the total rural debt in the Province?—No. I put the total rural debt at about 60 crores, it is my own estimate.

19820. Is it based on any investigation?—Judging from investigations made by the Settlement Department and other departments, I estimate the total debt of Bengal as Rs. 60,00,00,000.

19821. That is by guesswork?—More or less, but not entirely; it is based on certain figures.

19822. Only 60 crores?—Yes.

19823. We were told the mortgage debt in Madras was 90 crores, and you have about the same population?—My estimate may be wrong, but that is my view.

19824. You do not advocate measures to restrict or control the cultivator's credit?—No.

19825. Does that apply generally?—Not to backward tribes like the Santals and the hillmen.

19826. Even if you saw the credit being abused to enable the cultivators to buy drink?—That does not happen with the Bengali cultivator but it does with the Santals and hillmen. I have seen instances of it with the hillmen.

19827. Have you been able to gain any information which would suggest that one of the causes of increasing debt is the increased amount of capital in the possession of moneylenders?—I have seen instances where an influx of capital amongst moneylenders has led to increased borrowing on the part of cultivators.

19828. Is it your opinion that rural debt is decreasing or increasing in this Presidency?—I think it is more or less stationary.

R. B. J. M. Mitra.

19829 *Professor Gangulee* In all districts?—Not in all districts. In the Midnapore district, I think it is increasing, owing to the smaller outturn of agricultural produce.

19830 *Mr. Calvert* One of the difficulties in the way of setting up appropriate industries is the marketing of the product?—To a certain extent that is a difficulty.

19831. That difficulty only arises, of course, when the article produced is not consumed at home?—Yes.

19832. If the article produced were consumed at home, that difficulty would disappear?—The only difficulty would be if the raw material was not easy to procure.

19833. If you could set up activities for the betterment of the village there would be no question of marketing at all?—No.

19834. Do you think the time will come when you will be able to organise the spare labour of the village for the improvement of village roads and bridges, water-supply, sanitation and so on?—I think it might be possible in time.

19835. On page 131 you say there is no need for study into possible village industries?—We have too many studies; the time has come for action. There are too many pamphlets, books and inquiries; the time has come for definite action.

19836. If you have all the information required, what is the obstacle to progress?—I cannot answer that question. You had better ask someone else.

19837. On this question of a surplus of labour, apparently there is a surplus of labour in Bengal, yet I notice the taxi drivers here are nearly all Punjabis from the rural tracts. What is the obstacle which prevents your spare rural labour from finding employment in taxi driving?—I do not know; I suppose they do not care for the allurements of city life.

19838 *Professor Gangulee* And the country boatmen come from Bihar?—Not all of them.

19839 *Mr. Calvert*. With regard to co-operation, you say that non official agencies should be encouraged by every possible means. What means are you thinking of?—If there is a recognised non official agency it should be given grants and assistance.

19840. Financial assistance?—Yes.

19841. The old tale of giving public money to private bodies?—In return for doing public work.

19842. What kind of education do your audit and inspecting staff receive?—All the Inspectors must be graduates.

19843. In economics?—Not necessarily, but graduates in economics are given preference. For auditors, in the case of direct recruitment we insist that they shall have at least passed the Intermediate standard, but in the case of those promoted from Supervisors we do not insist on any educational qualifications; if we find they have done good work we appoint them.

19844. Do you give them any special education?—We place them under competent inspectors, and so they get their training, and we have a system of departmental examinations. Recently the Bengal Co-operative Organisation Society has taken up the opening of training classes.

19845. Do they themselves undergo any regular course of lectures on rural economics?—No.

19846. And they are not examined on rural economics?—Yes, that is a subject in the departmental examination.

19847. They are taught the Acts, by-laws and rules, I suppose?—Yes.

19848. To what extent do you think your members of primary societies understand the principles of co-operation?—I think to a large extent they do understand them. They know their duties and their rights, and that they can elect their panchayats or send them away. They know their relations with the Central Bank, and they attend its meetings and so on.

19849. Suppose a rich moneylender offered to remit all their debt on condition that they gave up co-operation, do you think they would agree?—I think in some cases they have done. In some cases rich moneylenders have taken them away from co-operative societies; in other cases they have refused.

19850. Have any members of your staff been on deputation to Europe to study co-operation there?—No.

19851. Are they sent to other Provinces to study?—Regularly, yes.

R. B. J. M. Mitra,

19852. Do you have any system of refresher courses to enable the staff to keep up their educational standard?—No.

19853. Who audits your Provincial Bank?—A chartered accountant.

19854. Paid by the Provincial Bank itself?—Yes.

19855. Does he also try to educate your other auditors in audit work?—I think our auditors are much more efficient for the purpose of auditing village societies than a chartered accountant. I would not accept an audit of village societies by a chartered accountant. Their audit is not so detailed as ours, and they are not in a position to value the assets.

19856. I do not quite understand why the audit fund is not being more completely used for audit staff?—I think there is a difference between the system in the Punjab and that in Bengal. Here the auditors are Government officers. The contributions of the societies go to Government, and Government sanctions the staff as if it was an ordinary staff.

19857. Your Provincial Co-operative Organisation Society does not control your audit fund?—No.

19858. Do you think it would be a good thing if the fund were transferred to the central organisation?—I would wait some time before doing that. The societies themselves are unwilling that the fund should be transferred, and the central organisation is also unwilling to take over the audit at this stage.

19859. What do you do with the reserves of primary societies?—They are supposed to be separately invested in a Central Bank, and the Central Bank is supposed to put them in the Provincial Bank. Some of the primary societies are reluctant to invest their reserve fund separately.

19860. In spite of the complete failure of that system in another Province, you still adhere to it?—Many of our primary societies are already keeping their reserves here.

19861. What is your objection to the primary society using its reserve in its own business?—I do not think that would be good business. It is not good business practice to mix up your reserves in your business. If there is a small deposit maturing and the reserve is available, they may draw from the reserve to pay it.

19862. Do you not think the members of your primary societies lose the educational value of managing their own reserve in that way?—I do not think so. I think it is a better system to have the reserve separately invested, and is a better means of educating the primary societies in the benefits of a reserve than by keeping it mixed up in the business.

19863. Is it not purely a paper transaction? You transfer Rs. 1,000 to the Central Bank as the reserve, and then have to borrow Rs. 1,000 to fill up the gap?—No; that is not it. At the end of each year you find out what your reserve is and send it to the bank. The borrowing comes later on.

19864. It is only a paper entry, all the same?—I do not look on it in that way; I think it has great educational value in impressing on the people that they have got together this reserve fund.

19865. A society takes 1,000 silver rupees to the Central Bank and says "This is my reserve fund"; the Central Bank puts it into its coffers and stirs it round, and then the primary society says "I want a loan of Rs. 1,000" and it hands it back?—There is a difference in the rate of interest. In the case of the reserve fund they got only 3 per cent from the Central Bank, and the Central Bank has to keep it with the Provincial Bank. If you deposited Rs. 1,000 at 10 per cent and borrowed Rs. 1,000 at 10 per cent that might be a paper transaction, but not otherwise. I have very definite views on this subject.

19866. It may be the actual silver rupees are the same as were paid in by the society?—What happens with the other system? Everyone is taking loans from the reserve fund, and a time may come when they say they will repay their ordinary loans but will not repay the reserve fund. I think from the educational point of view the other system is much better.

19867. On this question of the delay between an application by an individual member for a loan and the payment of the loan to him, have you any system here of fixing the maximum credit of primary societies?—I do not believe in it and would never do it. There is no such system.

19868. Professor Gangulee: You do not believe in it?—I object strongly to the system.

R. B. M. Mitra,

MO 13-11

19869. Why ?—When a Registrar fixes the maximum credit, he declares to the people that in his opinion the society is solvent for that amount. Why should I undertake to guarantee the solvency of primary societies ?

19870. *Mr. Calvert*. Why should not primary societies fix their own maximum ?—They do.

19871. By formal resolution ?—Yes.

19872. Do they pass it on to the Central Bank ?—Yes.

19873. Does the Central Bank then formally fix the maximum credit for that society ?—Sometimes it does, and sometimes it does not. When there is an application for a loan they inquire into their past transactions ; they have some knowledge of the society, and they sanction the loan. Sometimes they send out their officers to make inquiries. The ideal system would be the cash-credit system.

19874. For A class societies ?—For A and B, and gradually to raise the C class to the A class.

19875. Your Central Banks are comparatively small ?—Comparatively.

19876. Small area and small capital ?—Some of them have a large capital.

19877. They do not assess in general meeting the maximum credit of an individual primary society ?—No.

19878. Then you talk of giving members of a society cheques on a Central Bank. How can an individual member deal direct with a Central Bank ?—If a village committee sanctions a loan to a member of Rs 50 and the village society has no funds, they give him a cheque and he cashes it ; possibly he will be able to cash it in the village.

19879. The member of the primary society himself goes to the Central Bank to cash the cheque and the primary society does not handle the money ?—That is so.

19880. Is not that the very system which smashed things up in another Province ?—I do not think so. The society grants the loan.

19881. But it does not handle the cash ?—Ordinarily it would, but if at a particular moment it has no funds available and cannot send a man, it would give its member a cheque. I do not say a society should not handle cash ; it must ; I am referring to a loan granted in an emergency.

19882. That is the system which came to grief in the Central Provinces ?—I do not think so. The system there was that the society never handled the cash. I am only referring to the case of an emergency loan. I think you have misunderstood me.

19883. Are you satisfied that the repayments of loans to primary societies are made in cash ?—Yes.

19884. They are not met from borrowings ?—No.

19885. Have you any system here of group secretaries ?—No. I do not believe in that system.

19886. Each individual society has its own separate secretary, who may or may not be a member ?—In 99 per cent of cases, he is a member.

19887. You can get literate secretaries in each village ?—Yes.

19888. What is the chief object of these milk societies round Calcutta ?—To collect the members' milk and sell it at a profitable rate. It is a producers' society, not a consumers'.

19889. From popular accounts one gathers the main object is to provide Calcutta with a pure milk supply ?—That is a wrong idea. Incidentally it solves Calcutta's milk problem, but it is really a producers' society.

19890. The main object is the benefit of the individual producer whose average daily sale of milk is very small ?—Yes.

19891. About 1½ seers ?—Yes.

19892. Where you have co-operative seed distribution, do the costs of the distribution fall on the co-operative society ?—Yes.

19893. Where Government distributes the seed, the costs of distribution are paid by Government ?—That is one of the obstacles to the fuller use of co-operative societies for the distribution of seed.

19894. Have you any concrete evidence which indicates that any legislative restriction of credit, such as the Usurious Loans Act, has actually forced up the rate of interest on

R. B. J. M. Mitra.

moneylenders' loans ?—I have concrete evidence that sometimes the restriction on the sale of ryots' holdings makes credit very dear to them.

19895. Actually has the passing of the Usurious Loans Act been followed by a rise in the rate of interest charged by moneylenders ?—I do not think so ; I have no experience of that.

19896. To what extent in this Presidency does the cultivator borrow money from the landlord ?—Some small landlords do resort to moneylending, and in some cases the agents of landlords also. The system does obtain, but it is not widely prevalent.

19897. *Professor Gangulee* : What about the big landlords ?—I think their agents might do it, but the big landlords themselves do not do it as a rule.

19898. You do not know of any case ?—I know of one instance, Sir Rabindranath Tagore tried to introduce a system of land banks on his estate.

19899. Do you know the rate of interest of his bank ?—No. I think it was you who managed it.

19900. *Mr. Gupta* : Was that to help the ryots ?—Yes, that was the main idea.

19901. *Mr. Calvert* : Have you found any evidence to indicate that the landlord advances loans in order to maintain a hold on his tenant ?—It is the other way about. It is the moneylender who tries to secure the interest of the landlords in order to get a greater hold on the tenant.

19902. The moneylenders ?—It is the moneylenders sometimes who try to become landlords in order to get a greater grip over the tenants, and this is a particular phenomenon noticeable in the district of Dacca.

19903. Does your moneylending landlord also lend money in order to get a better grip on his tenants ?—I think mostly the idea is to get a better return for the money and incidentally to get a grip.

19904. And some control over his produce ?—Yes.

19905. In your experience have you found that the acceptance of a *taccavi* loan does prevent a man from getting a loan from his moneylender ?—I do not think in our Province the *taccavi* loan is taken very seriously. Nobody thinks of a *taccavi* loan. If some people in time of scarcity want a few rupees they go to the Collector. I do not think the acceptance of the *taccavi* loan has any effect on the moneylenders.

19906. Are your staff as a whole drawn from the same class as the members of the primary societies ?—A large part of our staff is drawn from the same class as members of village societies.

19907. If they stay the night in a village, they would find no caste difficulty in living and feeding with the actual members ?—No.

19908. *Mr. Kamal* : Regarding this delay in primary societies for members to obtain loans after loan applications, your experience is the same as in my Province. Have you thought of devising any means to minimise the delay ?—We have, as I said, introduced or are trying to introduce the system of cash credit and also we are trying to press upon the Central Banks to dispose of their loan applications as promptly as possible and we have also suggested that the Board of Directors should have a small committee to deal promptly with loan applications. I think the delays are being minimised as far as possible.

19909. Have you got in this Presidency agricultural purchase societies in large numbers ?—Not in large numbers. We have got a few.

19910. What is the reason ?—Partly we are understaffed and we are not able to do that propaganda which is necessary and partly we had found out by experience that a purchase society in order to pay its overhead charges must be started on a very big scale.

19911. In your Provincial Bank, have you got large funds available as deposits ?—We have got no difficulty about funds.

19912. There is no difficulty in this Presidency about funds ?—Not the slightest. Our difficulty, as I said, is to invest our surplus.

19913. About Agricultural Implements, you have said in one place that your difficulty is that there are very few improved agricultural implements which can be brought into use by the agriculturists ; will you kindly explain that ?—Well, the agriculturists do not know and we cannot recommend to them the use of any improved agricultural implement by the use of which they can save money or get an increased return. For instance,

R. B. J. M. Mitra.

Mo 2 13—11a

I persuaded one society to make an experiment with tractors. They spent a lot of money in making the experiment and then they found it did not succeed.

19914. That is with reference to tractors. What about other implements?—I do not know of any. Unfortunately I am ignorant of agricultural matters and I do not know of any implements which could be popularised and used.

19915. *Professor Gangulee* What about iron ploughs?—I do not think our bullocks will stand them or that the land requires them. I do not think the land is so difficult to till here.

19916. *Mr. Kamat* So on account of this difficulty you are losing in this Presidency one source of agricultural improvement attainable by the use of improved implements?—Yes.

19917. This difficulty can be met if you have an Agricultural Engineer?—If he can devise implements, yes.

19918. You have no Agricultural Engineer as such now?—No.

19919. Whether attached to your department or any other department?—No.

19920. And that is a great handicap, I suppose?—I suppose so.

19921. You once had an Agricultural Engineer in your department?—Yes, to assist minor irrigation works.

19922. Only irrigation work, and he had nothing to do with agricultural implements?—No; he had no time to devote his attention to agricultural implements. His hands were full.

19923. With irrigation matters?—Yes.

19924. I should like to know something about marketing with reference to the note appended to your statement, especially with reference to jute marketing. There are something like five middlemen, you say. Have you got a jute producers' society?—Yes; we are starting jute producers' societies.

19925. You are starting or have started?—We have got about five of them in full working. This year we have sold 20 lakhs worth of jute.

19926. Have you tried to minimise these middlemen by your co-operative movement?—That is our aim, and with that aim we have started these societies.

19927. How many middlemen can you cut out?—We have cut out in some places a lot of them and in some places we have cut out one or two of them. We cannot make a general statement. It is in an experimental stage. I should say we have made an excellent beginning, and I am very hopeful.

19928. *Professor Gangulee*: Do you meet with any opposition from vested interests to any great extent?—Vested interests, of course, do not like to see any competitors. It is natural that vested interests should oppose.

19929. *Mr. Kamat*: That is only a general statement. Now can you give me an idea of what is roughly the amount which the jute producer actually gets, I mean which actually goes into his pocket, as against the prevailing price of jute for the time being? What is the difference?—The difference varies in various places. If you want to go on the basis of average I put the difference at about Rs. 2-8 per maund.

19930. That is to say, roughly he gets Rs. 2-8 less per maund than he should get?—Yes. Actually the middlemen make more; but that is the net loss to him.

19931. What is the average price per maund of jute, the market price on which you are working?—Of course there are different classes of jute. Just at present the very lowest quality sells at Rs. 3 and here in Calcutta it will sell at Rs. 5-4.

19932. *Sir Ganga Ram*: Out of which the middlemen take Rs. 2-1?—Rs. 3 is the price which you can get in the jute centre. The cultivator gets about Rs. 2.

19933. *Mr. Kamat*: Out of Rs. 3 he gets Rs. 2, and it is sold in Calcutta at Rs. 5-4?—Yes.

19934. So in percentage he gets two-thirds the usual price?—Yes.

19935. He loses 33 per cent?—Well, in the case of higher grades of jute he does not lose so much. I put it at 25 per cent. He loses 25 per cent of the price.

19936. Now have you any idea roughly how many thousands or lakhs of bales of jute you export from this Presidency?—Yes. This year I think, the trade demand for export is 40 lakhs of bales as against the local consumption of 60 lakhs.

R. B. J. Mitra.

19937. Valued roughly at ?—The average price I should take to be about Rs. 7 per maund.

19938. Price per bale I am asking ?—The bale contains about  $3\frac{1}{2}$  maunds.

19939. *Professor Gangulee* : If we value each bale at Rs. 20 perhaps it will make it easier to calculate ?—Yes.

19940. *Mr. Kamat* : One-third of it is lost to the producer ?—One-fourth, I should say.

19941. *Sir Ganga Ram* : Is not a bale of 400 lbs ?—I was dealing with the bales consumed in the Calcutta mills. For export I think it is 5 maunds, baled under very high pressure.

19942. *Mr. Kamat* : So that the loss is so serious even from one crop that the problem requires very close investigation ?—Yes.

19943. *Rai Bahadur Bannerji* : In connection with this central anti-malaria movement set on foot by Rai Bahadur Dr. Gopal Chandra Chatterjee, you have told us you have stopped registering these until you get a declaration of policy by Government ?—Yes.

19944. Will not that mean a set-back to this anti-malaria movement ?—I do not think so. I am registering it in Calcutta, in the district of 24 Parganas and in the surrounding districts, but not in outlying districts with which the anti-malaria society is not much in touch.

19945. So you are not registering them because your department is not in close touch with these societies ?—I am not registering because I do not think the anti-malaria society is in the position of being in close touch with them.

19946. But cannot your department be easily in touch with them as it is with the other societies ?—Unfortunately my departmental staff is too much overworked.

19947. If your staff be increased you will be quite in a position to register these societies as before ?—Yes.

19948. There has been an idea in the country that these moribund anti-malarial societies might be replaced by the Union Boards taking up the work ?—Some very influential people whom I have met think so.

19949. Are they officials or non-officials ?—Both officials and non-officials.

19950. Are these Union Boards in a position to do such work as some of these anti-malaria societies are doing ?—For intensive work in the village I do not think the Union Board is in a position to do it, while co-operative anti-malaria societies are in an excellent position ; but for general supervision and for keeping up a continued interest in sanitation I think the Union Boards are the best agents.

19951. *Professor Gangulee* : The Union Boards do not take an interest in Dr. Chatterjee's movement ?—Some of the Union Boards do not and some Union Boards do. Government ought to investigate the matter and come to a definite understanding with the central anti-malaria society as to the assistance they can render. Even Rai Bahadur Dr. Gopal Chandra Chatterjee has written to me that his society should be relieved from organisation work because Government has cut out the grant. I have gone into the matter and I have been pressing for the last six months for a declaration of policy and the convening of a small conference, but without any result.

19952. *Rai Bahadur Bannerji* : Government have not declared any policy ?—They have not declared any policy.

19953. Do you think it should be done at once ?—It should be done at once, because I say that Rai Bahadur Dr. Gopal Chandra Chatterjee has been successful in a pre-eminent degree in rousing the interest of the people in rural sanitation. It may not commend itself to some but at any rate popular enthusiasm in sanitation has been created.

19954. *Professor Gangulee* : And you have drawn Dr. Bentley's attention to this problem ?—On several occasions I have drawn the attention of Government to it and pressed for a conference.

19955. Did you personally meet Dr. Bentley ?—He has just returned. His *locum tenens* did not favour these societies at all. There must be continuity of policy. If Dr. Bentley goes away and his successor comes he may say 'I do not want these societies.' There is no continuity of policy and I think the blame is entirely on the Government.

19956. *Mr. Gupta* : Are you referring to Major Stuart ?—I am not referring to anybody.

19957. He recommended something so far as I know ?—He did not recommend to Government the same treatment to societies as Dr. Bentley recommended.

19958. He did not want a block grant to be made ?—He recommended payment on the results of each society.

Mr. B. J. M. Mitra.

10959. *Rai Bahadur Banerji*: Now, as regards this irrigation by tanks and small streams, especially in Western Bengal, in Bankura, Midnapore and all these districts, has not the custom already been prevailing in the country that people have been taking water from these streams? Of course there is no question of tanks. But even from the streams people have been in the habit of taking water for irrigation from time immemorial?—Quite right.

10960. And they have been taking it with the help of *lutcha* earthen weirs and having the necessary channels?—Yes.

10961. What the Co-operative Department has been doing is to try and give these schemes of irrigation a permanent basis by the formation of co-operative irrigation societies to construct masonry weirs and better channels for distribution of water. In Western Bengal, usually these streams belong to the zamindars; is that not the case?—Yes, all these streams belong to the zamindars.

10962. All of them?—Yes.

10963. And the zamindars do not object to water being taken for the benefit of cultivation?—They do not object.

10964. In the formation of co-operative societies for tank and stream irrigation schemes, it is generally found that although a large majority are willing to co-operate, there are one or two who do not, and on account of that it is not possible to form a society?—Yes.

10965. Do you think that legislation to compel this minority to join the scheme is necessary?—Legislation is necessary on the lines I have suggested in my statement. They should not be compelled to join co-operative societies as members, nor should the co-operative societies be compelled to take them as members. But some measure to compel them to contribute towards the cost should be devised.

10966. It has been found in practice that when these small irrigation societies are formed you have to take the help of Government engineers. In Bankura and Birbhum you have irrigation sub-divisional officers. Although in Bankura he is called an Agricultural Engineer, it is a misnomer to call him so?—He is no longer called Agricultural Engineer.

10967. The plans of these Sub-divisional Officers have to be submitted to the Superintending Engineer and perhaps to the Chief Engineer for Irrigation and all this takes a long time, and they have to change their plans and estimates very often?—Yes, very often.

10968. What other course do you think will be most suitable for expediting the construction of these schemes?—The employment of a whole time irrigation officer under the Co-operative Department.

10969. *Mr. Gupta*. Why under the Co-operative Department?—Because we deal entirely with co-operative irrigation societies. We can ask him to take up these schemes and go on with the work without waiting.

10970. If many schemes are on the anvil?—We shall have a special officer.

10971. You will have two?—Yes, two. Even if you employ ten engineers, the Co-operative Department can give them full work; there is so much to do.

10972. *Rai Bahadur Banerji*: In that case you think there will be no delay as now?—There ought not to be any delay.

10973. You have generally conferences with Irrigation Engineers and you draw up proposals to be adopted. Are they put into effect?—Not generally, I am sorry to say.

10974. In the district of Birbhum this irrigation movement was set on foot, properly speaking, at the time when Mr. G. S. Dutt was District Officer. His policy was followed enthusiastically by Mr. J. R. Blackwood in his term of office, and it is being followed equally enthusiastically at the present moment by Mr. Quenton, the present District Officer?—That is so. I think Mr. A. C. Banerji, when he was Chairman of the District Board, did much for irrigation.

10975. You have stated in the course of your evidence that the village societies borrow at the rate of 9½ per cent?—Yes.

10976. And they lend at 12½ per cent?—That is in the Western Division.

10977. Is a reduction in the rate of interest possible?—I do not think it is possible until we are able to raise money much more cheaply. I do not like to charge the rates of interest until the people are educated to a full understanding of the principles of the movement. Cheap credit is a double-edged weapon.

R. B. J. M. Mitra.

19978. *Mr. Calvert* : Can you not use your reserves ?—We might thereby reduce the rates by one or two per cent but I think in keeping the reserve separate we keep it safe. It is more likely that we shall be able to reduce our rates sooner under my system than we can under your system.

19979. *Rai Bahadur Bannerji* : In Western Bengal the village *mahajans* have reduced their rate of interest on land mortgage to 8 per cent ?—I think there has been a general reduction of the rate of interest charged by the moneylenders on account of the co-operative movement not only in Western Bengal but throughout the Presidency.

19980. Should not the co-operative societies think now of devising methods to reduce their rates of interest ?—They might. As a matter of fact they have reduced their rate of interest this year on short-term loans. On short-term loans they are charging 12 per cent and not 12½ per cent; in Eastern Bengal they have reduced it from 15 to 12½. So that this year there has been a reduction in one class of loans.

19981. *Sir Ganga Ram* : Do you control marketing at all ?—I do not control the markets; I look after co-operative societies.

19982. Are these societies limited companies ?—No. They are not registered under the Joint Stock Companies Act; they are registered under the Co-operative Societies Act.

19983. Have they any status ?—Yes; they have.

19984. Can they compel people to join a society ? Supposing one producer refuses to join, can you compel him ?—No. These producers who want to form themselves into a society apply to us to be registered as a society and we register them as a society.

19985. There is no compulsion ?—There is no compulsion.

19986. I am not quite satisfied with your answer about the sale of jute. You said that the agent sold to the middleman ?—The agents sell to the Calcutta mills through the brokers; the Calcutta mills do not buy direct from the agents.

19987. Do you or your office get daily telegrams of the world rates for jute ?—No; the agent is supposed to get them.

19988. Does the agent get them ?—He keeps all the information he thinks he ought to keep.

19989. You have no control over him ?—I have no control; I do not want any control.

19990. On whose account is the jute sold ?—On the society's account.

19991. Supposing the agent sells forward 2 lakhs worth of jute, will the society be responsible for carrying out that order ?—Yes.

19992. Supposing he is in collusion with the brokers ?—The society itself is responsible for it. Why did they appoint him ?

19993. A very influential gentleman in Bengal came to me and said these producers were so poor that some of them, in fact the bulk of them, had got only one *dhoti* between two women ?—I do not believe that; it is a gross exaggeration, and nothing else.

19994. Are you aware of the under-currents of speculation ?—I hear something about it.

19995. From the information I have had, I think 75 per cent goes to the middlemen and 25 per cent only to the producer ?—That, I think, is also an exaggeration.

19996. Why should there be so many middlemen in Bengal; they are not required in other Provinces ? In other Provinces the people take their produce to the *mandi*. Is there a *mandi* system here ?—What is a *mandi* ?

19997. Bazaar ?—Here they do take it to the bazaar.

19998. In the Punjab, Government have made a rule to put up a sort of board, over the signature of the Director of Agriculture, giving the prices ruling daily in different parts of the world, so that the producer will know the ruling rate of the day ?—In our Province sometimes the cultivator goes to the *hat* (*mandi*), where some *Leparis* come and purchase their stuff. Then they take it to the baling firm, they must sell it through a broker to the baling firm.

19999. *Sir Ganga Ram* : Here the middleman is making a fortune; your producer is simply surrounded with pests.

*Mr. Gupta* : I hope the Commission will remove those pests.

*Sir Ganga Ram* : What I have described is a true picture of the whole thing. The money goes into the hands of the speculators; there is great room here for speculation.

B. B. J. M. Mitra.

20000 *Mr. Gupta* : Did you say that the indebtedness of the agriculturists is at a standstill ?—Speaking generally of the whole Province, yes.

20001. What about the work of your own department ? Has it not helped to remove agricultural indebtedness ?—We have only touched the fringe of the problem.

20002 It cannot be stationary unless they are contracting new debts ; your department must have helped them to reduce their debts ?—We have not covered the whole field yet.

20003 But you have made some impression ?—Yes ; the fact is we have made some reduction in the rates of interest.

20004. *Sir Henry Lawrence* You spoke of the Usurious Loans Act. Would you tell me what procedure is adopted here ?—I have not any experience of it.

20005. Is it in fact used for the protection of the ryot at all ?—I do not think much use is made of it.

20006 *The Chairman* : If I understood one of your answers aright, you occasionally refuse registration to those who are applying to be registered as a society on the ground that you have not sufficient staff to carry out supervision ?—On the ground that they have not been properly organised, and I cannot send a person to organise them. It is organised by private persons, and I have no certainty that it will continue to work well or that it will not change its co-operative character. I must see to two things : that they are co-operative and are likely to succeed, and that they will retain their co-operative character.

20007 I asked whether you ever refused registration on the ground that you have not sufficient staff to carry out adequate supervision ?—I have often asked organisers not to organise societies. I have not actually refused them registration on the ground that I have not sufficient staff to supervise.

20008. Would you be within your powers as defined in the Act if you declined registration on that ground ?—I would be absolutely within my power. I have to be quite sure that it will succeed.

20009 I want to be quite certain. Is it within your power, under the Act, to refuse registration on the ground that you have not sufficient staff to carry out adequate supervision ?—I have never refused registration on that ground. As a matter of fact, I have absolute discretion to register or not to register societies. That is the whole foundation of the Act.

20010. *Sir Henry Lawrence* . Without alleging any reason ?—I think under the rules we have got to allege reasons.

*The Chairman* I think that is almost certain to be the case.

(The witness withdrawn.)

**Khan Bahadur MAULVI HEMAYAT UDDIN AHMED, Pleader,  
Barisal (Bengal)**

**Replies to the Questionnaire**

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.**—(a) I am not aware of any improvement in the practice of cultivators in the district of Backergunj which is considered to be the granary of Bengal.

(b) If demonstrations are made economically within the means of common cultivator showing a fair margin of profit, it will then and then only be effective and attractive.

(c) The cultivators are not inclined to avail themselves of expert advice as they find the method suggested is too expensive for them and that the demonstration farms in their charge are not generally even self-supporting, not to speak of being remunerative. So if these farms are so managed as to prove a remunerative concern, then the cultivators will be inclined to follow it and to take the advice of its manager.

**QUESTION 5.—FINANCE.**—(a) Extensive and intensive propaganda for establishing rural co-operative societies.

(b) Government system of *taccari* is not at all popular in this district and I do not think it can be improved under the present condition.

**QUESTION 6.—AGRICULTURAL INDEBTEDNESS.**—(a) (i) Want of education and consequent forethought, extravagance, idleness, social rigidity in matters of religious and social rites and the last but not the least the high rate of interest as well as the illegal and arbitrary exactions of the *zamindars*.

(ii) *Mahajans*, co-operative credit societies and Government loan.

(iii) (1) Limited income coupled with the bad intention of the *mahajans* to get hold of his holding.

(2) Want of thrift. (3) Failure of crops (4) Sudden fall of the price of the agricultural produce.

(b) The application of the Usurious Loans Act seems to be the best measure in my opinion.

(c) I am not in favour of any restriction or control of the cultivators' credit.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—(c) It would be better if any inexpensive method could be introduced by legislation to deal with such persons and to keep disputes out of the courts.

**QUESTION 11.—CROPS.**—(i) Fodder crops are very much needed in this district, so I would suggest the introduction of Guinea grass.

**QUESTION 15.—VETERINARY.**—(a) Agricultural and Veterinary Departments should be co-ordinated, the Civil Veterinary Department may be under the Director of Agriculture with an Assistant Director who is an expert in veterinary science in charge of the Veterinary Department acting under the orders of the Director of Agriculture. Absolutely independent Directors for these two allied departments, are not desirable in my opinion.

(b) (i) Yes, it is working well.

(ii) Certainly not. Dispensaries are generally located in the district headquarters, where the people of the neighbourhood are rather labourers than agriculturists. The agricultural population live in the villages and cattle is their principal properties and agricultural accessories. This being the case, dispensaries in the interior or at least at each *thana* quarter are more needed than those at the district headquarters. So long as these dispensaries are not within the easy reach of the agricultural population, no appreciable good can be done to the people.

(iii) I think the Provincial Government is at present the controlling authority.

(c) (i) The agriculturist cannot make full use of the dispensaries for the reasons given in my reply to Question 15 (b) (ii) and the remedies are also suggested therein.

(ii) There is no touring dispensary in this district. The doctors in charge of dispensaries make tours in the villages for a certain number of days in the month which is not an adequate arrangement and the people cannot make full use of it.

(d) Paucity of doctors, ignorance and consequent indifference of the people, want of timely information, absence of *bhagar* (fixed place for the disposal of deceased carcases) are among the principal obstacles. I do not advocate legislation unless and until a sufficient proportion of the agriculturists understand the importance of segregation, inoculation, etc. If a fixed place in every village be allotted for the disposal of deceased carcases and the people of the village be bound by the bye-laws of Union Boards to dispose of the carcases there, on some penalty, the chief cause of the spread of epidemics may be combated. Other things in this connection may be dealt with by ordinary law as far as possible. In the present condition of the country, I do not consider that it is practicable to do more than this.

**K. B. Maulvi Hemayat Uddin Ahmed.**

(e) There is difficulty in securing sufficient serum in time but the difficulty may be overcome by the construction of serum-cellar in every district.

(f) Short period of immunisation is the principal obstacle which should by all means be increased by scientific measures. No fee is charged.

(g) Yes.

(i) No.

(ii) I advocate extension, so that the veterinary graduates may get sufficient training in bacteriological diagnoses, to enable them to do on the spot microscopic examinations.

(h) (i) No.

(ii) Yes.

(iii) I see no necessity for such an officer.

QUESTION 16.—ANIMAL HUSBANDRY.—(1) Improving the breeds of livestock is very much needed in this district and for this purpose I would suggest provision of better bulls in the village and spacious grazing grounds. Insufficiency of pasture is the principal cause of the degeneration of cattle. Unless it is removed, no improvement of cattle-breeding can be expected.

QUESTION 17.—AGRICULTURAL INDUSTRIES.—(b) This is a jute-growing district. The agricultural population has ample spare time at their disposal. Introduction of making good gunny bags and chatts would be a very suitable subsidiary industry for them.

(d) I would advocate establishing by Government industries connected with the preparation of agricultural produce for consumption such as sugar-making, utilisation of rice straw and betel-nut covers for paper-making in this district.

QUESTION 22.—CO-OPERATION.—(a) (i) Co-operative movement should stand on its own legs; the less the Government interference the better. The Government should not try to officialise it, but should always encourage private enterprise by (1) starting special agricultural schools for the sons of the agriculturists, (2) starting middle schools to impart the knowledge of co-operation and the principles of co-operative movement, (3) training schools and colleges for teaching book-keeping, banking and the general system of export and imports, etc., (4) by allotting sufficient money in the Budget for the appointment of supervising and auditing officers.

(ii) Statutory power should be given to reliable private persons to do some of the works which are now being done by the Registrar as criminal administration is entrusted to some extent to the Honorary Magistrates.

(b) (i) The co-operative movement in this district is at present almost limited to credit societies. The chief drawback is illiteracy. Compulsory free primary education is urgently needed for the expansion of such societies. Want of statutory power to call for the accounts of the creditor is keenly felt to ascertain the actual liabilities of the members. There is no speedy and effective means to realise the dues from the recalcitrant members. The attempt to control the disposal of the Reserve Fund by the Registrar is calculated to retard the progress of the movement. Unnecessary restriction which is now being introduced in the bye-laws\* by the department is another cause of complaint. Societies' dues should be made the first charge after rent on the assets of the members by legislation.

(ii) None in the district.

(iii) No such society is in working condition here, but such societies are very much needed for the sale of agricultural produce such as betel-nut, paddy and jute. The principal difficulty to run such society is marketing in absence of central organisation at the exporting places. It is necessary to have warehouses at Rangoon to dispose of betel-nuts (*"oghat"*) and at Calcutta to export jute and paddy.

(iv) No such societies are needed here.

(v) No room here for such societies.

(vi) Agricultural machinery cannot be used here in marshy land.

(vii) There is ample room for such societies in this district if the Government shows its inclination to settle *char* lands to such societies.

(viii) No such society exists here and is not likely to come into existence for want of proper training and education.

(d) Yes. Co-operative credit societies under the Central Bank of which I am the Secretary have in most cases been very successful. Indebtedness has been very much diminished, local rate of interest has shown a downward tendency and in many places it has reached the normal condition. A spirit of joint action and sense of joint and individual responsibility are appreciably visible. Want of literacy and business habit are being

\* Memorandum No. 4908, dated the 28th July 1926, issued by the Registrar of Co-operative Societies, Bengal (g. n.)

keenly felt and a desire to remove the former and to acquire the latter has been kindled. In short, there seems to be a new life in the village where there are some societies in good working order.

**QUESTION 23.—GENERAL EDUCATION.**—(a) The system of education which is in vogue in this country is not absolutely helpful to agricultural efficiency. It may produce a poet or novelist, a clerk or administrator, a politician or agitator but not a good business man or a model farmer. The causes for such a deplorable result are, in my opinion, to be found in the medium of instruction—English, owing to which vague ideas are received but not properly assimilated. More attention is paid to book knowledge rather than to practice.

(i) Collegiate education is received by the higher class people who have no concern with agriculture and therefore no provision has been made there for scientific agricultural training or education. In my opinion, if in the University there would have been a department of agriculture, the higher class people and the intelligentsia of the country would have taken some interest in agriculture.

(ii) Middle schools are only stepping stones to higher education. There should be a bifurcation at the lowest class, one branch leading to collegiate education and the other devoted to Agriculture, farming and other subjects of household economy.

(iii) The present system of primary education needs wholesale overhauling. As it exists in the country, it is rather harmful to the agricultural population. It neither increases their knowledge for the better management of their ancestral pursuit nor does it train their habit to successfully do the household work. It only kindles a desire in them to lead an easy life and creates a hatred towards manual labour. I would advocate a system of a sort of farm-school with a demonstration farm attached to it where the three R's may be taught in the class and practical training in agriculture may be given in the field.

(b) (i) Please see the above reply.

(ii) As Chairman of the Bacharganj District Board, I started a free primary school in a certain area under Mr. Bux's scheme which acted like a sort of compulsory education. The school attracted almost all the boys of the village, but the system not being quite suitable to the condition of the life of the agriculturists, it could not develop very much. Had the system of education been what I have suggested in my reply to Question (a) (iii) above, I believe, the people could appreciate the value practically and compulsion would be quite justifiable. I am an advocate of free compulsory education provided the system be suitable to the condition of an agricultural life. The school sits either from 11 a.m. to 1 p.m. or once in the morning and again in the evening; so the poor parent loses the services of his boy even when they grow old and are able to help him. Moreover, while the parent finds that his ward is not acquiring any knowledge helpful to his avocation, his enthusiasm cools down and the boy is taken away from the school to be employed at the plough or otherwise.

## Oral Evidence

20011. *The Chairman* : Khan Bahadur Hemayat Uddin Ahmed, you have provided the Commission with an interesting note of your views in answer to our Questionnaire, and we are greatly obliged to you for the trouble you have taken in the matter, the note is in the hands of my colleagues. Do you desire to make any statement of a general nature, or shall I ask you one or two questions on your note?—I would prefer to reply to questions.

20012. I see on page 169 you express the view that if demonstrations are made economically within the means of the common cultivator, the improvements demonstrated will be adopted by him?—Yes.

20013. Would you suggest making these experiments on the cultivator's own holdings?—Yes. Just at present, the demonstrations are held at the district headquarters, and the neighbouring people are labourers; they are not agriculturists. Agriculturists generally live in villages in the interior. Sometimes they try to carry out demonstrations through the cultivators, but they take to it very unwillingly.

20014. Do you not also think that the demonstrations which are held by the Agricultural Department are suspected by the cultivators? They always think that the Agricultural Department has better land than they have?—Yes, they think that the department has better land and that the department is using means not available to the cultivators, and they do not attach importance to such demonstrations at all.

20015. You think a demonstration on the cultivator's own holding is the best method?—It must be on the cultivator's own holding. Now it is done through the cultivators. I would suggest that the department should take a cultivator's land on long lease and the demonstrations should be held there.

20016. On page 169 of your note you say, "Fodder crops are very much needed in this district," and you suggest the introduction of Guinea grass. Is yours an irrigated district?—It is not.

20017. Would it be possible to grow these fodder crops there?—Yes, there is sufficient raised land on which they can be grown, an experiment is being made in that connection.

20018. Would it be grown at the sacrifice of other crops?—It could be grown on fallow lands also.

20019. You think that it can be fitted in with the present rotation?—Yes.

20020. You think that cultivators will take readily to the growing of fodder crops?—At first they will not, but when they find that it is advantageous to do it they will.

20021. Your note is very clear, and I have only one or two questions to ask you, mainly about co-operation. What experience have you of the co-operative movement?—Co-operative credit societies have now been established; people are accustomed to the system.

20022. Have you yourself much experience of these societies?—I have thirteen years experience.

20023. Are you a member of any society?—I am the Secretary of a Central Bank; I have established it and worked at it.

20024. Is it your experience that the primary societies with which you are most familiar are well managed?—Most of them are well managed.

20025. Do you think the supervision by the Central Banks is adequate?—I cannot speak for all Central Banks; in some banks there are a sufficient number of supervisors, but in others there are not. In the case of my Central Bank, I have about thirty societies under one supervisor.

20026. How many societies are attached to one Central Bank?—Three hundred just at present.

20027. For one Central Bank?—Three hundred societies. There were rather more, I think; the whole district was under my jurisdiction, but some other Central Banks have since been established, taking away the societies under my Central Bank.

20028. You provide supervisors from your Central Bank?—Yes.

20029. Are you satisfied with the services of the supervisors you provide?—I am satisfied with the supervisors under my Central Bank.

20030. How about the supervision by the department?—Audit is being done by them, but I am absolutely dissatisfied with the audit that is going on; it is not helpful to us.

20031. What is the matter with it?—It goes on throughout the year and not for a full financial year. Generally the Bengali year ends in *Chaitra* (March-April) and begins in *Baishakh* (April-May) and if the accounts for the whole year are not examined at the K. B. Maulvi Hemayat Uddin Ahmed.

beginning of the new year or at the end of the old year, but sometimes in the middle, it gives no idea of the real financial condition of the bank.

20032. If you examine the affairs of a society for any term of months, will not that give you an idea?—It will not. If the accounts are audited before the realisations are made, how can you have an idea of it? The two seasons when realisation is made are the jute season and the paddy season. If the society is audited then, it can be known whether the members are regular or irregular.

20033. You will have an idea what the condition of affairs of the society really is?—Yes. Another defect of the present audit is that it is done badly. Questions are answered haphazardly; the auditors do not get sufficient time to do it.

20034. Have you known specific instances where the audit by the department has failed to disclose improper practices on the part of the secretary of the society or any other officer?—I cannot give you the names.

20035. Have you any specific instances to give the Commission of the failure of the official audit? If you are not quite willing, you had better not give it at all?—Another thing is that this year 25 societies are being audited monthly by the departmental auditors which is physically impossible.

20036. Twenty-five societies monthly, by how many auditors?—Every auditor has to audit 25 societies a month in the Dacca Division, which is physically impossible. These societies are at different places, and what the auditors do is to finish their work at all costs. As I understand it, the audit of co-operative societies and that of chartered banks are quite different things; in the latter case, it is only arithmetical work; in the former case it is meant to give an exact idea of the society and how it is working.

20037. How long does it take, in your experience, properly to examine the accounts of a society?—It is not only an examination of the accounts, but there are various questions which have to be answered by the auditors, and that requires at least three days.

I think the rest of your note is quite clear. My colleagues may have one or two questions to ask you.

20038. *Sir James MacKenna*: You say, "The Civil Veterinary Department may be under the Director of Agriculture with an Assistant Director who is expert in Veterinary". That Assistant would be a Superintendent of the Civil Veterinary Department, would he not? He would be a veterinary officer, would he not?—I would prefer a man of higher status to be the Assistant Director.

20039. To be under the Director of Agriculture?—Yes.

20040. *Mr. Calvert*: You make a remark about the disposal of the reserve fund. Is it your opinion that the reserve fund of primary societies should be left in the primary society?—We have been preaching that from the very beginning. These people do not understand the importance of a reserve fund; so they are told at the very beginning that if a society is dissolved or comes to an end, somehow that reserve fund should be spent for the benefit of the area, according to the decision of the members of the society. But now a circular has been issued that it should be at the discretion of the Registrar of Co-operative Societies. That is quite contrary to what we have been preaching so long.

20041. Are you referring to the surplus assets after liquidation?—There is a reserve fund separately invested, and that fund is not divisible.

20042. You object to the disposal of the reserve fund being under the control of the Registrar. Do you mean the reserve fund of a living society or the reserve fund of a defunct society?—Of a defunct society.

20043. I am very glad to hear that indebtedness has been very much diminished. How does your Central Bank make up its mind to comply with or to refuse an application for a loan from a primary society? If a primary society applies to you for a loan, what is the procedure?—First, the application is examined on the spot by one of our supervisors, and he finds out whether the money is taken for a productive or an unproductive purpose; if the greater portion of the money is taken for productive purposes, then the loan is readily granted; if the greater portion of the loan is taken for any other purpose, then we look to the assets of the man who takes the loan. We generally give a loan to the extent of one-fifth of the real property; when we find that the loan exceeds that and is being taken for an unproductive purpose, then we refuse to grant the loan.

20044. Does the Central Bank go into all these details?—Yes.

20045. At your annual general meetings, you have representatives of the primary societies?—Yes.

20046. Do these representatives sit on the floor or on chairs?—Not on chairs but on benches; we cannot provide chairs enough for all.

K. B. Maulvi Hemayat Uddin Ahmed.

20047. Do you make any distinction between the individual members and the people from primary societies?—No; if in the Directorate we have a representative of the village societies who is a tenant, he sits with his landlord. In my own society I have got as a member on the Directorate, Babu Kaliprosanna Chaudhuri, who is a big zamindar, and one of his tenants is also a member of the Directorate, but he comes and sits in the chair just as his landlord does; they are both provided with chairs.

20048. You try to teach the members of the society that the Central Bank exists solely for their benefit?—Yes.

20049. Mr. Kamat. About co-operation, you say, "Statutory power should be given to reliable private persons to do some of the works which are now being done by the Registrar". What have you in mind?—Registration of societies which, I think, is more or less mechanical.

20050. In other words, you want honorary Registrars of Co-operative Societies?—Yes.

20051. Do you think that is a practicable proposition?—Yes.

20052. These honorary Registrars should register any society?—Under the law, those societies which are suitable and legal may be registered. What more the Assistant Registrars and the Registrar do I cannot understand. I understand their primary duty is to do that, and up to now I have never heard of an instance of an Assistant Registrar or the Registrar refusing to register any society.

20053. In practice, virtually, he registers every society?—Almost all the societies.

20054. Does the Registrar go round the districts, to your knowledge?—Yes, he goes round the districts, and I have travelled with him sometimes.

20055. Rai Bahadur Bannerji: You have stated that you are dissatisfied with the present system of audit; do you mean to say it is not sufficient, or it is not efficient?—It is neither sufficient nor efficient. To me it is nothing. I do not attach any importance to it.

20056. Sir Henry Lawrence: You state, "The application of the Usurious Loans Act to be the best measure in my opinion." Is the Usurious Loans Act not in force?—No.

20057. Not in force in the Presidency at all?—I am not aware of it.

20058. Professor Gangulee: It is in force, but the people do not make use of it?—But whatever is claimed by the mahajans is decreed.

20059. You mean in practice?—Yes.

20060. Sir Henry Lawrence: What is the procedure under which that Act should be brought into force?—Restriction of rates of interest.

20061. Is the debtor not entitled to ask that the Act shall be applied to a particular case?—So far as I am aware, nobody knows that it is in force, and no pleader ever advises his client to put forward such a plea.

20062. Are the people in your district principally Mahomedan?—The majority are Mahomedans.

20063. You are the Chairman of the District Board?—Yes.

20064. Do your Mussalmans there take interest on money lent?—Many of them, and most of them with a vengeance.

20065. Most of them do?—Yes.

20066. Do those that are members of co-operative societies take the interest that is due to them?—They borrow money from the society.

20067. When a dividend is declared, do they take it?—In rural societies dividends are not declared.

20068. None have been paying?—None.

20069. They have no objection to taking interest?—In the Central Bank I have two Mahomedan members who have declined to take the dividend; they are paying it to some charitable institution.

20070. That practice of the Mussalmans in your district presents no objection or difficulty to the extension of the co-operative movement?—In the Bhola quarter, I have more than 90 per cent Mahomedans, and there are some Maulvis, some of whom are raising obstacles, but there are also other Maulvis who are advocating it. The Secretary of the Bhola Central Bank is a Maulvi. I have got many Maulvis as secretaries of rural societies.

K. B. Maulvi Hemayat Uddin Ahmed.

20071. In regard to the Usurious Loans Act, what you wish done is that the Government should insist on Muncipals making use of the powers they have under the Act ; is that so ?—Yes ; even in the Small Causes Court three times the principal is decreed at present.

20072. *Professor Gangulee* : You come from Backergunj district which is called the granary of Bengal ?—Yes.

20073. Have you a paddy sale society ?—No.

20074. You have no paddy sale society in the whole district ?—No ; I tried to form one society for betel-nut, but I could not do it, because we have no warehouse at Rangoon.

20075. Did you make a proposal to the co-operative societies for organising a paddy sale society ?—It is very very difficult.

(The witness withdrew.)

**Mr. NAGENDRA NATH MUKHERJEE, B.L., Secretary,  
Ranaghat Central Co-operative Bank, Ltd.,  
Ranaghat, Bengal**

**Replies to the Questionnaire**

**QUESTION 2 (i)**—Practically there is no institution for imparting agricultural education. The number of teachers and institutions for the purpose are not at all sufficient. One or two institutions should be established in Bengal for the purpose of research and for imparting higher agricultural education but an attempt should be made to improve the general knowledge of agriculture among the people by the inclusion in the curricula of secondary and primary schools of agricultural subjects.

(ii) There is certainly urgent need for extension of teaching facilities in Nadia which I have the honour to represent in the District Board as its Chairman. An industrial school is going to be established at Krishnagar—the headquarters of the district—it is expected to be in working order from April next. Agricultural classes may very well be opened in connection with it by Government. It will prove a great boon to the district.

(iii) Teachers in rural areas cannot be drawn from agricultural classes at present inasmuch as they themselves possess no modern scientific knowledge, when they are properly trained it would certainly be desirable to engage them as teachers.

(iv) So far as my experience based on information and trend of feeling in the country goes, the attendances at the existing institutions are not as numerous as can be expected.

The reasons are that they do not afford any future lucrative career and that there are not proper opportunities and facilities for taking to agriculture as a profession.

The demand for instruction should be stimulated by showing concrete examples that agricultural study might be paying.

(i) The main incentive at present for lads to study agriculture is to obtain service under Government.

(ii) No.

(iii) In my opinion, students of any particular institution should be taken to different places in the Province to study soils, seeds suited to particular areas, peculiar distinctive conditions of different places without being confined to one place. That would enlarge their views, fit them up for setting up in business wherever they please. In a word greater attention should be given to the practical side of education.

(iv) Each of these items has some value of its own. The combination of nature study and school farms would be productive of good results.

(v) The careers of the majority of students are confined to ill-paid jobs which create no emulation in others.

(vi) In order to make agriculture attractive to middle class youths, it must be made sufficiently remunerative. They find that agriculture does not afford them even bare subsistence not to speak of affluence or competence as other walks of life do. In order to do so, scientific methods of modern improved agricultural production, of converting raw agricultural produce into finished products which will find a market both in and outside the country should be taught to them by actual demonstration. They should be taken as apprentices with or even without a small allowance in Government established or other successful farms for several years. Agricultural and industrial banks should be established which would finance them in starting agricultural farms on a commercial basis and Government should through their specially expert officers help them with advice and instructions in running these farms. Markets must also be found for their products. The present stereotyped cultivation of current crops and vegetables in the ordinary way yields no sufficient profit to induce lads of the middle class to take to agriculture. To my personal knowledge some agricultural ventures by sons of well-to-do men with fair capital and on a large scale proved failures—one failure of this nature makes others diffident and nervous. It must be shown by actual demonstration that agriculture can be adopted as a lucrative commercial career before middle class youths can be induced to take to it.

(vii) So far as I know—no.

(viii) Night schools should be opened and there should be an active propaganda to induce adults to join such schools.

(ix) Government ought to provide money for administration and finance for improvements of agriculture otherwise it would neither be popular nor successful.

**QUESTION 3**—The very slight improvement now noticeable in influencing and improving the practice of cultivators is due to propaganda (through exhibitions, lantern lectures) by demonstrators and to practical demonstration—

(a) In order to make field demonstrations effective several points are to be considered—

(i) number of demonstrators should be increased.

Mr. N. N. Mukherjee.

(ii) soils must be specially examined with a view to decide the suitability of some particular variety of crops for that field.

(iii) the nature of manure and use of implements suited to the soil should be determined.

(iv) steps should be taken to attract the notice of the people to the demonstration.

(c) By convincing them of greater yields by following expert advice in connection with the use of improved seeds, manures and implements. Education would also help. Their colossal ignorance and illiteracy are the main causes of their conservatism.

(d) The demonstration and propaganda with regard to *Chinsura green jute* seeds are instances of striking success. The reason for the success is the greater yield of the crop, given the facility for washing it. *Kataltara* paddy is also a success. *Charanak* paddy seeds were a failure last year on account of bad seeds.

QUESTION 4.—(c) (i) No. The number of subordinate staff is very low. The staff should be increased. They must pay greater attention to educating the cultivators in improved scientific agriculture and helping them in introducing new variety of crops.

(ii) The roads are exceptionally bad. Transport especially in the rainy season is extremely difficult if not impossible. This is one of the most important factors in agricultural improvement.

QUESTION 5.—(a) Co-operative credit societies are now greatly helping the cultivators in financing agricultural operations by them and short and intermediary term loans have also been introduced. As for long-term loans there ought to be separate land mortgage banks preferably on land mortgage basis and Government should be prepared to render liberal financial assistance either in the shape of subscribing to a portion of their debentures or by guaranteeing the interest on such debentures. For the purpose of long-term loans on land mortgage the provision of the Bengal Tenancy Act should be altered so far as regards the transferability of occupancy rights is concerned.

QUESTION 6.—(a) (i) The main causes of borrowing are:—

(1) Insufficiency of their income from land after defraying the cost of cultivation.

(2) Want of subsidiary occupations.

(3) Medical charges incurred on account of ill-health.

(4) Social system which entails comparatively heavy expenditure on account of marriage, *shradh*, etc.

(5) Failure of crops.

(6) Litigation (in some cases).

(ii) (a) Village *mahajans* (moneylenders) and

(b) Co-operative societies.

(iii) The inability to repay debts to co-operative societies is generally due to failure of crops but to *mahajans* it is due both to failure of crops and heavy interest.

(b) The measures indicated in the long run would prove harmful to cultivators. These measures would increase litigation which would mean ruin to them. Moreover, the *mahajans* would not advance them money even in cases of dire necessity. The remedy lies in the spread of co-operative societies which lend money at a very low rate of interest compared with the rate of *mahajans*.

(c) No. No legislation should be resorted to to artificially limit the rights of cultivators which would have the effect of diminishing the value of their land. These things may be left to be adjusted in the ordinary course through the co-operative societies according to circumstances in each particular case.

QUESTION 7.—(a) Co-operative consolidation societies may be started for the purpose of reducing loss on agricultural efficiency due to excessive fragmentation. Better still if members of Union Boards be given statutory authority to make consolidations binding on the parties for several years with the consent of the majority of persons concerned.

(b) The difficulties of consolidation are (1) the different grades of interest in land which would be affected by the consolidation, (2) absence of some parties from the village, (3) perversity of some of the parties concerned and (4) unwillingness of landlords to recognise consolidations. So far as Bengal is concerned the difficulty seems to be insurmountable except in cases where all the lands are held under one landlord under one title. Legislation might be made legalising consolidation without payment of *rahmi*.

(c) Legislation should not be resorted to unless sufficient experience is gained through the methods indicated above. Legislation always means increase of litigation.

QUESTION 8 (a).—I advocate the adoption of new irrigation schemes in Nadia by way of perennial canals, tanks and wells. In some places canals are necessary and in some tanks and wells. Irrigation canals are only possible under the Agricultural and Sanitary Improvements Act of 1920. Its complex procedure stands in the way of its application. It should be made more simple.

Tanks and wells are not small for want of funds.

Mr. N. N. Mukherjee.

QUESTION 10.—(a) Greater use could be made both of natural manures and artificial fertilisers. Cultivators should have more intimate knowledge of use of natural manures and artificial fertilisers. This knowledge can best be imparted by practical demonstration in farms.

(b) By making provision on the lines of a food Adulteration Act.

(c) By practical demonstration.

(f) By offering a substantial price to owners for cowdung and making other kinds of fuel cheaper and more easily available than at present.

QUESTION 11.—(a) (i) Improvement of existing crops depends first upon the use of improved variety of tested seeds, secondly upon suitable manures and thirdly upon irrigation facilities. Cultivation must be made independent of natural rainfall. Facilities should be placed to the cultivators for obtaining good seeds and suitable manures at the proper time. This could be done through co-operative seed and manure stores.

(ii) As regards new crops, soils of different places should be carefully examined and the suitability of any particular variety of crops for that class of soil should be ascertained. Demonstration should then be held with that crop in the locality either through private agencies supervised by departmental officers or through Government demonstration farms in the beginning.

(iii) Distribution of seeds should be made through co-operative seed stores—one such store being established in each Union Board—which would indent only for approved varieties of seeds. Particular attention must be paid to the supply of good seeds inasmuch as failure of one kind of seed shakes the confidence of cultivators in departmental seeds. The Central Banks also may be required to open a central seed depot which will supply seeds to all primary societies. The Ranaghat Central Bank of which I am the Secy. already indents different varieties of seeds and sells them to members of primary societies at cost price.

(iv) By taking steps to kill wild animals through *chowkidars* in the mofussil and by giving free licenses to cultivators to keep guns for protection of their crops and training them to use guns properly for the purpose.

(b) In Nadia, *Latalara* and *Indrasail* paddy may easily supplant present paddy crops. They are yielding greater produce. Except paddy no other crop would be used by people of this part of the country for food.

(c) *Indrasail* and *Latalara* have yielded better produce in my experience.

QUESTION 12 (i)—Tillage can be improved by using up-to-date scientific implements such as tractors, improved ploughs, etc. These improved implements might be purchased by a co-operative society and then let out on hire to cultivators of neighbouring places which would amply repay the cost of capital outlay—this would also solve to a certain extent the shortage of labour which is felt.

QUESTION 14.—(a) The answer is covered by note on question 12 (i).

(b) By holding demonstrations in Government established farms and showing the cultivators its benefits.

(c) More agencies are required for sale of improved implements—manufacturers may establish depots in suitable centres for the purpose. The cultivators should be taught the method of use and their usefulness. Demand should first be created and then facility placed in their way.

QUESTION 15.—(a) The Civil Veterinary Department should in my opinion be under the Director of Agriculture. That would lead to efficiency of service.

(b) (i) The dispensaries are under the control of District Boards. The system works well so far as funds are available.

(ii) The need for expansion is not being adequately met for want of sufficient funds.

(iii) I shall not advocate the transfer of control to Provincial authority provided sufficient funds are placed by Government in the hands of local authorities. These institutions should be controlled by non-official agencies according to their needs and requirements.

(c) (i) and (ii) Yes, where there are such dispensaries—at present in most of the sub-divisions there is only one Veterinary Assistant Surgeon who is a touring man and is to move about in the interior for 15 days in a month on an average. The needs of both urban and rural areas will be amply met if a hospital is opened at the headquarter station of each sub-division and a touring man placed in charge of each *thana*.

(d) Chief obstacles met with in dealing with contagious diseases are:—

(1) Want of proper reporting by reporting agencies which are generally Presidents of Union Boards.

(2) Submission of indent for serum by the Veterinary Assistant Surgeon who first proceeds to the seat of outbreak and after diagnosing the nature of the outbreak comes back to his headquarters for requisition of serum or submission of indent through the District Board which means delay and consequent loss of cattle in hundreds in time of epidemics.

Mr. N. N. Mukherjee.

- (3) Ignorance, illiteracy and conservatism of cultivators.
- (4) Prevalence of *godagas* (quacks).
- (5) Inadequacy of staff in cases of simultaneous outbreaks. I shall not advocate legislation unless other means fail. The villagers are mostly poor. Legislation in the direction of notification etc., may lead to oppression if rigidly enforced—spread of education and co-operation seems to me to be the chief remedy to be attempted in the beginning. Public segregation sheds should be constructed and sufficient quantity of land at the furthest end of the village reserved for the cremation or burial of carcasses. But burial of carcasses is not advisable as *Chamais* might dig up graves and use skin for their own purpose, thus helping in the spread of infection.
- (6) Yes. On account of the limited resources of the District Board free supply of serum by Government is essentially necessary.
- (7) The obstacles in the way of popularising preventive inoculation are (i) fees if any charged on this account. In Nadia, no such fee is charged. (ii) Illiteracy, ignorance and conservatism of peasantry—much of the present evils among the cultivators is due to want of education.
- (8) Yes.
- (9) I have no experience of the Muktesar Institute; my idea is that researches should be conducted by officers in the Provinces.

QUESTION 10.—(a) (i) By elimination of unfit bull-calves, castration, prohibition of slaughter of prime and dry cows, introduction of better animals from outside, provision of adequate number of good stud bulls in each Union by local authorities and by propaganda work as regards the maintenance of animals while in health and disease.

(ii) Betterment of the dairying industry can only be achieved on co-operative principles. At Ranaghat a co-operative agriculture and dairy farm is shortly to be started.

(b) Pastures in the strictest sense of the term are not in existence in this district, legislation may be resorted to, to compel zamindars to set apart sufficient quantity of land for pasture in each village.

(c) During the monsoon from June to September scarcity of fodder usually exists.

(d) (1) By starting co-operative societies for the production of fodder, (2) private persons may be subsidised for the purpose and (3) agricultural associations should be encouraged to grow green fodder and to sell it to the general public. This is one of the crying needs and every effort should be made to produce fodder specially green fodder in sufficient quantity.

(e) Landowners may be induced to take keener interest in these matters by gentle and sympathetic persuasion, by making them realise their benefit to themselves and to the people in general by showing to them that investment in agriculture and dairying is profitable.

QUESTION 17.—(a) An average cultivator works about 300 days in a year. He does not do much in the slack season except those who have got very small holdings or *utbundi* lands and who work as labourers.

(b) The adoption of subsidiary industries may be encouraged by establishing such industries in suitable centres where they may be employed on payment of wages during such slack season. This would have the effect of training them in the art. When they would see the advantages of employment in such subsidiary industries they would themselves take to them being financed with small capital by co-operative societies. We must show them the way in the beginning—spinning, weaving basket and rope making may be introduced.

(c) (1) Want of sufficient knowledge and information on the part of cultivators as to how these industries may be properly conducted.

(2) Want of funds.

(3) Want of combination and co-operation among the cultivators.

(4) Want of facilities put in their way for production and marketing.

In order that these subsidiary industries may thrive, we must first train them in the art by paying them their wages. We must provide means for marketing the finished products from their houses by making payments.

(d) Certainly.

(e) Yes. The answer is covered by answer to first portion of (b) above.

Industries on co-operative or joint stock basis may be established in rural areas in suitable centres. Government should also start such industries or subsidise others to start them.

(f) Certainly.

(h) By propaganda, education. They must be made to understand and appreciate the advantages that would accrue to them.

Mr. N. N. Mukherjee.

QUESTION 18.—(a) (1) By granting the labourers homestead land free of rent and some land for cultivation at a very low rate of rent.

(2) By making arrangements for medical help when necessary.

(3) By making legislation so that a man once brought from an outside area would be bound to serve for the stipulated period at a fixed rate (as the last means).

The above suggestions apply to cases where there is a permanent deficiency for labour and large tracts remain uncultivated.

In tracts where there are no such advantages higher wages seem to be the only remedy.

(b) The shortage of labour in this district is attributable mainly to the havoc caused by malaria which leaves a heavy toll year after year on the agricultural population considerably impairing the vitality of those surviving.

The remedy seems to be in the improvement of the sanitary and economic conditions of the people and by bringing people from outside to settle in the locality by means indicated above.

(c) Covered by answer to (a) above.

QUESTION 22.—(a) (i) So far as financial assistance to ordinary credit societies is concerned, there is no need for such assistance. But Government should be prepared to render financial assistance to new forms of co-operative societies, especially industrial societies. It is, however, very necessary that Government should spend sufficient money for propaganda through the Bengal Co-operative Organisation Society and otherwise and to strengthen the staff of the Co-operative Department by increasing the staff of Inspectors and Auditors, by reviving the post of Deputy Registrar and also by giving adequate facilities for travelling.

It is also necessary that Government should make grants to Central Banks and other Central societies to enable them to maintain a sufficient and efficient staff of supervisors.

I think Government should bear the cost of audit as it does with regard to Municipalities and District Boards. Government should also give facilities of banking to all Central Banks through the treasury.

(ii) (1) By giving financial help to the Bengal Co-operative Organisation Society, to carry on more intensive and extensive propaganda through non-official agencies.

(2) By allotment of seats to representatives of co-operative societies in the Legislative Council.

(3) In District Boards.

(b) The credit societies are working well and affording great relief to the people by reducing the rate of interest. But attempts should be made to augment their sources of income by agricultural improvement.

I consider the spread of other forms of co-operative societies highly desirable. They would teach the people self-help, self-reliance and would go a great way in improving their economic and sanitary conditions. But the difficulty lies in organising these societies and running them successfully. Energetic and enterprising people are not always available in rural areas. Government ought to make serious efforts in these directions. Without Government help in the initial stages in organising, supervising and financing these societies, they are not likely to be a success.

(c) Yes.

(d) Up till now I have experience of credit societies only. I think they have achieved their object.

QUESTION 23 (b).—(i) By making primary education compulsory among the agriculturists and at the same time giving them practical training in agriculture, in dairying, poultry breeding, carpentry, smithy, etc.

(ii) There is no compulsory education now in rural areas.

(iii) Poverty of the agriculturists who cannot afford to keep their boys in schools when they are sufficiently of age to help them in their work.

QUESTION 24.—(a) (1) To show by demonstration that agriculture might be a lucrative concern.

(2) Encouraging men of capital and enterprise to start agriculture on a commercial basis guaranteeing a certain profit or dividend on the capital expended.

(b) The Tenancy Law is a great hindrance to improvements on agricultural land. The zamindars who are the absolute owners of the soil in Bengal under the Permanent Settlement and who are generally not in actual possession of the land are not at all interested in making any improvement. The same remark applies to *patnidars*, etc. The occupancy ryots are generally too poor to make any permanent improvement, even the small minority of those who can afford to do so are opposed by zamindars who demand exorbitant *salami* or premiums. Tenants of inferior status have no right to make any permanent improvements and even if they have such right, they are not interested in doing so as they have no permanent interest in the land.

Mr. N. N. Mukherjee.

**QUESTION 25.**—This question raises the most important point now occupying the mind of all thoughtful men in the country, viz., how to improve the hygienic conditions in rural areas and to promote the general well-being and prosperity of the rural population. Only those who have any experience of rural conditions can realise the gravity of the situation. Great sustained and systematic efforts will have to be made by Government, local bodies and the people themselves for this purpose. Conditions differ in different places. But, generally speaking, attempts might be made in the following directions:—

Improvement of sanitary conditions of the people of rural areas.

Sanitary conditions of villages where population has become very thin cannot be improved without people being brought from somewhere else to settle in these villages. In the first place it is beyond the power of a small number of men living in a village to remove huge jungles in and round the villages. Even if it be possible to do so, the jungles would grow with greater vigour next year unless they are brought under cultivation. It is therefore in my opinion essential that people from other places will have to be brought to be settled on these villages, they should be given land free of rent on condition that they would reclaim the jungly lands and cultivate them free of rent for several years. If necessary legislation must be resorted to as the last means. Some villages have become so very bad that instead of attempting to renovate them, the remnant of the dying people may be induced to settle on the open lands on the outskirts and they should be given pecuniary help in doing so rather than spending any money over the village itself.

The improvement of the condition of roads is one of the most potent factors of village regeneration. Only those who have gone into a rural village in the rainy season could realise the difficulties of village life. The cry of "Back to the villages" is impossible of realisation unless communications are improved. Improvement of agriculture, sanitary and economic conditions depends greatly on communication. We see that as soon as a railway line passes through a village and a station is opened, it begins to thrive. The reason is *bhadralogs* come back to the village, shopkeepers, artisans, etc., settle there on account of their business, trade revives bringing in its train most of the amenities of modern life.

Village paths may be left to the villagers. Big communication roads must be improved and if possible made passable by motor cars throughout the year.

This could be possible if Government would give some financial help to the District Boards. Government should pay half the cost of metalling a road by way of grant and the rest by way of a loan. The District Boards should be given a free hand to levy tolls irrespective of the cost of the work (there is a provision now that District Board cannot levy tolls unless the cost exceeds Rs. 10,000 and cannot do it for more than 20 years) to recoup the amount together with interest thereon and future maintenance charges. I am perfectly sure that people benefited would gladly pay tolls for the benefit they derive.

*Bhadralogs* would not come back to villages unless the communications are made easy; unless they come back, permanent improvement is not possible.

Proper medical and educational facilities must be provided in villages. The want of these facilities drive all the people who can afford to do so to leave the villages and settle in towns.

Improvement of communications would make the opening of co-operative societies, commercial agricultural farms, their supervision, marketing, medical and educational facilities easy and lead to economic development.

Greater attention must be paid to education in its practical side—whether higher, secondary or primary. Education is a panacea for most of our evils. To my mind practical training in agriculture, industry and hygiene in higher and lower studies is absolutely necessary for the economic uplift of the country and on that would depend the improvement of the sanitary condition of rural areas which afford great opportunities for the development of our material resources. Whatever we might do would not be of any permanent and all pervading benefit unless accompanied by practical education in all its branches. Practical education would give a stimulus which is now wanting.

Settling people in depopulated villages, improving the means of communication, and practical education in agriculture, industry and hygiene are the most important factors for general well-being and prosperity of rural areas.

Great attention must be paid to supply of good drinking water and removal of water-hyacinth.

Binding regulations should be enforced in rural areas through Union Boards.

**QUESTION 26 (b).**—Yes. Information on these heads should be more effectively placed before cultivators. Information with regard to jute forecasts is one-sided only now. Agriculturists should have information with regard to the requirements of each year for each particular crop.

Mr. N. N. Mukherjee

## Oral Evidence

20076. *The Chairman* : Mr. Mukherjee, you are Chairman of the Central Co-operative Bank, Ltd., at Ranaghat ?—Yes.

20077. You have put in a note for which we are indebted to you. Do you desire to make any remarks of a general character before I ask you a few questions ?—Yes. I wish to observe that agricultural and sanitary improvements are interdependent, and that the whole question depends on finance. Moreover, if any money is available, I should like it to be spent at the bottom and not at the top; it should be spent in strengthening the agricultural and co-operative staff at the bottom. That is what we want.

20078. What grades are you thinking of there ?—The demonstrators, those who actually come in contact with the cultivators.

20079. You feel they are not quite getting down to the cultivators, because there are not enough of them ?—Yes, and I think men of higher training than those at present engaged should be employed for the purpose. We have only one demonstrator for our whole sub division, comprising 500 villages, and with a view to cut down expenditure on travelling he has been asked not to travel more than five miles from headquarters. That is no use. By means of demonstrators, cultivators could be induced to use new varieties of jute seed and new varieties of potatoes and sugarcane, but if the only demonstrator we have is restricted to an area within five miles of the headquarters it is no use keeping him. You cannot do anything with such restrictions. More men should be employed to bring the results of research and investigation to the homes of the cultivators.

20080. Your point is that it is no use having research unless you bring the results of that research to the notice of the cultivators ?—Exactly, and if a choice had to be made I should spend money on having men to carry the knowledge we have already to the cultivators rather than on research.

20081. On page 177 you deal with the very important question of extending the use of good seeds, and I see you say there that *charanal* paddy seed proved a failure in 1925 ?—Yes.

20082. Where did that seed come from ?—I wrote to the District Agricultural Officer, and he sent it. I do not know where he got it from.

20083. Did you make a complaint ?—Yes; I told him it was an entire failure. This year also I got 10 maunds from the Government farm at Dacca, and subsequently imported for 15 maunds from him.

20084. Are you quite sure the *charanal* paddy seed failed because it was bad seed, and not because it was badly planted ?—Yes, because it failed every where.

20085. The germination was bad ?—Yes.

20086. What was the outcome of your correspondence ? Did the Agricultural Department admit that the seed they sent you was bad ?—They had to keep quiet; there was no way out of it.

20087. What do you mean by that ?—I said the seed did not germinate, and no further correspondence took place between us.

20088. But you had to pay for it ?—Yes.

20089. *Professor Gangulce* : When they supplied you with the seed, did they declare the germination test ?—Last year I did not take that declaration, but, learning by experience I this year insisted that they must guarantee high germinating power or I would not take the seed. This year they did certify it, but in one case the report of the District Agricultural Officer did not turn out to be true, and I withheld payment for that consignment.

20090. *The Chairman* : On page 177 you are concerned to attempt the consolidation of fragmented holdings, and your view is that Union Boards might be given statutory authority to enforce consolidation, binding on the parties for several years ?—Yes.

20091. Is it your view that if these parties had practical experience of the advantage of consolidation for a number of years, they would consent to perpetuate it ? You think they would then agree to a permanent arrangement of that sort ?—Yes.

20092. Your recommendation there would give the Union Boards very great power in the matter, would it not ? Are you satisfied that they are the appropriate bodies to which to give so much power ?—Yes, because I have gone through the scheme which was in force in the Punjab.

20093. It was adopted voluntarily in the Punjab, was it not ?—Co operative societies to carry out these things were established, and the parties had to pay a certain amount of money. We have a constituted statutory body in the villages, and I think this matter

Mr. N. N. Mukherjee.

might be entrusted to them and so the parties would be relieved from making any payment. Moreover, the members being local people would be able to arrange consolidation amicably among the parties.

20091. Do you suggest the Union Boards should be empowered to compel a whole village to give effect to consolidation, or that they should be empowered to compel a small minority of villagers to conform to the wishes of the majority?—The latter, for the present.

20093. You would be content with that?—For the present. When they saw the advantages of these consolidations they would come forward of themselves. We do not wish to bring too much pressure to bear on the people at the beginning.

20096. *Mr. Calvert* : You said that in the Punjab the parties had to make a payment. There is no payment?—Yes, on account of the co-operative society being set up they have to pay something.

20097. Government pays?—I do not know; I think the parties have to pay something.

20098. No?—Then that is a misunderstanding on my part.

20099. *The Chairman* : From what you say on page 178 I see that, contrary to the view of some witnesses who have appeared before the Commission, you are definitely in favour of placing the Civil Veterinary Department under the Director of Agriculture?—Yes.

20100. What are your grounds for making that recommendation?—They are cognate branches of the same thing; both relate to agriculture, and therefore I think it would be better that they should be under one head instead of two.

20101. Are you satisfied with the services at present rendered to the public by the Civil Veterinary Department?—Yes, so far as they go, but I think their staff should be strengthened. At present we have only one resident veterinary surgeon in a sub-division.

20102. Have you any instances on which you would care to found the view that the Veterinary Department should be under the Director of Agriculture?—I have not got any specific instances. Veterinary surgeons are now under the Superintendent of the Veterinary Department, but if the Director of Agriculture thinks that such a man should go to a certain place or act in a certain way, I think it would be better for him to give instructions, rather than a separate department.

20103. You think that good service is being given at the moment by the Veterinary Department? You have no specific instances to give in support of your proposal, but you adhere to the view that the Veterinary Department should be under the Agricultural Department?—Yes, that is my impression.

20104. On page 181 you say your ambition is to provide the cultivator of jute with all possible information about markets and kindred matters. That is natural and sound, but I see great difficulties in putting the information at their disposal, do you not?—Machinery should be created through which information could be given to them. At present the whole arrangement is one-sided; the jute forecasts benefit the dealers without giving a corresponding advantage to the cultivators. The dealers control the prices, whereas the cultivators can only control their own cultivation.

20105. What are you concerned to do? Is it to give the cultivator information which will be useful to him in deciding how many acres to put under jute, or to give him information of market rates, with a view to his holding up his jute if he thinks the market will improve?—First of all, as to what amount of land he will put under jute.

20106. Do you think it is possible to make a forecast in time to assist the cultivator in that decision?—I think it can be done.

20107. Plainly the information which is valuable to merchants (estimates, for instance, of the effect of weather conditions on crops already planted) is of very little use to the cultivator; it is too late for him then?—Cannot it be given to them just in time for them to grow the jute?

20108. You will have to see a whole crop ahead to do that?—Yes, certainly.

20109. *Sir Henry Lawrence* : On the one page of your note you say the improvement of agricultural, sanitary and economic conditions depends greatly on communications. You have been, or you are, Chairman of a District Local Board?—I am Chairman of the District Board of Nadin.

20110. Does your District Board have control of primary education?—Yes.

20111. And also of expenditure on communications?—Yes.

20112. Is it your view that expenditure should be concentrated on communications in preference to education?—No, I do not say that; both must be taken in hand.

**Mr. N. N. Mukherjee.**

20113. Both are equally important ?—Certainly.

20114 I rather thought by this passage here you meant to imply that expenditure had not been sufficiently concentrated on communications ?—My point is this. I have made a special point of the fact that education is the panacea for most of our evils; it would remove most of our difficulties, at least among agriculturists. There are many good things we cannot do on account of the ignorance and illiteracy of the cultivators. Education, therefore, cannot be neglected. At the same time, means must be found to improve communications, on which the improvement of agriculture and of sanitation in rural areas depends a great deal. I have suggested a means whereby the extra income required may be obtained.

20115 But if a point is reached where a Board has to decide whether to spend money on education or communications, you will be in a difficulty ?—No, I am convinced that education must be improved. If there is a tie between the two I should go in for education rather than communications.

20116 You say further, "Improvement of communications would make the opening of co-operative societies, commercial agricultural farms, their supervision, marketing, medical and educational facilities easy and lead to economic development" ?—Yes, exactly.

20117. It seems to me in your note that you regard the improvement of communications as the foundation of everything ?—Not altogether. All these things must go hand in hand. One cannot lag behind the other.

20118 Your view is that your communications are not good at present and must be improved ?—Yes.

20119. You wish to raise money for the purpose, and you look to tolls for it ?—Yes.

20120. You have not got a free hand in levying tolls ?—No.

20121. Have you any tolls at all ?—Yes. In matters which involve a capital expenditure of over Rs. 10,000 we can levy tolls, but only for 20 years. There are many roads which could be made passable throughout the area by levying tolls, if the District Boards were given a free hand to do it. That is a point which I have rather insisted on, because we cannot curtail our expenditure on education, medical and other matters. So far as the Nadia district is concerned our expenditure on education is Rs. 1,00,000 and on medical matters, to, Rs. 1,00,000 and on communications 1,30,000; but that is not sufficient. We have 1,435 villages in the district and about 1,000 miles of *kutcha* roads and 200 miles of *pucca* roads. It is impossible to make the roads *pucca* or even passable in the rainy season with the small amount at our disposal. We must find money to improve the condition of these roads, and direct taxation is always looked on with great disfavour by the people, whereas they have not the same objection to indirect taxation and will be glad to pay small tolls provided the roads they have to use are made passable or *pucca*.

20122 I think you have made a good point there, but I should like to know what it is you want done. Do you want an alteration in the law ?—Yes; the law will have to be altered in that respect.

20123. Is it the law or an executive order of the Government that holds you up ?—The law; the Local Self Government Act. I think the limitation I mentioned is going to be reduced to Rs. 5,000; the District Boards will be given power to levy tolls in respect of works involving a capital outlay of Rs. 5,000 only. Still further powers are wanted, however. There should be no limitation of the power of District Boards to levy tolls when they are satisfied that the people would be willing to pay a toll in respect of a particular work.

20124 Mr Gupta. My impression is that the present power to levy tolls is confined to bridges only, and not roads ?—Yes, it is for bridges only.

20125 Sir Henry Laurence. You have not the power to levy a toll for the improvement of a road ?—No.

20126. And you wish to have that power ?—Yes.

20127 When was this Act passed ?—It is the Act of 1885.

20128. Has it been amended since ?—From time to time, but no wholesale amendment has been taken in hand since 1885.

20129. When do you hope to get this increased power ?—I think it will come up in the next legislature.

20130. Do you think it will be a popular move ?—I think it ought to be.

20131. You have the opinion of your district behind you in asking for it ?—Yes.

Mr. N. N. Mukherjee.

20132. And you are doing your best to carry it through ?—I have no power to carry it through in the legislature.

20133. Are you a voter ?—Yes, but I am not in the legislature as a councillor.

20134. Have you got compulsory education ?—No.

20135. Is there any idea of your having it ?—It cannot be done on account of want of money.

20136. You have no Compulsory Education Act in this Presidency ?—It has not been extended, and we cannot do it.

20137. What do you mean by saying it has not been extended ?—There has been an Act which would have to be extended to a particular area for it to be enforced in that area, but it has not been enforced and it would be rather unpopular if it was.

20138. Your District Local Board has the power to bring this Act into force ?—No, it is only the Government that can do it.

20139. On the application of the District Board ?—No, the Government can do it on its own motion, as far as I know.

20140. *Mr. Gupta* : On the application of the Municipality or Union Board concerned it can be put into force, and Government pay half the cost ?—But the difficulty is the people would not be willing to incur any direct taxation to enable it to be introduced.

20141. In other words, they will not apply ?—That is so.

20142. *Professor Gangulce* : Have you made any attempt in that direction ?—The villagers are not willing that it should be extended.

20143. On financial grounds ?—Yes.

20144. They are not willing to tax themselves ?—No.

20145. They object to an education cess ?—Exactly.

20146. *Sir Henry Lawrence* : What is the burden of the cess at present ?—The cess is only on the land ; it is 6 pice in the rupee for the road cess and the same amount for the public works cess.

20147. Is there any education cess ?—No.

20148. *Sir Ganga Ram* : On the valuation of the revenue ?—On the rent, so to speak.

20149. *Professor Gangulce* : Not on the valuation ?—Rent returns are made by the landlords to the collector, and he makes a valuation, and on that valuation the cess is imposed.

20150. *Sir Henry Lawrence* : Is there no local charge at all for education ?—No.

20151. The whole cost is met out of provincial revenues ?—No, we pay a certain amount from the district funds. Part comes from the Government and part from the District Board.

20152. You are talking to people who know nothing about your conditions. Can you tell us how your money for education is obtained ?—Our principal sources of income for a District Board are the road cess and the public works cess. These are raised from the people, and from that fund we allot certain amounts to education, medical work, roads, etc. Out of that fund Rs. 51,000 is found by the District Board for education, and Rs. 49,000 is obtained from the provincial revenues for education.

20153. If you want to have compulsory education introduced, by what means would you raise the revenue, by another cess ?—If we have to make primary education compulsory I do not see any other means except an education cess, which would be very unpopular.

20154. Have you got the legal power to raise that cess ?—No.

20155. If the Act is extended to your district on the application of your District Board, does not that authorise the District Board to levy a cess ?—Yes, that would.

20156. *Sir Ganga Ram* : You say in your note that appreciable improvement has been made by the action of demonstrators and cinomats ?—Yes.

20157. Will you specify what improvements have been made ? Has the yield been increased ?—Yes, to a certain extent, in respect of crops which have been introduced by the demonstrators.

20158. Specify clearly what improvements have been made ?—Take jute, for example; formerly our country was used to produce 5 maunds to the bigha.

*Mr. N. N. Mukherjee.*

20159. How many *bighas* go to make an acre ?—Three.

*Mr. Gupta* : Two and a half.

20160. *Sir Ganga Ram* : And what do you produce now ?—Seven maunds

20161. Is that due to the demonstrators ?—Yes, and to the new seeds

20162. Is it also due to improved seed ?—Yes, and the improved seed was introduced by sending demonstrators to the mofussil and explaining to the cultivators that it would be to their advantage to grow it.

20163. Do the demonstrators advise them on improved methods of cultivation ?—No.

20164. Or improved implements ?—No.

20165. It is simply a question of seed ?—Yes.

20166. In one year you say all the seed you took from the Agricultural Department failed ?—No, only the *charanak* paddy seed. There are two paddies ; *charanak* and *lodapalur*. This time the *charanak* has been a success.

20167. Did the Agricultural Department supply seed to the whole of your district, or were there any people there who obtained their seed from other sources ?—The Agricultural Department did not supply all the seed.

20168. And did the seed obtained from other sources fail as well ?—No.

20169. It was only the Agricultural Department's seed which failed ?—Yes, and only that one variety.

20170. Did you find out why it failed ? Was it old seed ?—I cannot say. All I know is that it failed

20171. Did you get any explanation from the Agricultural Department ?—No ; I cannot call for an explanation from the department.

20172. You can ask them why it failed ?—The seeds were not sound.

20173. People who planted other seeds did not have theirs fail ?—No.

20174. It was the fault of the seed ?—Yes.

20175. Are you a paid Chairman, or honorary ?—Honorary.

20176. What is your profession ?—I am a *Wakil* of the High Court.

20177. What proportion of the revenue does your Board get as its income ?—The allotments are made under separate heads. The Government earmark certain money for expenditure in a certain way. Government earmark Rs. 49,000, for example, as a grant for education

20178. Your income is derived partly from Government revenue ?—Yes.

20179. What percentage do you get ? Is there a percentage fixed ?—No

In other Provinces 12½ per cent or something like that, is taken from the zamindars and placed at the disposal of the District Board.

20180. *Dr. Hyder* : What local cesses have you ?—Public works and roads

20181. Besides the land revenue you pay, what other cesses are paid by the zamindars and ryots ?—No others.

20182. *Sir Ganga Ram* : What is the income of your District Board ?—It consists of contributions by Government under certain specific heads and an augmentation grant, given according to the income of each District Board ; and the public works and road cesses.

20183. These cesses are earmarked for these purposes ?—Yes.

20184. Do you take care that the money earmarked for roads is spent only on roads ?—No, because we spend it on other heads.

20185. *Sir Ganga Ram* . When you receive from the zamindars a cess to be spent on a certain thing, why do you spend it on other things ?

*Mr. Gupta* : The law empowers them to do so.

20186. *Sir Ganga Ram* . You say you have in your district 1,000 miles of *kulcha* roads ?—Yes.

20187. Are they all bridged ?—No, not in most places. In one or two places there are bridges, but in others there are none. Even small streams are not bridged.

20188. Then a person cannot go from one place to another ?—No, they will have to take a ferry. There may be culverts here and there, but that is all.

20189. Are there culverts wherever necessary ?—No, there are several gaps.

*Mr. N. N. Mukherjee*.

20190. Can a producer take his produce to market without interruption ?—No.

20191. *Dr. Hyder* : Are there any ferries maintained by the District Board in your district ?—Yes.

20192. *Sir Ganga Ram* : Who levies the ferry toll ?—We do, but there are also Government ferries for which Government levy the toll.

20193. Will you define what your ideas are about sanitary improvement ? How do you arrange your water-supply ?—By giving tanks and wells.

20194. Wells ?—Yes, *pucca* masonry wells.

20195. And you allow people to dip their buckets in ?—Yes.

20196. Is not that a source of infection ?—You cannot prevent that.

20197. Tell me what is the practice there ? Is the practice to allow every man to dip the vessel whether that vessel may be contaminated with cholera germs or something else ?—Yes, we do allow it now.

20198. And do you sink your wells separately from the village tank in which all the cattle are washed ?—Yes ; tanks and wells are separate.

20199. Do you take them away from the habitation or do you keep them near the habitation ?—Near the habitation.

20200. Near the tanks where the cattle are washed ?—Generally speaking we are spending money on wells because they can be protected.

20201. But where is the protection if you allow the people to dip their vessels in ?—In a tank all the people and cattle go in.

20202. Please give me your answer separately for wells and tanks. With regard to wells what precaution do you take ?—We disinfect them periodically with potassium permanganate.

20203. You allow the people to dip their vessels ?—Yes.

20204. You have no other system ?—No other system.

20205. That is one improvement in rural sanitation which you want ?—Yes.

20206. And where do you have it, away from the habitation ?—In the centre of the habitation so that it may be accessible to all the villagers. They are big masonry wells.

20207. Water goes through the subsoil ?—That you cannot prevent. That is the best water that you are in a position to give.

20208. Is sanitary improvement a part of the District Board's responsibility ?—Yes, there is a Health Department.

20209. How much money do you spend on sanitary improvement ?—About Rs. 20,000.

20210. Every year ?—Yes, every year.

20211. In your district ?—In my district.

20212. What is the total income of your district ?—About four lakhs.

20213. Your District Board alone ?—Yes.

20214. *Sir Henry Lawrence* : Is there a sanitation cess ?—No.

20215. Is that money obtained from the road cess ?—Yes.

20216. *Sir Ganga Ram* : You said something about rotation of jute. Do you consult the Agricultural Department for rotation ?—I did not say so.

20217. You have said that the zamindars ask them how much land should be put under jute. Do you ask the Agricultural Department for advice as to how much land should be put under jute ?—No. I wanted the cultivators to know beforehand the total requirements of the year so that they might regulate the extent of land which they would put under jute and thus prevent under-selling their production.

20218. *Sir Thomas Middleton* : I want you to go back to the question which you discussed with the last Member, about the powers under the Education Act. You have a permissive Act as it is called in Bengal ?—Yes.

20219. Dated ?—I think 1920.

20220. Now under that Act if you make an application, Government can pass an order empowering you to introduce compulsory education ?—Yes.

20221. If advantage were taken by your District Board of that power, do Government promise you some definite proportion of your expenditure on education ? You are now

Mr. N. N. Mukherjee.

spending, you told us, Rs. 51,000 and Government are giving Rs. 40,000. Assuming that you had a scheme for compulsory education which involved in some locality an expenditure of Rs. 1,00,000, would Government automatically increase the grant to about the same sum?—No, at least there is no liability at present so far as I know.

20222 It is a question of arrangement in every particular case; there is no automatic grant depending on your expenditure?—No.

20223 *Mr. Gupta* Are you aware of the provisions of this Act accurately?—I am not perfectly aware of them.

20224 There is no power to levy any cess and Government do provide half the cost of the initial expenditure and a certain proportion of the recurring cost?—That might be; I saw the Act long ago and consequently I do not remember its provisions just now.

The best thing would be to get information; otherwise the Commission does not have the correct information

20225 *Sir Thomas Middleton* May I know if it is a substantial percentage or a small percentage?

*Mr. Gupta* It is a small percentage; if necessary I shall send for the Act.\*

20226 *Sir Thomas Middleton* Now to go back to page 170 of your note, you advocate a larger number and a better output of demonstrators?—Yes.

20227 About what number of demonstrators do you think is needed in a district such as ours?—I should think there must be one demonstrator in each *thana*.

20228 How many have you in your district?—In my sub-division I have got only one demonstrator.

20229 And you would like to see how many?—At least five.

20230 *Sir Henry Laurence* What is a sub-division?—The district is divided into several parts and each of these parts is called a sub-division. My district contains several sub-divisions, and in each sub-division I think there is only one demonstrator now. I am not sure whether each has got a demonstrator, but I have got one by writing to the Director of Agriculture, after a good deal of effort, I think.

20231 *Mr. Hyder* You said just now that you would like to have one demonstrator in every *thana*, how many *thanas* have you in a sub-division?—I have five in my sub-division.

20232 On an average there are five in a sub-division?—Generally I think.

20233 *Sir Thomas Middleton* That gives some indication of what you would like to see?—Yes.

20234 Now as to the quality, do you think it is possible or do you think it is desirable that we should have engaged on this work men who have studied at least to the Intermediate stage?—I do not place so much trust in the general education as on the particular departmental education, agricultural education and the knowledge they may have.

20235 Is it possible, do you think, to give the necessary amount of technical knowledge unless they have had a good general education?—It is not always necessary, I think. In our villages the cultivators know sufficient of these agricultural matters; but they have not got the money to utilise that knowledge about good manures and all these things.

20236 How would you get that quality of demonstrator which you desire to see? How would you train him?—By giving him practical training somewhere so that he may examine the soil; he may decide and ascertain as to what seeds would be suited to any particular area, as to what manures would be suited to that particular land and so on.

20237 *Mr. Gupta* Do you give that training in your district farm?—Yes.

20238 *Sir Thomas Middleton* At what age would you begin to give him that training?—At 16 or 17.

20239 Then you would have him trained for what period?—For four or five years.

20240 You think a boy of 21 would be wise enough to go and advise the cultivator?—Provided he has had sufficient training.

20241 He must be cleverer than most of those I have come across?—That would depend on the capacity of the man.

\* Bengal Act No. IV of 1910. (The Bengal Primary Education Act, 1910)—Section 4

20242. *The Chairman* : Or the teacher ?—Yes; also of the teacher to a certain extent; but I attach greater importance to the practical side of the education than to the theoretical side.

20243. *Sir Thomas Middleton* : I attach equal importance to the practical side. I do not think you attach sufficient importance to the early training ?—We lawyers, when we come out of the college with the knowledge of books, do not know what to do when a case comes to us. Now we have put in 30 years of practice at the Bar and we have forgotten much of what we read in the college, but we can help our clients by our experience.

20244. It is quite the same in agriculture. If we could get as many recruits as you lawyers should we have enough demonstrators ?—Exactly; but agriculture is not such a good opening. I should very much like to put one of my sons into agriculture but there are no openings.

20245. *Professor Gangulee* : Therefore he is going to be a lawyer ?—Yes, because there is no other opening.

20246. *Dr. Hyder* : A personal question. Have you got enough land ?—Yes; I did agriculture for several years and made a loss of Rs. 1,000 in three years and gave it up in disgust.

20247. *Sir Gunga Ram* : About 300 *bighas* of land ?—Yes.

20248. And from 300 *bighas* of land you made a loss ?—Yes. About 30 or 40 *bighas* were within the municipality and I could look after them every day; that is of course where I experimented.

20249. *Sir Thomas Middleton* : You are a well-educated man and experienced and still you made a loss ?—Yes.

20250. *The Raja of Parlakimedi* : Was the season against you ?—Yes; labour was not available, neither a market nor irrigation.

20251. *Sir Gunga Ram* : Is it irrigated land ?—No.

20252. Then there is no hope for agriculture as a profession in your Presidency, is that right ?—Unless improvements are effected in irrigation, manure, seed and labour. These are the principal things and we must concentrate all our attention on these things if we want to do something.

20253. *Sir Thomas Middleton* : On page 178 of your memorandum you make a suggestion. You say 'By offering a substantial price to owners for cowdung and making other kinds of fuel cheaper.' Surely your object should be to get the owner of the cowdung to use it on his land ?—Yes; of course, if he can do so, it is all right. But he may also sell to others who have not got it.

20254. Can he spare from his own ?—It may be a man has got several heads of cattle but no land and it may also be that a man has got plenty of land but not the requisite number of cattle; so the whole thing may be adjusted.

20255. On page 179, in discussing the difficulties you have in getting good animals, you refer to the prevalence of quacks. Are there many of these men practising in a district like yours ?—I cannot give you the exact number.

20256. I only want to know whether they are commonly found in villages ?—Not commonly.

20257. You say, on the same page, that you would prohibit the slaughter of 'primo and dry cows.' But surely people do not slaughter good cows in your districts ?—I suppose not; but they are sold to people who take them to Calcutta and other places and there they are slaughtered. We have no proper system of slaughter houses in the districts; the people sell them to *bepari* who take them elsewhere for slaughter.

20258. You use the word 'primo.' Do you mean by 'primo' good cows ? Do they sell good cows ?—Yes.

20259. *Professor Gangulee* : Do they sell good cows when they are in milking condition ?—Even then they sell for want of money, I have seen people doing so.

20260. *Dr. Hyder* : What do you mean by saying 'for want of money' ? To pay their debts ?—Yes, or for some other reason.

20261. I understand from your paper that you want sanitation, sanitary improvements, water-supply, one demonstrator for every *thana*, development of co-operation and a hundred other things. Now tell me where is the money to come from for all these things ?—That is the greatest difficulty.

Mr. N. N. Mukherjee.

20262. Are you over-taxed or under-taxed in Bengal?—Over-taxed. That is the cry all over the country.

20263. Let me go back to this cry. Since the days of Lord Cornwallis there has been no change in taxation so far as land is concerned, is not that so?—I do not know; the Road Cess Act, I think, came after that.

20264. You refer to the Permanent Settlement?—Yes; that is also a tax on the land.

20265. I say there has been no change since the days of Lord Cornwallis?—Of the Permanent Settlement?

20266. Of the revenue demand?—But the public works cess is also charged on the land.

20267. And there has been no change in that?—I cannot give an unqualified answer.

20268. You know in other Provinces there is a periodical revision and the demand is either increased or decreased?—Yes.

20269. But there is a periodical adjustment?—Yes; and in *halas mahal* land also there is that.

20270. It does not form the bulk of your land?—No.

20271. Let us confine ourselves to the bulk of the lands. There has been no change in the revenue demand since the days of Lord Cornwallis?—No.

20272. And there has been a change in that demand in all other Provinces, is not that so?—Yes.

20273. And the bulk of the money that is spent on these different things is provided by the people of other Provinces by themselves?—Yes.

20274. But here you are not prepared to provide this money and you still want these things to drop from Heaven?—The tenants pay to the zamindars and the advantage of the Permanent Settlement goes to the zamindars and not to the tenants.

20275. *Mr. Gupta* : What about the road cess and the public works cess which are paid by everybody in Bengal?—It is also a matter which I have already referred to.

20276. *Sir Ganga Ram* : Is there no cess on law?—No, except in this way that all Pleaders have to pay Rs. 25 every year, barring of course the High Court Vakils; we pay Rs. 500 in one lump sum.

20277. Your income is derived chiefly from the zamindars?—Not necessarily; zamindars also are our clients, just as other people, traders, merchants and others.

20278. *The Chairman* : Do you not pay income-tax?—Yes.

20279. *Dr. Hyder* : You gave a very interesting cause of indebtedness. You say on page 177 "medical charges incurred on account of ill-health." Are you referring to the *bhadralog* or to the real cultivator?—To the real cultivator.

20280. Tell me how much does he pay on account of the physician's bill?—Whenever an illness occurs in a cultivator's house, in ordinary cases he cannot afford to engage a doctor; but if there is serious illness he has to engage a doctor and does pay for the medicine charges. I know that even if some of them can pay for the medicine they cannot even pay for the fruits and other things which are required for nourishment.

20281. Are there no dispensaries in your district where the people get medicine free and where treatment also is free?—Our condition has been reduced to such a state that even in charitable dispensaries which we have got in my district, we are now levying a fee of one anna for the first prescription for every patient and one pie for every renewed prescription, because otherwise we cannot maintain these dispensaries.

20282. And you are still of opinion that medical charges form a big item?—In the district of Nadia we have only 28 dispensaries. We cannot afford free medical relief to all the cultivators.

20283. Have you not, under the Agricultural and Sanitary Improvements Act of 1920, any powers of taxation?—That is almost a dead letter on account of the complexity of the procedure.

20284. What is the complexity of the procedure?—First of all, the villagers must make an application and deposit money for the cost of the preliminary survey, and if after the preliminary survey it is found that the scheme would not succeed, the scheme would be dropped and the money paid would be lost.

20285. They forfeit the deposit?—Yes; they forfeit the deposit.

20286. *Mr. Gupta* : The money is spent in preparing the scheme?—Yes.

*Mr. N. N. Mukherjee.*

20287. *Dr. Hyder* : You do not think it is a check on wild schemes ?—The result is that not a single scheme that I know of has matured. All schemes pending under the Sanitary Improvements Act did not succeed on account of this stumbling block in the way.

20288. The stumbling block is the preliminary survey ?—And the fact that money has to be paid by the people without any certainty that the scheme would be successful. I think *Mr. Gupta* has written a long note on that.

20289. You have got *utbandi* tenures ?—Yes.

20290. You have got produce rents and fixed money rents ?—Generally speaking, we have got money rents, but there are produce rents also. There is a proposal, I hear, to allow tenants to get their rents converted into fixed money rents.

20291. You think it is desirable ?—Yes.

20292. You are not in favour of produce rents, so far as the cultivator is concerned ?—I am not.

20293. So far as they affect improvement in agriculture also ?—Yes.

20294. You speak of compelling the zamindars by legislation to set apart a certain area of land for grazing purposes ?—Yes.

20295. Why do you make that suggestion ?—Because no land is available for pasture. The zamindars ought not to derive the entire benefit from the land ; they must set apart a certain portion for the benefit of their tenants.

20296. To benefit the tenants the zamindar gives the land on rent and the tenant grows paddy ?—But he gets rent from him. I say he must set apart a certain quantity of land in the village without any rent.

20297. Without any rent ?—Yes.

20298. *The Raja of Parlakimedi* : Even then, do not the cultivators encroach upon the land ?—All land has disappeared.

20299. So there is that practice of encroaching upon available land whether it is admitted or not ?—At present there is no such land, and therefore no encroachment can be made.

Every periodical survey discloses encroachments even on village commons and communal *poramboles*.

20300. *Dr. Hyder* : Is your department interested in fisheries ?—To a certain extent, but not as much as other districts. Nadia is not a riverine district.

20301. Coming to the welfare of agriculturists, you say that the tenancy law and the rights of zamindars to absolute ownership act as a hindrance to agricultural improvements ?—You mean consolidation, or what ?

20302. I ask you to look at page 180, Question 24. Tell me whether the majority of your tenants here, not the *utbandi* tenants, enjoy occupancy rights ?—Yes.

20303. Therefore, if the tenant had a fixed money rent, he is free to grow the improved varieties of crop ?—Yes.

20304. There is no hindrance either of the Tenancy Law or the law of absolute ownership in that case. Can you tell me any other matters in which these things operate as a hindrance ?—Under the Tenancy Law, as it has been interpreted by the High Courts, a tenant cannot excavate a tank in a land which he has taken for raising crops only. That stands in the way of his making improvements for irrigation facilities. He cannot even make a *pucca* house upon his own land.

20305. You cannot erect a house on land belonging to somebody else ?—Why not ? I am the occupancy holder. Why should I not be allowed to erect a structure upon my occupancy land ?

20306. *Sir Henry Lawrence* : Is there any proposal to give the tenants these rights by law ?—Not to my knowledge.

20307. *Mr. Gupta* : Is not the Tenancy Act under modification now ?—Yes, but we do not know in what form it will come out.

20308. The matter is under the consideration of Government ?—Yes.

20309. *Dr. Hyder* : You say the people of your district are not in favour of direct taxation. You advocate tolls. What is that, direct or indirect taxation ?—Indirect.

*Mr. N. N. Mukherjee.*

20310. How will you levy it?—Whenever a bridge is made upon a certain road a certain amount will be levied as a toll on any cart, motor car or other vehicle that passes over it.

20311. Who will pay it? Will it be the cultivator?—The carter or the man who passes.

20312. He must be an agriculturist?—Not necessarily.

20313. Your *bhadralog* would go seat-free?—Certainly not, everyone would pay.

20314. The tolls would fall chiefly either on carts belonging to the agriculturists or motor cars belonging to *bhadralog*?—No. Even pedestrians will have to pay one pie or two pie, a motor car will pay Re. 1; a cart 4 anna. It will be graduated, and every one will pay.

20315. You advocate this on account of the peculiar circumstances of your Presidency; otherwise you are not in favour of the system of tolls?—Except for the specific work I am not for any tolls.

20316. On page 181 you say, "*Bhadralogs* would not come back to villages unless the communications are made easy, unless they come back, permanent improvement is not possible." I ask you, although you have told me already, whether these *bhadralogs* possess lands?—Some of them do possess land, but they let them out now to tenants.

20317. Do you think these people who own land would improve agriculture if they went back to the villages?—Yes; they would spend money on land as on many other things.

20318. Mr. Gupta: As Dr. Hyder has pointed out, you have got various suggestions to make about the material and moral progress of your district. The Commission is primarily engaged on the question of agricultural improvements. Do I understand that educated Bengal would not favour a certain amount of local taxation if it were necessary, if it took the form of a consolidated tax for the various objects you have mentioned and if a certain amount of aid from the State was promised to supplement it? I do not suggest that separate taxes should be levied for each and every improvement, but I suggest a consolidated rural improvement tax for sanitary improvements, elementary education, agricultural improvements, etc. A pleader like you, an educated man of your type, will surely realise that your scheme will not receive any attention unless you support it with proposals to finance it. Now take the road cess, for example. What is the incidence of that cess?—Six pie in the rupee.

20319. Supposing another twelve pie were levied, would that be objectionable?—Yes.

20320. Would you take up the inflexible position that you do not want to pay anything more?—My personal view would be one thing and the popular view would be quite another.

20321. You are giving your opinion here. The popular opinion may be any way?—As a matter of fact, when the educational scheme of Mr. Bis was put before me, I supported it. Mr. Bis said that people ought to pay something and he calculated that three pie per head would cover the additional educational expenditure. But that is my personal opinion.

20322. That is your personal opinion?—Yes. If you want to make any improvement you will have to pay for it. That is my personal view, but I ought to tell you at the same time that popular opinion would not support me.

20323. No people in the world really pay taxes without grumbling. But once they realise the necessity of it, they gradually become reconciled to it. The example has to be set by leaders of public opinion like yourself?—Yes.

20324. You would personally favour such taxation provided there are not separate taxes, the tax is not excessive, and the State supplements it. Is that the position?—Yes.

20325. Mr. Gupta: Is that going to be a district tax the entire benefit of which will go to the people of the district?—That would be more preferable.

20326. Of course that is what I meant. If the people see that they are getting something back for the money they are paying they may be reconciled to it, just as in the case of tolls. If the tax is centralised and the benefits come back to them in a form they do not understand, there would not be any willingness to pay it. Therefore there would not be any insuperable difficulty in collecting a district tax?—At least there ought not to be.

Mr. N. N. Mukherjee.

20327. About the question of demonstrators, you are very anxious, and in my opinion rightly, that there should be more demonstrators. Mr. Finlow has told us that their scheme is to have a demonstrator for each *thana*; at present you have only one for each sub-division. Meanwhile, would you agree to Union Board Secretaries acting as demonstrators until we get the demonstrators?—Yes, certainly.

20328. Turning to the jute seeds, you stated that they were a failure?—This year I had some difficulty about the *Chinsura green seeds*.

20329. Did you get them from Dacca?—No. I heard that 100 maunds of *Chinsura green seeds* were in the hands of the Collector. I at once wrote to him whether he could supply me some portion of it. He referred me to the District Agricultural Officer, and I wrote and asked him if he could give me some. He told me that he had got the consignment from Midnapore and asked me whether I was prepared to take it, and I said I would.

20330. You got it through the Collector?—I wrote to the Collector as President of the District Agricultural Association.

20331. It was only this year?—Yes.

20332. You did not grow it?—Not everywhere.

20333. Was it put in anywhere?—Yes.

20334. You said you had a farm, and you said you lost. You are in favour of a mixed dairy farm?—Yes, on a co-operative basis.

20335. And on purely commercial lines?—I cannot say as yet. We have only 54 *bighas* of land. My idea is that we should extend the co-operative movement to spheres other than mere credit supply. We want also good milk. Therefore, my idea is to introduce the co-operative principle to dairying and agricultural development.

20336. You are going to have a mixed farm?—Yes, mixed farm.

20337. Your previous failure has not damped your enthusiasm?—It has not.

20338. You agree with me that in opening out suitable occupation for middle classes, there is no sphere in which their prospect is so great as in agriculture?—Yes, and also industry.

20339. *The Raja of Parlakinedi*: On page 176 you say that institutions for agricultural education are not sufficient?—Yes.

20340. Are you sure that an increase in the number of institutions for agricultural training will induce people to take to agriculture as a profession?—I have already said that all those things must go hand in hand. We cannot produce teachers and then make improvements in agriculture. The practical side of agricultural education must be given greater attention to.

20341. Would you restrict recruitment of students to those institutions to people who actually take up cultivation as a profession and to people who possess lands?—I do not wish to restrict it in any way. Those who come out of these schools may set up farms on their own plots.

20342. Are you aware that there are institutions in other Provinces and graduates of those institutions do not take up farming but are after appointments?—It might be because agriculture does not pay. It has not been shown neither do we see that agriculture, as a profession, is paying. It is for that reason that they go out for jobs to other places.

20343. They may not be taking a personal interest in the matter?—I do not think so.

20344. Have you tried yourself personally that agriculture does not pay?—I said I started a farm myself, there was a loss and consequently I gave it up.

20345. That is not the experience in other parts?—It might be that is my unfortunate experience.

20346. *Sir Ganga Ram*: Did you cultivate yourself?—I engaged labourers for it.

20347. You directed them how to cultivate?—I did not myself know how to cultivate. I left it to them.

20348. *Mr. Gupta*: In that case, I suppose one of the best things the Agricultural Department can do is to demonstrate in practice that model farms of 200 acres can pay. That would be an excellent thing for everybody?—This is exactly my point.

20349. *Mr. Kamat*: Were you farming while you were conducting your legal practice?—Yes.

20350. You were doing both simultaneously?—Yes.

Mr. N. N. Mukherjee.

20351. *Sir Ganga Ram* : In whose hands is the farm of yours now ?—I have given it up; I have let it out to tenants.

20352. Have you transferred your land to them ?—They cultivate it themselves. The difficulty for the *bhadralog*s to take to agriculture is this. Supposing I engage two labourers, they do not take any interest in the produce; they sit idle for the best part of the day, and whenever I go there they stir about and show to their master that they are doing something.

20353. What rent per year do you get ?—Rs. 12.

20354. From 200 *bighas* ?—From 200 *bighas* I get about Rs. 50 to Rs. 60.

20355. But you said Rs. 12 ?—Rs. 12 for 30 *bighas*; this is within the town, in which I started my own cultivation.

20356. How much of it is private land ?—I have let out the whole of it to tenants.

20357. How much ?—60 to 70 *bighas*.

20358. On that basis, are you prepared to give those 200 *bighas* to the Agricultural Department ?—Certainly I would; or let the Agricultural Department come in according to the *bhag* system; let the income be divided, I will take one-fourth and let the Agricultural Department take three-fourths; I am willing to give the land free; that will serve the purpose of showing to the neighbouring cultivators what can be done.

20359. *The Raja of Paralakhmed* : No man of education, if he went about carrying on agriculture on your principles, will make it work on a profitable basis ?—Why not ?

20360. He must take a personal interest in the matter; he must make that a sort of primary object in life, and he must also be in touch with it ?—I have taken a personal interest in the matter, but there are many difficulties; the land was fit for cultivation, but I did not get labourers for weeding, or other operations.

20361. *Dr. Hyder* : Are you a superior landlord or have you an inferior interest ?—I hold a portion as rent payer; it is *jama* land.

20362. *Mr. Gupta* : You do not expect these young men to take to agriculture if they transact business in the same way as you do ?—It is not my fault; it is the fault of the system; we must change the system. Manure is not available; there is no irrigation facility, the labourers are scarce. If you place these facilities at my disposal, even now I can show that I can make a profit out of it.

20363. You did not look after it ?—So far as possible, I did.

20364. *Sir Henry Lawrence* : Government should provide the labourers ?—No, the labourers are not available.

20365. By whom should these be placed at your disposal; by Government ?—No, but manure and seeds should be made available.

20366. *The Raja of Paralakhmed* : You say in one of your paragraphs that there are no proper facilities available for taking to agriculture as a profession ?—Yes.

20367. May I know what are your suggestions in the matter of making it a prosperous profession ?—My point is that unless it is seen by boys of the *bhadralog* class, they will not take to it. For example, take any industry; we see that some people are making money by taking to industries, and even though there may be chances of failure, the sons of the *bhadralog* class take to it. Take the profession of law; simply because some of them become rich, others also take to that profession in expectation of becoming rich, whether they become successful or unsuccessful. Let us see some ventures on agriculture, which will show that by adopting certain methods or expedients we may become rich.

20368. You must believe me when I say that I took up a farm under my personal supervision, and in the very first year, after treating my labourers and everybody else concerned very liberally, I got a clear profit of Rs. 2,000 ?—How many *bighas* of land was it ?

20369. One hundred acres of land ?—That is 300 *bighas*, according to our standard. Lands here are rather bad, I should say.

20370. You will have to investigate in which way you have to enrich the land ?—That is exactly what I have expressed.

20371. You must place yourself in touch with the department ?—But the departmental staff is not sufficient.

Mr. N. N. Mukherjee.

20372. They can give you very good advice if you only keep in touch with them?—Even for myself, I could not get them; there is one demonstrator, and he has to go round the whole sub-division; there was no demonstrator at the time I started farming.

20373. For you no demonstration is necessary; you can read about the experiments that are being carried out in the department, and the department advise you what to do?—Practical advice is one thing, and theoretical knowledge is another.

As far as manures and other things are concerned, the educated man requires no demonstration.

20374. On page 176, you say, "In order to do so, scientific methods of modern improved agricultural production, of converting raw agricultural produce into finished products which will find market both in and outside the country should be taught to them by actual demonstration". In regard to that, I should like to know what crops you would concentrate upon. You must demonstrate?—Yes.

20375. So that it may be lucrative?—Yes.

20376. How would you go about it?—I do not quite follow.

20377. *Mr. Gupta*: What kind of demonstration do you want?—Suppose I have got a plantation of 50 *bighas* of bananas. I cannot sell all the produce at the local market; we must convert it into finished products, and send them to other places for sale.

20378. *The Raja of Parlakimedi*: Who is to do that?—Of course we have to convert it into finished products, but we have no machinery, and I do not know how it is to be done.

20379. *Sir James MacKenna*: What is the banana as a finished product?—*Suttee* food is manufactured out of it and certain other things, I have read that in other countries raw materials are converted into certain other finished products. Take dairying for instance. I may start a dairy and I may produce 4 or 5 maunds of milk, but the whole amount may not be consumed in the town of Calcutta; you must convert it into cheese, tin it and send it to other places for sale.

20380. *The Raja of Parlakimedi*: Are the co-operative societies handling any of these things?—Not yet.

20381. In the Bombay Presidency such things are being done; why do you not get the literature on it and try to do that?—I say, therefore, that the co-operative movement should also be extended to those matters now.

20382. At present there is no such movement?—I am going to start one venture in Ranaghat; I have mentioned in my written answer that at Ranaghat a co-operative agricultural and dairy farm is shortly to be started; the Department of Agriculture has forbidden to give me one demonstrator there and the Veterinary Department has promised to give me one Veterinary Assistant Surgeon.

20383. Again, you say that improved methods of cultivation and new crops should be introduced in those areas?—Yes.

20384. Before doing that, do you not think that you must consider the climatic conditions?—Certainly. I have also said that the suitability of the land should be first of all ascertained.

20385. Not only the land, but you must take into consideration the climatic conditions also. Indigenous methods of cultivation have been going on for ages together, and they have adopted certain crops for certain areas because they must be suitable to those places?—Not necessarily.

20386. In the majority of cases it is like that?—Of course, we must take all these things into consideration.

20387. So you may just as well include climatic conditions?—Certainly. Take, for example, potato growing; it was not in vogue in our part of the country, but potato growing is now extending. We are introducing new varieties which were not in vogue previously. So, we might test new varieties of crops, and if they are paying, or we can get better produce, we may take to them. If the climatic conditions do not permit of any particular crop being grown in any particular place, certainly I could not advocate its introduction.

20388. Is potato grown in this part as an irrigated crop?—It cannot be grown in places where there is no facility for irrigation. There must be either a tank or a well at least the water of which can be used for the crop, and where these facilities exist potato is grown.

Mr. N. N. Mukherjee.

no x 13—13a,

20389. In Nadia are there irrigational facilities?—None up till now.
20390. *Sir Ganga Ram* : Is there no river?—There is a river, but it is of no use for purposes of irrigation.
20391. *The Raja of Parlatimedi* : Is any cattle-breeding carried out in your part of the Province?—Not in my district.
20392. In this Province, has not any private man taken up cattle breeding?—I know one barrister took to cattle-breeding and poultry keeping.
20393. Poultry keeping is different?—Cattle-breeding is not usually taken up.
20394. We have been told that lack of pasture is the cause, is that so?—Yes.
20395. Who has encroached upon pasture land?—Of course tenants; but I do not know if there were pasture lands before. In my experience, I have never seen pasture lands in any village which have been subsequently encroached upon by tenants.
20396. It is extensive cultivation all along?—Yes.
20397. Has it encroached upon pasture land?—May be, if there were pasture lands before.
20398. They must have been waste lands?—There are certain waste lands, no doubt.
20399. *Professor Gangulee* : Would you say that cultivation has extended in your district?—No.
20400. *The Raja of Parlatimedi* : Then you say on another page of your memorandum that Government should finance these schemes. Government ought to provide money for demonstration and for improvements in agriculture; otherwise it would neither be popular nor successful. How do you meet that demand upon Government funds?—That is not for me to say, as to how Government should find the money.
20401. The only means left is to increase taxation?—Increased taxation would be very unpopular in the country, but there are other means. People will say that the police charges might be reduced; these are big political questions, and it is no use discussing them. They may raise some money by imposing some export tax on jute, but people are not willing to pay extra taxation; that is the popular view. I can say this much that increased taxation will be very unpopular; Government must seek other means to find the money.
20402. *Professor Gangulee* : Would you define 'popular view'? I find some difficulty in understanding the term?—Popular view is the view of the people at large, those who pay.
20403. Would you include members of the District Boards among them?—Yes, members of the District Board would certainly come under that category.
20404. This is the view of the members of the District Board?—Yes; I could not pass any measure for increased taxes through the municipality, and in the District Boards it will be the same.
20405. In the District Board, you are the only one in favour of it?—I will be in favour of it as the last means; if there is no other means it will have to be done.
20406. *The Raja of Parlatimedi* : In rural areas, what other methods would you suggest for improving demonstrations for the illiterate people? You suggest the use of lantern slides and demonstration on Government farms. What other improvements do you suggest?—Sending the demonstrators out to explain it to them personally.
20407. Do you not think that it is better to carry out this demonstration on their own lands?—Certainly.
20408. And guaranteeing any loss that may be incurred?—That is one of the best means, I should say.
20409. Would you include that as one of the best means in preference to lantern slides?—Of course, as one of them.
20410. *Sir James MacKenna* : I just want to clear up one or two points about the seed given to you by the demonstrator and which failed; was it jute or rice seed?—This year it was jute and last year it was charanal paddy seed.
20411. Was this failure of the jute seed reported to the department?—I wrote to the Agricultural Officer at Krishnagar.
20412. And he did not reply?—He could not say anything more; he asked me not to realise any prices from the persons to whom those seeds were distributed.

Mr. H. N. Mukherjee.

20413. Are you quite sure that all that jute seed was provided by the department?—I did not say it was provided by the department; I got it through the District Agricultural Officer.

20414. I understand that the jute seed from Dacca is guaranteed?—The seeds from Dacca were perfectly all right.

20415. Do you not think it would be better to approach the Director of Agriculture in cases like that?—The quantity of seed which I got from the department was all exhausted, and still the demand for it was very great. I heard that there was some amount in stock at Krishnagar, and I wrote to the Collector asking if he could supply me with some quantity of seed; he referred me to the Agricultural Officer; I wrote to him and he sent me 15 maunds.

20416. My only point was that it was rather a serious matter for Dacca jute seeds to fail?—They did not belong to that farm, and I do not blame them.

20417. Jute seeds from Dacca are all guaranteed?—They are all right.

20418. With reference to your position as Secretary of a Central Bank, I should like to ask you a few questions. What is the capital of the Central Bank?—It will be a lakh of rupees.

20419. How much of that is subscribed by the people in the territorial area?—It consists of two parts, share capital and deposits; the share capital would be about Rs. 10,000 and the rest of it consists of deposits.

20420. Is the share capital subscribed locally?—Yes.

20421. As regards the deposits, some of which are local and some from outside, which would be the major portion?—The major portion is from outside and the lesser portion from the locality.

20422. Is the major portion from residents of large towns in the neighbourhood?—Yes.

20423. To what extent are deposits made by rural cultivators and to what extent by the professional classes?—Practically speaking, no deposits are made by the cultivators.

20424. Except through the society, practically all the deposits are made by the professional men living in the town?—Yes.

20425. What rate of interest do you pay on deposits?—Formerly we were paying 7 per cent. for one year and  $7\frac{1}{2}$  per cent. for 2 years, but now, because there has been an abundance of money lying stagnant in our hands, we have reduced the rates of interest, and we are paying 7 per cent. for 2 years and  $6\frac{1}{2}$  per cent. for one year.

20426. Professor Gangulee: You have a great deal of surplus?—Yes, we have a surplus in our hands. I am refusing deposits.

20427. Sir James MacKenna: Because you cannot utilise them?—Yes.

20428. How many societies have you under your Central Bank?—About 100.

20429. Sir Ganga Ram: One hundred in your district?—In my sub-division; under the Central Bank of which I am secretary at Ranaghat. I started with 12 about three years ago, and I have gone up to 100 now.

20430. Sir James MacKenna: From what class do the directors of your Central Bank come?—There are 15 directors altogether; three come from the towns, and the rest are representatives of rural societies.

20431. That is to say, the cultivating classes have more than 50 per cent. of the representation?—Yes, more than that.

20432. And they have an equal vote in the annual meetings?—Yes.

20433. Professor Gangulee: As you are a High Court Vakil, I suppose you stay in Calcutta?—No, at Ranaghat.

20434. Who managed this farm of yours?—I myself, practically.

20435. Did you take farm castings?—To a certain extent, but I did not keep regular accounts.

20436. Do you understand what we mean by farm castings?—Do you mean regular accounts of the expenditure and income?

20437. The detailed income and expenditure?—I did not keep accounts of the detailed expenditure.

20438. You yourself managed that farm?—Yes.

Mr. N. N. Mukherjee.

20139. You ascribe your failure to various reasons?—Yes.

20140. May I suggest your failure may have been due to bad management?—I do not admit that.

20141. You say on page 176 that to your knowledge some agricultural ventures by sons of well-to-do men with fair capital and on a large scale have been failures. You know of other cases?—I know of another case near Ranaghat where a sub-judge after retirement put one of his sons into agriculture, and he failed.

20142. What time did he get up in the morning? 8 o'clock, perhaps?—No. For myself, I am an early riser and get up at 5 a.m.

20143. On page 177 you say, "Their (i.e., the farmers') colossal ignorance and illiteracy are the main causes of their conservatism." Do you mean to suggest that the cultivator in your neighbourhood does not know a good thing when it is shown to him?—When it is shown to him he does.

20144. He has enough common sense?—Yes.

20145. He may be illiterate, but he is intelligent?—Yes.

20146. On the same page you set out the main causes of borrowing, and you are modest enough to put litigation last on the list as you are a lawyer?—Yes.

20147. And you think litigation is not an important cause?—There is mis-conception about it.

20148. How many cultivators, what proportion of the total number, really take part in litigation? How many of them are involved?—I can say from my own personal experience that not more than 5 per cent. of the agriculturists are litigants, and the peculiar fact is that those who are litigants are always litigants, and those who do not come to the court never come. You see the same men coming to the court every month.

20149. From the amount of wealth pouring out of the High Court in this country into the pockets of the lawyers, one imagines the figure must be more than 5 per cent.?—It may be, but it is not much more, so the general indebtedness of the agriculturist cannot be ascribed to litigation.

20150. So you put litigation last. I say that is modest on your part?—From my own personal experience I can say that the money which goes into the pockets of the barristers does not come from the cultivators, but from people like traders, merchants and big landlords. The major portion of it comes from such people. The Calcutta barristers make their money out of the Marwaris, who are engaged in commercial transactions, and people like that.

20151. You say the remedy lies in the spread of co-operative societies which lend money at a very low rate of interest. Do you mean to suggest lower than the existing rate?—Yes.

20152. What is the existing rate charged by co-operative societies?—8 to 12 per cent.

20153. Can you reduce the rate of interest?—We are not in a position to reduce it.

20154. From what class do the moneylenders in your district come?—They are small traders.

20155. And small landlords?—Yes.

20156. Any pleaders?—No.

20157. They do not lend money?—No.

20158. Is there a demonstration farm in your district?—No. One is going to be started, but it is not in existence yet.

20159. Have demonstrators from the Department of Agriculture visited your district at any time?—Yes, there is one posted at Ranaghat.

20160. We understand these demonstrations are given on the lands of the cultivators?—Yes.

20161. When they are held, do you attend them?—No.

20162. Have you been invited at any time?—No.

20163. Did you ever come to know that the demonstrations were being held in the neighbourhood of your place?—Yes.

20164. You are proposing to start a co-operative agricultural and dairy farm at Ranaghat?—Yes.

Mr. N. K. Mukherjee.

20165. Who are going to be the members, urban or rural people?—For the present we are getting urban people.

20166. So it does not affect the rural population at all?—We are starting it for demonstration to the cultivators. They cannot afford the money; it is the urban people who have subscribed the share capital, and you must take your directors from among those who purchase shares.

20167. Will it be in the town itself?—Yes.

20168. You are not trying to get the farmers of the neighbourhood into the scheme?—We have tried to sell shares amongst them. It is about to be started; it has just been registered.

20169. This society you propose to start is really an urban society?—Yes, for the present.

20170. With regard to the average cultivator working 300 days a year, they must be very prosperous in your district and have no need of subsidiary occupations. Can you tell us how you arrive at that figure of 300 days a year?—Yes. During one month in the year there is very little for them to do, and I have put down also certain days in other months. I have inquired into the matter, and from my inquiries I think 300 days is the right figure.

20171. It is really a guess?—Yes.

20172. Do you think there is any room for a subsidiary occupation?—Yes, they have 65 days to spare in which they could do something.

20173. Are you a member of the Bengal Co-operative Organisation Society?—No.

20174. Are you a member of any co-operative society?—Yes, I am secretary of one society and I am a member of the Bengal Provincial Bank.

20175. Is your society federated with the Bengal Co-operative Organisation Society?—Yes. That society does propaganda work, and it was only started this year, or rather only put on a systematic basis this year.

20176. It has been going on for some time?—It had no statutory or legal sanction, but now it has been registered as a co-operative society.

20177. Do you yourself take part in propaganda work for co-operation?—Yes.

20178. To teach the people co-operative principles?—Yes.

20179. In what way?—Whenever I go to the mofussil I instruct the people how to start co-operative pasture grounds or manure stores.

20180. Do you watch the effect of your propaganda?—Yes.

20181. Are you quite satisfied with it?—I go once in six months. The impression I create disappears in a day or two, and that is why I say systematic efforts should be made.

20182. Precisely; that is what I mean?—That is why I want more demonstrators and co-operative supervisors, to bring these things constantly before the people and induce them to take them up. We non-officials who have other work to do cannot be expected to carry on systematic work in that direction.

20183. You have no other non-official agency in your town to help you?—No.

20184. No other influential gentlemen to help you?—No.

20185. You say the difficulty lies in organising the societies and running them successfully, and you say energetic and enterprising people are not always available in rural areas. We all know that. Then you say "Government ought to make serious efforts in that direction." Do you mean to say Government should supply energetic and enterprising men?—No, but I suggest Government should employ more supervisors under the Co-operative Department and more demonstrators under the Agricultural Department. That is my point.

20186. Mr. Calvert: You refer to the establishment of agricultural and industrial banks. Are you thinking there of any special type of bank, other than the co-operative bank?—Yes, because co-operative banks at present cannot advance more than ten times the paid-up share capital; that is under the Co-operative Societies Act.

20187. Under the rule?—Yes. There are certain possibilities of the failure of these enterprises in the beginning. If the co-operative banks advanced more than that, the money of the depositors might be lost and the confidence of the people greatly shaken; but if these big banks are established and they finance these enterprises, their stability would not be affected, and consequently I suggest these agricultural and industrial banks should be established to finance these societies.

Mr. N. N. Mukherjee.

20488. What kind of constitution would the agricultural bank you contemplate have?—They would be big banks where money could be had by the agriculturist.

20489. Where would their capital come from?—The Government might raise it, or they might be a part of the Imperial Bank. I have not worked that out, but it might be under Government supervision or Government might find the money to establish these banks.

20490. An agricultural bank would depend on the public for deposits?—Yes, to a certain extent it might.

20491. What could an agricultural bank do which a co-operative bank cannot do?—If the paid-up capital of a co-operative bank is Rs. 200, the Central Bank can advance only Rs. 2,000, and with that amount a big commercial firm cannot be carried on.

20492. A co-operative bank adopts that rule for its security?—Yes.

20493. Would the agricultural banks take risks the co-operative bank cannot take?—Yes, because unless they take risks in the beginning nothing can be done.

20494. The bank would take business considered too risky for a co-operative bank?—Yes.

20495. Whose funds would they be lending for this risky business?—There would be a Government guarantee, and if there was that guarantee people would come forward with money. Unless and until there is a Government guarantee and safety for the depositors the money will not be forthcoming.

20496. Government would take all the risk?—Yes.

20497. Have you thought out any scheme for the industrial banks you propose?—Just as there would be agricultural banks so there would be industrial banks, and their funds would also come from the same source.

20498. From Government?—Government guarantee. If there was a Government guarantee the Government could, through its officers, look after these agricultural and industrial ventures, and if there is Government supervision in the beginning over these enterprises we expect they will be a success. Private ventures are likely to fail, and the consequence of the failure of these enterprises would reflect on the banks and the whole thing would collapse. My idea is, therefore, that there should be stable agricultural and industrial banks which would not be shaken by failures in one or two cases in rural areas. These banks would be able to stand a few failures, and if you start 100 enterprises it cannot be expected that they will all fail. Some will fail and some succeed. We want these banks established in such a way that one or two failures will not affect their stability.

20499. The correct conception of an industrial bank is a bank with very large shares, say of Rs. 1,000 each, and it is the share capital that is lent out and not the deposits. There are no funds other than the share capital. Is that the kind of bank you are contemplating?—No.

I ask that because the only people who have made a success of industrial banks of that type are German Jews.

20500. You suggest that night schools should be opened?—Yes.

20501. Have you yourself tried to open them in Ranaghat?—No.

20502. Do you think there is scope for them?—Yes. I have seen some night schools in rural places. In a rural place I have found at dusk adults and even small boys going to take lessons.

20503. You are hopeful that propaganda there would be a success?—Yes.

20504. I am glad to hear that. Coming now to the causes of borrowing, do you think the moneylender with capital for which he is trying to find an investment is one of the causes of borrowing?—No.

20505. You do not think the moneylender is a cause of borrowing?—No, I do not think people borrow simply because money is available.

20506. In pre-British days, there was practically no debt as we know it now, because there was no money to lend?—I am not quite sure of that.

20507. Not on the same scale?—I do not think debts were non-existent. It may be that owing to their producing good crops cultivators had not the same need of assistance.

20508. Do you think dishonest accounting is common among moneylenders?—I have heard the allegation, but I do not say it is always true. It may be true in some cases, but not as a general rule.

Mr. N. N. Mukherjee.

20509. Have you never found thumb-marks on blank sheets of paper?—In some cases, but not as a general rule.

20510. You mention you would not like to do anything which would have the effect of diminishing the value of land?—Yes.

20511. Is it your experience that the rise in the value of land has preceded the rise in debt?—I cannot say whether the rise in the value of land or the debt came first.

20512. Do you think the rise in the value of land is a cause of borrowing?—No.

20513. With regard to consolidation of holdings, I do not wish to underestimate the extreme difficulties in Bengal, but have you read Mr. McLean's little note on the Punjab system?—Yes.

20514. He mentions there a village called Chomo which it took two years to deal with, and he explains that at the end of two years the owners wished to begin all over again. Do you think you could do a village here in two years if really skilled men were at work?—I think we could.

20515. You think you could get results with really trained men with sufficient patience to overcome the difficulties?—Yes.

20516. Are your District Boards allowed to spend money on propaganda in favour of co-operation?—No.

20517. Is it your experience that these repayments to primary societies are really fictitious? Are they in cash?—Yes.

20518. You know the common system is to repay a loan and borrow a fresh loan on the same date?—Not always; so far as my experience goes it is not that.

20519. Repayments to your Central Banks are quite proper repayments and not fictitious?—Not fictitious.

20520. There is no question of going to the moneylender and repaying the debt and three days after taking another loan?—At least that is not my experience.

20521. In your general meetings of your Central Banks, do you get a fair attendance of representatives from primary societies?—Yes.

20522. Are they treated exactly as politely as any other members?—Yes.

20523. There is no distinction between the seating accommodation allowed to the individual members of the town and the seating accommodation allowed to the primary societies?—Of course benches are given when chairs are not available. Except that, they are not treated in a different way from the town members.

20524. Do they know how to exercise their voting power?—Of course, they are gaining experience in the matter gradually. We see every year some change in this. They are really taking an interest in exercising their vote.

20525. What is the language in your meetings?—Bengali.

20526. Do you prohibit the use of English entirely?—There are some who do not know English and consequently we are bound to speak in Bengali and even in general meetings, for instance, when Mr. Graham, the Collector presided over the last meeting, we carried on the entire discussion in Bengali.

20527. *Professor Ganguly*: Are your accounts kept in Bengali?—No, the Central Bank accounts are kept in English, but the rural society accounts are kept in Bengali.

20528. *Mr. Calvert*: Do you think it would be beneficial to your movement if Government provided a staff of highly trained economists who would teach villagers co-operation and village economics and things like that and try to explain the cause of poverty in the village?—Yes.

20529. On the question of village roads, the trouble I gather, is that you are trying to finance your roads out of your current revenues?—Yes.

20530. Now would it be possible in your own case to construct the roadway, the earth work and the bridges and so on from a loan and only pay for the wearing coat and sinking fund from revenue?—Yes; the cost of the road consists of more or less permanent expenditure on earth work, bridges and things of that sort.

20531. And your current expenditure on the wearing coat, etc., that is to be renewed every three or four years?—Yes.

20532. Would it be possible to pay the capital from current revenue by keeping a sinking fund?—We cannot meet that if it is from the current revenue unless we realise the whole amount, including the maintenance charges also from the tolls; or loans

Mr. N. N. Mukherjee.

will have to be raised in order to make those improvements; but we will have to realise the amount which will cover also the maintenance charges because the greater the range of the *pucca* roads, the greater is the responsibility thrust upon the District Boards to maintain them. With the present funds at our disposal it is not possible for us to maintain all those roads in proper condition; and if we increase the mileage of roads it will be still more difficult to keep them in proper condition with the funds at our disposal now.

20533. *Mr. Kamat* I have no desire to ask you any personal question because I do not think it will be fair to you. But I want to elucidate the outlook of educated men in this Presidency by one or two questions which have a positive bearing on the environment. In addition to your profession, you are devoting part of your time to the co-operative movement, are you not?—Yes.

20534. And therefore you come in contact with the rural people?—Yes, and also the Chairman of the District Board I come in contact with them.

20535. As such you devote part of your time to rural welfare?—Yes.

20536. And you know their practical difficulties?—Yes.

20537. And you think the country requires far more men, with all the limitations of time and other things, to work for the welfare of the people?—Yes.

20538. And in this matter of the rural work, in the long run this kind of help really advances the movement rather than sitting in the country?—Certainly, it does.

20539. Now about your outlook, you were saying that you had no money for road communications and that stood in the way of the *bhadralog* going to rural villages and such like things. Would you suggest a remedy for it?—Yes, I have suggested it in my note.

20540. Do you think the agricultural income of the people of this Presidency is going up or is stationary?—That would depend upon the produce from year to year.

20541. Is it going up, according to your information, or going down?—I should say that it is going down; that is my impression.

20542. Looking to the seasonal reports, I want to bring to your notice that in your district, taking the question of jute, the normal harvesting price was Rs. 4-13 0, whereas the year before last it was Rs. 12 or nearly three times as much. Last year it was Rs. 20 or five times as much. In the face of that, do you think that the agricultural income of the Presidency is going down?—Yes, in this way; this year it was Rs. 6 and last year was a very prosperous year. Therefore I have said that it will depend on the produce of the year and jute is not the only crop we have. It is a small proportion of the crops that are grown.

20543. Can you show me any crop which has gone down?—The cost of wages has increased; the cost of cultivation has increased; the fertility of the soil has decreased and the produce has been less. That is my impression.

20544. And you think the income of the people, therefore, is less?—Yes.

20545. Have you looked into the other question whether your Presidency is contributing sufficiently towards the welfare of the public and whether it is properly taxed?—I think it is properly taxed.

20546. You knew the general revenues of your Presidency?—Yes, to a certain extent.

20547. They are about 10 crores?—Yes.

20548. Have you compared that with other Presidencies and with their population?—No.

20549. In Madras it is 16 crores and in Bombay it is 16 crores. Do you know how it works out?—How?

20550. According to your population you are taxing yourself only Rs. 2 8-0 per annum. The Madras man taxes himself to Rs. 4 and the Bombay man to Rs. 8?—Have you also taken into consideration their income from land, whether it is more or less?

20551. This is income from everything?—That is taxation per head you say. But what is the income? The capacity to pay the tax depends upon the income of the particular cultivator in each Province. I may pay Rs. 1 as tax and I may consider myself having regard to my income or to the other taxes I pay, to be heavily taxed. But a man paying Rs. 4 may not be considering himself to be over-taxed.

20552. *Mr. Gupta* Is it not a fact that the revenue of this Province is 32 crores of which 22 crores go to the Central Government as contribution from this Province, and not 10?—I do not know exactly what it is.

*Mr. N. N. Mukherjee.*

20553. *Mr. Kanat*: I am dealing with provincial revenues and we have nothing to do with what Mr. Gupta has said. You therefore think there is no scope for further taxation?—Yes, that is my opinion.

20554. As the Chairman of a District Board you said in answer to Mr. Gupta that personally you were in favour of raising the taxes?—I said they could be raised, that is my opinion. If all these improvements are to be made the people must pay something, otherwise they cannot have them; they cannot sit idle.

20555. Mr. Gupta asked you, subject to certain provisos, one of which was that there should be State aid, whether you would be willing to tax yourself and you gave that out as the educated public opinion in this Presidency?—That was my personal view; but I said that people would object to it.

20556. Were you returned by the people as Chairman to the Board or were you nominated by the Government?—I was elected as Chairman by the District Board, but nominated as member of the Local Board.

20557. And I take it, therefore, you are a popular man?—Yes.

20558. And you represent the popular mind?—To a certain extent, yes.

20559. If you represent the popular mind, would you attempt to bring a proposal in the District Board to have some cess levied so as to bring in more income? Could you venture upon it?—No, because I do not think it is possible to carry it through.

20560. You would simply follow public opinion and not put before the public your personal opinion?—Yes; I would not be able to carry it through.

20561. And therefore for sometime you would not venture to touch the question of additional taxation for all the reforms which you want?—At least I would not be able to carry it through.

20562. Would you attempt it?—Even if I attempted it, I would not be successful.

20563. Supposing some people are in favour of it and ask you, would you attempt it, would you test public opinion?—Yes, I might; but you see there is a good deal of unpopularity about all these matters. I know perfectly well that people will not support me. So knowing the position fully well, why should I run my unpopularity by doing it when I have no chance of carrying it through? If I know that there is a substantial majority in favour of my proposal, I should attempt it. But knowing fully well the will of the people there is no use attempting it.

20564. *Professor Ganguly*: In other words, you will not attempt to create a public opinion?—That is not it. The public opinion is stubborn on that point. I know it is difficult to influence public opinion on that point.

20565. But when you went to the electorate and got their votes, did you express your personal opinion?—No, that question did not arise at all.

20566. You do not think it worth while to bring this personal opinion to their notice?—That question did not arise at all, you see.

20567. *Rai Bahadur Bannerji*: Just a few months ago when the idea of having free primary education was in motion in the country, the Divisional Commissioners had a conference in which the representatives of District Boards were invited to give their opinion as to whether the educational cess of one anna or one anna and a quarter per rupee would be acceptable to them. What opinion did your District Board give?—They did not agree to it; I think they dropped it.

20568. *Mr. Gupta*: What opinion did you give?—Of course in the Municipality I gave my opinion and did make an attempt really speaking; but in the District Board I do not remember what I said, but really speaking I said, in effect, "You cannot sit with your hands idle. If you want these improvements, you will have to do something". It was a cry in the wilderness.

20569. It has nothing to do with this; it is more or less a scheme?—Taxation in whatever form would not be acceptable to the people.

20570. *Rai Bahadur Bannerji*: Supposing a bill were introduced in the next Bengal Legislative Council and you were a Member of the Council, what would you do? Would you support the measure?—I said already that it was a very delicate question. There is one personal opinion and another, the opinion of the electorate which I am bound to obey. It is not yet certain as to whether a Member of the Council would give his own personal opinion or whether he would voice the opinion of the people whom he represents. If I am there to represent the views of the people I should say "no" to that; and if I am to give my own personal opinion I should say that a certain small proportion should be paid by the people, provided that the other portion comes from the Government.

*Mr. N. N. Mukherjee.*

20571. *Mr. Calvert* : What is the meaning of the phrase 'Leader of the people'?—'Leader of the people' has different meanings. It has no meaning properly speaking. People are not now led by one man. The leader is thrown overboard as soon as the leader goes against the wishes of the people.

20572. That is the state of things nowadays?—Yes, one day he is the leader of the people and the next day he is nowhere because he ventures to give vent to opinions which are not liked by the people.

20573. *Dr. Hyder* : What will he do if he wants business?—He would be nowhere, I tell you. The leader of the people would be gone at once.

20574. *Mr. Gupta* : Your income of the District Board, as you said, is from roads cess and public works cess?—I say the main heads.

20575. Now the money that you get from the public works cess has to be spent on education, sanitation, water-supply and similar objects?—Yes.

20576. And the money you get from the roads cess has to be entirely spent on the construction and maintenance of roads, has it not?—Yes; that is right.

20577. You say on page 178 of your note 'By offering a substantial price to owners for cowdung and making other kinds of fuel cheaper and more easily available than at present'. What other kinds of fuel had you in your mind when you wrote this note?—Fire-wood which is not available; and coal.

20578. Or soft coke?—Yes.

20579. How can you make soft coke cheaper than what it is today?—That I do not know of course, but that is the only way. Otherwise, the poor people will not part with their cowdung.

20580. Cannot soft coke be made cheaper if the owners of the coal mines reduce the price or if the railway company reduce its railway freight?—Certainly.

20581. *Sir Ganga Ram* : What is the value of your land?—That differs at different places.

20582. I ask you about your land; you have got 200 acres?—40 *bighas* and I purchased it for Rs. 400, at Rs. 10 per *bigha*.

20583. Rupees 10 per *bigha*? You can get land at that price?—Yes.

20584. Is that the general price?—Of course cultivated lands generally vary from Rs. 10 to Rs. 25 a *bigha*. A *bigha* is one-third of an acre.

20585. That means Rs. 30 to 60 an acre?—Yes.

20586. What is the wage of a labourer?—Nowadays it is increased to 12 annas per diem.

20587. The ordinary agricultural labourer?—Yes.

20588. Can you get sufficient work for that man?—People engage them at that rate.

20589. In urban or rural areas?—In urban areas.

20590. Twelve annas?—Yes.

20591. A mason for instance?—A mason, if he works for 8 hours will get Rs. 1-2-0

20592. Otherwise?—He would get 12 annas.

20593. The same rate for a mason and an ordinary labourer?—No; I say it is Rs. 1-2-0 for the mason.

20594. But ordinarily it is 12 annas?—Yes, 12 annas for the ordinary labourer.

20595. Is that the only difference between the mason and the labourer, Rs. 1-2-0 and 12 annas?—Masons are only used for constructing buildings; there are also labourers engaged for that purpose.

20596. *Sir Ganga Ram* : You are thinking of starting a dairy?—Yes.

20597. Have you considered what you will do with the useless animal, the cow that goes dry?—We have not decided upon that particularly, but we will take expert advice upon that.

20598. Upon that question?—Yes.

20599. *Professor Gangulee* : The butcher is the expert?—Not exactly; we may consult outside experts. We have not decided upon that; these are details which will have to be decided by experts.

*Mr. N. N. Mukherjee.*

20600. *Sir Thomas Middleton* : I am much interested in your evidence. We had some difference about the question of the qualifications required for recruits to the Agricultural Department. Do you now agree with me that improved agriculture is a most difficult process, wanting knowledge, skill and energy ?—Yes.

20601. Do you agree that it may even be as difficult a matter to be a successful agriculturist as to be a successful lawyer ?—Yes.

20602. Do you agree that ability is abundant in the boys of Bengal ?—Yes.

20603. And they make good college students ?—Yes.

20604. Then, I ask you this. Is it not worth while to give good education up to the Interimmediate standard to the boys to be recruited by the Agricultural Department, for the purpose of advising agriculturists ?—I do not wish to have a hard and fast rule on that point. I think Matriculation would be sufficient for those who would like to go to an agricultural class.

20605. But you are aware of the fact that at the Matriculation standard they have no knowledge of science ?—Yes. I have suggested therefore that from the very beginning agricultural subjects might be included in the curricula of the lower classes.

20606. That will mean an alteration in school curricula ?—Yes.

(The witness withdrew.)

*The Commission then adjourned till 10 a.m., on Friday, the 3rd December, 1926*

Friday, December 3rd, 1926

## CALCUTTA

## PRESENT :

THE MAJORITY OF LENTITHGOW, D.L. (*Chairman*).

SIR HENRY STANTON LAWRENCE, K.C.S.I.,  
I.C.S.  
SIR THOMAS WEDDINGTON, K.B.L., C.B.  
RAJ Bahadur SIR GANGA RAM, Kt., C.I.D.,  
M.V.O.  
SIR JAMES MACKENZIE, Kt., C.I.D., I.C.S.

RAJA SRI KRISHNA CHANDRA GHARATI  
NARAYANA Dey of Parikhulshi.  
Profes of N. GANGULI.  
Dr. L. K. HYDER.  
Mr. B. S. KAVAT.

Mr. J. N. GUPTA, I.C.S.  
RAI A. C. BANERJEE Bahadur } (*Co-opted Members*)  
Mr. J. A. MADAN, I.C.S. }  
Mr. P. W. H. SMITH. } (*Joint Secretaries*).

Mr. E. O. SHEBBEARE, Conservator of Forests, Bengal, Darjeeling

## Replies to the Questionnaire

QUESTION 16.—ANIMAL Husbandry.—(a) (i) and (b) (i). The best breeds of cattle are said to come from the parts of India and Burma where pasturage is scarcest. In Bengal grazing is cheap, often free, so that it costs next to nothing to own cattle which have come to be regarded almost as a form of currency. The result has been that the head of cattle has increased up to the maximum number that the available pasturage will support through the dry weather in a half-starved condition. The breed thus weakened has further deteriorated owing to promiscuous mating, often of immature animals, while any young bull showing promise is castrated and put to work.

The only remedy would appear to be to limit the head of cattle grazed and gradually to reduce this number while trying to improve the breed by selection. There are far too many cattle at present; America with three times the area of India has only one-third the head of cattle and is a milk and beef exporting country.

In the hills round Darjeeling, owing to the damage done by forest grazing, the Forest Department has gradually substituted stall-feeding by building cattle sheds surrounded by fenced paddocks in the forest and charging a nominal rate for cut fodder. It is not profitable to stall feed poor milkers and the result has been an improvement in the stock kept. These paddocks can be seen from Darjeeling in half a day with a motor car.

QUESTION 18.—FORESTS.—(a) No. The *taungya* system, which has now been introduced into most of the Government forests of Bengal, has opened up possibilities of a considerable extension of cultivation.

Under this system, which consists in replanting clear-felled forest by the aid of agricultural crops, from  $\frac{1}{10}$ th to  $\frac{3}{10}$ th of the total area of the forest should be under field crops, the rotation of the forest crop being usually either 10 or 80 years and the field crops taken off each area for two years in succession.

The extension of the system since its introduction some ten years ago has been gradual, cultivators being slow to accept a novelty, and there are at present only 1,039 families living as *taungya* cultivators in the Government forests of the Province. The Forest Department is making every effort to increase their numbers as it is believed that the future forest wealth of Bengal lies largely in the even-aged plantations grown with their help.

A description of the method as carried out in Bengal will be found in *Indian Forest Records*, Volume VIII, Part IV, and the system can best be seen working at Rajbhatkhawa on the Eastern Bengal Railway (about 16 hours from Calcutta), at Sukna on the Darjeeling-Himalaynn Railway (12 hours) or at Kaptai in the Chittagong Hill tracts (26 hours).

I do not consider any extension of forest grazing in Bengal compatible with the proper preservation of forest areas. On the contrary many blocks are overgrazed and ought to be closed. The great improvement in the Government forests of Northern Bengal since conservancy began has been principally due to protection from fire and grazing.

Mr. E. O. Shebbeare.

which in practice are inseparable. A comparison between two similar forests, separated only by a boundary line, the one protected from fire and grazing and the other not, can best be made at the 9th mile of the Siliguri-Sivoke road (12 hours from Calcutta).

The Forest Department encourages the cutting of fodder by charging a nominal fee and by building cattle sheds surrounded by fenced exercise paddocks. This applies only to the hills; stall-feeding is unfortunately not yet practised in the plains where the cattle are of too poor a breed to repay the trouble. These stall-feeding establishments can be seen from Darjeeling in half a day with a motor car.

(b) The only means of increasing the supply of firewood and fodder in rural areas away from Government reserves would appear to be the formation of village forests. In some parts of Bengal a certain amount of scrub jungle still remains which could with care be restored but, in most districts, any high land which exists would have to be replanted. I understand that some villagers in Madras have made plantations for their own use and protect them jealously.

At the request of the agricultural and civil authorities, I recently investigated some of the remains of forests in Western Bengal and, among other things, recommended that an attempt should be made to protect and improve scrub jungle in the interests of fuel and fodder as well as to conserve water and prevent erosion. The Collector of Bankura, working through the village co-operative societies, began some experiments in this direction; I cannot say at present how far he has succeeded in his extremely difficult task, or how far my advice proved of any practical value. The chief difficulty in an attempt of this kind is that, where everybody is at liberty to cut, burn and graze anything anywhere, the first steps towards improvement are bound to be in the direction of the curtailment of privileges.

(c) The destruction of forests in Western Bengal during recent times has brought about serious erosion and the drying up of streams and surface water within the memory of living people. The process is still continuing and these western districts appear to be tending towards almost desert conditions. At present the only means of conserving water for agricultural purposes is the damming of small valleys to form artificial reservoirs and occasionally by the cutting of contour ditches on the hill-sides.

In the moist sub-Himalayan tract the deterioration of head-water forests in the Kalimpong sub-division through overgrazing has caused landslips in the hills and floods in the plains below. In the Chittagong Hill tracts, the deforestation of the Maini valley led to the silting up of the Karnaphuli river and formation of sand-bars impassable except to the smallest craft.

(d) The shortage of moisture in the soil and damage by erosion are both symptoms of the same complaint, too rapid a "run-off." The remedy lies in what Americans call the "fly-wheel action of forests," that is to say, spreading the effect of short but violent storms and a short but heavy rainy season to give sufficient moisture throughout the year. The maintenance (or establishment) of an absorbent pad of forest on all hill-tops and head-waters is indicated.

(e) I have dealt with this under (b) above.

(f) Yes, in many places often because what appears to be light grazing in terms of the head of cattle per acre is, in practice, concentrated near the villages, in stream beds and grassy banks; the last two being just where it does most harm. To quote from a recent review\* :—"It is a shortsighted policy of Government to encourage this forest grazing. Cheap grazing only encourages large herds of useless half-starved cattle and ruins the forest." I think that the majority of agricultural and forest officers will subscribe to these sentiments, though some of them may say that, under existing conditions, some forest grazing is unavoidable. This is to some extent true and civil officers, who have the peace of their districts to consider, cannot be expected to favour sudden and drastic closing down of forest grazing over large areas which might lead to hardship or disorder. On the other hand, if Government agrees that cheap forest grazing is harmful both to the breed of cattle and to the forest, a policy of gradually increasing the grazing fees while keeping the rates for cut fodder nominal, could surely be introduced so as to discourage the practice without causing hardship to anybody. In one district where the rate for forest grazing is only one anna per head per annum, cultivators living away from the forest are said to pay landowners as much as eight annas a month for the same privilege.

\* Review of the Central Provinces Administration Report in *Indian Forester* for November 1920.

## Oral Evidence

20607 *The Chairman*: Mr. Shebbeare, you are Conservator of Forests in this Presidency?—Yes.

20608 You have put in a note of the evidence which you wish to give and the Commission is greatly obliged to you for it. Do you want to make any general statement at this stage?—No.

20609. I should like to ask you first whether you think that, having regard to the services that the forest areas can provide for agriculture, there is sufficiently intimate and active touch and interchange of opinions between your Department and the Agricultural Department?—Yes; we see a good deal of each other and we get on very well.

20610 Do you think your subordinate officers understand the extent to which forest areas can be used for agriculture under certain conditions?—I think so.

20611. How would you regard the suggestion that suitable junior officers of your department should be attached for a short time to the Agricultural Department in areas where agricultural lands are contiguous to forest areas, so that they might get some insight into the problem from the agricultural angle?—All areas are contiguous to agricultural areas. I think it would be a good suggestion to accept if we had time. The trouble is that all these additional training schemes take up a certain amount of time; I think that would be the only objection otherwise the idea is an excellent one. There are so many things that have been suggested. It has been suggested, for instance, that we should go round with the Settlement Officer for a time. That would be an excellent thing to do provided we had time. The difficulty is that we have not got time.

20612. Would you just tell the Commission how your forests in this Presidency are classified?—What do you mean by classification? You mean reserved and protected and so on?

20613. Yes, just to be certain that the practice in this Presidency is the same as in other Provinces?—The important forests are reserved forests. Certain forests, which may be eventually required for other purposes or which have only been recently taken over, are classed as protected forests.

20614. Is the big timber in the reserved forest?—Yes, the important forests are reserved forests. Some protected forests contain valuable timber. They have, of course, been taken over for a very long time. The rules regarding the protected forests are, one might say, more easy-going than those of the reserved forest. Then there are Unclassed State Forests in which cultivation is allowed such as broad tracts of land like the Chittagong Hill tracts where shifting cultivation is allowed. They are shown as Unclassed State Forests because we got some money out of a certain class of produce that is obviously not grown by the people.

20615. What measure of control have you over the operations of agriculturists in the Unclassed State Forests?—We have none barring that certain reserved trees may not be felled and so on. As to where they should cultivate and where they should not are matters which are entirely in the hands of the Civil Department.

20616 That is to say, the trees of certain reserved species may not be cut down?—That is right. They are allowed to cut any number of bamboos they may like and any other trees with the exception, I think, of about half a dozen.

20617. Have you Forest Panchayats in this Presidency?—No.

20618. Are you familiar with the administrative experiments that are being made in that direction in other parts of India?—I have never heard of them.

20619. You have not heard anything about the control of forests by panchayats?—You mean like the one they have in Madras. I am afraid I would like to know more about it. I do not know much about it. I have just spoken to one or two Madras men about it. It sounds as though it is rather a good thing.

20620. Are there large tracts of forests in this Presidency which are owned by private persons?—Yes, they are fairly large, although they are not as large as Government forests.

20621. Do large zamindars own fairly big forests?—In Dacca and Mymensingh there are small areas of forests owned by private zamindars. In Northern Bengal also there are some privately-owned forests. The same is the case with Western Bengal in places like Bankura and Midnapore.

20622. Is grazing allowed in reserved forests?—In some forests it is allowed.

20623. And grass cutting?—Grass cutting is always allowed and everywhere.

Mr. E. O. Shebbeare.

20624. Is grazing also allowed in the protected forests?—Some of the protected forests are open to grazing and some are not.

20625. But they are all open to grass cutting?—Yes.

20626. Is grazing hired out in the private forests?—I understand this is the case. Obviously the graziers must pay. I know of certain cases where it has been done.

20627. You have no control in or responsibility for the private forests?—In Dacca we have responsibility now. We have just taken them over for the owners.

20628. At their desire?—Yes, at their request.

20629. Supposing that serious denudation was apparent in a private-owned forest area as a result of too hard cutting, could you step in?—Not unless I was managing the forest. In Dacca, of course, it is my responsibility. I am now managing the forest for them. I have got to do my best to protect their forests. But Jale, for instance, Jalpaiguri. They may cut it down to-morrow; I have nothing to do with it.

20630. Will you please turn to page 206 of your note. Your argument is that in those areas where fodder is most easily obtained the cattle are worst?—I do not know enough about the whole of India to absolutely vouch for it. I am really quoting second hand information from various authorities. At the same time it bears out what I have seen.

20631. I would suggest to you that in these areas fodder is plentiful at certain seasons but almost entirely lacking in other seasons?—That is the case everywhere in India. There is bound to be much more fodder during the rains; but if you are grazing up to your grazing possibility, you are bound to have a time when it will run short.

20632. And the better thing to do for the cattle of the country is to store fodder?—I have thought so all the time.

20633. Do you have fodder famines in this Presidency?—You never see cattle dying like flies in this Presidency.

20634. So, there may be a dearth but never an absolute famine?—No.

20635. Do you think there is any opening for the preparation of preserved fodder in forest areas to be sold to the cultivator?—I think it would be an excellent scheme if it could be worked. I have no first-hand knowledge of it in our forests. It was done in Bihar and Orissa.

20636. If it were proved to be within the range of economic possibility, would you suggest that the Forest Department should undertake that work or that the Agricultural Department should do it?—We would certainly like to have the advice of the Agricultural Department about it but the actual shopkeeper's part of the work should be our job.

20637. You do not want to see the Agricultural Department running about in the forests?—I do not mind that. They run about even now. What I mean to say is that where it comes to rupees, annas and pice, I would like to have that under me.

20638. You are going to have the money?—I do not mind that.

20639. Supposing it costs money, would you like to keep it in your hands even then? Would it make it less attractive?—Yes.

20640. *Professor Gangulce*: Why do the Agricultural Department run about in the forests?—We ask them to come and give us their advice.

20641. *The Chairman*: On page 206, you talk about the *taungya* system. How long has that system been in operation in this Presidency?—On a practical scale you might say six years.

20642. Only six years in actual operation?—On the practical scale. The first experiment in that direction was made in 1905; we began to get on the right lines about 1914 and we put out the first reasonably big sized plantation in 1920.

20643. It is a matter of felling forests and allowing cultivation for two seasons. Is that the idea?—That is broadly the idea. It means that you are working the forests on the uniform method.

20644. Can you get your heaviest timber in an 80 years' cycle?—Yes, from 10 to 80 years.

20645. Is that, in fact, an attempt to control the practice of *jhuming* of timber?—That was originally the scheme. It began in Burma when the problem of *jhuming* was very acute and it was very successful. Then it almost stopped in 1903. It has been started again in full force quite lately.

Mr. E. O. Shebbeare.

NO. 12—14

20646. *Dr. Hyder* : Have you been to Burma yourself ?—I have just been there to see and have a look round. I have never served in Burma.

20647. *The Chairman* : What tribes are taking advantage of it ? Are they the tribes that are accustomed to shifting cultivation ?—Mostly our tribes are not shifting cultivation people except in Chittagong. I can tell you the tribes that do it now. Our best people are the Garos, the next best are the Malpharies, a tribe from Chota Nagpur, and the next best after them, I should say, are the hill men. All these people have been doing shifting cultivation fairly recently.

20648. You say you do not recommend any extension of forest grazing in the Bengal forests. Apart from the obvious point about animals nibbling off young seedlings, what is the harm done by too much grazing ?—It eventually causes a particularly hard irony surface to the soil which is perfectly unmistakable once you have seen it, and also certain weeds which are also unmistakable once you have seen them. Those two things together with fires, of course, seem to have a very bad effect not only on regeneration but also on standing trees.

20649. The fires being produced by the people in charge of the cattle ?—Yes. In good forests there is no good grazing. In places that are beginning to wear somewhat bare you can get grass in fairly easily, the grazing will bring it in by itself and if that grass gets burnt in the hot weather that makes a bigger patch still; so eventually good forest can be turned into good grazing ground but it will not be a very good forest after that.

20650. I understand what you say in answer to question 19, but do you think there is any opening for planting with trees reasonably good land not at present cultivated ?—Yes. I should say that all high land which is not paddy land will grow trees and that as the demand for dry crops is very small you could practically work the whole of the high land in Bengal under *taungya* on short rotation and produce much more forest than you have now and get as much dry crops as you get now. They are doing shifting cultivation now without getting any trees up.

20651. Do you think Government could control that in any way ?—I think the only possible way to do it is that Government (in the widest sense) should control it. I do not think the Forest Department could take over the whole work straight off and run it. You cannot take over large tracts of country where no one has ever seen a forest before and start close forest conservancy; you will simply cause a riot. You have to approach the matter a little more carefully than that, and as we are not experts in the careful handling of situations, it is not our job. I think there are certainly places where we could take it on, but these are in the more out of the way districts; where there is a certain amount of forest left there is also a certain amount of forest ownership worth holding on to, as in the south west corner of Bankura, for instance. There we could take over the forest by paying the man who owns it now and run it as a forest. But where it is a question of planting a little bit of high land alongside a village it is more than we could tackle; it would take a certain amount of finesse, and probably a certain amount of brute force as well, before that could be done.

20652. Do you think if you had a special section chosen for tact as well as for drive they could take it on ?—Such a special section would not necessarily consist of foresters; because all they would have to know would be a little plantation work. It might contain 10 per cent. of foresters, 40 per cent. of civilians and 50 per cent. of policemen.

20653. Have you ever worked out the economic side of any proposals of that sort ?—Yes. In Bankura, I worked it out as far as it can be worked out. One can see it would be profitable, but it would be difficult to give exact figures for what a forest is going to be worth if it is looked after when one has only seen the bare shreds of it left.

20654. Do you think if the matter was examined and experiments made it might prove to be remunerative ?—Certainly.

20655. How long have you known Bengal ?—Since 1906.

20656. Has there been any deterioration of cultivable land during that time as a result of the over cutting of forests ?—Yes; in certain places there have been wash outs which are caused by clearing forests. I should not like to say the main land had been affected, but there are enormous tracts which have disappeared since I have known them, as for instance, between Jalpaiguri and Barnes Ghat where there is nothing but sand now from end to end.

20657. How large is that area ?—It is  $2\frac{1}{2}$  miles wide. It goes up stream for 15 miles and I do not know how far down stream.

20658. That tract has been ruined in your time ?—Yes.

Mr. E. O. Shebbeare.

20650. Is that owing to shifting cultivation?—Not exactly; it is owing to grazing all during the rains and quite good paddy cultivation in dangerous places. Perhaps it is hardly a case in point and I should give you an instance more obviously due to denudation of forests like the Choll river. There is a very large area there which has been carried away by the grazing in the forests in the foothills of Kalimpong. I think I have mentioned that in my note. The best examples are in Western Bengal, but I do not know much about that part of the country; I have only been there a couple of times to report. Any one from Binkura, Midnapore or any where round there could give you striking examples of what has happened in that neighbourhood.

20660. Do you think it is a growing difficulty? Are you apprehensive about the future?—It will go on getting worse.

20661. Do you suggest stops might be taken to check it?—Yes. I think it would be much better to put all holdwaters and tops of hills, if they are not used for growing paddy (and of course they are not in most cases), under forest or under forest and shifting cultivation, combined.

20662. Under control?—Yes, of some sort.

20663. That would require a very much larger staff?—It would.

20664. *Rai Bahadur Bannerji*: Would not it require a new law, because they belong to the zamindars?—You would have to take them over in one way or another, either for the zamindar (which is the most satisfactory way in many respects because then the zamindar and yourself are on the same side) or by buying them from the zamindar, in which case he does not care what happens to them and you have him and everybody else up against you.

20665. But the zamindars have been converting these places into paddy fields?—Where it will grow paddy it is better to grow it; paddy will always pay you better than forests. I am talking of land which is not paddy land.

20666. *The Chairman*: We have the figure somewhere, but what is your total forest area here?—I have a note of it which I can give you.

20667. *Professor Gangulee*: 11,223 square miles?—Yes, of which about 6,000 is reserved forest, which is the important thing.

20668. *Sir Ganga Ram*: 11,000 altogether?—Yes. About 1,700 would be protected forest.

20669. *Professor Gangulee*: The reserved forest is about 5,288 square miles?—Yes.

20670. *The Raja of Parlatinadi*: The protected forests are unreserved?—They are reserved under another section of the Forest Act; that is the actual definition of them. If you look up the Act you will see there is a chapter for protected forests which allows you to take over the forests and look after them and prevent them being denuded and completely spoilt, but does not give you the complete control you have with reserved forests.

20671. In that area, do you protect the superior varieties of timber?—Yes. You are allowed to gazette any species or in some cases all the species. We have sometimes reserved all the species in a protected forest, but that does not often happen; that would only be where there was particular danger of the land slipping, or that kind of thing. Ordinarily you protect only the valuable species but the Government of Bengal issues its own notifications under certain sections.

20672. Gazettees them?—Yes.

20673. *The Chairman*: Do you think this large area of forest is capable economically of supplying the cultivating population with more fuel than it does at present?—With much more than they take now. We are working up the business of sending it by rail, and we are sending more and more fuel down, by rail now. The difficulty is that in Bengal there is one lot of forest at one end and one at the other, with nothing in between. We can do nothing for the cultivator who lives in between unless he is on a railway line. Along the railways we are gradually working up a market for firewood. In most places we have much more firewood than we can sell, and we are trying to work up a market for it and gradually extending its sale. The idea is that a shopkeeper in the bazar buys a truckload of firewood from us and retails it. In that way we can help places near a railway. People away from the railway can only get firewood by buying forests of their own.

20674. How do you fix the price at which you sell this firewood?—We sell it at cost price for cutting, loading and so on, plus the usual royalty.

20675. Are you actually putting the firewood on to the rail?—Yes.

Mr. E. J. Shebbeare.

13—14a

20676. Where does it leave your hands?—When it is on the truck. In the case of Siliguri, we load it on to the broad-gauge truck ourselves.

20677. You do no distribution?—No, except that we send it up to the tea gardens. We always sell by the truckload on the rail.

20678. Have you any depôts?—Yes. The Siliguri depôt is one. My depôt is where I load it.

20679. You have no depôts in the cultivated areas between the forests?—No. I have no staff for that. It would, I admit, be the right way to do it, but the simplest way is to sell it to a shopkeeper and let him do that part of the work.

20680. Can you give any idea of the rate at which the demand for fuel is growing?—It has only started in the last few years. Five years ago it was an almost unknown thing to see firewood on a truck in Northern Bengal, and now about 50 acres a year is used, with round about 2,000 to 3,000 cubic feet to an acre. It would be very difficult to give you figures; I can only say it is certainly increasing. Of course we are developing it purely from the commercial point of view, with no philanthropic idea at all. We are simply looking for a market.

20681. Are you getting special rates from the railways?—We are just beginning to do so. The railway rates used to be a big item. I have figures here which may be useful to you. This was when I used to send fuel by rail. Cutting and stacking come to Rs. 1-2 per hundred cubic feet. Carrying to the railway you could put down at anything from 3½ annas to 8 annas; and loading was about 2 annas. We made some profit on it over and above the royalty, because we engaged our own labour.

20682. Mr. Gupta: But the royalty is your profit too?—The royalty is our profit for owning the forest and the other profit is our profit on the commercial undertaking. The royalty was at that time Rs. 2-10. I think it has gone down a bit now. We are not making very much out of it.

20683. The Chairman: Rs. 2 6 or something like that?—It may be less; it may be Rs. 2 now, royalty and profit. Whether you call it royalty or profit makes no difference.

20684. And Rs. 2 covers both?—At that time we were paying freights up to the tea gardens at Rs. 36 for the truck of 850 cubic feet. You have got to divide 36 by 8½ and that would give the real freight to where the principal market was. It was very expensive of course. We got much better rates now by the Eastern Bengal Railway.

20685. What are the rates?—I think we have got specially reduced rates for our fuel.

20686. Do you feel that every effort has been made by your own department and the Agricultural Department to combine their interests to get the rates for fuel reduced as low as possible?—Yes; we made every effort on our part but naturally the railways are slow to make alterations.

20687. Do you know at all how the price to the consumer compares with coal?—I can tell you from my own district. The cost of a maund of coal is about 12 annas in a certain garden; it is getting wood fuel for something like 8 annas.

20688. The same bulk or the same calorific value?—The same maundage; and the calorific value is roughly, as nearly as possible, half. He was actually losing by using wood instead of coal except that he is far from the railway and short of carts.

20689. But when you come down into the cultivated districts between your two great forest areas?—Then it comes by rail, but I am afraid I cannot give you *pukka* figures now; I can give you them later.

20690. I think they are important?—I can give you them.

20691. Have you considered the problem of preparing fuel from wood?—Yes; just after the War, in 1919, we considered the question of burning charcoal and making briquettes. It was considered by the Buxar Timber Trading Company, since defunct. The difficulty was to get the stuff to stick together. The people who know most about it at present are the Research Institute at Dehra Dun and you are no doubt in touch with them. They will be able to give the latest information about it. The only reason why we are not doing it is that so far as we know it has not been commercially successful for us yet.

20692. But you will agree that where the railway freightage is such a very important consideration, reduction in bulk without a reduction in the calorific value is an important matter?—Yes; in the hills we are burning a lot of charcoal because most of our firewood really goes out as charcoal for the same reason; but I thought you meant on rather a big scale.

Mr. E. O. Shebbears.

20693. I was thinking of both ?—We can always get more charcoal burnt. The difficulty is shortage of charcoal burners.

20694. Could they not be trained ?—They probably could. But you know sometimes it is difficult to get a big enough crowd of men for training. They are all one type of men in the hills and it would be a good thing if we could train other people to do it. But labour shortage is a difficulty all round the place. We are always short of labour.

20695. You told the Commission that your department regards these matters from the commercial angle. Having regard to the immense importance to the cultivators and to agriculture in general of an adequate supply of some fuel other than cowdung, do you feel that your department, in the nature of things, can give this matter the attention and provide the impetus which its importance deserved ?—I would rather if it were taken up by somebody else; but certainly we do as much as we can. The point is that firewood from our point of view is roughly about a fifth of the value of timber. We give about five times as much time to thinking about timber than we do to thinking about firewood. But I am all for helping any scheme like that or investigating it myself as far as I can.

20696. I take it that necessarily the greater part of your time and attention is devoted to the commercial interests of the large timber areas which are committed to your charge ?—Yes.

20697. And I presume neither you nor your superior subordinates can devote their personal attention to these matters which, from the forestry angle, are matters of minor detail ?—Yes; of course, you cannot call firewood a matter of minor detail. It is probably a fifth as important as timber. It is engaging more and more of our attention every day. But at the same time I say if anybody else will take it up, we shall be pleased to help him.

20698. *The Raja of Parlakimedi*: Are there many villages round about your reserves ?—Yes; naturally the land adjoining the reserve is cultivated land in most cases. You mean big villages ?

20699. Thickly populated villages ?—On the whole the forests are in the less thickly populated areas.

20700. You have reserve lines cut all round, have you not ?—Yes, unless there is a natural boundary, for instance, a stream or something else.

20701. In such thickly populated areas, do you allow a certain percentage of removal for *bona fide* use of the cultivators from the forests ?—In Chittagong we have a special rate. But ordinarily the cultivators are considered as the general public. We do not ordinarily regard a cultivator who lives next door to us any differently to what we regard a man ten miles away. In Northern Bengal, that is the case.

20702. The cultivators do not get any concession rates for removal of fuel or wood for implements from the forests ?—In Chittagong they do; there are special rates for household purposes; household rates and trade rates; but in Northern Bengal the two things are the same to anybody.

20703. No difference between the two ?—No difference between the cultivator and any other man. In fact, practically all our customers are cultivators unless there are tea gardens.

20704. Do you have the system of cutting by coupes ?—Yes, it is practically all by coupes except dead wood.

20705. And do you allow the removal of dead wood in the reserves ?—Yes, we allow it at one up rates by cart-load or by the head-load.

20706. You do not allow removal of that sort of wood free of charge ?—No, not free of charge. I am not sure, but in the Chittagong hill tract I should imagine it is free of charge; that is a jingly part.

20707. Do you set apart any portion of the reserve for *bona fide* demands of the villagers ?—No; my reserve is supposed to be for the whole of Bengal. I do not make any distinction. All my stuff goes to the villagers. My profits go up when you get a good jute year and they go down in a bad jute year and the same with paddy. My customers are practically the cultivators.

20708. What superior species do you have in your forests ?—*Sal* is the most important in Northern Bengal, *sundri* in the Sunderbans, and it is a pretty long list in Chittagong.

20709. Do you have teak also ?—We have no natural teak. We have got teak plantations in Chittagong.

Mr. E. O. Shebbeare.

20710. Are you encouraging plantations of the superior variety?—Yes.

20711. You are taking that up?—Yes.

20712. May I know what percentage of the superior species required by the Railway Department you are able to supply?—We are supplying very little except *sal* to the Railway Department.

20713. That is for sleepers?—Sleepers and construction work. The Carriage Department takes *sal* from us too. The rest is only slightly taken, more experimental orders. They have tried a few things lately from us. We are always experimenting with things. But really the big business between us is practically confined to *sal*, with the exception of *gurjan* from Chittagong which is also bought by the Railway Department.

20714. That is for what purpose?—Carriage construction I should imagine.

20715. Why only a small percentage? Is it because of the scarcity of good timber, or is it because you cannot get the timber down from the forests? You say you are able to supply only a certain percentage of the requirements of the railways?—I did not say "a certain percentage of the requirements of the railways," I said "only a small percentage of the trees of that species we are selling to the railways." We are supplying the railways as much as we can in the open market. The railways are not as good customers as some other people; sometimes we can get a bit more from the other people. But as a matter of fact the railways are large customers mostly for *sal*.

20716. Has sandalwood been tried in these parts?—No. I think the chances of growing sandalwood would be about much the same as of growing pines in the plains of Bengal. I do not know if Western Bengal might be able to grow it.

20717. It has not been tried?—No. If anyone suggested it to me I should certainly dissuade them. It is a hot climate. Possibly Western Bengal might be able to grow sandalwood.

20718. In the high hills you grow cinchona?—Yes, but that has been done by the Cinchona Department.

20719. The Forest Department has nothing to do with it?—It has nothing to do with me. I make over land to them. It is a special job; I know less about growing cinchona than about growing paddy; I do grow paddy sometimes, but I do not grow cinchona.

20720. With regard to grazing fees, have you different rates for different species of cattle?—Not for different species.

20721. For cows and buffaloes?—Yes; they do have different rates.

20722. Do you encourage cheap grazing in your forests?—I discourage it. Personally I discourage grazing as far as I can. It is sometimes absolutely necessary to allow grazing; but I personally would like to see the tail of the last cow walking out of the forests.

20723. *Sir James MacKenna*: What about the lac industry in Bengal?—We have not done much; we tried it experimentally once or twice. I hear they are doing fairly well in Assam, and, if I hear that it is definitely successful there, it is quite possible we might grow it.

20724. It is not a serious matter with you at present?—No. Bihar and Orissa and Assam are the two Provinces to ask.

*Sir James MacKenna*: And Burma?

20725. *Professor Gangulee*: You refer to shortage of labour; is it periodic or chronic?—It is chronic. The more labour I can get the better I shall be pleased.

20726. Have you thought about the idea of having a labour colony?—We have labour colonies; every forest village is in a sense a labour colony.

20727. Is there no surplus labour?—I send out recruiters, and they come back with a man and a boy.

20728. What about communications in your forest areas?—We are shouting for more money. They have improved very much in recent years.

20729. Without communications you cannot possibly develop your fodder supply or fuel supply?—No.

20730. You have referred to the question of denudation of forest. Is it your view that denudation may be one of the chief causes of floods?—Certainly; I have said that in my note.

Mr. E. O. Shebbeare.

20731. In recent years there have been a number of floods in the Presidency. Do you think they were due to this denudation?—You are referring to the big floods. I was not speaking about them; I am speaking about the comparatively milder ones, when a river comes down in flood and there is a big wash-out. I have no experience of anything 50 miles away from the forests.

20732. The Teesta flood; that was perhaps due to denudation?—If the whole of the hills had been still under forest, I think the Teesta would not have been split up as it has been. In the absence of vegetation, the rains run off in torrents. The clearing of forests has a lot to do with it. If they had been warned about it, and they had carefully grown trees for twenty years, the Teesta would have been much more manageable than it is now. The more you clear the more floods you get.

20733. What quality of grass you grow? Have you taken any survey?—I know most of the species. We get various *saccharums*, *Saccharum spontaneum* grows on the river beds. In actual forests we try to grow trees, and the result is the more trees we get in, the less grass we get.

20734. Your method of stall-feeding is rather interesting. Is it getting popular amongst the cultivators in your neighbourhood?—Well; all the grass in the hills is now sold to the graziers in and out of the forests. I find it is becoming popular because they still continue to get more cattle into the villages. It was not popular to start with, not a bit.

20735. On what occasions do you come into contact with the Department of Agriculture?—I grow a little jute seed for them and they come up and give me advice.

20736. Soil erosion is a serious problem. Did you discuss that matter with them?—Mr. Pinlow approached me at the same time as Mr. G. S. Dutt, and that was the reason I went to Western Bengal. The agricultural people supported me.

20737. On any other occasion, say on the question of stall-feeding?—I do not think we have ever talked about stall-feeding.

20738. Mr. Kanai; Are there any bamboo areas in Bengal?—Yes, in Chittagong.

20739. What use are you making of your bamboos?—We are selling them as far as we can; we are also making use of them for grazing, but that is a side line. We are selling them mostly to local people, mainly cultivators; we are also selling quite a lot recently to the paper industry.

20740. That is exactly what I wanted. Have you considered the possibility of making papers out of your bamboos?—In Dehra Dun they made original investigations and published the results. They put in a plant as a sort of experiment.

20741. That has been done by Mr. Ratti?—Yes. When I get a bamboo and I want to test it, I send it direct to Dehra Dun.

20742. Do you know what opinion Mr. Ratti has given about the Bengal bamboos?—I am afraid I cannot tell you what his opinion is. I do not know which the paper concerns him.

20743. The Titagarh people go outside the Province of Bengal for their raw material?—The cause of that probably is bad communications.

20744. They are also making paper from grass. Is that from your Province or from outside?—I think from outside. It is all *sabai* grass they get, and we have not got *sabai* grass. We have tried experiments with all kinds of grasses, and though I have got samples of paper prepared from them, I think their conversion will never be a commercial success.

20745. Do you know Mr. Sanjall, who was appointed by the Government of India sometime ago?—No.

20746. I think he was in Burma. Did he visit your Province?—I never met him.

20747. It was not in your time?—I have never heard of him.

20748. Do you know that besides *sabai* grass there are other grasses from which paper could be made?—In fact you can make paper out of any grass. The question is whether it will be a practical proposition both from the mill point of view and the collection point of view.

20749. If that is the case, why do the Titagarh people import their grass from a place so far away as Nepal?—Because possibly they want *sabai* grass which we do not grow. I should think that is the reason; but I do not actually know what reason they have. If they want this *sabai* grass we cannot make it for them.

Mr. E. O. Shebbeare.

20750. It is not only *sabai* grass, but every grass ?—Are the Titagarh people making paper from every grass ?

20751. Certainly. I myself have sent some grasses to England, and they are making paper out of it ?—I have a great many samples of paper made from grasses, but I do not know the commercial possibilities which depend upon the quality of grass you can get.

20752. I know it, and I have sent grass to Sweden and other places. I do not know whether you are exploiting your grasses well ?—No. I have not done anything. If you want to try some grasses I will give you them and I will give any information I may have on them.

20753. I have got grass in my Province ?—Then, what do you want ?

20754. Capital ?—We are a quasi-Commercial Department but I have never been asked for a loan before.

20755. Are you exploiting your grass forests well ?—We are not exploiting them at all. We get some money by selling grass for thatching.

20756. *Rai Bahadur Bannerji*. You told the Commission a few minutes ago that you used to pay Rs. 36 per truck to the Eastern Bengal Railway ?—No ; to the Darjeeling-Himalayan Railway we paid Rs. 36-4. Recently the Eastern Bengal Railway have reduced their rates.

20757. Do you think a further reduction of the railway freight to carry firewood will bring it closer to the real cultivators ?—Yes, certainly.

20758. You said that the calorific value of fuelwood was half as much as that of coal ?—Yes.

20759. What is the calorific value of charcoal as compared to that of coal ?—It might take me a minute or two to look up, but I can let you have it later.

20760. *The Chairman* : That is the best way.

20761. *Rai Bahadur Bannerji* : Do you not think that soft coke has got more calorific value than steam coal ?—I am afraid I have not the least idea.

20762. *Sir Ganga Ram* : What is soft coke ?

20763. *Rai Bahadur Bannerji* : Soft coke is charred coal, steam coal or *kutch* coal is burnt to red heat and all the gaseous components are driven out ?—I am afraid I am not an expert in fuels. I could tell you something about wood and also something in comparison with coal, but I am afraid I cannot give you any comparison between coal and coke.

20764. You said in the course of your examination that Western Bengal has not been investigated as to the probabilities of afforestation or disafforestation ?—It has not been properly investigated yet.

20765. Do you not think it should be done in the near future ?—Yes, I have been down there twice and written a report, but the trouble is not so much a technical one. I think every one will agree as to what ought to be done ; but the point is what can be done, and if anything ever is done, it will be the result of a strenuous policy.

20766. *Sir Henry Lawrence* : You derive most of your revenue from reserved forests ?—Certainly from reserved forests.

20767. And your revenue is Rs. 25 lakhs a year ?—The net revenue this year was Rs. 16 lakhs and the gross was about 26 lakhs. We did rather better this year than last.

20768. Have you got the report ?—It is in the press ; last year, as far as I remember we cleared Rs. 10 lakhs.

20769. The expenditure is Rs. 15 lakhs, the revenue is Rs. 25 lakhs, and you clear roughly Rs. 10 lakhs ?—That was last year ; this year we have cleared 15 lakhs and the expenditure was somewhere about 12 lakhs ; that would be a gross revenue of 27 lakhs. I had better give you more exact figures which are in the annual report, which I will send you.

20770. Are you satisfied with the money you have at your disposal for the organisation and improvement of your forest areas ?—Yes, on the whole we can generally get money. We have got to consider both sides of the book rather differently from other departments. Even if we can get the money we do not always want to spend too much straight off ; on the whole, we have been very fairly well treated.

20771. In this statement here, your expenditure on communications and building is about Rs. 1½ lakhs ?—Yes.

Mr. E. O. Shebbeare.

20772. Is that sufficient for the improvement of your forests?—That is a figure which fluctuates from year to year very much; I cannot really tell you what that year represented exactly; we were not doing very much, I fancy.

20773. Were you suffering from retrenchment?—No, I do not think we have anything very much to complain of; it is more or less in our own hands; we are more or less consulted about how much we are going to put back into the business and how much we are going to show as profit.

20774. Do you think that the question of the preparation of charcoal and its distribution to the villagers has received sufficient attention?—I do not know about charcoal; most of the villagers do not want charcoal, they mostly want firewood. It has had some attention, and it will get some more; it is certainly a thing that ought to be more thoroughly investigated.

20775. I do not see it mentioned in the report of the Government on the operations of the department?—I do not think it was mentioned; it is really rather in the experimental stage. I do not know that we have even got down to the experimental stage; you can quite well say that it is a subject for more attention.

20776. Would that require much more expenditure?—No. We hope to be able to make the thing profitable straight away.

20777. You can do it within your budget?—Yes. We have got to work the thing up; if they are commercial success, they pay for themselves.

20778. Do you consider that any propaganda should be undertaken to educate the villager to the use of firewood?—I think, if the *Lyahs* and shopkeepers buy truck-loads, which they seem to be inclined to do, you can leave the propaganda to them. If you have a bigger propaganda now, the difficulty will be that you will not have the material to supply to them. It is vital not to advertise a thing until you can really push it on to the market; if the supply ran short, the propaganda would all go to waste.

20779. The distributing agency is sufficiently acute and alive to its own interest?—The *Lyah* is very much alive to his own interest; if we can make it a job for him, he will push it.

20780. I was checking up some figures and comparing your general financial results with those of Bombay with which I am more acquainted. I see that you have spent about 4 annas an acre, which is rather less, as Bombay spends about 8 annas an acre on exploitation and development; and you get a net return of 3 annas an acre and Bombay gets 4 annas?—Yes.

20781. With the final result that you get Rs. 10 or Rs. 15 lakhs revenue and Bombay gets Rs. 25 lakhs, Rs. 30 lakhs and Rs. 35 lakhs as revenue?—Care must be exercised in the interpretation of average figures, because it depends on what the forests are like. An enormous amount of stuff that is shown as forest is actually cultivated land in the Chittagong Hill tracts. Four thousand square miles of cultivated land in the Chittagong Hill tracts is shown as Unclassed State Forest, but it is not really forest at all.

20782. Your developments in the Sunderbans, I suppose, do not take the form of making roads very much?—No; you do not need any roads there at all.

20783. They are covered by water?—That is the secret of the Sunderbans cheapness.

20784. You get your revenue there very cheaply?—Yes.

20785. Have you got efficient means of transport by water?—We have two big steamers and three little ones that are fairly efficient. I do not think we really ought to spend more on steamers. All forest produce is extracted by country boats.

20786. *Sir James MacKenna*: Are they departmental steamers?—Yes.

20787. *Sir Henry Lawrence*: I would like to ask you whether you do not think that by spending more money you could get a great deal more revenue?—Yes, but, if I may be allowed to say so, let me have it gradually; if I am landed with a large amount of money, I shall not be able to digest it, so to speak.

20788. You want to train your establishment?—That is the great thing; training the establishment and also exploring schemes for plantations. I could make more by spending more any time.

20789. If you had a gradual increase of your budget in five years, at the end of the 5 years you would show a substantial profit?—Yes.

20790. *Sir Ganga Ram*: What are the commercial timbers in your forests?—Sal is the most important.

Mr. E. O. Shebbeare.

20791. Are there any factories which make sleepers?—We have a mill, but they are mostly sawn in the forest.

20792. You make sleepers?—We make sleepers; it is done by hand sawing, mostly in the forest.

20793. How many sleepers do you supply to the Railway Department?—I could not tell you off hand, I should put it at something like 50,000 ordinaries and perhaps about an equal bulk of specials, but we do a lot of specials.

20794. Do you supply all the wants of the railways?—No, not all their wants.

20795. Can you not supply all the requirements of the railways?—No; as far as *sal* is concerned, I am selling the whole of my crop, all that I have got to sell each year, the whole of my annual outturn, so that I could not increase my market for *sal*. On the other hand, sometimes I get better prices from other people than I do from the railways for *sal*.

20796. For building purposes?—For building purposes and for all sorts of other purposes. I like the railways as a stand by, and I am determined never to let the railways down; what I promise I will give them; I like them as a market to fall back upon.

20797. You must see that the thing as a whole is in the interests of India?—Yes.

20798. If you supply them with all your *sal*, they need not import from other Provinces?—I find that if they use our *sal* for sleepers, they do not pay us as much as the other people, and if we supply them with all our *sal* other people will have to import the same thing at higher rates; it will cut both ways.

20799. Do you supply them with seasoned sleepers or fresh cut sleepers?—Fresh cut.

20800. Do they not insist upon seasoned sleepers?—No. You cannot season *sal* practically.

20801. That is the only timber you have for railway sleepers?—Practically; not, however, the only one.

20802. Have you any timber for starting match factories?—Yes, but there is rather a difficulty about it. I can supply different species of wood, but the match factories like to get one species only. I have something like 500 different species in Northern Bengal, and if they get 500 trees of different species it makes it rather hard for the engineer in charge of the match factory.

20803. Can you not supply them with one kind of tree?—I could supply them 1 in 500.

20804. There is a match factory in Bengal?—There are several.

20805. And they are importing their wood?—Yes. I have had match factory men up to see me, and I have gone as far as possible in every direction; I have offered them anything they want. The difficulty is that we have not got any forests of one species. It does not matter which it may be; take the worst of the lot, we will say *ladamb*. If I had that, I could supply the requirements of the match factories, the difficulty is, that one is a *ladamb* tree, another something else, there are 50 different varieties growing in the same block; it is therefore extremely difficult to supply a man with what he wants in sufficient quantities. The secret of success of *sal* is that we have a lot of it rather than that it is the best timber.

20806. I should think that you should supply the railways with all they want?—If they pay better prices, we will do it.

20807. Of course, they pay you the same price as they do for imported sleepers, do they not?—If they pay me as much as I can get from other people, I will let them have my sleepers every time.

20808. You said something about the scarcity of labour. What wages do you pay to the labourers?—The wages vary in different places. We pay the same wages as are paid by tea gardens in Northern Bengal. It amounts to about 8 or 9 annas a day. Sawyers, of course, get more.

20809. And you cannot get sufficient labour for 8 or 9 annas?—No.

20810. How is that? Can you explain it in any way? There is such an immense population and then there is the cry of unemployment?—The foot hills of Bengal are not very healthy; in fact, they are rather unhealthy; that is one reason.

20811. You allow grazing to the villagers?—Yes, to our own villagers.

Mr. E. O. Shebbeare.

20812. And there are leaves also. Do not the tea planters collect them?—We do not sell any leaf mould, not in any real quantity.

20813. What about the cattle-dung and all that sort of thing that is left behind?—That does not amount to much. The grazing is not very heavy, so the cowdung does not make much difference.

20814. I thought that cowdung was in great demand by the tea planters?—What the graziers ordinarily do is that they drive their cattle home in the afternoon and whatever cowdung there is they take it away for growing tobacco.

20815. Do you help the cultivators with any nurseries where they can get trees for plantation?—If they wanted them, we could always give them. I have not done so actually because I have not yet been asked for them.

20816. Is it not a good suggestion for the improvement of the land?—If they asked for them from us, we would certainly have given them.

20817. You might have made a suggestion of that kind?—It certainly could be done.

20818. You have no resin industry in this Presidency?—No, we have no such industry.

20819. Have you any other commercial industry?—There are no commercial industries other than those that I have already mentioned.

20820. At what rate do you supply the charcoal to the contractor? Do you have your own charcoal or do you simply give them the wood to burn charcoal?—We sell them the wood and they burn it on the spot.

20821. Have you any idea as to what they get? Is it one-third of the wood?—They get about Rs. 1-8-0 per bag, supposed to weigh one maund, in the Darjeeling bazaar. If you want exact information about it you had better ask me separately about it. I would much rather get it straight from the book.

20822. You make the bulk of your income from the old forests. How much income do you make from the forests that you have planted?—The trees that we have planted are very small yet.

20823. What have you planted?—We have planted *sal* trees, but they are very small.

20824. Some day they will become big. What other trees have you planted?—We have planted *gamari champ*, *malagiri* teak and many other varieties of trees. There is a very long list. I wish you could come round and have a look at them. They are very interesting.

20825. Are they in the Sunderbans or in Darjeeling?—They are all over Northern Bengal and Chittagong.

20825a. You mentioned just now that a large area was simply waste. Was that for want of forests?—If they had given us that area, we would have taken care of it.

20826. Whose business was it to look after this?—It is the Civil Department presumably who are in possession of that area. In point of fact, you must have a certain amount of cultivation and cultivation naturally is in charge of the Civil Department.

20827. The cultivation was to the good of Government. Was it not?—Yes. But we cannot start planting trees in other peoples' fields.

20828. But the area belonged to Government?—If they give us those fields, we could certainly plant trees there. I know forest people who say that the whole of Bengal should be in charge of the Forest Department.

20829. Have you ever tried in your forest slopes to raise trees by terracing them?—It has been done only in two land slips. That is generally done by the Public Works Department in conjunction with us. We plant the trees and they do the terracing.

20830. What do they do with the terrace? Do not they leave it to the people for cultivation?—Only in dangerous places they do terracing and we plant trees. But we are not allowed to cut them.

20831. In the meantime, do they not grow potatoes there?—We put in the fastest growing trees.

20832. Potato is the best crop for it?—I find the potatoes are the worst crop for steep slopes on the hill side.

20833. If you lease the land on very cheap terms, I think people would come forward and grow potatoes?—They will grow potatoes all right, but they will have the whole of your hill side down before you know where you are.

Mr. E. O. Shebbeare.

20834 *Sir Thomas Middleton* : What are your sleepers worth roughly ?—We are paid Rs. 3-2-0 for motor-gauge sleepers and Rs. 8-0-0 for broad-gauge sleepers at present. We think they are worth more.

20835 *Sir Henry Lawrence* raised the question of the net revenue from the Bombay and Bengal forests. Are those forests comparable in this sense that in Bombay a much greater proportion of them is under grazing than in Bengal ?—I should think so. But I am afraid I really do not know anything of Bombay. I have not even been in the forests of Bombay.

*Sir Henry Lawrence* : The answer is in the negative.

20836. *Sir Thomas Middleton* : I think you told us that the total area under forests according to your measurements was something like 11,000 square miles ?—Yes, but I do not know if I have given the right figure.

20837. That is roughly about 7,000,000 acres. I have been comparing that area with the area which is accounted for in the Bengal statistics and the area which is accounted for there district by district is  $4\frac{1}{2}$  million acres. I wonder where the missing acres exist. Are they in the South ?—I should imagine it is the Unclassed State Forests that have been left out. They come to about 4,000 square miles. Are you sure that the statement you made is not for reserved forests only ?

20838. It is forests without any qualification ?—Strictly speaking it ought to be 11,000 square miles. Of this area 5,286 square miles is reserved. The protected area is 1,700 square miles and the rest would be Unclassed State Forests which you can practically consider as no forests at all.

20839. And the area in Northern Bengal, which is a very important area, as given in the Bengal statistics would be 650,000 acres ?—Yes. If you simply add the areas of forests in Jalpaiguri and Darjeeling civil districts, it would give you the total area. It is about 1,000 square miles.

20840. That means that there is a missing area somewhere in the south. Chittagong is about 2,000 square miles ?—It only comes to 2,000 square miles there, because 4,000 square miles is in the Chittagong hill tracts which are shown as Unclassed State Forests.

20841. Chittagong hill tracts are given here as about 900,000 acres, which would be about 1,500 square miles ?—The whole of the Chittagong hill tracts is shown as Unclassed State Forests. It is not really forests at all and I understood that that area was supposed to be 4,000 square miles.

20842. Is it then that the missing acres exist ?—Yes. It is of no importance.

20843. Your forests in Bengal are well distributed. That is to say, you have got them in north, south and east and you are adopting the *taungya* system in all of them ?—Yes, except the Sunderbans.

20844. Have you had a good deal of experience in working the *taungya* system experimentally ?—Yes.

20845. What happens after a clear felling. How long do you leave it before you start cultivation ?—You do it as quickly as you can. Ideally, you are likely to get your trees cleared in February and burnt in March and then you should get a crop as soon after that as may be possible.

20846. Do not the roots give you trouble ?—You get rid of a certain amount of them by harrowing the land.

20847. So, in practice you do not have much trouble in getting cultivation there in the first year ?—You have very little trouble in the first year. It costs about Rs. 10 an acre if you are doing it yourself. The cultivator does not reckon on his time much and he probably does not put in as deep a hoe as we do. Then we sometimes hoe it again for levelling and that may cost us something like Rs. 2-8 or Rs. 3 per acre. Then we sow crops of various kinds; jute is very often put in. The cultivator generally puts in paddy and cotton.

20848. Jute would be in the Khulna area ?—It is in the north of Bengal. We grow it for seed purposes.

20849. Is there any trouble in the second year ?—You can get a crop in the second year too. The best cultivators like to get a second crop. You have practically no trouble in the second year. They generally put in mustard in the cold weather. In the second year they put in another crop. Then during the second rains you get nothing but grass and that gives us no trouble. This grass is called *bansam*. We get these two years' cultivation and then you can be quite sure you are going to have a good show; when the cultivator has finished with it we generally sow *tephrosia*.

Mr. E. O. Shebbeare.

20850. That is a leguminous plant?—Yes.

20851. When the cultivator has finished with it, what is your first process?—We have to put in our things, in the first year; we have got our plants in with the first year's crop.

20852. You plant?—We plant or sow, depending on the species. In the case of *sal* we put them in in long rows, six feet apart, and the crop is grown in the middle. It is not a crop you can plough; it is all done with a hoe; so it does not get in the way of the crops.

20853. Can you tell me whether this system of cultivation has been adopted anywhere else except in Burma?—They have tried it in the Central Provinces and Bihar and Orissa, and I think in certain places in Madras. I should be surprised if they have not small areas in almost every province.

20854. From the forestry point of view you regard it as a very desirable practice?—Yes.

20855. Have you any purely coniferous forests in the northern area?—We have little patches in rather inaccessible places from 10,000 to 12,000 feet up.

20856. Then this practice is for broad leaves trees?—Yes. We have introduced coniferous species *Cryptomeria Japonica* between 5,000 and 7,000 feet.

20857. Is that a timber tree with you?—Yes; it makes boxes, planking, ceilings and things like that very well.

20858. Coming to the village forests, you have heard of the practice in Madras and you think it is one that ought to be encouraged?—I do not pretend to know much about it, but if it is as I have heard represented by a Madras forest man it sounds an excellent idea. I do not pretend to know anything about it first-hand at all.

20859. Assuming you thought well of the idea and wanted to introduce it in Bengal, would you be prepared to lend a forest officer to advise these villagers who are making village forests?—What I have done so far is to go down myself and advise the Collector, and he has carried on. I would rather do it myself than lend any one else. I can go along and do it in a week or so.

20860. Would they not want some one on the spot for a year or two to start with?—It is a fairly simple thing from a technical point of view. The difficult thing is to get the people to do it. It is all a matter of advising; you cannot order anyone to do anything. I think their own people, the Civil officers, are the people to do it. There was one man at Bankura who was very keen and who got the thing going; I simply told him what should be done.

20861. If you found keen men in other districts you would be prepared to do all you could?—Certainly.

20862. From your knowledge of Bengal, do you think there would be any trouble in suggesting suitable species for any area?—I know exactly what to suggest for Northern and Eastern Bengal. I have made suggestions for Western Bengal, but I should like to see how they work out before giving a final opinion.

20863. Are you aiming at a very short rotation?—Yes.

20864. Fifteen years?—It will have to be even shorter than that to start with. My advice in these very much cut-about forests is to divide the little patch of forest into two and try to protect one half, leaving the other half for two years, and then divide it into four and take one of the parts that has had two years to get up a little, and work in that quarter; after which you might have a four-year rotation for some time. That seems to be the only possible way to do it without having a riot or trouble of some kind.

20865. You would gradually lengthen your rotation as you accumulated material locally so as to work up to ten and fifteen years?—Certainly, work up to that and possibly longer eventually.

20866. *Dr. Hyder*: Is the whole of this *taungya* system of cultivation under your control or do the forest ryots trick you sometimes in Chittagong and other hill tracts? Is this *taungya* system of cultivation departmental or aboriginal?—Departmental.

20867. You do not have any forest tribes as they have in Burma?—No. In Chittagong there are people who are doing it now, but without planting up of course. This is the practice of *jhuming* as we call it here. There are *jhumiers* in many parts, and in Chittagong they sometimes come and do the *taungya* system of *jhuming* in the forest for us, but in Northern Bengal most of the people who do the *taungya* system for us are people who

Mr. E. O. Shebbear.

gave up *pluming* some time ago and who had more or less settled down to fixed cultivation, but who go back to the old practice if given the opportunity.

20865. Would you grow *sal* or *gamari* in a cleared area?—It depends on the land. If the land will grow *sal* I should grow *sal*.

20866. *Sal* would give you in 80 years about Rs. 5,000?—About 8,000 cubic feet in 80 years, while *gamari* will give you 8,000 cubic feet in 10 years. On the other hand, we get something like Rs. 2 a cubic foot in the round for the *sal*, and something like 8 annas a cubic foot for the other. It is a financial problem which has to be worked out, and must be based on the price the timber is going to fetch in 10 years time.

20870. And the suitability of the soil?—That is the chief point, that is why we sometimes put in *gamari*. I do not put in *gamari* anywhere where I can grow *sal*.

20871. Do you know what the price of *chaulmugra* reed is?—Last time I let a man collect all he could for Rs. 200, and he failed to get it. I have no doubt it is worth a lot, but it has not been a commercial success so far. I have simply let a man see what he could do for one year at a nominal figure. He failed two years running, and then he got a boat-load of it and the boat sank.

20872. Mr. Gupta is visiting Bankura and looking into the possibility of having village forests there, are you acting under the orders of Government?—No, not exactly. I was asked both by the Civil and the Agricultural Departments if I would mind doing it, and I was rather keen on doing it and went and did it more or less on my own.

20873. Did you make any report or scheme?—I wrote a report and tried to make out a sort of scheme.

20874. But you do not know what has happened to it?—No, not at the moment. I want to go back and see about April next.

20875. It is very important to have a workable scheme for village forests in Bengal, and Bankura is probably one of the districts which offers the best possibilities in that direction. It has been proposed that Government should acquire the land, and we are getting it very cheaply, so I am surprised you did not get orders from Government?—I had no Government orders at all. However, the Accountant General has not objected to my travelling allowance bill, so I suppose my visit was official to that extent.

20876. But you did submit a report of some kind?—Yes. The Collector will have a copy, and Mr. Dutt and Mr. Finlow.

20877. You said that in fixing the price of firewood you had in view both the royalty and a certain profit. As Conservator of Forests, would you have any objection if the Commission recommended that either the royalty or the profit should be left out, so that the firewood might be sold more cheaply and the use of coal-dung for fuel diminished?—As long as I do not make a loss, I should not object. I would rather sell it than give it. If I simply got the royalty and not the profit, I think that would be all right. Someone, however, is going to make that profit, and I would rather I made it than the railway.

20878. I wanted the consumer to make the profit by getting cheaper firewood?—We should always aim at that ourselves from a commercial point of view, to encourage the thing to start with.

20879. With regard to grazing, naturally you do not like to see it encouraged, but of course the present law allows a certain amount of grazing?—Yes, we have to, because it would be a great hardship if it were suddenly cut off.

20880. I was going to suggest that I suppose your subordinates look on it in the same light; they do not put unnecessary obstacles in the way?—They are very much left to themselves in the interior. It requires my orders for a block to be opened or closed.

20881. But when it is opened I hope they have strict orders not to interfere?—The cattle go in all right once it is opened.

20882. Have you any trees in your forests of which you could cut the twigs and leaves and stack them as fodder. For instance, in Kashmir they do that with mulberry and walnut trees?—There are many trees that can be lopped for fodder, but we only allow it in the hills and with a few species.

20883. What kind of trees will not be harmed by it?—It will always harm the tree, but we generally allow trees it does not much matter about. There is no species which is encouraged by being lopped.

20884. I was told it did not matter with mulberry and walnut trees, and that even if they were lopped very close they would grow up just the same again next year, or even be better?—They will grow up again as fodder all right, but they will not be such good mulberry trees.

Mr. E. O. Shebbear.

20885. I wanted to suggest that experiments might be made with certain trees to try to preserve their leaves and twigs for fodder? The question of how far forests can help grazing has not been raised specially by anyone, but it is very important, I think. It is very important from the agricultural point of view?—If I throw all my forests open to grazing now it would have practically no effect on the problem at all, because they will not go into the good parts of the forest. I have tried the effect of offering them grazing there at low rates, but they will not look at it. In Northern Bengal they wanted to go to a river-bed where of course I could not allow it; but even if all the river-beds were open to grazing it would only affect the villagers living within a radius of 2 or 3 miles, so the whole problem of grazing in Bengal is not to be settled in that way.

20886. Your forests are in certain areas, and it would only affect the villagers round about?—And those villagers have already considerably more outside grazing than the people living in the middle of Bengal.

20887. But cattle are moved great distances in Bengal and if good grazing were to be had might move their cattle to the forest areas?—Yes, but we have not good grazing to offer.

20888. So from that point of view even this is not so important as you probably think. About these industrial trees, I say that because in going to different firms I have often heard them say that they do not get as much encouragement as they expect from the Forest Department and you have given the reasons that because these members are prejudiced and because you want to grow a particular tree they would not like it. Would it be worth while then to try and grow trees of that particular kind?—That is exactly what we are doing; I have been telling you about that.

20889. With regard to this question of extension of forests, I hope you are quite satisfied with it; for instance, in the Sunderbans, you do not want any more forests than you have got now?—The department wants less now apparently. The new scheme is going to take it away.

20890. That is a point I wished to ask you about, and that is why I asked you to meet me and the Collector the other day but you could not come that day. Of course we have taken into consideration the needs of the cultivators also and you also find that the profit to Government from cultivation and from the Forest Department is so discrepant; and you have no particular complaint from that point of view?—No. I think Government have to consider each time; you cannot take up the whole as forest nor can you put the whole of the Sunderbans under cultivation, I should think.

20891. *Professor Gangulee*: Could you tell us if tea cultivation in Darjeeling is increasing or likely to expand extension?—Yes; when I say Darjeeling I mean Northern Bengal. In the Darjeeling district there is very little tea except in the Terai.

20892. And for the purpose of expanding tea cultivation, you have to denude certain forest areas?—We had never had to give up forests for tea recently; I think the last was about 25 years ago.

20893. Do you pay visits occasionally to Dehra Dun?—I have been there twice. I should like to go often, but it takes a long time you know.

20894. And when you pay visits there do you discuss forest problems?—Yes; I went there first on a Silviculture Board; that was long ago. Then I went with the Board of Forestry one or two years ago.

20895. *Sir Ganga Ram*: Do you grow mulberry in your forests?—One species of mulberry, yes.

20896. Is that good for sericulture?—No; I think it is no good.

20897. Do you grow walnut?—Yes.

20898. Up to what size?—About 5 to 7 feet.

20899. That is a thing which ought to be encouraged. The zamindars ought to be encouraged to grow it?—It grows in the hills. There are no zamindars up there.

20900. No cultivators?—There are cultivators who grow it; you sometimes find them up to Sikkim. But they prefer to grow fruit of a more edible kind.

20901. They would certainly grow it if you supplied them with nurseries?—I am rather hard put to it to get enough seed at present. I put out all I can get; I am rather short of seed.

20902. Have you any professional shepherds in this Presidency?—Yes, in Sikkim.

20903. Not actually in Bengal?—They have professional graziers for grazing cattle

Mr. E. O. Shebbeare.

20904. Not sheep ?—Not sheep. Professional shepherds are all in Sikkim and they are all at a high elevation, round about 12,000.

20905. And they come down in the cold weather to your low forests ?—No; they do not come into the forests.

20906. *Professor Gangulee* What about goat-keepers ?—I do not encourage them; but as a matter of fact I have no serious objection. I do not like goats. I think they are the most infernal things to get into the forests.

20907. *Sir Ganga Ram* Have you any *lhuds* or rivers with falls in your forest, and do you make any use of the gravitation levels ?—I have got lots of rivers. You mean for water power ?

20908. Yes ?—I am afraid the trouble about most of them is, you got lots of water in the rains but not much in the cold weather; they go dry.

20909. In cold weather you have no *lhuds* which bring water ?—The *lhuds* are there but the streams dry up, a good many of them.

20910. They fall from springs on the top ?—Yes, but they dwindle down; there is not enough of them. Water power engineers have investigated the matter.

20911. Do you have any coffee plantations in your area ?—No; coffee was tried in the Darjeeling district about 1900. It was not a success then and all the coffee plantations went out into tea later.

20912. Have you considered the question of intercultural between your young saplings ?—Yes; that is what the '*taungya*' system means.

20913. What crops have you grown ?—I grow jute, paddy and cotton.

20914. Paddy ?—Dry weather paddy, *bhadoi* paddy.

20915. Is there a paddy like that ?—Dry paddy; it is a very good paddy.

*Rai Bahadur Bannerji* : It is harvested in the month of *Bhadra*.

20916. *Sir Ganga Ram* : I want you to encourage potatoes. They are grown on our side ?—I like potatoes myself; but my predecessor put an order down to the effect that 'whatever happened do not allow potatoes', because he found the land slipping wherever they have been growing them.

20917. Do you grow alms ?—No, not commercially. You mean for fibre ?

20918. Yes ?—No.

20919. Is there no demand for it ?—It has been tried experimentally.

20920. Commercially ?—Apparently it was not a commercial success. I do not of course try a great many experiments myself because I have got other things to do.

(The witness withdrew.)

Mr. E. O. Shebbeare.

**Rai Dr. G. C. CHATTERJEE Bahadur, Secretary, The Central  
Co-operative Anti-Malaria Society, Ltd., Calcutta**

**Replies to the Questionnaire**

**QUESTION 8.—IRRIGATION.**—(b) Irrigation canals—defects in. In this country, we very often see the benefit which the irrigation canal confers on the cultivators by bringing water to their crops is nullified by these canals being the cause of intense malaria in the region. As these very cultivators are the sufferers, they cannot get the full benefit of their labour. This kind of malaria which is designated by malarialogists, as "man made malaria" is not at all due to the canal itself, but is entirely due to gross negligence on the part of the authorities, in not keeping (a) the bunds in proper repair, thereby allowing water to percolate through the bunds, which becoming stagnant all along the canal, contribute to the breeding of mosquitoes, and (b) in not properly closing during the dry season the lock gates or there being some defects in the gates, allowing water continuously to leak. This water getting up into dried up bed of the canals, serves as admirable breeding grounds for mosquitoes—whole of the Ganges Canal, for example, originating near Hardwar in the construction of which the Irrigation Department takes part, is however, the source of intense misery to the people living near its neighbourhood, and this is caused entirely through a negligence which can be rectified without the least expense—all that is necessary is to get the bunds water-tight by timely repair, and the lock gates made properly water-tight.

This stupid ignorance of elementary sanitary rules on the part of otherwise expert engineers is causing misery not only to the people, but to the very staff of the Irrigation Department as in the case of Panchkula Irrigation Canal in Midnapore, when three sets of irrigation officers have to go away on leave on account of malaria.

**QUESTION 14.—IMPLEMENTA.**—(a), (b) and (c).—From my limited knowledge in this line, I have come to know that great improvements in agriculture are possible by use of agricultural implements and that the agriculturists of this country will take to the use of implements, if they be shown that they will be benefited by using them. But unfortunately this information in proper assimilable form is not available nor is it possible for any one to give the information to the right party and in the right way, unless it be through an organisation which will not exploit the agriculturists. For this reason, it is desirable to form a Central Co-operative agency like that of the Co-operative Milk Union or the Central Society of the Co-operative anti-malaria and public health movement. Government agency will not be able to do this work, as they not being able to come in touch with the people, their opinion will not carry weight nor will their information be based and corrected from local information. This Central Co-operative Agricultural Implement Supply Company will have for its shareholders the unit agricultural societies in the rural areas, who will take on loan or buy the implements from their own Central Society. An organisation on this line is in the process of formation. The only difficulty is that we do not get sufficient amount of help in advice and assistance from the Co-operative Department, as we learn that the department is undermanned.

**QUESTION 22.—CO-OPERATION.**—(b) (i) Societies for the digging of wells. The co-operative public health societies with their central organisation are admirably suited for helping rural areas, digging wells or boring bore wells both for agricultural and pure water supply. The work which has already been done in this connection by this society will be in illustration of the point. All the rural areas in the Province are included in one type or other of local body. The information about the facilities which Central Government or the bigger local bodies (District Boards) offer to the rural areas for water-supply do not as a rule reach them. Even if information is available, they have not got means to utilise it they not being able to raise sufficient amount of money to satisfy the minimum condition laid down in the above schemes. For this reason, we see the curious phenomenon, while large sums sanctioned by Government for water-supply are not utilised and got lapsed year after year, whereas rural areas are suffering from want of drinking water-supply. The Central Society has been able to remove this difficulty to a great extent, by adopting the following policy. Each registered co-operative society affiliated to the Central Society can get a loan carrying no interest, from the Central Society, by the aid of which they are able to take advantage of the Government Scheme. In a few cases, the rural societies have taken loans or purchased in-salinity tanks and excavated them by the help of these loans and have stocked them with fish and have been able to make this concern remunerative. The Central Society is doing with its own funds. But as the sum available for the purpose is not great,

**R. B. Dr. G. C. Chatterjee.**

it applied to Government for a loan of two lakhs, without any interest, to be given over to the rural societies for this purpose. For this the Central Society has offered securities. Two years have passed, we have not received any reply as yet.

(b) (i) The Central Co-operative Anti-malaria Society, Ltd., is an instance to the point. This has been formed with the express purpose of controlling preventible diseases like malaria, *kala-azar* and cholera by co-operative efforts of the people. As these societies have been able to do to a great extent what they profess, commensurate with the money and the labour available for the purpose, as is evidenced by the popularity of the movement, about 1,070 societies having been formed by only last three years' efforts of its promoters, it is desirable to push this organisation as much as possible. As these organisations have besides been able to solve the water supply problem of the rural areas where over it has been tried and as they have been able to infuse a high moral tone to the local bodies, want of which is the main cause of failure of the Local Self Government in this country, it is all the more necessary to help this movement in every possible way. The way by which this movement can be spread, is by helping the Central Society, in employing a large number of organisers and the Co-operative Department paying the travelling allowance of honorary organisers and giving other facilities.

(c) Yes.

QUESTION 25.—WELFARE OF RURAL POPULATION.—(a) The only suggestion I like to make in connection with the improvement of hygiene in rural areas and for promoting the general well-being and prosperity of the rural population is that there are intimately connected in this province with the prevention of malaria and *kala-azar*. Village after village is being literally wiped out by their ravages, even in places where abundant harvest is possible, due to the land being extremely fertile and all the facilities for growing paddy being available.

No agricultural improvement, however helped, is possible, so long the people who are to carry on the work, are made non-existent through the ravages of malaria. Money spent in this direction will be repaid a thousandfold. A little reflection of what has taken place in this line in Panama Canal region will convince anyone of the utility of launching or helping all anti-malaria measures which indirectly is capable of giving any amount of wealth by saving the people who are the producers of wealth. This tract of country whereby cutting a canal joining the two oceans is capable of giving any amount of wealth to the promoters, could not be done at first because of malaria and yellow fever. As soon as the promoters, not being swayed by sophistry of false economist experts (that disease is caused by want of nutrition and this is due to want of money whereas reverse is often the case), gave supreme importance to prevention of malaria, the problem of excavation became an easy task, so this policy has been productive of greatest amount of wealth.

In this country, this sophistry is paralyzing action. Besides, prevention of malaria and *kala-azar* is possible in this country with expenditure of very little money—the people themselves as soon as they get rid of this scourge will themselves finance any anti-malaria and anti *kala-azar* scheme, with the money got out of their improved agricultural operations. Of the above we can cite any number of instances.

In Bishnath sub-division, for example, an extensive tract of land around Birballi *berl*, being extremely fertile, is productive of greatest amount of wealth to the people around it. They were recently nearly depopulated by a virulent epidemic of *kala-azar*. All agricultural operations were stopped for the time being. Very recently due to the creation of several co-operative public health societies maintained by them in the area, health has returned and the tract is now as prosperous as possible. All that is necessary to do in this connection is giving the people the proper lead. In this connection, it is necessary to state that this lead which the local bodies are expected to give is not being given in the way they should give. This is due to defective franchise, the result of this is that the real people are being trodden down by some of their own countrymen, who get at the helm of affairs of the local bodies but who could not have been there, if the people had real power to elect their own representative. In this way, all the available money is being wasted in doing things which ought not to be done. Formerly in the interior of rural areas, this all important lead used to be given by some one among themselves, who were able to give it on account of their comparatively superior intelligence and are, so to say, born leaders, who become so, not by any election process, but by natural process. The Government has changed this order of things, by giving a representative institution in its place. But if this representative institution had been given in its entirety, these natural leaders would have come to the forefront, but as it has been given in a mutilated form, hedging in with restriction (e.g. by nomination, by which the

R. B. Dr. G. C. Chatterjee.

executive officers get power to interfere) is doing immense amount of harm. If a cart is to be replaced by a motor lorry, let it be done in its entirety—keeping back the lightening set or the brake or horn or the rubber tyres will not do. The solution of malaria rests not so much on huge expenditure, but on giving real franchise, by creating, for example a centralised Local Self-Government Board, consisting of best engineers, bacteriologists and sanitary experts who are to remain in touch with and guide perfectly autonomous local bodies. Any laches on the part of the local bodies are to be dealt with by this Local Self-Government Board, which is expected to possess the necessary knowledge to make out where lies the fault of the local body and not by the executive officers who have got very little knowledge of sanitation and who are swayed more by questions of prestige than well-being of the people.

## Oral Evidence

20921. *The Chairman* Dr Chatterjee, you are good enough to come here this morning to give the Commission some information from the fund of experience that you have accumulated in using various schemes of village and sanitary improvements and you have put in a series of notes which have been before the Commission and for which we are indebted to you. Would you like to make any statement in amplification of these notes now?—All my idea is that there is a local patriotism which we are tapping. The system of Local Self Government of England, if applied here, will not suffice to deal with the problem. If we start from the bottom, namely, the village societies which correspond to the village community of the olden days, the problem will be easily solved.

20922. Should I be right if I say that local patriotism comes to a focus in a village community?—Yes, the village community wants to do their part but they are hindered by various obstacles which are beyond their control, for example, bunds of irrigation canals and railway lines. For the removal of these they very often have to go to the District Magistrate who often refers them to various departments concerned. So they do not get any remedy. So a sort of a Village Improvement Board which will include all the heads of departments concerned with land which will give speedy remedy to the villagers is required.

20923. I hoped to examine you either in conjunction with or after Dr. Bentley because I think it would have been easier then to see how your own organisation and your own ideas fit in with the Public Health organisations. But as that cannot be I should like to ask you at once whether you feel that the Public Health Department are doing all that they can do to further the interest that you have so much at heart?—If the medical portion of the Government Public Health Department were absolutely independent then they certainly would have done something. But they are not independent. They are ruled by civilians who have got no knowledge of sanitation. The difficulty is there. If they were free they knowing where the shoe pinches would have helped us.

20924. You find the medical officers themselves so far as they are concerned very ready to give every assistance, is that the position?—Yes.

20925. Will you tell me something about the inception of this scheme? When did you take interest in it?—Practically in 1917 in my own village but I should say 1914 for it was then that the idea struck me and my association with the Municipality started. I knew a little about sanitary matters as I was in the bacteriological laboratory. I wanted to try and get the Municipality to take in the matter of sanitation. A large part of insanitation was due to the people themselves. I found if the municipality took action against the people, they became unpopular and the members who were responsible for such action were not returned at the next election. Unless the people are educated in sanitary matters it was impossible to get them to elect people taking interest in sanitary matters. I thought of getting the villagers themselves to form co-operative societies for the improvement of the sanitation. My idea was that if they found their work after all paying and economical, the local body would be induced to carry on the work more easily. The co-operative society and the local body would then merge themselves into one and the moral tone would be heightened. My idea was to work from the bottom upwards.

20926. Take the case of the anti-malarial societies. Do you think the readiness with which the villagers adopt your recommendation is due to their confidence in you or some other individuals or due to a real understanding of and belief in scientific facts?—It is due to actual belief in scientific facts. They find that scientific truths are being realised. There is no question of personality. In my own village many persons used to die of cholera but after the introduction of pure drinking water and other preventive measures like the use of disinfectants they found that cholera vanished. Thus they came to realise that disease was due to their own making and could be prevented by them.

20927. You find that the fatalistic outlook on life came to disappear in those places?—That is my view.

20928. Are you in touch with the Co-operative Department at all?—Our societies are registered under the Co-operative Societies Act. But we are not subordinate to the department. We have to obey the bye-laws under the Act. And we have to send our bye laws for confirmation to the Registrar. For these matters we have to come into contact with them.

20929. Are all your societies registered?—About 1,000 have been formed, 300 have been registered. Gradually all will be registered.

20930. Have your co-operative health societies any capital?—Yes, gradually they get capital.

R. B. Dr. G. C. Chatterjee.

20931. Share capital?—We insist on their having share capital. When they start they have a small capital and when they develop, this capital increases and they utilise it in remunerative business forming part of the health work.

20932. That is the framework upon which your organisation is being built?—Yes.

20933. You told us that you first thought of these matters in 1914 and the true inception began in 1917?—Yes.

20934. Now we are in 1926, how old is the oldest living society and is it living?—Oldest societies are still in nice working condition. I should say they are the most developed societies I have ever seen. The oldest society formed in 1917 is the Panhati society. They have developed gradually and they are now taking on their shoulders the responsibility of the bigger problems like public water-supply and prevention of all the infectious diseases besides malaria. If they get more money in their hands they will form Home Crofters' Association for agricultural purposes.

20935. In your note you mention the fact that the society subsidises medical officers in some cases?—Yes.

20936. Is that medical officer as a rule the medical officer receiving Government subsidy?—That has got nothing to do with Government.

20937. I know your subsidy has nothing to do with Government. But I want to know whether the medical officer who receives a subsidy is sometimes or always an officer who is receiving a subsidy in order to persuade him to live in rural areas?—Excepting doctors I do not know whether there is any Government scheme for subsidising medical practitioners to live in rural areas. In our case, the Government are indirectly helping us through the local bodies for paying the subsidies to the medical officers of societies.

20938. What proportion of the subsidy are Government paying to the local authorities?—That varies very much. There is no definite scheme. But Government money comes in for anti-kalu-cha work and also for direct payment to the registered societies through the local bodies. The societies pay their medical officers from this sum.

20939. Professor Gangulee: What is the amount of subsidy?—All registered graduates of the medical college get Rs. 50 a month and all those who pass out of the medical schools get Rs. 30 a month.

20940. Altogether?—Yes.

20941. From all sources?—Yes.

20942. *Rai Bahadur Dannerji*: From your society?—We do not always subsidise. We are more or less a propaganda society. We see that they are paid somehow or other. We do not always pay.

20943. *Mr. Chaudhary*: Do the villagers pay?—The village society forms as it were a part and parcel of the local body. There is a rule in the local body that they will pay to the society an amount equal to the amount the society takes. From this sum they are able to subsidise their medical officers.

20944. I rather gather from you that the practice is uneven between a village and village. In some cases a local authority may contribute, in others they may not contribute?—That is quite right.

20945. And the amount which the villages have to lend depends upon how much other people are prepared to put down?—That is true.

20946. So much for the village societies. Do I understand your societies are grouped according to the objects of the central organisation? You say you are the Central Co-operative Anti-Malaria Society, Ltd. What are the constituent bodies of the Central Co-operative Anti-Malaria Society?—We have got 206 members who pay Rs. 6 a year. The members of the Board of Directors have to pay Rs. 125 to become members.

20947. These are all members on their own behalf as individuals?—Yes.

20948. What about the representation of the primary societies?—One third of the Board of Directors must be from the rural societies. They have not got to pay anything.

20949. Is there any intermediary organisation between the Central Co-operative Anti-Malaria Society and the Village Anti-Malaria Society?—We try to get them formed but did not succeed.

20950. Are these village anti-malaria societies in touch with the central organisation?—We are trying to get them in touch with us. But in many cases we could not. We are in touch with those societies which are situated in the districts near where they are located.

R. B. Dr. G. C. Chatterjee.

20951. Would it be correct to say that organisation would conform to the average type of co operative societies throughout the countries?—They are going to be more and more public health societies getting in touch with the local bodies and not with the Co-operative Department.

20952. You do not think that they are coming more in touch with the Co operative Department as it is organised?—We are gradually drifting away from them. The money comes from the Government through the local bodies. Therefore the idea is to get the societies more in touch with the local bodies than with the Co-operative Department.

20953. What local authorities do they deal with?—District Boards, Union Boards, Municipalities. They are gradually becoming continuous with the local bodies. They are keeping their individuality but their men as a rule get elected as members of the local bodies and thereby influence their policy.

20954. Do you find as a result of this movement towards closer affiliation with the local authority any tendency for the co operative spirit as such to decline?—I do not.

20955. I wonder whether you know what I mean by "co operative spirit." That is spirit of self-help and of mutual responsibility, man for man in the common interest. Do you find that the spirit is inclined to wane or that the local authority comes in and assumes an important place in the organisation?—That is what is hindering our progress. We do not know how to get rid of that. Somehow or other we suffer from it. If the co operative spirit have been encouraged by the local authorities, it would have been plain sailing with us and we would have wiped off malaria in no time. But the local authorities assume an authority which damps the co operative spirit in the societies, that is what is hindering our work.

20956. Do you not think the more your co operators learn to depend upon the funds and officers of the local authorities the less those co-operators will be prepared to help themselves?—Certainly but here is a question of authority and not so much of funds.

20957. It is a question of leaving Government to do things which people might do themselves. Is it not?—Public health work cannot be done entirely by co operation. There are men who will not obey and who come in the way. For these a little power is required. There is for example the question of acquisition of land for making a drain. The co operative societies have not got this power and for this they must look to the local bodies.

20958. Do you not think that watchful competition between the truly co-operative organisation on the one hand and the normal machinery of the Government on the other is very helpful?—I will relate one instance that will explain the point. In my own Municipality there are seven wards and there are seven anti malaria societies. The ordinary procedure at the time of election is that two-thirds of the members are elected by the people and one-third by the Government. The two thirds elected by the people were men who have got an idea of public health. But the members nominated by Government were then opposed to the improvement of public health. So I asked the Government why they should not nominate persons who have some public health spirit. That nomination is hindering the whole thing.

20959. Are you sure in your mind that you welcome the tendency of co operative health societies to conform more and more to the organisation of the local body?—Yes.

20960. Do you welcome that? Do you think it is a good thing?—I think so.

20961. You would not rather see your organisation veer towards the co operative organisation?—I would not because it is not possible. A co operative society cannot carry on public health work independently of the local bodies. It is an impossible task.

20962. They might work in sympathetic touch with the local authority but they might look for leadership and finance to the co operative movement, might they not?—I have not looked from that point of view and I have not thought over the matter in that light. My idea is to gradually raise the moral tone of the local bodies through public health societies. I do not know whether any development of our movement can take place by working with the co operative societies. My idea is to make the people carry on real public health work and not make a fetish of co-operative principle. You know of the story of the lady who went for a ride on a tiger and came back inside the tiger?

*Professor Gangulce.* That is what has happened  
**R. B. Dr. G. C. Chatterjee.**

20963. *The Chairman* : So much for the anti malaria organisation. Now do you have another and different central organisation for other societies?—No.

20964. Just one central society?—Only one. We tried to form a central society for each district. For this by-laws have been framed. But the public spirit is not so much developed in this country that we can have a central organisation for each district. So we are more or less handicapped. One central organisation by itself can not do the work for a whole of Bengal.

20965. *Professor Gangulee* : Have you any central organisation for kala-azar?—Our central society works for kala-azar as well.

20966. *The Chairman* : Some of your societies concern themselves with water-supplies? How many of them exist now?—950 out of which 700 are working and the rest are not.

20967. Have you noticed any sign of a decline of interest on the part of villagers in any of these societies?—I must say there is such a tendency. But if we can encourage them by visiting them even once a year then their interest in the societies can be kept up. But our resources do not permit of sending an organiser even once a year. Want of personal contact is the difficulty. It is not so much that the movement is dying out.

20968. It looks as though the element of personal leadership is of the utmost importance in the earlier stages of the society?—I do not believe in it. We must show them that they have derived so much benefit from their societies. Then they will agree to carry their work. We must show them by actual statistics to what extent malaria has diminished. For that purpose we must have sufficient number of organisers and workers to go round the villagers but we have not sufficient funds for it.

20969. At what rate, if at all, is your movement growing at this moment?—Last year when the annual report was published there were 352 societies. At the present time there are 950, in the year previous to that there were 89, in the previous 31 and in the year previous to that only 3. From 3 within the last three or four years they have gone to 950.

20970. Have you written off any societies that have failed?—We do not like to do so. Because there is no financial responsibility in these societies. We send every month our vernacular journal dealing with public health problems to all societies whether dead or alive. For this purpose we have to keep their names in the register. Then we find sometimes that an apparently dead society after a little watering sprouts out and becomes a healthy plant later on.

20971. Can you say how many are in the dormant state and how many live ones you have got?—About 700 living ones and about 250 dying or dead.

20972. *Professor Gangulee* : Are they quite alive?—We cannot pay personal visits to all of them. But judging from the information got from their reports we can say they are alive.

20973. *The Chairman* : Have you any societies in which you are interested which conform more to the co-operative type?—Yes, many. Some have started co-operative dispensaries and are making profit out of them, and some have started co-operative agricultural farms as well.

20974. They conform to the co-operative type and principle?—Yes.

20975. Do they show much vigour?—They are as much vigorous as possible. We have not have even to go there to encourage them. They are carrying on their work independently of us, and they are self-contained.

20976. Does not that carry conviction?—Yes.

20977. Have any of your societies, or has your central body considered the problem of nutrition at all?—We are thinking of it just now. At the present moment we are organising a society called Home Crofters' Association for cultivating fallow lands in which plants for their foods will be grown.

20978. Is it a question of diet?—Yes.

20979. Have you touched at all the matter of child diet?—No. We have not.

20980. I wonder how far your organisation has proceeded in that direction?—We have not done that.

20981. I believe curry and rice is regarded as quite a good diet for a small child in most of the villages?—It may be. But we cannot touch that for it is a matter of habit and custom.

20982. I thought you were out to improve their habit and custom?—Not as yet.

R. B. Dr. G. C. Chatterjee.

20983. Is that not you are doing ?—That will put too much strain on their intelligence at the present moment. They will not listen to us.

20984. *Sir Henry Lawrence* In this report you speak of the difficulties which you have experienced. These difficulties arise not only from local bodies but also from Government departments ?—Yes, that is true.

20985. You do not receive from Government the support that you are entitled to ?—That is my idea, not the Public Health Department. I am leaving that aside, because they have done what they could under the circumstances.

20986. Do you get any help from the Co-operative Department ?—I should say we ought to get some help from them. In the case of Co-operative Credit Societies they pay the travelling expenses of honorary organisers. But in our case we are left to ourselves. We are told we are independent.

20987. Travelling allowances are paid to honorary organisers in the co-operative movement ?—Yes; but we are not paid at all.

20988. Why is the distinction made ?—I do not know.

20989. You have made representation to Government on this matter, I suppose ?—We have done so. We have asked for paid organisers and travelling for honorary organisers. But somehow or other they make a distinction, the Co-operative Department is Government while we are not. There was a Conference in the Government House presided over by Lord Lytton and attended by the Secretary, Local Self-Government, and Member of the Executive Council. At the Conference a clear cut distinction was made between the District Boards and Municipalities which they said were Government and our society which we were told was not Government. We could not understand what their idea was.

20990. You have discussed the question with the Registrar ?—Yes.

20991. You cannot understand each other's point of view ?—We do not understand what they meant. They said "You have a Board of Directors and you have raised money for help to the societies. We will not interfere in your matters. You are autonomous." And this autonomy means that we are left out without being cared for at all.

20992. Are many of your societies registered ?—300 out of 950.

20993. Have you applied for the others to be registered ?—About eight months ago there were 300 societies, to-day there are 950. Last year there were 100 societies registered. As they are gradually forming and developing they are being registered.

20994. You have no complaint about your societies not registered ?—We have some complaint on this score, because a circular has been issued by the Registrar of Co-operative Societies informing Assistant Registrars not to register societies in the Dacca Division, because the Central Society cannot look after them. When we asked for organisers we were refused assistance. So far as I know, the circular has been withdrawn.

20995. It has been withdrawn ?—When the circular was issued, we were not informed at all. I do not know for certain whether it has been withdrawn or not. So far as I believe the circular is not in force. That is my impression.

20996. You have no longer any complaint or difficulty on that point ?—Three days ago the registration of one society was withheld on account of the circular I believe. But many other societies were registered in spite of the circular. I have still a complaint to make. The bad effect of the circular is still being felt.

20997. Then you mention in the supplementary note of yours that you are anxious to improve the water supply. You asked for a loan of two lakhs two years ago and you offered securities but you have received no reply. Is that the position ?—Yes. There was a talk between me and the Registrar of the Co-operative Society who showed me the file. He told me that the Government insisted that we should pay the interest. We said that in the matter of water supply the societies could not tax the people using the water, therefore they could not pay any interest. Even without the help of the Government loan we are giving loans to co-operative societies bearing no interest. We have not since heard whether the Government have rejected the proposal or whether it is still pending.

20998. Your object was to prevent the ruin of money sanctioned by Government for water supply from lapsing ?—Rs. 2,50,000 is sanctioned every year by Government which is utilised for giving help to villagers in the proportion of two-thirds from the Government fund and one-third raised by the villagers themselves. Even that one-third cannot be raised by the people. So we are offering to the co-operative society that one-third in the shape of a loan or some portion of it, so that they may get the benefit of the Government grant to the extent of two-thirds. In this way they will be able to have their water-supply.

R. B. Dr. G. C. Chatterjee.

Later on they can pay off their loan. They can pay it in four or five years. There was a meeting which was presided over by Lord Lytton and in that meeting we were assured that we would get the money. The Registrar of Co-operative Credit Societies also said to the same effect. The Secretary to the Local Self-Government was also there and he also assured us that we would get the money. The proposal, however, has not passed through the Government machinery and we do not know what has become of it. They all told me at the meeting that it was a very nice idea because a large number of villages in Bengal would have their water-supply. Somehow or other the matter has not yet materialised.

21009. I hope you have not given up your efforts?—Not yet. But we have latterly become very despondent on account of the delay in getting the money.

21000. Patience and perseverance may win in the end?—Let us hope so.

21001. Are your societies philanthropic societies?—No. They are based on self help.

21002. Do all these cultivators work honorarily on these peoples' societies?—Yes.

21003. Your function is only to combat malaria or do you also deal with other diseases?—Our societies deal with those diseases which are preventable and not with those which are non-preventable like dyspepsia and other diseases.

21004. Do not such diseases as can be prevented by inoculation come under your purview?—Yes, they do.

21005. Sometime ago in the Punjab there was a fish exhibited which they said lived on the larvæ of the mosquito?—We also do advocate that.

21006. But does it do any good?—It does. In Bengal it is to be found in ponds.

21007. What do you call it?—In Bengali it is called *techo* (*haplochilus ranchuk*).

21008. I have heard there was an injection fund for *kala-azar*. Is it working now?—It is working and we are quite confident that if we are not obstructed we will be able to tackle this problem of *kala-azar* within the next two or three years.

21009. Has it been a success?—It has been a marked success.

21010. Have you also been successful in combating dengue fever?—We do not get much of dengue fever in Bengal.

21011. The proper medicine for malaria as every one knows is quinine?—Yes.

21012. Do you attempt to sell quinine at a very cheap rate?—We get the quinine from Government for our society and we give it absolutely free. When the malaria season is on, people are given doses of quinine so that they may not suffer from malaria.

21013. Is there any particular season of malaria?—It is generally from September to October.

21014. Just when the paddy ripens?—No, just when the water stagnates. It is at that time that the breeding of mosquitoes starts and the malaria season begins.

21015. You told me this morning that there were certain paddy tracts where there is no malaria?—Yes, it is Barishat and Diamond Harbour.

21016. Have you investigated the reason for malaria? Is that due to soil?—It is due to gross negligence on the part of the people not to observe ordinary sanitary precautions.

21017. You mean that they do not take quinine?—No, they allow the water to stagnate everywhere. The paddy crop by itself has got nothing to do with anti-malaria.

21018. So the stagnation of water causes malaria?—Yes.

21019. Have your societies been able to combat the disease of malaria?—Wherever we have tried we have been able to do it.

21020. As the people of Bengal are subject to malaria, do the Insurance Companies charge higher rates of premium from them?—I do not know anything about that, but most likely they do not charge Bengalees higher rates. I have myself been insured and they did not charge me any higher premium because I am a Bengalee.

21021. Is it not the case that malaria is more prevalent in rural areas than it is in the urban areas?—That is quite true.

21022. Does not the giving of votes, according to the new Reformed Constitution, interfere with your work?—I do not know much of politics. I am so much engaged in my work that I cannot think of politics.

R. B. Dr. G. C. Chatterjee.

21023. *Sir Thomas Middleton* : In answer to the Chairman you indicated the difficulty of altering the food habits of the people. Is it within your knowledge that in Bengal the usual dietary contains too much rice and too little *dahl*?—I have not thought over the question because as a medical man I do not think there is much in it. There are so much epidemic diseases that carry them off in thousands, so it does not matter which diet they take. Malaria is alone killing them in thousands, so it does not matter which diet they take. The malaria is killing them in thousands and we cannot prevent it, whereas all the world over they have actually hunched it. The dietary, in my opinion, is a very small matter.

21024. Do you think that if the people were better fed, malaria would not prove fatal?—If the people are free from malaria, they would be able to live on any kind of food, even on the food which they grow in their own field. But if the people are suffering from fever they cannot even remove the products of their labour from the field.

21025. So you attach primary importance to the infection and not to the nutrition of the individual?—Yes.

21026. *Sir Ganga Ram* : Is it not a fact that in the urban population people are in the habit of taking rice only once a day, either in the morning or in the evening or *rice tiffin* and wheat at the other time?—I do not know much about it.

21027. Is it within your knowledge that those who can afford to take wheat do take it once a day?—I have not thought over the matter.

21028. *Mr. Gupta* : You say that your societies are gradually coming into closer contact with the local bodies such as Union Boards. You also said that it was quite natural and you are not against this movement?—I am not against this movement.

21029. I suppose the reason is that the functions of both these bodies, namely, the anti-malaria societies and Union Boards, are really the same?—Yes.

21030. The guiding principle of both these institutions are really the same. They are both non-official bodies?—My idea is a little different. The Union Boards are too much being influenced by the officials and are becoming official bodies. Our idea is to make them a little less official and more non-official.

21031. There is the official influence?—Yes, by nomination system they officialise these Union Boards altogether.

21032. But all the members are non-official. Is it not true to say that you cannot have a single official member on these bodies?—Yes.

21033. There is not a single member of a Union Board who is an official?—No.

21034. What I mean to say is that both these Union Boards and these anti-malaria societies have the same object in view, namely, to teach the people to help themselves. Therefore, in principle, there is no antagonism between these two bodies?—There ought not to be.

21035. What is happening now is that the Government aid is given for health work and these bodies are helping your societies?—Only the bigger bodies are doing it. The Union Boards have not yet learnt public health work. They are too much engaged in *chowkidari* work. For them a little training is still required. They are not yet so efficient as they ought to be.

21036. You want them to take a little more interest in sanitation?—Yes.

21037. *The Chairman* : What is the lowest rung of your purely official organisation?

*Mr. Gupta* : Nothing below the sub-divisional Officer. There is also the Circle Officer to look after these Union Boards.

21038. *The Chairman* : What about the Local Board? Is that an official body?

*Mr. Gupta* : There is no official on the Local Board.

21039. *The Chairman* : Is the District Board, in fact, the smallest purely official organisation?

*Mr. Gupta* : There are only four members out of 32 who are officials. So it is also practically a non-official body. The Chairman is non-official and there is a great majority of non-official members. In fact, not more than one-fourth of the elected members can be officials according to law. So, there is hardly any element of official influence in that body also.

21040. *The Chairman* : We are interpreting the word 'official' in rather different ways.

*Mr. Gupta* : You mean official influence? There cannot be more than four members.

R. B. Dr. G. C. Chatterjee.

21041. *The Chairman* : Constituted according to Statute ?

*Mr. Gupta* : They are all constituted according to Statute.

21042. *The Chairman* : Including the Union Board ?

*Mr. Gupta* : Yes.

21043. A word about the assistance you are getting from Government. You got a fair sized grant the year before this work ?—Yes.

21044. And this year ?—Nothing was given until late this year. We are told we would get a grant but all sorts of conditions were attached to it. We said we would not touch the money under those circumstances, and the conditions have since been relaxed.

21045. What was the condition to which you objected ?—The officers were to get Rs. 100 a month and were not allowed to practise.

21046. The doctors in charge of cholera centres ?—Yes. They were to attend three centres, to have a servant on Rs. 10 a month, work six days and have one day's rest, and such and such medicines were to be given.

21047. There was too much red tape and official routine ?—Yes.

21048. You objected to that ?—Yes, and I saw His Excellency the Governor and through his influence these conditions have since been relaxed and we were able to take a grant of Rs. 5,000 and I believe we will get Rs. 5,000 again.

21049. Government offered their contribution under conditions which you thought rather too stringent and which were being reconsidered ?—Yes.

21050. In addition to the Government grant, some District Boards also assist the movement ?—Yes.

21051. The District Boards are also doing what they can ?—Certainly.

21052. So I hope this organisation which you have started, and for which so much credit is due to you, is not going to die ?—I hope not.

21053. You are getting some support, but not in the shape you want ?—That is my view.

21054. You get the assistance of the Public Health Department ?—Yes.

21055. You are in close touch with Dr. Bentley ?—Yes.

21056. He is the Government officer who deals with these matters, so I am sure your views will receive the utmost attention from Government, and as representing one division I can assure you my officers will do all in their power to help ?—Thank you.

21057. *The Chairman* : Who acts as Secretary of the Union Boards ?—A paid man, getting Rs. 20 a month.

21058. Who pays him ?—The Union Board authorities.

21059. *Professor Gangulee* : You have raised many controversial points in your press to which I will not refer, but I wish to ask you one or two questions about your anti-malaria society. It was started in 1917 ?—Yes.

21060. You say up to now you have got 1,000 societies ?—Yes.

21061. In how many years ?—Eight or nine.

21062. From the figures you give here I find that altogether some 1,000 societies have been started. Do I understand something like 2,000 societies have been started out of which 1,000 have survived ?—No.

21063. I see from page 62\* that 2 societies were formed in 1917, 3 in 1918 and so it goes up to 800 in 1920 ?—No, these are the total numbers.

21064. You began your society in your own village ?—Yes.

21065. Did you hold any office on the local body then ?—I was a Municipal Commissioner.

21066. For how long ?—Nearly twenty years.

21067. For twenty years you had experience of Local Self-Government ?—Yes.

21068. At the time of forming your society did you actually hold any office ?—Yes.

21069. Do you still ?—In the Municipality ?

21070. Yes ?—No.

21071. In the District Board ?—No. I have been asked to join the Kala-azar Board but not as an elected man.

---

\*The Sixth Annual Report of the Central Co-operative Anti-Malaria Society, Ltd.  
R. B. Dr. G. C. Chatterjee.

21072. You stay most of your time in Calcutta?—Yes.
21073. With regard to the subsidy question, I see from your list you have 34 doctors?—Yes.
21074. Out of which 22 serve in the 24-Parganas?—Yes.
21075. Only three serve in Howrah?—Yes.
21076. Therefore there are 23 round Calcutta out of 34?—Yes, but since that report was written their number has almost been doubled, and we have got men in Hooghly and Burdwan and elsewhere.
21077. The point I am on is this. You have now about 1,000 societies?—Yes.
21078. I find your activities are more or less confined to the urban areas and areas round the urban areas?—No, we operate in rural areas mainly.
21079. It does not seriously touch the rural areas; it is mostly round Calcutta?—No, it reaches the villages of the interior.
21080. *Mr. Gupta* The area of the 24-Parganas is 5,000 square miles, so it goes very far into the interior?—Yes.
21081. *Professor Gangulee*: Your activities are principally confined to the 24-Parganas?—I would not say that.
21082. Out of the 34 subsidised medical officers, 25 are confined to this district?—But since then we have developed very much.
21083. You have three in Howrah?—Yes, and Burdwan has been developed very much.
21084. To what extent do the honorary medical officers render services to your society?—They are practising in the locality, and they take charge of *Kala-azar* centres and deal with cholera cases and tell the people what precautions to take.
21085. These honorary medical officers actually visit the rural areas?—Yes; they are practising there.
21086. What are the functions of the medical volunteers?—They go out from Calcutta.
21087. They are Calcutta boys?—Yes.
21088. Your motto is "Self-help, not Charity"?—Yes.
21089. But from your cash account I find donations from the public were Rs. 33,500 and grants from Government and other sources Rs. 1,70,000. How much actual self-help money has come in?—That does not affect the central society.
21090. That is philanthropic?—Yes. The central society is absolutely philanthropic and no one reaps any financial advantage from it, but the village societies are true self-help societies. We encourage the formation of societies on a self-help basis, but our central organisation is not on that basis; it is not even co-operative. We have given it a co-operative form because we want it registered under the Co-operative Department, and so we issue shares, but shares do not bear dividend.
21091. There is nothing co-operative really about the Central Co-operative Anti-Malaria Society?—No.
21092. "Co-operative" is a misnomer?—Yes.
21093. You complain you do not receive sufficient financial assistance from the Government, but I find here the Government assistance comes to about Rs. 70,000?—Yes. The total is about Rs. 1,00,000.
21094. Besides personal grants from men like Lord Ronaldshay?—Taking everything it comes to about Rs. 1,00,000.
21095. *Ran Bahadur Banerji*. In how many years?—Seven or eight. The first year we had Rs. 10,000.
21096. *Professor Gangulee*. Do you have any recurring grant from any source?—No.
- 21096a. These grants are given only once?—Yes.
21097. With regard to your work, on page 35\* it is stated that the total amount expended on kerosene for fighting malaria was Rs. 325-12-3. That seems exceedingly small?—
- You are under a misapprehension. Our Central Society has nothing to do with the actual Anti-Malaria work; the village societies do that. They have their own funds. We occasionally give them a little lead, that is all.
21098. You have only given these societies Rs. 325 worth of kerosene?—We do not feed the societies in that way; they are self-fed. Occasionally we give a little to some

\*I *ide* footnote on page 235.

societies just to give them a helping hand, but that is all. This year we did not give them a single anna's worth of kerosene.

21109. From the reports you have submitted to us we cannot get an idea of the actual working of your village societies?—It would require quite a big volume to contain the reports of all these 1,000 societies. They publish their own reports themselves.

21100. On page 225 of your note you say "large sums sanctioned by Government for water-supply are not utilised and get lapsed year after year". Can you give us instances of that?—No, but that is what I have been told by the District Boards. Only yesterday I heard from a District Board that they would not utilise the money but were returning it.

21101. You cannot supply this Commission with any actual facts?—No.

21102. This statement is merely your impression from hearsay?—Yes.

21103. *Rai Bahadur Bannjerji*: But it is a fact?—The District Board Chairman can testify to that.

21104. *Professor Gangulee*: You talk here of the sophistry of false economics.

21105. What do you mean by that?—For example, in the case of the Panama Canal it was thought from an economic point of view it was bound to be a success, but the earliest efforts were vitiated by disease, and it was not until medical men were placed in charge that anything could be done. Health here contributed to economics.

21106. Have you studied irrigation problems from an engineering point of view?—No; I am a medical man. I have seen the defects, however, with my own eyes; I have seen the terrible effects at Hardwar, where a number of people contract malaria through defects in the irrigation scheme. Malaria is also rife at Panchpur (Maidnapore) because the water leaks through the *bunds*.

21107. *Mr. Gupta*: Did you bring this to the notice of the Irrigation Department of Government?—I do not know whom to tell. You are an authority on these matters, and the least word from you would be of great assistance.

21108. *Dr. Hyder*: You are referring to Hardwar and Dehra Dun districts?—Yes.

21109. You say malaria is intense there?—Just three months ago I was there; I saw a number of people were suffering from malaria.

21110. Do you possess definite information on that point?—Once in a season I went there and found the people suffering from malaria.

21111. Do you ascribe that to the influence of water?—No. I went to the Ganges Canal and saw the gate of it closed, but water was trickling down because it was not properly closed; there was stagnant water all along the canal. I examined the water and found millions of larvae in it; each one of them would become a mosquito and if a mosquito bites one man suffering from malaria any number of people would be infected. There was a school, I think the Rishikesh school, and they told me that all the boys there were suffering from malaria and the school had to be closed for the time being. All this is simply due to the fact that the flood gate was not properly closed. If the irrigation canal had been constructed properly no water would have trickled down and there would have been no difficulty.

21112. *Professor Gangulee*: You have not brought this to the notice of the Government at any time?—No. But this I saw myself and I brought it to the notice of the authorities of the Gurukul school.

21113. I know that school and His Excellency the Governor of this Province takes interest in it?—Yes.

21114. You are in touch with Dr. Bentley?—Yes.

21115. Did you bring this matter to the notice of His Excellency or Dr. Bentley?—It is not in Bengal; it is in Hardwar.

21116. I am referring to this particular thing?—Yes; I had a talk with Dr. Bentley.

21117. One question with regard to Local Self-Government. Here you say you depend on natural leaders, born leaders. You say "In the interior of rural areas, this all important lead used to be given by some one among themselves, who were able to give it on account of their comparatively superior intelligence and are so to say, born leaders who become so, not by any election process, but by natural process. I have not been able to find out whom you mean, what type of leaders?—The old type of village mandals. They were a little more expert and clever than their co-villagers."

21118. Are you a born leader or an election leader?—I do not meddle in elections.

R. B. Dr. G. C. Chatterjee.

21119. *Mr. Kamal* I wish to know whether these public health societies of yours are educating the village people in the principles of general hygiene and sanitation or whether they are confining themselves only to anti-malaria work?—They are anti-malaria and public health societies and so they do anything and everything.

21120. You mean you teach the people how to keep sanitation in their houses and around their houses?—Yes, the main disease being malaria, we lay special stress on that.

21121. You lay stress on malaria and you also educate public opinion in villages about sanitation?—Yes.

21122. Since 1917 up till now you have organised 1,000 public health societies?—Yes.

21123. Is it not the case that, as we stand at present, most of the activities must radiate from urban to rural areas in India?—You mean our activities or the activity of the villagers?

21124. General activities. As the intelligentsia are in urban areas, is it not inevitable that they radiate from urban areas to rural areas?—Yes, it is. But I would rather prefer that it should begin from the rural areas because it will take centuries if we have to depend on this information going from the cities to the rural areas. They will be wiped off before we reach them.

21125. So they should emanate from the bottom?—Yes.

21126. But as the intelligentsia are in the towns, is it not inevitable that they must radiate from the urban areas?—Yes.

21127. You have been assisted in this splendid work by your medical friends?—Yes.

21128. Do other people, other than the medical graduates, assist you in this rural welfare work?—Yes. It is simply due to the efforts of the medical men of Bengal. I take pride in that, that our medical profession is helping us splendidly and the success is simply due to that.

21129. In that splendid work of yours is it the medical graduates only who help, or are you being assisted by such people as college men or college professors?—No; we do not get much assistance from them.

21130. *Rai Bahadur Bannerji* You have told the Commission that you have altogether about 970 rural societies of which 700 are active and about 250 are dying or dead and all these have been formed in the course of the last 9 years?—Yes.

21131. It was latterly that the development was very rapid?—Yes.

21132. In addition to that about 300 are registered co-operative societies?—Yes.

21133. You have also told us that you are more in touch with the Union Boards than with the Co-operative Department for your help?—Yes.

21134. The Government grant which is being allotted for the purpose of sanitation is distributed through the agency of the Union Boards?—Up till now it was given direct from the District Board, but only this year it is being given to the Union Boards and we are told that it has rather retarded the movement because of the Union Boards not appreciating public health work very well. It has retarded the movement and I believe a letter of protest against it was sent to the Director of Public Health and it was also sent to the papers.

21135. Whatever may be your opinion, the Government have thought fit to have the agency of the Union Boards as the proper one for distribution of the sanitary grants to your anti-malaria societies?—Yes.

21136. For which purpose they have to be registered?—Yes.

21137. An unregistered anti-malaria society will have no grant-in-aid from the Union Board?—None.

21138. We understand that the Registrar of Co-operative Department has suspended or stopped, as the case may be, the registration of several societies because they are not on a sound and economic basis?—No, that is not the fact. The main idea is that our Central Society can discharge its functions better for those districts near Calcutta, but we will not be able to do our part for those which are situated at a long distance from Calcutta. That is the main consideration. He told me that he wanted to force the hand of Government in order that they would give money for organisation so that we might be in touch with the distant districts. He said he was in opposition to us in order to help us; that was his idea.

**R. B. Dr. G. C. Chatterjee.**

21139. So you understand that this temporary suspension of registration is due to the Co-operative Department not having sufficient staff for supervision?—Yes

21140. If it be a fact that this temporary suspension is due to these societies not being founded on an economic basis, how will that affect your organisation?—That complaint I have not heard as yet.

21141. You have said in the course of your evidence that you live in Calcutta?—Yes.

21142. Do you not go to your village or villages every Saturday and Sunday?—Every Sunday I do go and see some of the societies situated outside.

21143. While you were talking of this Hardwar canal mischief, was it in your mind that the prevalence of malaria was due to irrigation or to the defects in the embankment and in the closing of the gates?—It was due to the defects.

21144. In this lowest rung of Local Self-Government, the Union Boards, if the official influence of the subordinate officer and upwards be withdrawn all at once by the Government, do you think the Union Boards will exist at all?—I do not know much about it. But at any rate I say the Union Boards are too much under the thumb of these officials who act under the orders of the Sub-divisional Officers, so much so that it is nothing but an official organisation now. But I hope gradually in course of time that will change.

21145. Our people might be sufficiently well educated in their own methods of doing things. But are they at all educated to adopt these western institutions of Local Self-Government all at once unless there be agencies to teach them in these days?—My idea is a little radical. I have studied the Local Self-Government institutions of England a little, and I am of opinion that the system should be adopted here without much modification at once. The local bodies of England are perfectly autonomous. The power of Central Government is represented in what is called Local Self-Government Board. This consists of best medical men, bacteriologist and engineers as its officers. Over them all is a man of the position of a cabinet minister. The work of the local bodies is judged solely by the birth rate and death rate which is published every week by the Registrar General of Births and Deaths. If the death rate of any local body goes up, the Board sends its medical officer for inspection; if he finds any fault in the local body or any jobbery taking place such as the Chairman appointing his son-in-law as the Health Officer without looking into his qualifications, the public opinion being sufficiently enlightened, suffices to remove the Health Officer. They know that through the fault of the Health Officer they are suffering from tuberculosis or typhoid fever. But if the Health Officer is kept in his place in spite of the remarks, the ordinary arrangement is that the parliamentary grant of the local body is withheld. That is the way the people of England do their work. In England people and the Government come into direct contact through the Local Self-Government Board. The order issued by the Board is more to the point, as it emanates from experts. But here we have an officer in charge, who knows nothing about sanitation. His orders are more for efficiency, than for solution of public health problem. For this reason, the people not having the autonomy and the proper lead from Government, cannot do away with the epidemic diseases. If they get the power, training and the law and proper legislation, as they have in England, the epidemic diseases will be done away with in no time. Then the Local Self-Government will develop as it has developed in England. My belief is that our country's future depends entirely on development of Local Self-Government. It is in this way that we will develop proper *sanity* and not in the way it is developing now. When people are trained in Local Self-Government we will have the proper type of men in the Legislative Councils, men who are trained by managing their own local bodies, instead of the type of men we are getting now.

(The witness withdrew.)

**Dr. C. A. BENTLEY, M.B., D.P.H., D.T.M. & H., Director of  
Public Health, Bengal**

Replies to the Questionnaire

**QUESTION 1.—RESEARCH.**—(a) (b) and (c) Under this head, I wish to emphasise the immense importance of statistical research regarding agriculture and allied subjects. Few countries in the world possess more abundant or better statistical material than is available in India. But although this material is being added to year after year, at present little or no use is being made of the data owing to there being so few people who possess an adequate knowledge of modern statistical science.

Statistical science and its application has made very great strides in recent years, especially in America, and as a result a knowledge of rainfall cycles, harvest cycles, and trade cycles, has become almost a commonplace in commercial and other circles in that country. The statistician is regularly consulted in America and I know of at least six private statistical bureaux there that are prepared to supply statistical information in regard to almost any conceivable subject in return for a fee. But in India, as in Great Britain, the value of the statistician is not yet understood and the work of statistical departments mostly stop short at the compilation, abstraction and publication of tables of figures. The only use that is usually made of statistical data is when a little of it is selected for the purpose of "special pleading" or for bolstering up some particular view. This prostitution of statistics has led to the common jest: "*Lies, damned lies, and statistics*"

Yet, without statistical science, all the biological sciences are fruitless—for just as chemistry and physics cannot be pursued without the aid of mathematics, so all the sciences concerned with the study of life, whether in plants, or animals or human beings, are helpless without the aid of statistical science. The need for statistical research in connexion with agriculture in India is very great. More than ten years ago Professor Moore of Columbia University demonstrated by modern statistical methods the existence of rainfall cycles and harvest cycles in America. Subsequently he worked out the harvest cycle for Europe. His work has been followed up by many others and at the present time any one conversant with the economic and statistical journals published in the United States must be aware of the immense emphasis that is now being attached both to harvest and trade cycles in that country. Evidence of similar cycles in the rainfall, the harvests, disease and many other factors can easily be discovered in India by synthesis of the existing statistical data. In this connection I attach a reprint\* of an article by Mr. J. Bowie, published in the *Statesman* in 1924, and at the same time I would call attention to the latter portion of my own printed note† on Bengal malaria.

In conclusion, I wish to urge upon the Commission, with all the emphasis I can command, the immense good that is likely to result from adequate statistical research into agricultural trade and meteorological conditions in India.

**QUESTION 6.—AGRICULTURAL INDEBTEDNESS.**—(a) Personal investigations in certain rural areas of Bengal have led me to the following conclusions:—Broadly speaking, from the point of view of indebtedness, every village population can be divided into three classes. (a) lenders, (b) borrowers and (c) persons too poor either to lend or to borrow. It is my experience that cultivators who possess assets of any value and who are not themselves the lenders of money to others are invariably in debt. Contrary also to what is often believed, the amount of a cultivator's indebtedness is ordinarily a measure rather of his position and prosperity than of his poverty.

Agriculturists in every part of the world as a class invariably depend upon credit to enable them to live while they prepare the land and bring their crops to maturity. Consequently the indebtedness of agriculturists cannot be considered a phenomenon peculiar to India; neither can it be explained by charges of special extravagance or loose living on the part of Indian cultivators. If agriculturists were not in debt, the observers who now blame their supposed extravagance would have nothing to say to their heavy expenditure on marriages, funerals, etc. I do not deny that from the western standpoint much of this expenditure seems wasteful; but we have always to remember that it is the conventional thing; and the normal man, whether he be European or Indian, is still a slave to the conventions of his class and period. The indebtedness of cultivators is due therefore in the first place to the universal necessity for obtaining credit to which agriculturists all over the world are exposed; the sources of their credit are in the main that class of local moneylender which is created by this demand for credit; and the chief reason preventing repayment is the fact that such repayment is ordinarily sought neither by the borrower nor the lender. A borrower, in my experience, is almost invariably in debt to the fullest

\* Not printed.

† Not printed. "Malaria in Bengal" by Dr. C. A. Bentley, Bengal Government Press, Calcutta, 1926.

Dr. C. A. Bentley.

possible extent of his credit. He considers his credit as a commodity which he exchanges for cash, and he regards the moneylender as his banker from whom he has a permanent overdraft, and to whom he goes whenever he has need for money. It must not be understood from what I have said that I consider that indebtedness is not an evil. On the contrary, it is a very great evil. But I maintain that, unless its real nature is understood attempts to reduce it cannot possibly succeed. Up to the present, every effort at preventing or controlling agricultural indebtedness has failed and the special legislation designed for this purpose has everywhere been abortive. The only rational method of dealing with the question is to regard agricultural indebtedness as a necessary evil, to be gradually reduced by establishing land banks, loan agencies and co-operative credit societies to compete with the existing moneylender class by offering better terms of credit. Meanwhile, the spread of education, the growth of public opinion and the gradual evolution of different standards of living that will condemn instead of encouraging wasteful social expenditure will do more to diminish indebtedness than any mistaken and misdirected attempt to abolish, reduce or control it by legislation or direct Government action.

**QUESTION 8.—IRRIGATION.**—The whole question of irrigation is dealt with at length in my recent Report on Malaria and Agriculture, copies of which are attached. Meanwhile I may point out that the districts mentioned below are greatly in need of irrigation, and that many other districts also require it:—

- |                |                      |
|----------------|----------------------|
| (1) Burdwan,   | (6) Howrah,          |
| (2) Birbhum,   | (7) Nadia,           |
| (3) Bankura,   | (8) Murshidabad, and |
| (4) Midnapore, | (9) Jessore.         |
| (5) Hooghly,   |                      |

The forms of irrigation most urgently required are non-perennial canals and tanks and ponds but the whole matter requires the most careful investigation. With adequate irrigation facilities, Bengal could feed the whole of India. If the existing rice-fields of Bengal gave a yield per acre as high as those in Spain, they would suffice for this purpose. If they yielded as well as the rice fields of Japan, they would feed 200 millions of people. "Any country", says Sir William Willcocks, "which possesses rivers and streams whose waters are in flood for six weeks per annum at a suitable season of the year can betake itself to basin irrigation with more or less profit. The science of dams, weirs and regulators has received such development during recent years that there can be no problem so difficult that it cannot be solved by experience and originality. Basin irrigation allows of the thorough development of countries that have streams with short and turbid floods which precede a fairly cool season; whether such irrigation be the stately irrigation of the Nile Valley, perfected by the science and experience of 7,000 years; or the less perfect but still highly effective and river-fed tank systems of Madras; or the primitive but effective basins of Bundelkhand, where impounded water irrigates the crops on the down-stream sides of the basins for one season and then allows of the basins themselves being dried and cultivated in the next."

The above words apply with special force to Bengal, where the rivers are all in flood at a suitable time of the year, preceding a fairly cool season. Moreover, at one time irrigation used to be practised on a very extensive scale in Bengal. The Burdwan Division even now possesses thousands of tanks which were formerly used for irrigation purposes. An examination of the old survey maps on the 1" scale will show what an enormous number of tanks were once in existence. At this time, the country was not protected from inundation by continuous river embankments and the tanks were partly fed by river overflow in addition to local rainfall; moreover, the subsoil reservoir was likewise annually replenished and the water-table kept at a high level as a result of the recurring inundations. At this period, the Burdwan Division was the most prosperous and progressive Province in the whole of India. But since 1860 conditions have greatly changed, especially in the Burdwan district, where, owing to the confinement of the Damodar river to its bed by marginal embankments, the country has been deprived of needed moisture. The rainfall of Western Bengal is relatively scanty and by itself wholly insufficient to allow of the intensive cultivation of the area that was cropped under former conditions. There has therefore been a progressive diminution in the net cropped area. Meanwhile, many of the tanks have dried up, and the subsoil water becomes so greatly reduced at the end of the dry season that its level is far below the surface of the country. The former simple system of tank irrigation has thus become greatly disorganised, and agriculture has in consequence suffered a serious decline, accompanied by a progressive loss of population. In this connection, I would refer the Commissioners to my Report\* on Malaria and Agriculture in Bengal, and especially to the graphs opposite page 8 of that report, which show the progressive decline in the net cropped area of

\* Bengal Government Press, Calcutta, 1925.

Burdwan since 1890. This is now a little more than half of what it was forty years ago; moreover only 5 per cent. of this area is twice sown because the supply of moisture is so small. The cause of this lack of moisture may be more readily grasped when it is pointed out that at the end of the dry season the subsoil water-level lies at an average depth of 26 feet below the surface and in some parts of the district wells 60 feet deep are dry in May. A foot of loam soil will hold 4 inches of water when fully saturated. So that (assuming the soil of Burdwan to be loam) it would require at least 104 inches of water to raise the subsoil water level of that area to the surface, a condition necessary where winter rice is to be grown. But the average monsoon rainfall of Burdwan is less than 50 inches so that in the absence of supplementary supplies of water only a relatively small proportion of the district can be planted with wet crops even in favourable seasons. Conditions are equally unsuitable for dry crops also, hence the small area sown. Meanwhile, year by year enormous volumes of water flow through the Burdwan district unused, often causing immense flood damage in lower lying tracts which at present continually receive more water than they actually require.

*Obstacles to the extension of irrigation.*—One of the chief obstacles to the extension of irrigation in Bengal is the prevalent belief that, owing to the abundant rainfall it is quite unnecessary. Thus the late Lord Curzon expressly stated in his speeches on the subject that irrigation was unnecessary in Bengal. But although in those speeches he was dealing primarily with the question of famine prevention, his words encouraged the notion that irrigation was not required in Bengal, and as a consequence little or no attention has been paid to the subject. For many years, therefore, the Public Works Department (Irrigation Branch) has confined its activities mainly to drainage schemes. One of the results of this policy is that to day Bengal possesses few or no experts with practical acquaintance with modern irrigation practice, as carried on in the Punjab, Madras, the United Provinces, Sind and other countries, such as Egypt, Italy, France, Spain and America. This is obviously a serious obstacle to irrigation in Bengal.

Other serious obstacles are the Permanent Settlement and the land tenure system of Bengal. Irrigation cannot be administered in Bengal in the manner customary in places where a ryotwari settlement system is in force, and because of this the two projects that were carried out in the Province many years ago, viz., the Midnapore Irrigation Project and the Eden Canal Project, do not give satisfactory financial results to Government. There has thus been no great inducement for incurring further capital expenditure on irrigation schemes. But irrigation is so badly needed in Bengal that methods of administration specially suited to local conditions will certainly have to be devised.

The existing methods of distributing canal water in the case of the two schemes mentioned above are not satisfactory for the reasons explained in paragraph 250, pages 181-182 of my Report on Malaria and Agriculture.

**QUESTION 10.—FERTILISERS.**—The question of natural fertilisation of the soil by irrigation with silt-laden river water is dealt with in my Report on Malaria and Agriculture, copies of which are attached.

**QUESTION 16.—ANIMAL HUSBANDRY.**—It has long been admitted that under-feeding is one of the chief causes of the miserable physique and poor quality of the cattle and other live stock in Bengal. Fodder crops are almost non-existent and the lack of moisture in the soil during the dry season prevents the growth of grass at that time of the year. Cattle are chiefly fed upon rice straw and what they can pick up on waste land and along the roads. These facts emphasise the need for irrigation, which would do much to remedy the existing shortage of fodder, thus helping to improve the cattle and other live stock of the country.

**QUESTION 22.—CO-OPERATION.**—(See pages 19 and 27 of printed note on Malaria in Bengal, and pages 119 and 120 of Report on Malaria and Agriculture.)

Some years ago, I strongly recommended to Government's notice a movement on co-operative lines for dealing with malaria and improving the health of village communities that had just begun to take root in Bengal under the auspices of a Central Co-operative Anti-malaria Society. Thanks to the untiring efforts of the originator of the movement, Rai Gopal Chandra Chatterjee Bahadur, M.B., there are now many hundred branch co-operative public health societies in Bengal to day. It is impossible in the brief space at my disposal to describe the immense good that has already been accomplished through their agency. I would strongly urge that the Commission should take the opportunity of securing evidence in regard to these societies from Rai Gopal Chandra Chatterjee Bahadur, in person. In my opinion, a very large proportion of the societies, which he and his organisation have succeeded in establishing, have in the main achieved their aim, viz., the awakening of Bengal villagers to the necessity and the possibility of improving the health of their villages by their own efforts.

Dr. C. A. Bentley.

QUESTION 17.—AGRICULTURAL INDUSTRIES.—(a) It is not easy to give an exact estimate of the number of days of work done by an average cultivator on his holding during the year, because conditions vary in every district as may be seen by the following figures extracted from the "Agricultural Statistics of Bengal" for the year ending June 30th, 1924 :—

Districts				Twice sown	Net cropped area	Percentage twice sown
				Acres.	Acres.	
Burdwan	..	..	..	36,300	814,200	4.5
Birbhum	..	..	..	14,100	590,500	2.4
Bankura	..	..	..	37,700	627,800	6.0
Midnapore	..	..	..	88,100	1,745,800	5.1
Hooghly	..	..	..	10,500	235,300	3.7
Howrah	..	..	..	20,000	110,400	18.1
				207,000	4,174,000	5.0
24 Parganas	..	..	..	66,500	807,800	8.2
Nadia	..	..	..	207,100	676,000	30.6
Murshidabad	..	..	..	107,400	420,700	25.0
Jessore	..	..	..	40,900	1,028,500	4.0
Khulna	..	..	..	97,400	761,100	12.8
				519,300	3,703,100	14.0
Rajshahi	..	..	..	188,800	900,600	21.0
Dinajpur	..	..	..	10,000	1,031,800	1.0
Jalpaiguri	..	..	..	120,700	670,500	18.0
Darjeeling	..	..	..	16,900	148,400	11.4
Rangpur	..	..	..	.....	1,226,100	.....
Bogra	..	..	..	120,400	370,700	30.3
Pabna	..	..	..	191,400	835,100	22.0
Malda	..	..	..	50,000	549,800	9.1
				608,200	5,712,200	12.2
Dacca	..	..	..	277,200	1,300,000	21.2
Mymensingh	..	..	..	1,151,800	2,230,900	51.5
Faridpur	..	..	..	176,400	1,178,200	15.0
Backerganj	..	..	..	201,000	1,673,300	15.8
				1,806,400	6,400,100	20.2
Chittagong	..	..	..	50,500	622,800	7.6
Tippura	..	..	..	385,200	1,092,700	35.5
Noukhali	..	..	..	361,300	738,900	51.5
				826,000	2,454,300	33.6

These figures show that in the Burdwan Division only 5 per cent. of the net cropped area was sown twice during the year, whereas in the Chittagong Division 33.6 per cent

Dr. C. A. Bentley,  
p 13—16a

was sown more than once. Taking individual districts the variation is even more marked, for whereas only 1 per cent. of the land was twice sown in Dinajpur, in Mymensingh and Noakhali, on the other hand, more than half the net cropped area was twice sown. In the Province, as a whole, 18.3 per cent. of the net cropped area was twice sown.

It is generally admitted that at present, except at the special times of ploughing, sowing, weeding and final harvesting, the cultivators usually have little or nothing to do. If any useful subsidiary occupation could be found for them, their economic position could be greatly improved.

(b) The soundest method of encouraging the adoption of subsidiary industries seems to be the discovery or creation of a demand for produce. The most hopeful direction in which advance can be made is probably in the direction of encouraging existing industries.

The main obstacles to the expansion of such industries as poultry-rearing, fruit-rearing, sericulture, lac culture, rope making, basket-making, etc., are to be found in the lack of necessary demand. The finding of suitable markets for the produce of these industries is thus all important, for markets create a demand, and an unsatisfied demand is a vacuum that nature abhors. Take the case of poultry-rearing. Some years ago I saw many thousands of eggs in the Birbhum district waiting at railway stations for export to Calcutta. This shows some one had discovered that a profitable business could be done in these eggs, after collecting them and paying the freight. The eggs were not picked but merely put into large flat baskets and the breakages must have been heavy.

Fruit and vegetable culture is an industry almost entirely dependent upon the existence of a local demand as may be seen by examining the figures relating to the area under these crops in the various districts:—

Districts				Acreage devoted to fruit and vegetable	Percentage of net cropped area of district	Percentage of provincial acreage devoted to these crops
Noakhali	..	..	..	75,000	10.15	12.5
Bacharganj	..	..	..	168,400	9.45	26.1
Howrah	..	..	..	7,700	6.97	1.3
Hooghly	..	..	..	12,000	4.63	2.2
Faridpur	..	..	..	50,300	4.27	8.4
Birbhum	..	..	..	22,500	3.81	3.8
Dacca	..	..	..	48,800	3.74	8.2
Mymensingh	..	..	..	82,300	3.66	13.7
Jalpaiguri	..	..	..	22,600	3.37	3.8
24 Parganas	..	..	..	20,700	2.56	3.6
Khulna	..	..	..	18,400	2.42	3.1
Rajshahi	..	..	..	21,100	2.33	3.5
Rangpur	..	..	..	26,600	2.17	4.6
Darjeeling	..	..	..	2,000	1.35	0.3
Dinajpur	..	..	..	10,200	1.00	1.7
Tippura	..	..	..	10,500	.96	1.8
Chittagong	..	..	..	5,900	.95	1.0
Bogra	..	..	..	3,500	.92	0.6
Nadia	..	..	..	6,000	.59	1.0
Murshidabad	..	..	..	3,000	.81	0.6
Midnapore	..	..	..	12,600	.72	2.1
Bankura	..	..	..	3,500	.56	0.6
Burdwan	..	..	..	4,400	.54	0.7
Malda	..	..	..	800	.51	0.5
Jessore	..	..	..	3,300	.32	0.6
Pabna	..	..	..	2,600	.31	0.4

The table above is prepared from data extracted from the Agricultural Statistics for 1924. In the Province as a whole, about 2.7 per cent. of the net cropped area is devoted to growing fruit and vegetables. In many districts however a much smaller proportion of the net cropped area is occupied by these crops. The places where this sort of culture

Dr. C. A. Bentley.

is already practised on a fairly large scale are obviously the most suitable for further development under this head.

**Pisciculture.**—Although there is everywhere a demand for fish owing to the fact that from time immemorial fish has formed a favourite diet in Bengal, the supply of fish has greatly diminished in many parts of the Province. The reports of the late Sir Krishna Gupta and of Mr. K. C. De, C.I.R., I.C.S., are unanimous on this point. The cause of this diminution is to be sought in the gradual drying up of the streams and swamps and a general reduction of surface water. But even now in many districts an acre of water in the form of tanks devoted to fish culture is more profitable than a similar area of dry land. Owing, however, to the existing laws of inheritance many tanks are owned by numerous co-sharers who cannot agree upon the necessary steps for their upkeep, and as a result, they often tend to silt up and become useless. This same obstacle prevents others acquiring old tanks and improving them. Many difficulties are met with also when it is desired to excavate new tanks, for landlords have the right to prohibit work of this kind or to exact very heavy *salami*. The drying up of many parts of Bengal, formerly subject to annual inundation, as a result of the shutting out of flood water from the rivers and the almost total lack of artificial irrigation to replace the lost supplies of surface and subsoil water, is a further obstacle to the practice of pisciculture, which is thus rendered increasingly difficult in Bengal.

In this connection, the following quotation from a paper read at the Paris International Congress of 1889 by a Chinese statesman, General Schangte-tong, is not without special interest:—

“I may add that without these gigantic irrigation works, the Chinese could never have carried to such a pitch of perfection one of their most important industries. I speak of pisciculture. Thanks to the abundance of water, the whole of my countrymen, instead of contenting themselves with covering with their fishing boats the seas, rivers and lakes of our country, have devoted themselves to the breeding of fish. The spawn is everywhere carefully collected; far from leaving it to take its chance, the peasant gives this source of wealth a safe shelter in some spot where a perennial supply of water can be assured. The irrigation reservoirs teem with fish. During winter, the rice fields are fallow: the water is led into them, and they are instantly full of carp. This industry allows us to make fish a considerable factor in the food of our people. The fish are either eaten fresh, or salted, and dried; they are despatched to all parts of the Empire and sold at a price which is remunerative, though it is exceedingly cheap.

**Sericiculture.**—Sericiculture formerly flourished in many parts of Bengal, but it has long been in a decaying state owing mainly to the loss of the export market for silk, which appears to have been gradually diverted to China, Japan, Italy and France. I have had personal experience of the disastrous effect of this upon the health of village communities in Bengal. In the Birbhum and the Murshidabad districts, for example, I have had occasion to investigate serious outbreaks of very fatal malaria in village population, caused apparently by the privation and distress following upon the closing down of silk filatures upon which many of the people were largely dependent. It would be an immense boon to the people of many districts if the silk industry could be revived. In this connection I may point out that in many parts of the Province, the Burdwan Division especially, wild castor plant, upon which the *eri* silk moth feeds, grows wild very luxuriantly. Provided a market can be found for *eri* silk, therefore, a thriving village industry could certainly be built up in many villages which would exert a most beneficial effect upon the health of the people.

**QUESTION 18.—AGRICULTURAL LABOUR.**—(a) and (b) There is a shortage of agricultural labour in many parts of the Province at certain seasons of the year, as is proved from the migration of such labour to certain districts and by the extraordinarily high wages that labour can often command.

Among the causes which produce or aggravate labour shortage, sickness or mortality must be mentioned. In malarious localities, a large proportion of the labouring population is often prostrated with attacks of fever at the very time of the rice harvest, so that sometimes the crops cannot be reaped. A comparison of the data regarding mortality, birth rate, and natural increase of the population shows that, contrary to what is often believed, it is the death rate rather than the birth rate which governs the natural increase of the population. Any measures that can be devised for reducing the death rate therefore will eventually lead to a considerable increase of the labour available for agriculture.

(c) The occupation and development of areas not at present under cultivation would be greatly facilitated by the adoption of irrigation. There are more than 6,000,000 acres of cultivable land lying waste in Bengal at present and a further 4,000,000 acres are lying

Dr. G. A. Bentley.

fallow. Most of this uncultivated and fallow land is situated in the northern, western and central portions of the Province. This land remains uncultivated chiefly owing to the fact that the available supply of moisture is insufficient for the purpose of raising crops. Yet every year enormous volumes of rich river water, a mere fraction of which would serve to irrigate the whole of this land, passes unutilised to the sea.

As I have pointed out in my recent Report on *Malaria and Agriculture*, irrigation is required not only for the purpose of improving existing agriculture and bringing waste and fallow lands under cultivation, but also for the purpose of reducing malaria. The latter object when attained would also increase the supply and efficiency of agricultural labour very greatly.

**QUESTION 19.—CONCRETS.**—(a) and (b) The supply of fodder in many of the rural areas in Bengal, particularly in the Burdwan and Presidency Divisions, which is at present very deficient could undoubtedly be increased to an almost unlimited extent as a result of irrigation.

(c) The cutting down of *sal* trees which formerly covered large areas in the west of Burdwan, Birbhum, Bankura and Midnapore has been followed by very extensive erosion in these districts. There are large tracts now so denuded of soil that little or nothing will grow there and during the dry weather these areas resemble arid deserts of undulating limestone. Better facilities for irrigation are urgently required to enable cultivation to be gradually extended so that the land can be slowly reclaimed, and the process of denudation checked.

At present, the soil of these denuded areas is so poor and so dry for long periods as to prevent the growth of vegetation and consequently the rain that falls upon the undulating surface runs off very rapidly greatly increasing the existing disorganisation of the land surface. Expenditure on a system of contour drains and bunds is first required to divert the rainfall from the bare surfaces into irrigation tanks where the water may be stored for the supply of fields at a lower elevation. I believe much of the land could eventually be reclaimed by a system of terracing or Italian methods of colmatage.

(d) Heavy rainfall is almost always associated with the growth of dense vegetation; and dense forests with heavy rainfall. It is reasonable to suppose, therefore, that whenever afforestation can be carried out, it must eventually exert a favourable effect in increasing rainfall. Probably also it often serves to increase the moisture in the soil although in certain circumstances it is supposed to have a contrary effect. There is reason to believe, however, that forests are especially beneficial by checking or regulating the flow of water over the surface of the country thereby preventing erosion.

(e) I am doubtful if there is any opening for afforestation in the neighbourhood of villages in Bengal and it might probably prove dangerous to health.

**QUESTION 21.—TANNIN AND SALT TARIFFS.**—(a) Existing export duties on jute do affect the prosperity of cultivators in certain Bengal districts adversely. The duty on jute is fixed at Rs. 4-2-6 a bale, irrespective of price and quality. It has been assumed that, because jute is almost a natural monopoly of Bengal, it can safely stand an export duty, and it is argued that this duty is necessarily borne by the consumer abroad. But this is a fallacy as is shown by the fact that since the imposition of the duty the world consumption of jute has ceased to expand. This latter observation is suggestive of the increasing use of various substitutes for jute. Apart also from the general effect of the duty upon the world demand for jute, the method of levying the duty bears most heavily upon and is producing the cheaper qualities of the fibre. The disastrous effect of this selective action may be traced in the case of the Pabna district, where the area under jute has progressively diminished since the duty was imposed.

*Recommendation.*—The duty should either be (1) greatly reduced or (2) totally abolished. It is probable that the local jute mill industry would object to its abolition, as it is believed to be rather favourable than not to the local manufacture of jute fabrics in competition with foreign manufacture. If the duty is not abolished, it should be reduced and a large proportion of the revenue derived from it should be devoted to benefiting the industry as a whole by stimulating the consumption and world demand for jute and improving by every possible means the cultivation of this important product.

Finally, as jute is of such immense importance to the welfare of Bengal, the control of all revenue derived from the duty should be vested wholly in the Government of Bengal.

**QUESTION 25.—WELFARE OF RURAL POPULATION.**—(a) Apart from the extension of the co-operative health movement for the improvement of village hygiene, which I have mentioned elsewhere, I am most anxious to see a further development in the direction of providing a sufficient number of assistant health officers and other subordinate

Dr. C. A. Bentley.

staff to enable us to combat epidemic diseases efficiently. Bengal was the first Province in India to appoint district health officers, but a single officer, however efficient, keen and conscientious, can himself do little to reduce sickness and mortality in the average district area of 2,700 square miles with a population of  $1\frac{1}{2}$  million people living in thousands of villages. The provision annually of less than one pice per head of the population would enable us to employ a health staff sufficiently numerous for the control and final eradication of cholera, small-pox and *kala-azar*. At the same time, it would provide for propaganda work that would teach the people the possibility of reducing malaria and other diseases by their own organised efforts.

(b) In communities almost wholly dependent upon agriculture, welfare and prosperity is not a fixed condition, but is constantly varying according as prices rise and fall and harvests are good, bad or indifferent, respectively. Moreover, villagers usually possess such vague notions as to their income and expenditure that it is often exceedingly difficult to obtain any exact information in regard to such matters. For example, few of them can tell what their domestic budgets amount to. Nevertheless the carrying out of a detailed economic survey might bring to light important facts and help to an understanding of many of the problems that require solution. Before, however, such a detailed survey as I have in mind could be carried out with advantage, it would be necessary, I think, in the first place to make a critical examination of the immense amount of statistical information bearing upon the economic condition of districts and their populations, which is already available, in order to obtain a clearer idea than can be given at present of the blanks in our knowledge that require more particularly to be filled.

(c) While I must disclaim having made anything in the nature of an intensive economic enquiry, such as is referred to in the question, I have from time to time, as opportunity offered, endeavoured to investigate certain economic questions affecting the health and welfare of communities in Bengal. As a result, I have found again and again that severe outbreaks of malaria have been associated with the existence of economic stress in the affected community. On numerous occasions I have shown also that evidence can always be found of a serious decline of agriculture in rural areas in which the census has discovered a marked reduction of population. I have also again and again observed that the occurrence of poor harvests and a high death rate are associated whereas good harvests are associated with low death rates. Some of these points are dealt with in my Report on Malaria and Agriculture and the printed note on Malaria in Bengal.

QUESTION 26.—STATISTICS.—(a) In this connection, I wish to utter a serious warning. I have had occasion frequently to examine and make use of many of the statistics relating to agriculture and other subjects that have been collected and compiled during the past thirty years in India. Again and again, I have discovered that the value of the data has been greatly reduced by some obvious change in the mode of collecting or recording the figures, or where estimates have been employed, by the introduction of some new basis for the estimate. Until, therefore, modern synthetic statistical methods have been applied to the mass of data already existing I would urge that no change should be made in the methods of collecting, compiling or publishing the existing statistics.

(b) I would like to suggest the need for carrying out a statistical agricultural survey of every district in India by means of the existing statistics for past years. The material is available in the records of every Province. What is required is that the data for as many years back as possible should be dealt with analytically and synthetically by modern statistical methods so as to make it possible to trace the course of events from year to year and cycle to cycle; and to correlate the various data in such a way as to arrive at their rational interpretation. Such a survey as I have in mind has already been carried out for part of Bengal by a gentleman with whom I am acquainted, who is unfortunately at present in England. This gentleman (who is a very fine mathematician and statistician) devoted several years to this work which he carried out entirely at his own expense. The work he accomplished, which is as yet mostly unpublished, is so extraordinarily valuable that I think the Commission should get into touch with Mr. Bowie, who is the gentleman I refer to, with a view to examining his work. His present address is—J. Bowie, Esq., Avondale Hotel, 1-4, Tavistock Place, Tavistock Square, London.

Dr. C. A. Bentley.

## Oral Evidence

21146. *The Chairman* Dr. Bentley, you are Director of Public Health in the Presidency of Bengal?—Yes.

21147. You have provided the Commission with a note of the evidence that you wish to give. Do you want to make any statement in amplification of that at this stage?—I am very much interested in the question of statistical research because it appears to me it has to be the basis really of all our public health work, and it seems to me, of all biological science. Take the case of public health. Unless we know what has been happening for a series of years and were able to compare from year to year, we could not tell what we were doing. And it seems to me in regard to agriculture it is essential that the data that exist should be treated with the respect they deserve. We are impressed by the remarkable advance in the work of statistical analysis and appreciation that has taken place in recent years, especially in America, but not in Great Britain. In Great Britain, in fact in Europe generally, there is not nearly the same interest in dealing with statistics as in America. Take the Statistical Economic Institute at Rome, which was originally entirely staffed by Americans and which was initiated by America. We have a great number of excellent specialists in Europe, but in many parts their work has been in a groove. The use of what I call synthetic methods has not yet spread as it should. We do not hear in England about cycles to the extent that one reads of them in American statistical literature. In fact, I know in regard to India the question of rainfall cycles which has cropped from time to time has been in the past jeered at, laughed to scorn, in fact it has been stated that there is no evidence of rainfall cycles; and yet it is not a difficult matter to demonstrate the occurrence of such cycles. It is a matter of definition of the term.

21148. Have you any constructive suggestions to make which might have the effect of providing this country with a more efficient department or service for statistical work?—What I would like to suggest is this, every department in each Province should have at least one trained statistical clerk to begin with.

21149. Where do you suggest he should be trained?—Statistics is not such an abstruse science. The demand for such clerks would speedily create the supply. Every year our Universities are turning out graduates in economics and mathematics. Any of them, either a graduate in economics or a graduate in mathematics, with a little training, would easily take up the work. For my own department I had to train a clerk, not a graduate, in order to do the simple sort of work that our establishment and our finances enable us to do. I set him on a few days ago to get out figures,—I happened to have the data available in my office,—of the not cropped areas for the last thirty and odd years in every district in Bengal. He is a clerk drawing Rs. 125 a month. These statistics were collected by him. The graph on page 8 of my report shows that the course of events has been in certain very badly affected malarious areas in Bengal; the not cropped areas in them have fallen by 50 per cent. in thirty years.

21150. Does that mean that there is a close relation between economic conditions and vital statistics?—Undoubtedly, in Bengal, and, as far as I can see, in all countries depending upon agriculture, there is such a close connection that you can never get away from it.

21151. The Commission has had an opportunity of reading through your interesting note and also the volume entitled "Malaria and Agriculture in Bengal" which has been prepared by you. I wanted in the main, if I may, to take you rather off the lines of your note and to get from you evidence on one or two questions of general importance. I should like first to ask you to give the Commission quite shortly an account of the distribution of your forces in the Presidency?—You mean the Public Health organisation?

21152. Yes, the Public Health organisation?—The Public Health organisation in Bengal now resolves itself into the central organisation and the local. The central organisation consists of myself and a few senior officers. There is a Director of the Public Health Laboratory; there is an officer who devotes attention specially to malaria; and there are four other officers at the present time who are engaged in inspection work, generally inspection of the work of local bodies and the inspection of epidemic work.

21153. Are they entitled "Assistant Directors"?—Yes, "Assistant Directors of Public Health."

21154. There are three of them?—There are three of them; a special Malaria Officer; and a Director of the Public Health Laboratory; total 5.

21155. Are they of the grade of Assistant Surgeons?—No. Most of them have British medical qualifications, a British diploma in Public Health; one of them has a Calcutta diploma in Public Health.

Dr. C. A. Bentley.

21156. How many Europeans?—There is one officer in addition to myself, the Director of the Public Health Laboratory, Colonel Stewart.

21157. I think the officer concerned with malaria is a trained malariologist?—Yes; he was trained in England; he holds a diploma in Tropical Medicine and a diploma in Public Health, and has had long experience.

21158. What is the actual strength of your inspection staff?—The Assistant Directors of Public Health are the superior inspectorate. Then, I have a small staff of Sub-Assistant Surgeons, at the moment I cannot give you the actual number, because the number has been increased since I had been on leave, I have a small staff of Sub-Assistant Surgeons for epidemic work to be lent to local authorities.

21159. A mobile column for emergency?—Yes, for *lalu-azar* work and for temporary loan for cholera work.

21160. How many Health Officers in addition to those?—I have no Health Officers. We have them under the local authorities; under District Boards and Municipalities there are Sanitary Inspectors.

21161. Where are they trained?—They are trained in a class which is held by an officer working under me, a teacher, and my Assistant Directors also take part in the training.

21162. How long does it last?—A year.

21163. Are you satisfied with the men turned out?—Yes. At the present moment we have got some of our old vaccination inspecting staff undergoing training; they were brought in from the rural areas to undergo training with a view to utilising their services, more in connection with control of epidemics; and, as I had anticipated, that material is rather defective; many of them can read and write only in the vernacular, they are not very intelligent and their education has been deficient. There are about 60 of these. But the men that are turned out as sanitary inspectors are not at all bad; in fact, they are just as good as the men turned out in Bombay and given a certificate under the Royal Institute from London.

21164. Can you say how many Sanitary Inspectors you have?—Something over a hundred in the whole Province. I have none myself, but there are over a hundred in the whole Province. Without referring to files I could not tell you the exact number now.

21165. Is it an exact territorial unit each with its Sanitary Inspector?—We have 120 Municipalities in Bengal, of which the larger ones employ Health Officers of their own and Sanitary Inspectors. A certain number of the very smallest employ nobody, whatever, because their income is too small to enable them to meet the cost. That is for the town areas. We have 26 District Boards. All but one of these District Boards have their own Health Officers and employ their own epidemic doctors and a certain number of Sanitary Inspectors.

21166. These are men trained in the manner you describe?—Yes.

21167. Are the Health Officers qualified men?—They hold a diploma in Public Health.

21168. Is this part of Local Self-Government?—The Local Self-Government organisation?

21169. Yes?—Yes, it is.

21170. You have no Public Health Act as such?—No. I have in season and out of season pointed out the necessity for a Public Health Act, but we are still without it.

21171. What are the grounds that you understand are given for that recommendation not being taken up?—We had a Bill drafted, and unfortunately that Bill was not passed before the Reformed Council came in. It was never introduced into the Council. There was a meeting of the chairmen and delegates of local authorities to consider the question of this Bill and to consider whether it should be proceeded with. Unfortunately when these local authorities had been addressed in connection with this Bill, emphasis by mistake had been laid on the question of taxation, and they naturally said this was only another Act which would increase taxation and they would have none of it. And consequently when the resolution was put at the meeting that the Bill should be proceeded with, the meeting was in the majority against it. So, there it remains.

21172. What about the attitude of the local authorities towards questions of public health and hygiene?—The majority of the local authorities now are exceedingly keen.

21173. They are active?—They are very keen. The difficulty they find is the financial one, because their resources are extraordinarily limited in the rural areas. Our

Dr. C. A. Bentley.

District Boards, for example, command only an average income per head of the populace they serve, of  $4\frac{1}{2}$  annas per annum for all purposes, communication and everything, and that does not leave them a very large sum to spend on public health.

21174. Has there been a marked increase in the interest that local authorities show towards these questions?—Yes, a very great increase.

21175. Of recent years?—Yes, ever since they had District Health Officers; ever since they had definite encouragement from Government in the form of grants-in-aid, and if we could extend that encouragement we should have still further advance.

21176. Do these authorities get a fixed grant-in-aid or a percentage?—I may say I use the term wrongly. The principle of grant-in-aid has not yet been applied in the way in which it has been applied in Great Britain. It is really usually a dole, when Government had the money, something has been given, and when times were bad that help has been withdrawn.

21177. So that no local authority could undertake a fixed annual charge with confidence that Government, year by year, would bear a share?—That has been one of the great difficulties, half of the salaries of Health Officers and Sanitary Inspectors in Municipalities has been met by Government; that has been the only thing they could count upon. But even there difficulties arise, because when a man goes on leave the Government contribution ceases.

21178. Are Government in this Presidency subsidising practitioners, with a view to persuading them to practise in rural areas?—I believe there has been a scheme of that sort tried in one or two districts: it has been tried at various times; I do not think it has been very successful. I have been out of the country for nearly 18 months, but I think there is one such scheme in one of the districts; that comes under the Medical Department.

21179. Would you advocate such schemes?—Yes, if a satisfactory scheme can be devised. The difficulty is in the laying down of conditions. If too hard and fast conditions are laid down, it prevents any scheme being successful.

21180. It requires to be sympathetically administered?—Yes, very sympathetically; I was listening to Dr. Chatterjee's evidence this morning, and I can say that everything depends upon that. As a Government official, I am tied hand and foot. For instance, there is cholera raging to-day, but I cannot go out and do what I wish; I am tied. In Bengal, to-day, I know very well that I can stamp out cholera at a comparatively small cost, just as the Dutch have done in Java, but before I can get a chance to do that, it would take me eighteen months. Meanwhile, cholera is killing thousands of people practically every week. Their methods are cumbersome, and I could not get the permission in time. I would have to put up a set and dried scheme, say exactly how I was going to work, what staff I wanted, exactly how much each was going to be paid, including the pay of the chaprasis and peons. Everything would have to be first of all put up in order to get any consideration at all. When that had been considered, it would still have to be gone through again after it had been included in the budget, it would then have to be voted on by the Legislative Council; then, even when the Council had perhaps approved of the scheme and had agreed to the grant, still I could not begin work until I had direct orders from Government, giving me sanction to spend the money. Some years ago, before we have our present system of public health, I remember a Civil Surgeon sent out vaccinator to stamp out an epidemic of small-pox. He did not consult me beforehand, but after the men had done their work, he sent in a bill for allowances, I had to go up to Government to get a grant for that, but when I got the grant I also got with that grant a letter of censure for having incurred the expenditure without the sanction of Government. One takes such things as a matter of course, it is all in the routine work. As Government officials, we have to work to rules, but it gives you an example of the difficulties that a Public Health Department has to face in getting to work in this country.

21181. About Dr. Chatterjee's evidence, to which you listened this morning, are you personally familiar with the working of Dr. Chatterjee's movement?—I have taken an interest in it for a number of years. Ever since I realised and discovered that societies had been started, and that the members were actually trying themselves voluntarily even to a small extent, to do sanitary work in their areas, I realised that that was no ordinary movement. At that time, there were only about three societies.

21182. Would you like to see these societies looking more and more to the Local Unions or towards the co-operative movement as such?—It is a difficult question to reply to; take the question of our Union Boards: the Village Self-Government Act was passed some years ago, but Union Boards do not exist for the great part of the Province now. It has been successful in a few districts, but in many districts it hangs fire, and the Union Boards are still, in a number of areas, regarded with suspicion by the people. So long

Dr. C. A. Bentley.

as that sort of feeling exists among the people, it is quite impossible that you will have any sort of relationship between non-existing Union Boards and such societies as exist. If the Act could be applied to the whole of the Province, there should be 7,000 to 8,000 Union Boards, but their number now is somewhere in the neighbourhood of 1,500.

21183. *Mr. Gupta* : Where they exist, you have no objection ?—Where they exist, there is no objection, but in this Presidency, unfortunately they exist in a very few districts.

21184. *The Chairman* : You have no strong feeling on the point, probably ?—I may say that back in 1919 and more recently, I have expressed the view officially to Government that the Union Boards as a local authority were doomed to failure, so that I am possibly rather biased.

21185. So that, in your view, the voluntary societies who attach themselves to Union Boards in preference to attaching themselves to the co-operative movement will not be able to achieve much ?—Unless they can do what has been done in one or two cases, where they themselves have captured the Municipality ; they have to capture the Union Boards, and that is what I think Dr. Chatterjee has said. Supposing a society can so far capture the Union Board by seeing that some of its officers are elected, then it will improve the vitality of both, undoubtedly.

21186. *Sir Henry Lawrence* : What is the area of jurisdiction of the Union Boards ?—About 10 to 12 square miles.

21187. How many villages ?—It varies ; on an average there is a village to each square mile, probably rather more.

21188. *The Chairman* : Have you any suggestions to lay before the Royal Commission as to the direction in which the Education Department might forward the interest of public health and hygiene ?—A great deal, undoubtedly, can be done, and is being attempted in fact, by the Education Department ; they have a syllabus on hygiene, and there is some attempt being made, I believe, to teach it. In certain areas, the District Boards and the Municipalities have taken up medical inspection of school children on a small scale, and there has been a certain amount of active work in regard to the prevention of malaria amongst school children, the administration of quinine, and so on. I think probably a good deal more might be attempted, but it is the question of funds that stands in the way ; we have only a limited number of officers and a limited amount of money to spend.

21189. How about the text-books, if there are any, for the teaching of hygiene in elementary schools ?—There are an enormous number of text-books on hygiene.

21190. In the vernacular ?—Yes : their number must now run, I should think, into at least a hundred.

21191. Are they up to date ?—Some of them are quite good.

21192. Are you satisfied with them, on the whole ?—On the whole, I am satisfied with them ; some of them are excellent ; they are increasing in number from year to year.

21193. How about the training of school teachers in the art of teaching the elementary rules of health ? Are you paying any attention to the normal schools at all ?—We have really not got the staff for that, but some of our officers, on occasions, do give courses of lectures, at the request of the Education Department or some of its officers, in the training schools and so on, but if we really want to take up the matter seriously, we want a very much larger staff than we have at present.

21194. It is very little use teaching school children rules of health, if the sanitary appliances at the school are thoroughly unsatisfactory ; what about the sanitary appliances ?—Many of them are very defective still, even in Calcutta. In many of the rural areas, wherever there is a grant-in-aid in connection with a school, the erection of a school, or the addition of a school building, the plans are submitted to the Director of Public Health for approval and we have been able, by careful scrutiny of these plans and working in harmony with the Education Department, to get considerable improvement made in school buildings that are being erected. But there is a vast number of schools in buildings that were never designed for schools ; they are in dwelling houses and other places in which the conditions of lighting and ventilation and everything of that sort are very defective. In rural areas, where there are no latrines and no proper water-supply, it is practically impossible to do anything.

21195. How about keeping latrines in schools in proper order ; have you any system of inspection ?—We have not got anything like the staff ; there are somewhere about 150,000 schools.

21196. You have a right to inspect wherever Government subsidise ?—We have the right, but we have not got the staff to do it ; we inspect a few now and again.

**Dr. C. A. Bentley.**

21197. What do those inspections show?—I think I can give you some data; we found a very large number of defectives among the school children. In 1924 we examined 93 schools and 5,741 school children. That was the work done by our own staff of Inspectors, in addition to the work that was done by some of the local authorities. As regards physical condition, 19 per cent of the children were well nourished, 62 per cent in fair condition, 19 per cent ill nourished, 39 per cent wore shoes and 60 per cent did not; 22 per cent were well dressed, 51 per cent had fair clothing and 24 per cent were poorly clad; in physical condition, 65 per cent showed defects.

21198. I am concerned, at the moment, with the manner in which the schools were kept; were the sanitary arrangements clean?—It is really impossible to say, because the number of schools examined from that point of view was small; also, they all had previous notice of the inspection.

21199. Do you know how often these health primers are used?—I cannot say. It is only the Education Department that can give you that information.

21200. When your Inspectors go round to schools, do they ask the children questions on hygiene, elementary rules of health and so on?—No, because we are almost, I may say, in the way of many of the teachers yet. Our Inspectors are not particularly welcomed; in some cases they are welcomed. We do interfere to a certain extent with the teaching of the particular day of the inspection and therefore we have to proceed in that work very tactfully so as not to get up, on the one hand, against the teaching staff and, on the other, against the parents. So far, we have, I think, avoided being unpopular. If we had become unpopular, the work would have been shut down entirely. In fact, I may say that only three years ago, just after the work was started, the work itself was threatened by our Retrenchment Committee.

21201. Now, one or two questions about the epidemic diseases. Is hookworm a very important problem in this Presidency?—Probably 90 per cent of the people suffer from it.

21202. Have you any campaign against hookworm?—We did start a campaign against it but it was shut down because there were objectors in the Council.

21203. How about the campaign against hookworm in tea plantations in this Presidency?—They have their own staff. They have European medical officers as well as Indian doctors on each garden and the work is carried out by them. They are not in any way connected with us and they do not submit their reports to us. We can only get the information from them by a special request.

21204. I am sure they are much too wise not to proceed on the lines of careful examination of the problem and a due recording of experiences. Do they put all facts at your disposal?—When we had our campaign there was a great deal of work done by our officers on the tea gardens with the idea that the work would be continued by their own staff and their own officers. I know that it has been continued not merely there but also in Asansol Mining Settlement, that is, in the coal mining area too.

21205. I suppose the provision of sanitary latrines is the central point in the campaign?—Undoubtedly.

21206. And then the treatment of infected individuals?—Yes, the latrine problem is the most difficult.

21207. You have got to design a reasonably cheap latrine, which is hard enough, and then you have got to look after it properly?—In Jalpaiguri district they have built a septic tank latrine of quite considerable size and they consulted me about it. That was before I went Home. I do not know how it is working now. The tea industry took a great deal of interest in it and there were enough planters and medical officers who were carrying out experiments with various types of latrines in order to get over the difficulty.

21208. What has been the effect on the working efficiency of the labourers by this campaign?—It has always been admitted that they have got a definite return relating to efficiency. I could not give you exact figures at the present moment as I have not got the recent reports in my office.

21209. We have this volume, which is the report of the Bengal Kala-azar Conference. Is that disease a very important problem in this Presidency too?—Indeed, it is a very important disease.

21210. Is it spreading?—It has undoubtedly been spreading. There are several areas that have been tapped in quite recent times, say, during the last two or three years, I had a great deal to do with the recognition and influence of kala azar years ago. There are

Dr. C. A. Bentley.

many parts of Bengal which ten or twelve years ago were relatively free from the disease but are now suffering from it extensively.

21211. Has there been a re-infection of Bengal from some outside source?—I think the disease has been endemic probably for a long time. Of course, it has its own cycle.

21212. *Professor Ganguly*: Have you any knowledge of the mode of infection?—A good deal of work has been done in research and some evidence seems to indicate that there is one species of sandfly which is responsible for infection.

21213. *The Chairman*: What about *bilharziosis* in men?—It is practically unknown in Bengal.

21214. Do you get it in cattle?—I believe there are some species of the worm with us at present but I have not heard very much about it.

21215. How about phthisis?—That is a very common disease.

21216. Is it extending?—I think in all probability it is.

21217. Is there surgical tuberculosis?—Very little, that is to say, as compared with European countries.

21218. Do you attach great importance to the problem of malnutrition in this Presidency?—In one sense, yes. There is a very large proportion of the population that at certain times of the year or in certain districts does not get enough nourishment at all.

21219. That is starvation. I want to know whether the diet is badly balanced or whether certain essential food-stuffs are absent?—Badly balanced diet is also universal.

21220. Do they take too much rice?—They take too little proteids. The milk-supply is very very poor. It is very costly and a large number of people cannot buy milk; they cannot take sufficient quantity of *ghi* also. Most of the people cannot take oven fish and the Bengalees, as a race, do not like *dal*.

21221. How about the proportion of the pulses to rice eaten?—Many people in Bengal hardly touch them. I know that it is not taken to the same extent that it is taken in the United Provinces and the Central Provinces and elsewhere in India. In Assam I tried to give to the coolies a larger amount of *dal* who came from Chota Nagpur and from some parts of Bankura, but I could not succeed in doing so. They were not accustomed to it and they would not have it.

21222. Is the incidence of beriberi high in the Presidency?—In Calcutta there has been a good deal of the so-called epidemic dropsy, which, I believe, to be the same as beriberi.

21223. To what do you attribute beriberi?—I have been inclined to consider it an infective disease. As far as I can see it is not directly associated in many cases with nutrition at all, even with diet deficiency. There are personal friends of mine, wealthy Indians, including wealthy Indian medical men, who themselves have suffered from it. They ascribe it to having got the infection while attending patients. Again, there are many wealthy Marwaris who have suffered from it. It is really very difficult to understand how it can be a deficiency disease when one knows it occurring in people who, as far as one can see, are not in any way taking a deficient or diseased diet. Besides that it has a seasonal incidence from which it looks as though it is an infective disease.

21224. Can you cite any experiment on which you base your statement?—There has been a considerable amount of investigatory work and all sorts of theories have been put forward about it. At one time it was ascribed to polished rice. I saw an epidemic of beriberi occurring in Jalpaiguri district in 1907 or 1908 which swept through a tea garden and there were hundreds of cases. For example, there was an Indian doctor and his family who suffered from it. When it spread in the tea garden, there was no Burma rice there; but when investigations were carried out, the epidemic was ascribed to Burma rice.

21225. It may be that there are two diseases, and that there is failure to distinguish one from the other?—There may be several.

21226. Would you attach importance to other work which is being carried on in the field of human and animal nutrition?—Undoubtedly I would.

21227. Would you go so far as to say that the problem of malnutrition in man and beast is of great importance?—It is one of those things on which we cannot have too much information. It is very difficult to say whether one would place this problem above everything else in importance. But there is no doubt that it is exceedingly important and I do not think we can have as much information on the subject.

Dr. C. A. Bentley.

21228 Have you anything to say about the growth or decline of the population in relation to the food supply in this Presidency?—In the rural areas where there has been a decline of population, there has also been a decline in agriculture and my observations go to show that there has been a correlation between the actual output of harvests as reported by the Agricultural Department and by district officers for a long series of years in given districts with mortality.

21229 Do you think under present conditions of agriculture and irrigation your population is nearing that point where natural checks to any increase operate?—The problem varies in different parts of the Presidency. The problem is a wholly different one in Eastern Bengal to that in Western and Central Bengal. The chart here shows the growth of population in the different districts of the Presidency. Places where the population is still increasing most rapidly are the places where the line has increased most rapidly in the past. So, there is no question of the population having reached the asymptotic level yet. I saw a reference made to this matter in Madras; it was reported in the papers. I may say that I totally disagree with the evidence that was given upon this very question in Madras by the Director of Public Health.

21230. Are you familiar with the conditions of Madras?—What I mean to say is that I disagree with his general statement.

21231. You have, of course, I take it, got to accept the fact that there is such a thing as an asymptotic line, which, when you approach it, is a danger signal?—The point to be borne in mind in this connection is that it has been reached by countries in which there is no question of plentiful food-supply. For instance, in countries like France it has been reached. It has, as far as I can see, nothing whatsoever to do with food-supply. The Director of Public Health in Madras urged, he might have been wrongly reported, that no attempt should be made to increase the food supply of the population because there was a danger that the population would still go on increasing.

21232. You should see the evidence that was given and not the evidence as it was reported. On the point that you mentioned comparing France with this country, of course the standard of living makes all the difference?—Undoubtedly. We have had evidence, I think, of an increasing standard of comfort as regards Eastern Bengal for example, because in the last 25 years there has been a 30 per cent. decline in the birth rate in the most prosperous areas.

21233. There are two checks, the point where life can no longer be maintained and the point in the standard of living below which the population refuses to drop. If they hold to that with sufficient insistence, the effect of that is shown in the birth rate?—Yes. In Eastern Bengal, the birth rate is declining as the result of prosperity; on the other hand, in Western and Central Bengal, the population is declining owing to adversity.

21234. Do you think that in the district where the birth rate is declining owing to greater prosperity there is deliberate control?—No, I think it is purely biological. Since I returned from leave eighteen months ago there has been the beginning of a campaign by the educated classes in favour of birth control. That is in Calcutta; it has not reached the mass of the population.

21235. You think a higher standard of thinking and living tends in some degree to limit fecundity?—Undoubtedly.

21236 *Dr. Hyder*: Is the evidence on this point accepted as conclusive by scientists?—It has never been looked at.

21237. But is the evidence in regard to diminution in fecundity as a result of prosperity regarded as conclusive by scientists? Do scientists accept it?—No, there are numbers who do not. You have only to study the reports of the Birth Commission to see that as soon as some facts were put forward quite a number of men refused even to look at them. We know very well in our own experience that there is a very large amount of limited fertility among the highly educated classes and those who are in what may be called a prosperous condition, whereas there is no want of children among the poor.

21238. *The Chairman*: With regard to irrigation in relation to public health problems in the Presidency, you are in favour of further irrigation where possible?—I say it is the big thing in Bengal. We are almost powerless without it, because agriculture is the mainstay of Bengal and the agriculture of a very large portion of Bengal has seriously declined owing to reduced water supply. The agriculture of the only prosperous areas is entirely dependent on natural and semi-natural irrigation (there is a good deal still of almost accidentally organised irrigation) and that is being to some extent interfered with. We have signs that in Eastern Bengal, which is the most prosperous area, agriculture is not as prosperous now as it was some years ago. There is already in certain districts there a decline in the net crop area.

*Dr. C. A. Bentley.*

21230. Would you agree that a larger consumption of milk and milk products by the local population would make a great contribution towards their health and resistance to disease?—Undoubtedly.

21240. If that is to be obtained, it will be necessary to provide more fodder?—Undoubtedly.

21241. And without irrigation how can further fodder be provided?—It cannot be.

21242. One or two questions about village conditions. You have mentioned water-supply, and I observe from your note that in some cases in this Presidency very satisfactory results have been obtained by sinking tube wells?—Yes.

21243. Does that give a satisfactory water-supply from the public health angle?—In the majority of cases.

21244. Not always?—No; sometimes the tube wells give unsuitable water.

21245. Saline?—Yes, and sometimes bacteriologically unsound.

21246. How do you account for that?—I have not been able to have the question investigated, because it is the exception for this to be so, but since I came back from England I have heard that some wells which gave pure water when they were sunk two or three years ago have since started to give impure water.

21247. Does not that look like infection?—I have not carefully investigated a case of that sort, but it looks to me as though it might easily be due to percolation down the outside of the tube, or something of that sort, or something to do with the pump. It may be merely accidental. Only yesterday I had a report of that sort submitted to me.

21248. Broadly speaking, it must be true that the deeper you go for water the more apt you are to get pure drinking water?—Undoubtedly.

21249. Do you attach great importance to an improved water-supply in relation to health?—It is of very great importance; it is only second in importance to the supply of more water, and in many cases you cannot have even sufficient pure water unless you have sufficient water of some sort.

21250. Have you ever put forward a considered proposal for the improvement of village water supplies on a large scale?—We have a scheme in operation now; small grants are being made to District Boards for the purpose of giving grants to Union Boards for wells, tanks and that sort of thing.

21251. Is that under a special Act?—No, it is simply a grant given by Government; it is one of the duties Government give. They find they can spend a couple of lakhs on this for one year, but we are not certain it can be continued.

21252. Is there any indication that public opinion is moving in this matter?—There is a tremendous demand for something to be done in this way.

21253. From the rural population?—Yes, from everybody. The great difficulty is money. Government have only got Rs. 2 per head of the population for all purposes.

21254. Have you ever attempted to measure the relief which a better water-supply, by giving better health, might mean to the State in the direction of lower charges for curing disease, maintaining indigent persons and so on?—We have no data for that; nothing is done towards supporting the poor except by voluntary effort. We have nothing like the Poor Law Act or anything of that sort. The only sort of relief which is given is medical attendance and medicines, and even that is given only on a small scale, relatively, and only touches the fringe of the population. We have therefore no data to go on.

21255. Is it possible to express in money the change on public revenues as a result of water-borne epidemic disease?—No, because with the public revenues which we got it would be impossible to show that. Whatever we were to spend on that would come from the public revenues, but there would be no chance of getting added revenues back.

21256. That is the difficulty of financing a scheme of that sort?—It is. Those of our municipalities which have extended their water-supply are of course taxing themselves, but they can only construct these schemes by means of large grants from Government.

21257. Have you any cases of village supplies derived from wells being pumped up into gravity tanks?—Yes, there are one or two schemes of that sort.

21258. Have you any instances of windmills being used to pump up the water?—Not by any local authority, nor so far as I am aware in any scheme Government have in hand.

Dr. C. A. Bentley.

21259. Do you happen to know whether a wind survey has ever been carried out here?—I do not think it has. I have seen windmills installed here and there by private persons, but I do not know if they are successful.

21260. Is there sufficient breeze here to work a mill during many days of the year?—Near the banks of some of the rivers there is a fairly constant breeze, but I could not say whether it exists all the year round.

21261. With regard to dwelling houses in the rural hamlets, have you anything to say about the possibility of improving these houses? I take it it is no use asking the countrymen to change their practices of building altogether, but within the limits the rural population would accept?—Taking Eastern Bengal, for example, I do not think much can be said in criticism against the house in which the reasonably well off cultivator lives. It consists of several huts provided with verandahs raised on very high plinths, the walls are made of bamboo, and the building is sometimes covered with corrugated iron, which I do not think is as good as thatch but which is cheaper. A prosperous village is really a pleasant sight, and I do not think there is much that can be objected to in that type of house. It is different from the mud house which is sometimes used in Western Bengal, and that is a danger, especially when we get near Behar, where there is plague. It is not such a good type of house as we have in Eastern Bengal.

21262. Is a corrugated roof really cheaper than thatch?—Yes, because it lasts.

21263. Are the floors of dwellings raised off the ground on piles?—No, on a high earth plinth.

21264. Is that better than piles?—I do not say it is better, but you could not get the timber for piles. In the densely populated areas, timber is a very great difficulty, and bamboo has to be used.

21265. A word more about the milk supply. What about the urban milk-supply in Calcutta? Are there local rules drawn up for that? Does the Municipality control the milk supply?—Yes, they have considerable powers under the Calcutta Municipal Act.

21266. Are those powers used?—Yes, they are used fairly well.

21267. Is an inspection of the milk offered for sale in public places carried out?—Yes. You cannot compare our standard of inspection here with what you will find in London or Huddersfield or any other English town, but on the whole it is not bad, and it has been very much improved in recent years.

21268. Is Calcutta the only city in the Presidency where milk inspection is carried out?—No, but there is not very much that can be done at the present time in the way of milk inspection. Wherever there is a Health Officer and a Sanitary Inspector, a certain amount of work of that sort is being done. The chief difficulty, but with is the fact that the supplies of milk are so scanty that there is a temptation, I believe, for the officers not to be too drastic in their inspection, as otherwise they would reduce the supplies of milk available and raise the price. The price of milk is very high in Bengal, especially in the mofussil towns.

21269. *Sir Henry Lawrence*. What is the price of milk in rural areas?—It was reported to me the other day that in Jessore town it was even as high as Rs. 1 a seer, 12 annas a seer. I know that in many places you cannot get 3 seers for less than a rupee, and 2 seers for a rupee is a fair price now.

21270. For a pucca seer of 2 lbs.?—Yes.

21271. Can the poor afford to pay that?—There is hardly anyone in Bengal who can afford to pay it, except the wealthy and people who say they must have milk.

21272. So that in fact milk is unobtainable as a diet except among very few?—A very large number cannot afford it. I know the other day I had to report on a school where one of my officers had gone and inspected the school hostel. He went into this question of diet and found that there were one or two boys who were taking a pound of milk a day; a very large proportion of them took no milk whatsoever, the reason being they could not afford it.

21273. And for people who live on rice, you consider that milk is a particularly valuable addition to their diet?—Undoubtedly milk is essential, milk and ghee.

21274. As to these experiments regarding malnutrition which the Chairman has asked you about, would you require such experiments to be conducted in every Province or would you accept the result of experiments made, say, in Madras as applying to Bengal?—It would be much better to have experiments carried out in each Province,

Dr. C. A. Bentley.

because conditions vary. Taking the question of rice alone there are so many varieties. I could not name them; I know it runs into an enormous number.

21275. And their nutritive value is different?—In all probability.

21276. Do you accept the view (stated to us in Madras) that large numbers of people eat so much rice that it is indigestible and that with this margin of money which they now spend on the additional rice they could buy other more nutritious and valuable food?—I think probably that is quite sound, yes. But they are accustomed to it, and it is very difficult to get a man who has been accustomed from his boyhood to feed in a certain way to change his habits.

21277. Then I understand from your note that there has been some falling off in the consumption of fish; the area from which fish has been obtained has been decreased?—I do not know that there is any exact data showing the decline; but we know that very well in the reports of the late Sri Krishna Gupta and K. C. De; they enquired into the question of fish supplies in the Presidency of Bengal and came to the conclusion that there was a great diminution in the supply and that the price of fish had gone up. It is very difficult to purchase fish now at a reasonable figure. Supplies of fish are much reduced from what they were formerly, even within my own experience.

21278. Is that due to the drying up of tanks?—Yes; the majority of the tanks now will not hold water throughout the year and there are enormous numbers of tanks which from the point of view of fish are of very little use now; formerly they must have contained innumerable fish.

21279. On which department rests the duty of looking after these tanks?—On none. Most of these tanks belong, under our settlement system here, to private owners. There is no department responsible unless they happen to be used for a public drinking water-supply. There is no local authority that will do anything for them and it rests with the individual co-sharers or co-owners and if they have not the will or the means to do it nothing is done.

21280. Do you consider that in the public interest some measures should be taken to enforce the improvement of these tanks?—It is no use enforcing an improvement of the existing tanks. Take, for example, the Burdwan district. Unless the supply of water is increased it will only waste money; the delta areas both in Burdwan and in the Presidency Division have been deprived of so much water that that has been, in my opinion, the main cause of the tanks going out of use. The first need is a larger supply of water. Then, once you get that, automatically you would get the improvement of a number of the tanks.

21281. By the zamindars themselves?—The people, the co-sharers, would find at once that if they find water they would find fish. Now it is known very well that an acre of water is more profitable than an acre of land; but you cannot get water; that is the difficulty.

21282. You have no suggestions to make for public action through Government or any agency authorised by Government by legislative power to improve these tanks?—I would urge the taking up of a comprehensive policy of irrigation in order, among other things, to increase the supply of subsoil water and to provide the increased supply of surface water to feed the tanks which at the present time are waterless or are filled up, with a view to improving both agriculture and public health by reducing malaria and also reducing water-borne diseases.

21283. But you do not recommend any interference by legislative power with the tanks themselves?—Not unless there are arrangements for a fresh supply of water. Perhaps I am not quite grasping your question. There are great difficulties at the present time. Supposing a man or even a local authority wants to construct a tank there are difficulties in getting a site to excavate a tank. I certainly think that there should be legislative powers in order to simplify the acquisition of tanks for improvement; but as regards the general policy I say nothing should be done on a large scale unless the water-supply is increased.

21284. For the construction of a tank, is there not already legislative power under the Land Acquisition Act?—Yes; but then that does not help individuals and also there have been difficulties, even local authorities have found difficulty, in making use of it. The question of the actual ownership of tanks is a very difficult one in Bengal.

21285. And you have no definite proposal to make as regards any legislative power?—I certainly would support legislation to simplify the existing procedure and make it possible, for example, for those who wish to improve tanks; say if there is one co-sharer of a tank who wishes to improve it, at the present moment even though the other co-sharers have not money to improve it themselves, they can prevent him doing it and not frequently

fellows of this sort do prevent the improvement of the existing tanks. Obviously, sanitary tanks are a danger not merely to the owners but also to others in the neighbourhood and there should be some means of enabling the existing tanks to be improved if there is somebody willing to do it, whether it be a local authority or whether it be a private person.

21286. Have any proposals to this effect been discussed by Government at all?—The Government have considered the whole question of water-supply policy for years. We have got file after file dealing with this problem; but they have never come to any conclusion, mainly, I think, because every proposal has involved enormous expense and they did not know where to find the money. But as regards this question of legislation, that has not been taken up by itself. It might be with advantage, I think.

21287. Are you prepared to put up proposals to that effect in your department?—Yes; I think I am prepared. I will be prepared to go into the question and make, I would say, first of all suggestions, because there are a whole lot of other people who have to be consulted. It would be no use my making proposals unless others have been consulted. I can make suggestions and can open the question.

21288. The ball has been there for 20 or 30 years and it will be just as well to start it rolling soon?—This ball has been rolling about Bengal for the last 25 years at least; but it does nothing but roll. I think Mr. Gupta knows that and this question of water supply is one which has worried Government and also local authorities for years. We are also faced with the question of money. I can easily supply copies of the note that I submitted years ago to Government on this very subject to the Commission if it would be of any use to them.

21289. You attach considerable importance to irrigation. The Chief Engineer of Irrigation a day or two ago seemed to think that there was much prospect for irrigation. Have you ever discussed the question with him?—I have discussed it frequently with officers of the Public Works Department. I am quite aware of their ideas.

21290. Do they coincide with yours?—They do not, because I do not think they have considered the question except from their own point of view. All our departments are tied in this question by past traditions and it is very difficult for the head of the department to come forward and say, "The policy that our department has been following for so many years has been a wrong one and we have got to reverse it." That is what it actually would amount to in Bengal, because certainly ever since the late Lord Curzon's pronouncement on irrigation most of the people who had any voice in the matter have wiped out Bengal as not requiring irrigation at all and consequently the Public Works Department have paid no attention to it.

21291. Then you consider that the condition of certain parts of the Presidency deteriorated owing to the embankments on certain rivers, the Damodar river, for instance?—I find the decay of many of the rivers has followed that and certainly many of the rivers themselves have suffered by that. All engineers, I think, are entirely agreed upon that. It is an admitted thing.

21292. Do you advocate the removal of these embankments now?—No; I advocate the introduction of irrigation systems. Really I would say this, to use the words of the late Colonel Baird Smith, one of the greatest irrigation experts of India, while discussing the very question of irrigation and flood control of the Mahanadi many years ago. He said it is necessary to harness a river in order to prevent its doing damage; but, he said, if you harness it and do not employ its waters it will sooner or later break loose and destroy. He likened it to a horse and he said you must not harness a horse and tie it; harness a horse and work it; so also harness a river and utilise its water and the first thing you must do when you are going to irrigate from a river is you must embank it; that was done in the Nile; but he said it is fatal to leave those waters unutilised.

21293. You spoke of your budget having been one eighth of the total expenditure of the Province; that is medical and public health expenditure?—No. The Medical Department is quite separate from the Public Health Department.

21294. The Public Health budget, I understand, is about 38 lakhs?—As a matter of fact it includes a lot of things which I should not call public health. Our real budget is very much smaller than that. A few years ago the allotment for certain other heads were put under the heading "Public Health." I do not know what those are, and I do not know how they spend. But the amount which my own department is concerned with is very small.

21295. *Rai Bahadur Bannerji*: What was it last year?—I could not tell you what the last two budgets were, because I had been away. But it is only one fourth of the sum referred to just now. It is about 9 lakhs; it may be a little bit more because we have had large grants for kala-azar while I have been on leave; it might be 12 lakhs now.

Dr. C. A. Benfley.

21296. *Sir Henry Lawrence* : Taking these figures from the printed budget, the expenditure comes to 60 lakhs for Medical and 40 lakhs for Public Health. Do you regard that as proper application of public money? Would you like to see public health recognised more and more than medical?—I suppose we all think our own departments most important. I think myself that Public Health is really more important than Medical, the prevention of disease is more important than the treatment of disease. I think so, but there are probably still others who think differently.

21297. Could you put that into figures? Do you consider that Public Health ought to have nine-tenths and Medical one-tenth?—Personally, I should not complain if I had for the Public Health Department as much as the Medical Department. With that we would be better off than we ever dreamed of.

21298. An increase of 50 per cent. in your budget would satisfy you?—I do not say it would satisfy me; I say we shall be better off than we ever dreamed of. It is one of those things in which I would not like to rob Peter to pay Paul; because we are treated so badly by the financial settlement. Of every 6 or 8 rupees of revenue raised in Bengal only 2 rupees remain in the Province, and it does not give us a fair chance. I am speaking in this way for all departments and not merely for my own.

21299. *Sir Thomas Middleton* : You say that investigations into questions of nutrition should be carried on in each Province?—I would like to see it carried on in each Province.

21300. Would you agree that in any case dietary studies should be conducted in each Province?—Yes; I certainly think so.

21301. Has any one continued the work of Colonel McCay?—That I cannot say at the present moment. For a time at least there was some work done, but exactly on what scale I do not know. The Professor of Physiology was carrying out further work, but I do not think it was anything on the same scale.

21302. No important work has been done since?—I should not like to say that. There has been some important work done by the School of Tropical Medicine by Major Acton and by Major Chopra. I think they have done some very useful work recently on dietetics and nutrition.

21303. You may remember that Colonel McCay came to the conclusion that the Bengal diet is ill-balanced. Whereas the ordinary diet of the working Bengali was taken by him as being 24 ounces of rice and 1 or 2 ounces of dal, he recommended 18 ounces of rice and 6 ounces of dal. That is his view. Has that view been generally accepted by the medical profession?—I think the medical profession were too busy about their own affairs to bother then head about it.

21304. *Professor Gangulee* : Colonel McCay's work was confined to the jail population?—His conclusions I think myself are perfectly sound, but they do not apply to a very large proportion of the people of Bengal because they do not get anything like the amount of that rice to eat.

21305. *Sir Thomas Middleton* : They do not get that amount?—No.

21306. If his conclusions were sound, that the diet was ill-balanced, is it not a most important thing for the public health of the community that steps should be taken to correct the ill-balanced diet?—This is a thing in which I myself am very keen; I would like to see it. But I should first like to see them get sufficient food. I think that is of even more importance than the question of balancing the diet. That is really our problem in Bengal. I have known cultivators when I was investigating malaria in villages, and I have myself found villagers, who at certain times of the year had practically nothing but the produce of their fruit trees; that is the diet they have until the rice comes up again.

21307. That would apply only to 10 per cent. of the population?—No; very much more than that. It depends upon the districts; it varies according to the districts, because the economic condition of the different districts varies. For instance, in certain areas of the Birbhum district, a very large proportion of the population do not have enough to eat, although it has not been considered bad enough to call it a famine. Only a couple of years ago I visited villages in the Birbhum district in which the bulk of the people had not enough food. I went in connection with cholera, but I found that the people were starving.

21308. That is quite likely. But taking the normal position, whereas your statement would refer, one would hope, only to a small percentage, Colonel McCay's conclusion that the general diet is ill-balanced must refer to something like 90 per cent. of the population?—It applies equally to the European population, because I think the Europeans are almost

Dr. C. A. Bentley.

NO X 13—17a

the worst sinners with regard to ill-balanced diet. Speaking of the Europeans in India they take a great amount of proteins, for example.

21309. That may be. Does not the Bengali diet consist of an excess of rice?—It is a case in which a medical man may be quite convinced of the importance of a balanced diet, but it is quite probable that one does not get a balanced diet oneself when one gets down to it.

21310. You are convinced as a medical man that, generally speaking, it is true that the dietary of a Bengali is badly balanced?—Yes.

21311. Could you not adopt the same methods of propaganda as you do in connection with your malarial work?—We have done so, but we have not emphasised it so much, because it is really not so obvious. If we were to start emphasising the question of diet at the present time, in the beginning we should be looked upon by the bulk of the people as mad men. They will say "Why do you not turn your attention to malaria instead of to ill-balanced diet which we do not believe in?" That is the real difficulty. I have got a considerable amount of literature; in every one of our exhibitions we always have this question dealt with; we have exhibits and we have charts drawn up for this very purpose. But the question of pure food creates far greater interest at the present moment among even educated Indians in Bengal than the question of a balanced diet. I quite agree that it is important, but as a matter of policy we cannot even give the emphasis which its importance deserves because that would damage our other work.

21312. So that while you have figures which enable you to say that every day 1,000 Bengalis die of malaria, you have no figures which would enable you to indicate whether 1,000 or 10,000 die because they live on ill-balanced rations?—No. The difficulty is this, whereas every Bengali who reads our statistics that on an average so many Bengalis die of malaria, believes it, if we put up that so many Bengalis die of an ill-balanced diet, he would say "What in the world are you talking about?"

21313. Because you have not facts?—Not merely that. They have not yet reached the stage in which they can appreciate the thing. We may tell them the facts, but they would not believe it.

21314. It is a matter of education and propaganda?—Yes; we want education in our schools; this is a matter which should be taken up.

21315. Coming to another subject, you refer to the work that has been done by Mr. Bowle. What is the character of his statistical work?—He was originally an engineer. Some years ago he was employed by a firm which was dealing with steel, railway material and that sort of thing. He got interested in the theoretical side of his business, and he set himself to discover all the statistical information in regard to the steel and iron trade in India from the point of view of his business, including the question of supply and demand. That made him gather together an enormous amount of data, and dealing with them he discovered that he could not understand the fluctuations in demand for iron and steel products in India. This demand fluctuated from time to time and he found that he must discover why it fluctuated. That led him on to look to agriculture, because he found there was correlation between the two. His business was concerned with Bengal, and therefore he turned to the most important agricultural industry in Bengal, jute, and he set himself to work out all the available data he could find that had any bearing whatsoever on jute, the cultivation of the crop, the areas, the yield and also the jute mill industry. Unfortunately he was not able to attend to the end of his work and publish his figures, but he has got an immense amount of most valuable data, and, what is more, he has dealt with it in a very highly scientific manner.

21316. His work was on jute?—Yes.

21317. You have told us that you yourself have used the statistics of the Agricultural Department. Have you found these statistics satisfactory for your purpose?—I do not say that they are more satisfactory than my own statistics, but they are of very great value; I may say that they are not by any means accurate. But my own are also not accurate. In the chart where you have rice harvests compared with mortality over a long series of years, you got such a strong correlation that is very obvious there, and the statistics are collected in the same area by the same agency. It is quite certain that the statistics are of value.

21318. In working with them, you are generally satisfied that they provide you with a kind of information which it would be worth while using a great deal more?—Undoubtedly.

21319. You use your own medical statistics extensively, but you indicated just now that you are not satisfied with your own statistics?—Yes.

21320. I want to take an example of your statistics; deaths from pneumonia per 1,000 for example: we get in Calcutta 3.61 per 1,000 and in Nakhali 1 in 10,000. To what extent is that a genuine figure, and to what extent is it due to errors in diagnosis?—In the one case, in Calcutta, the deaths are reported by a certified medical man, or else,

Dr. C. A. Bentley.

each death which has not been so reported is enquired into by a medical man, who is employed for that special purpose; whereas in Naokhali the deaths are reported by the village *chowkidar*.

21321. So that, in Calcutta the figures are satisfactory, and the Naokhali figures are in no way comparable with the Calcutta figures?—Not for causes of death.

21322. You make a very interesting case for the point that Sir Henry Lawrence referred to, the effect of irrigation on production; but in connection with that you make a statement which at any rate I was surprised to read. You say that with adequate irrigation facilities Bengal could feed the whole of India. How do you get at that conclusion?—By taking the cultivable rice area and the yield per acre. I should refer you, in this connection, to the paper by Dr. Butler, late of the Agricultural Department of India; he used to be at Pusa, and he has published a paper called "Rice Culture in Spain." Dr. Butler attended a conference in Europe on this question, and in his paper he gave the data, including the data for rice production per acre in Spain and in a certain number of other countries.

21323. I had heard the production in Spain referred to, but I could not discover the "original sinner" who made the estimate for India?—Supposing the existing rice fields of Bengal gave an average yield of rice according to the figure quoted by Dr. Butler for Spain, then the amount of rice produced would feed something like 365 millions.

21324. I was so much puzzled by the Spanish figures that I have looked up the statistics, and this is the position; in Spain there is a very small area under rice: rice accounts for something like 6 per cent. of the total area under cereals, but in Bengal rice accounts for something like 98 per cent. of the area. It is well known that if you get a very small area in a particular country under a particular crop, you may get a very heavy yield, but it does not follow from that that if the area were expanded so as to cover the whole cultivable land of the country you could get anything like the same heavy yield?—I am aware of it, and that is why I gave figures for Japan. I stated it in the way in which I did, because I wished to direct attention to it. We are suffering so badly in Bengal for lack of the water necessary for the cultivation of rice, that it is necessary that attention should be directed to it. Here comes the case for special pleading by making a dramatic statement. I am perfectly aware that that figure can be explained in the way that you have suggested. But, on the other hand, the one for Japan is a much more moderate figure, and that is one which is rather difficult to get over, because your criticism applies equally to Japan.

21325. I have not tested the Japan figure, but I am very familiar with the estimates of the "Spanish type." You pleaded so strongly for the better use of statistics that I could not help taking up this example?—This is an example of statistics being used for special pleading; I admit that.

21326. My point on that is that your case for irrigation is a very strong one, and it would have been strengthened if we merely had the suggestion that one might double the output of rice in Bengal?—I have merely stated that if the rice fields gave the yield of Japan, they would feed 200 million people, because I wish people to look into the subject; they are not aware of the fact.

21327. You have now got on to Japan, and I do not know the position there?—I say the people are not aware of the fact; in Spain it is reported that you can get 5,500 lbs. of rice per acre.

21328. *Sir Henry Lawrence*: What is the output per acre in Japan?—It is about 2,000 to 2,500 lbs.

21329. *Sir Thomas Middleton*: The Spanish figure is an astonishing one; it probably represents two crops a year on the same land?—There are similar figures for Egypt too; it is 2,000 lbs.

21330. *Dr. Hyder*: With regard to this matter of statistics, to which you have referred so expressively, I want to ask you a few preliminary questions on matters that have so far cropped up. The first thing is about the population of Bengal infected with malaria. You say that the population of Bengal infected with malaria is 33 millions?—Of course, that is a very rough estimate.

21331. I was going to ask you how you have arrived at this figure?—I arrived at it by taking the proportion in a very large number of the dispensaries; I took the proportion of the total admissions for malaria and its ratio to the total admissions, and also by getting the figures in jails and so on, where one can get a fixed population, and can know the incidence of malaria. In a malarious area we can get some sort of a guide. For nearly eleven years I was medical officer in a tea garden estate, and I had then from 12,000 to 25,000 coolies under my charge, with a number of Indian doctors as assistants; there I had a fixed population, and I had a record of the cases treated. I know what the incidence

Dr. C. A. Bentley.

of malaria can be in association with a given spleen index. We have not got complete figures, but we have a very large number of figures for different parts of Bengal, and I think I am well within the mark when I say that in certain areas practically every person suffers from malaria once in the year; many of them suffer many times over; there are certain districts in which it is the exception not to find a person who has suffered in the year from even a mild attack of malaria. It is the case even among Europeans there.

21332. With regard to this decline of population in Western Bengal, I ask you whether you have sufficient data over a series of years, to get at the proper causes of this decline, if it does exist?—There is the decline, we have got evidence for it over a number of years; the census figures show a definite decline, and I myself got them out for a number of *thanas*.

21333. Was not this decline in the population of Western Bengal chiefly due to the influenza epidemic, according to the figures given in this report?—No, the decline has been going on.

21334. Has this decline been continuous?—In my book I have given a whole series of curves showing in the form of graphs the results of each census since 1872, and I have worked out the figures for the *thanas* on the same lines. In the case of the bad districts, the decline in certain *thanas* has been absolutely continuous.

21335. Since when has jute become a commercial crop in Bengal? Could you give me the date?—I cannot give you the date, but I know it has been so for many years; but I could not say exactly without reference.

21336. Because, you say there is a rain cycle; how far are the records of the Government of India Meteorological Department available?—There are some records available for 70 or 80 years.

21337. Does jute go back to 70 or 80 years also?—Not on a commercial scale, but on a small scale, it has been gradually increasing, and I take it it is about thirty years since it has really become the important thing it is now.

21338. I quite agree with you that great caution must be shown in eliciting any meaning from any set of figures, but the only point that I had in my mind when I asked you this question was this, whether you have sufficient data over a series of years to associate the economic decline with this question of irrigation in Bengal?—Undoubtedly. You can get a correlation because you can work out your error. It is a matter for association. You measure the association of certain factors when you have got a series of figures extending over thirty years as is shown in the graph here. Here is a definite association and it is so obvious that anybody can see it. It is impossible to avoid the idea that there is an association there.

21339. *The Chairman*: Just tell us where is this diagram?—It is opposite to page 68 of my book on "Malaria and Agriculture in Bengal."\*

21340. *Dr. Hyder*: You say in your report that the system of distribution of quinine through the post offices has been a failure. The quinine has not gone to the malaria-infected population but that it has been collared by the sharp section of the population for their own benefit?—It has been a failure in so far as it has not reached a very large proportion of the population. It has not been a failure in one way only. What I would like to see is that the use of the quinine should be extended far more. I have told the Government again and again that the question of the supply of quinine has never been placed on a business footing. I maintain that we ought to sell much more quinine in Bengal.

21341. You can have cinchona plantations here?—The existing plantations are very small. The matter has been gone into again. It was also investigated by Colonel Gize. The amount of available land suitable for growing the species of cinchona that would produce quinine is scanty. On the other hand, there is a species of cinchona from which cinchona can be produced which is practically as good as quinine. That grows on a lower elevation and matures more rapidly. So, I have suggested that the matter should be taken up again from that point of view, namely, from the point of view of extending the cultivation of that particular plant, because it is much better to have cinchona and have a large supply of it than to have neither cinchona nor quinine.

21342. With regard to this question of irrigation which is at the root of all problems in Bengal, could you please tell what you are going to do with water after October?—If you can get sufficient water on the land surface in the higher lands, then it will very largely settle itself because your drainage channels have been obstructed owing to the fact that your higher lands have not been getting enough water and also your subsoil level is right down, so that you have not got the constant flow throughout the soil which you should have.

---

\* Bengal Government Press, Calcutta, 1925.

21343. *Mr. Gupta* . You will also grow your *rabi* crop ?—Yes.

21344. And you would also grow new fodder crops ?—Yes, we are helpless without them.

21345. *Dr. Hyder* : So you will have to lift up the water to your higher lands ?—You might in some cases ; but, in the case of the Burdwan Division, the Damodar river is shut out from the country at a height many feet above the level of the country. So also in the flood season in Murshidabad and in Nadia district the Ganges is shut out from the country at a level above the country. I have done my best to get experiments tried. Siphons might be employed for the purpose of experiments or the sluices which exist might be opened. As far as I am aware, those sluices have not been opened and certainly no siphons have been tried.

21346. Comparing the cost of the quinine method, the method of eradication and the method of irrigation, do you think the method of irrigation will turn out to be the cheapest in the end ?—The difficulty is that we have not got the money to carry out the other methods on the scale needed. If Bengal could have irrigation, the people would soon get the money which will enable them to put into practice specific measures of malaria control on a scale which is adequate.

21347. *Mr. Gupta* : How does your Province compare with other Provinces in India in the matter of health and the importance of your department ? Would you consider Bengal as favourably situated in the matter of health, or is it a really very unhealthy Province ?—It is unhealthy. During the last few years, I may say, in the matter of birth rate our Province has been at its lowest. It has not been quite at the top of the list as regards death rate recently, but it is always fairly high up.

21348. As far as the death rate and birth rate is concerned, is the health of the Presidency getting better or is it declining ?—There has not been any great sign of improvement. It remains more or less the same. There has been a reduction of mortality in the last few years, but I think that is the reaction from the immense mortality of the influenza era.

21349. Judging from the standard of other Provinces in India and of other countries, do you not think the Health Department is one of the most important departments of the administration of this Province ?—It should be, but it is not. It is one of the minor departments.

21350. That is quite wrong in your opinion, is it not ?—I certainly think that the Health Department should have the same standing as, say, the Ministry of Health in Great Britain.

21351. I entirely agree with your views. I am only trying to recapitulate your views on this matter. You also hold that there is not much in the argument that if you try and improve health and if you try and improve wealth, the population of the country will go up and it will not be able to keep pace with the supply of the country and therefore from that point of view it will be creating fresh difficulties. Do you think there is any substance in that argument ?—That is one of the arguments which has constantly been put up to me, especially during the past few years. It has been discussed usually more or less in private when one has been discussing it with educated people. The question is whether public health efforts were justified or not and whether they were really necessary. It has again and again been said that if you prevent the people from dying, the country will be over-populated. But that is wrong. If you increase prosperity and raise the standard of living, the population will finally cease to expand.

21352. In the Rotary Club last year that point was urged and obviously there was nobody to contradict it ?—I wish I had been there to contradict it.

21353. Regarding your staff, do you not think that your greatest trouble is that you have not got any staff to cope with the rural areas of the district and that under the health officers of the District Boards the only staff is a few vaccination officers ?—That is one of the greatest troubles. If we had a sufficient staff, which would only cost practically a shilling per head of the population, we could wipe out cholera within three years.

21354. What has happened to the scheme of Government in which it was proposed to have a health officer in each *thana* and an offer was made to the District Boards that Government would find money for the recurring cost of the maintenance of this health officer as long as they agreed to find the subordinate staff and also paid for the medicine ?—That scheme is, I believe, still under consideration. In fact, I have the file with me in my office.

21355. It is a most important matter and I hope that it is going to receive the attention that it deserves ?—Yes.

*Dr. C. A. Bentley.*

21356. Regarding Government contribution, may I ask you whether it is not the fact that quite recently Government have made over the public works cess to District Boards and have earmarked it for sanitation and water-supply?—It is a very small sum.

21357. Besides this subvention, Government are also giving grants for combating diseases like malaria and kala azar?—We have had a grant but it is very little for Bengal. The Government of Assam have been spending, I think, about 3 lakhs on kala-azar and we are spending about 2 lakhs and we are seven times as big.

21358. But we are beginning to move?—Yes.

21359. I quite agree with you that, notwithstanding the money that the District Boards have got from the public works cess and the small grants that Government have made, there is a need for great financial resources. Would you be in favour of a small sanitary tax? Do you not think that without some further means of getting money it is impossible really to advance very far in the matter of rural sanitation?—I think it is certainly impossible to advance further without added resources and the only way in which you can increase these resources in the ordinary manner among the population is by taxation. If you can, as I have urged, improve the prosperity of the people, then there is no question about taxation.

21360. How can you improve the prosperity of the people without initiating the schemes to which you have referred and they all require money?—That means trying to rob the Government of India as far as I can see.

21361. At the same time, unless the people of the Province put by something you cannot expect that any Government will do anything?—That view must be accepted by all of us.

21362. Now, with regard to the question of water-supply and the improvement of tanks. You know, of course, that, in Bankura and other places, co-operative societies have been established to improve tanks; you also know that Act VI especially provides for this scheme; and you also know that every District Board has now got a complete table showing the various small schemes for wells and tanks that each Union might be taking up. Of course, Government have taken time but now we have got a move on. For instance, Government pay a small contribution for every scheme that is taken up under Act VI and in this way it is hoped there will be a greater advance. You will admit that Government are doing something?—Something is being done. I have always said that the present policy will lead the District Boards to bankruptcy. Even the water-supply policy will lead Government to bankruptcy.

21363. Even in the matter of water-supply, Government are making a small contribution?—That policy will lead Government to bankruptcy.

21364. What is your policy then?—The policy that I advocate is the loans policy in connection with this money.

21365. If you can raise money by loans, so much the better. But you cannot find fault with Government for giving you something as it has been doing?—It is preventing a proper policy. You cannot supply the people of Bengal with water out of revenue. It cannot be done. No community in the world can do it.

21366. But it is better to do something than to do nothing at all?—It is not really supplying the people; it is only providing one person here and there. It is not really touching the problem. It is preventing the problem from really being tackled as it ought to be tackled.

21367. In what way?—If we had a proper loans policy, we would get the work done on a large scale and benefit by it.

21368. That does not mean that you do not approve of Government doing something in the matter, in the direction in which action is being taken now? Loans will probably give us more money than we have at present, but something can be done by encouraging Union and District Boards to respond to the grant. Government have made this grant on condition that money is also found by the District Boards concerned and by the people benefited to supplement the grant, and in each district we are thus able to carry out many useful schemes. In my own Division we have now a number of tanks. I will not say we have sufficient, but we have made a move. I see your point; you want the pace accelerated, and think we should get the help of a much larger sum of money?—I estimated some years ago that to give a well or tank to each village would cost something like 30 annas; obviously, if the sum required is anything like that, very little can be done with a grant of 2 lakhs a year.

21369. I admit it is very little?—Even with a similar sum raised by the people themselves that is not going to take us very far.

Dr. C. A. Bentley.

21370. I entirely agree with what you have said on the subject of irrigation. You consider irrigation one of the most important problems in Bengal, both from the point of view of health and the point of view of agriculture?—At the present moment I consider it is the problem in Bengal.

21371. On the question of co-operative anti-malaria societies and their association with Union Boards, under what Act have these Union Boards been established?—The Village Self-Government Act.

21372. The object of the establishment of these Boards is to help the villagers to govern themselves?—Yes, but of course the name of the Act is a misnomer. It is not village government; it is government by small districts, districts of ten or twelve miles. It is based on the old idea, which was current at one time in England, that the parish was the satisfactory unit of local Government.

21373. Do you mean the unit is not small enough?—It is neither one thing nor the other.

21374. Would you like it smaller?—It is not the village or anything else; it is artificial.

21375. You must have a nucleus, a sufficiently compact area, and a source from which you can get an appreciable income. If it was smaller, you would lose your income, and if it was larger, you would lose touch. I have been intimately in touch with these Union Boards for many years, and as a workable scheme it is as good as anything that could be devised. If it was smaller, you would get neither the men nor the money; if larger, you would not get that association of interest which is necessary for success; that is my opinion. The object of the Act is to establish institutions at the bottom which will help the people to govern themselves. The co-operative movement has the same object. Is it not a fact that the money which the Union Boards now give the anti-malaria societies is only given to those societies which are registered under the Act?—A whole lot of conditions have been attached to these grants since I went on leave.

21376. There is no opposition in principle between the co-operative movement and these anti-malaria societies which will prevent their being connected with our Union Boards. As a matter of fact, the primary societies have co-operative unions of their own, and there is nothing to prevent these co-operative unions coalescing with our local self-governing unions. We are doing that, so I fail to see in principle what opposition there is between all these institutions which are all working towards the same end?—If human beings were perfect, they would all work together.

21377. I do not contend they have reached that stage, but that is our object, and I wanted to bring that to the notice of the Commissioners?—During the luncheon interval a medical man called to see me from the Birbhum District and asked me whether I would go out to visit a centre with which he was connected where there were nine public health co-operative societies, which were all registered and doing good work. They are not connected with Dr. Chatterjee's movement, but they have sprung up in imitation of that movement and are doing good work independently of it. The doctor told me they were anxious to work in with the District Boards there. He is also working quite satisfactorily with the Co-operative Department.

21378. One word about the need for a Public Health Act in this Province. In the draft which was made the rural areas and the urban areas were all lumped into one. Was not that found to be one of the principal difficulties in piloting that bill through?—It was the question of taxation that was voted against.

21379. But in it urban as well as rural areas were included. I remember it very well, because the matter was placed before us, and my District Officers thought conditions in rural areas were so different from urban conditions that one Act should not include both?—I remember that was thrashed out before the Commissioners' Conference. There were many people who did not realise that in every civilised country in the world except this there is public health legislation.

21380. We were in favour of it, but thought there should be two separate Acts. Do you not think it is much more necessary for rural than for urban areas, because the Local Self-Government (Municipal) Act already gives power to local bodies to look after sanitary matters to some extent. There is room for improvement no doubt; but there is nothing in rural areas at all?—The point I have raised again and again is that at the present moment in Bengal with the exception of Calcutta (which was made only by its last Act a statutory sanitary authority) we have no statutory sanitary authorities whatsoever; we have no one who is definitely charged with the care of the public health, with mandatory legislation. By its recent Act, Calcutta became for the first time a statutory sanitary authority, but there is no other one in Bengal.

Dr. C. A. Bentley.

*Mr Gupta* I quite agree there is room for improvement, but I suggest you should bring your influence to bear to emphasise the need for an Act to deal with rural areas first, because I take it that is our most urgent need.

21391. *The Raja of Parlakimedi* What are the most common diseases in this Province?—Probably malaria is the most prevalent, but there are also *lala azar*, cholera, small pox and tuberculosis. Malaria, however, is probably the most important single disease.

21392. May I know what your department is trying to do, apart from medicine, in the way of taking preventive measures against it? Is propaganda being carried out amongst the people?—Yes, we have a small publicity department consisting of two officers, who are fairly constantly on tour. They attend *melas* and agricultural shows and give lectures, magic lantern lectures and so on. We help the local authorities in carrying out work of the same kind. We are now preparing for baby week exhibitions all over Bengal, we help the local authorities with exhibits and lectures. That has done a very great deal of good.

21393. Are the lectures all given in the vernacular?—Almost entirely.

21394. Among the villagers?—Yes. Sometimes I or one of my colleagues will address an English-understanding audience in Calcutta in English, but all this propaganda work is done in the vernacular, although the wording on our posters is always in English and the vernacular.

21395. Do you include in your tours visits to rural parts?—Yes, and especially where there are *melas* or agricultural exhibitions. We have only a very small staff, two men and we have 120 towns and 84,000 villages in Bengal, so that we are only touching the minutest fringe of the problem.

21396. Do you not think the circulation of bulletins in the vernacular among the villagers will improve matters?—We do that. We have a very large amount of propaganda literature in the vernacular, posters and that sort of thing. Cholera is rampant in a number of districts in Bengal now and we have large pictorial posters dealing with cholera and its prevention. If small-pox is prevalent we have posters dealing with that, and these have been effective in inducing people to get vaccinated.

21397. How does the Postal Department treat you? Do you get any concession?—The material is practically always sent out by hand. We send the things out by rail or steamer to district headquarters, and they distribute it through their own staff. We do not use the post more than we can help, because it is too expensive; it would swallow up a very large amount of our small resources if we were to use it largely.

21398. They do not give you any concessions?—I do not think we have ever approached them.

21399. As regards the death rate of children, are there any statistics to show what that is?—On the average for this Presidency it is practically always in the neighbourhood of 200 per 1,000 births. It varies in different districts from 150 to 300 per 1,000.

21400. Can you give us a rough idea of its rise and fall during, say, the last three or four years?—Yes, I have a document here which shows the course of events for the last 40 years.

21401. Then have you taken up this also in your propaganda work as a sort of preventive measure? What are the reasons first of all?—There are many causes. Taking the case of infantile tetanus, on the average there are 35,000 infants dying within a few days of birth, within ten days or a fortnight after birth. It is purely and simply from dirt, the handling by untrained midwives. There are simply 35,000 infants sacrificed to ignorance and the failure to use a little amount of water, just a little care and attention would serve to wipe out that mortality wholly. As soon as we can get sufficient staff for work and propaganda we can have it stopped.

21402. Does the number of workers stand in the same proportion as that of the propagandists?—The midwives in rural areas are mostly untrained low class women.

21403. I mean the trained people?—They are very few in number and they hardly exist in the rural areas. It is almost impossible to get them in the rural areas.

21404. May I know what is the number available in each district?—In each district you can count the number on the fingers of the two hands. You probably will not have more than a dozen actually trained midwives.

21405. For every district?—In any district, except in Calcutta and in the immediate neighbourhood, on the Asansol borders, in the extreme west of the Burdwan district they have employed a certain number of midwives and some have settled in practice; so there are a number of trained midwives in practice in that area of 400 square miles; but that is exceptional. We have many Municipalities, especially the smaller ones, in which there are hardly any trained midwives.

Dr. C. A. Bentley.

21396. What interest do these local bodies take in that line?—Some of them have tried to employ them and now we are trying to train *dais*. We have got a certain number of classes for training the indigenous *dais* and we find the *bhadralog* ladies themselves are coming forward because they wish to take advantage of this training. It is something quite new and is a very promising thing.

21397. What provision is made for this sort of training?—We have a small grant. The Public Health Department had a small grant which has been paid to either societies or local authorities where they can employ a medical man who will hold the classes; he is paid a small honorarium and then we provide the midwives, the *dais* who attend them with an apparatus, with soap and needle brush, cotton for ligature and so on and we also give a small allowance as an inducement to attend the classes regularly. The movement has only been started in the last two years, but it is showing signs of having a promising future.

21398. Are these District Boards making any contribution for such training?—The grants in certain instances have actually been made over to District Boards with a view to getting them to organise the training by means of their dispensary medical officers.

21399. But they do not set apart a portion of their revenue as a contribution for this sort of work?—What the District Boards are feeling is that the Public Health Department wants them to do more public health work without increasing in any way their revenue. But many of them are now willing to come forward. One of the District Board Chairmen came to me the other day and told me that he was going to start propaganda throughout the district because he was convinced of the value of it and he asked me to give him advice and help because he wished to employ an officer doing nothing but this. I knew he is going to do that and I am going to help him to the utmost of my ability; but I cannot help him except by the loan now of an officer, the loan of a bioscope and films, the loan of lantern slides and a gift of literature, because I have no money definitely for that purpose.

21400. How many District Boards do you try to visit every year?—I have found it increasingly difficult in recent years to get away from office work. I should like very much to visit the whole lot of them in the year; but it becomes very difficult now-a-days especially with the increase of legislation. These legal questions are constantly referred to the Director of Public Health, and there are questions about the Food Adulteration Act and the change of rules and so on and suggested legislation, and the Director of Public Health is asked to put up draft proposals; and I have been told by lawyer friends that even if I had been a lawyer I would find that such work as legal drafting is not easy and it takes a very long time and you have got simply to concentrate on that and dealing with one file occupies the best part of several days, perhaps. When you have got increased work of this sort, it is difficult to do that amount of touring which one would like to do.

21401. Then as regards this statistical research work, how would you make it accessible to the rural parts, I mean the benefits of it?—I think the first of the benefits must come to the administrator. At present our administrators are in ignorance of what is going on for the simple reason that it is impossible to judge merely from a table of figures what is going on. If each department were compelled to put up this data in the form of simple sort of graphs, it would provide a record which could be seen at a glance. If I were the Governor of a Province, for example, I would like to see every department putting up this data in that way; then I got at a glance whether this was increasing or that was increasing and I can have various things correlated and I can find for myself if both things were moving together. It is from the education of the administrators, that the people in the rural areas will benefit. For example, I may say this that had simple graphs showing the net crop area been put up before successive Governors in Bengal, I am perfectly certain that they would have said, "We must find out what this is, we must see what can be done; here is a net crop area being neglected steadily."

21402. So you would include also circularising the local bodies, District Boards and Municipalities?—I would have them keep their own statistics, each one of them as regards public health matters. I have been trying to get the District Health Officers to make proper use of their statistics for educating the members of their District Boards and I am glad to say that many of them have done it. The other day a report came from one district which showed that the District Health Officer was doing excellent work in that way and was keeping that District Board informed by means of graphs and by means of maps of the condition of his district.

21403. And would you like them to circularise this information in the vernacular in their respective areas by posters?—Yes; as far as possible we make use of the posters; for example, simple diagrams in poster form, things that can be of interest even to villagers.

Dr. C. A. Bentley.

For example, I have one diagram showing the appropriate weight of an infant at different ages. That is shown in the form of diagrams of children in an ordinary scale, children at different sizes showing the corresponding weight at which they should be, all in vernacular, so that the adults can say "Our child is so many years old and it should be of such and such a weight".

21404. For the death rate also, do you not think there should be a similar thing?—Yes, as far as possible we make use of these large exhibitions and *melas* where many villagers come and attend.

21405. *Professor Gangulee* : You lay a great deal of emphasis on the importance of irrigation. Are you aware of the view that irrigation is also responsible for malaria?—Yes, I believe it is a prevalent belief that irrigation is the cause of malaria in parts of the Punjab, the United Provinces and elsewhere and I believe that that belief is founded upon fact. But conditions in deltaic tracts are so different from those near rivers that one finds in deltas irrigation is not associated with intense malaria. In the Madras deltas, the Godavari, Krishna and Cauvery, where there is irrigation, there is little or no malaria and this factor has constantly been commented on. In fact these deltas were more malarious than they are now before they had irrigation. It is the same, I take it, in regard to Bengal. The areas which now get natural irrigation or semi-natural irrigation are free of malaria than the areas that have no irrigation in Bengal.

21406. You say difference in conditions. What are the conditions?—The time of the year when irrigation is carried out and the crop that is being raised. If you irrigate in the monsoon, in the rainy season, and irrigate wet crops, you want a plentiful supply of water and that sort of irrigation does not produce malaria. In fact it helps to remove it. But if you irrigate dry crops, you have got to irrigate through a whole series of channels and these channels which are not used during the wet season become breeding places for mosquitoes when they hold rain water.

21407. You have in the course of your evidence stated that one of the main purposes of statistics is to educate the administrators?—Yes.

21408. Is it not supposed by some administrators that statistics are useless?—It has constantly been said that our statistics in India are useless and the critics who have criticised from that point of view are usually not those who have any knowledge of statistical methods; because people who have had to do statistical work know very well that there are whole lot of errors and one error would tend to nullify another. To give an example, I think there are 84,000 village *choukidars* in Bengal and these *choukidars* are responsible, among other things, for reporting births and deaths. Some of them, probably every *choukidar*, make an error; they even report a birth as a death by accident. It might be thought that the effect of their mistakes would be cumulative; but it is not so. Usually the mistakes they make nullify each other.

21409. With reference to the question of vital statistics, are you satisfied with your present arrangement?—No; gradually we can improve them provided we get more money.

21410. There is no use in having a statistical method evolved unless you have these reporting organisations perfected?—There is an enormous amount of existing data in every Government office and that data ought to be dealt with properly in such a way that they could be correlated.

21411. Are you aware of Mr. Jacob's work?—I have seen references to it, but unfortunately I have not actually read it.

21412. Are the statistics you have shown obtained from the statistics of the Agricultural Department?—Yes, from the published statements of the Agricultural Department.

21413. You have based the graphs on the statistics already available in Government publications?—Yes.

21414. Now, Sir Henry Lawrence made a reference to the total budget. Can you answer this? If you split up your budget into different heads, out of the ten lakhs what proportion goes to administration and what proportion to propaganda?—I could not give it at the moment. Of course our department is in line with other Public Health Departments. In every Public Health Department in the world, administration and staff is always the biggest item, because there is skilled work to be done. That is one of the criticisms which is almost invariably raised against public health work. People often enough prefer spending money on engineering schemes, something which they can see, rather than on employing a trained staff to carry out the work of preventing disease, because they are not able to assess the value of that.

Dr. C. A. Bentley.

21415. You have a Sanitary Board in this Presidency; what are its duties? Are they advisory?—Advisory. History shows that Local Self-Government administration in India would be bettered by establishing a Local Government Board, but I have not gone as far as that. In fact our system of Local Self-Government is so different from that of Great Britain that it would not fit in with a Local Government Board, although I really think we need it.

21416. In answer to the Chairman you have said that there is great deal of interest in public health shown by the people. Do you see a decided change in their attitude?—There has been a tremendous change in the last ten years.

21417. Do you find the same change in the local bodies?—Yes, very much.

21418. Do you think the impetus came from the Government?—Possibly I flatter myself, rather I pride myself, one being one of the main agents in having assisted the growth of that movement in Bengal, and I am a representative of Government.

21419. May I ask you whether there is continuity of policy pursued by these local bodies, District Boards or Union Boards?—It is rather difficult to answer that unless I have a concrete example.

21420. Say one chairman is keen on supply of drinking water in the rural areas, and after three years of his tenure of office, he ceases to be chairman and another man comes in whose main interest is perhaps in roads and communications. Have the District Boards, as organisations, laid out a definite policy for five or ten years?—I do not think that has been done. I think possibly here and there recently a District Board may have done that sort of thing. I know I have myself made suggestions as to the advantage of such a policy.

21421. Therefore, I take it that there is no continuity of policy?—I doubt very much, except the sort of natural continuity which is secured by the fact that it is much easier to run in a groove than depart from it.

21422. You say public interest in public health has been created. What is the attitude of the Legislative Council towards the whole question of public health?—On the whole, the Council has been sympathetic towards public health matters. I remember I was not quite certain whether the Public Health budget was going to be thrown out; instead of that it was passed. I consider that we have been dealt with gently by the Council.

21423. With regard to the Hook-worm Commission, do I understand that the Council's attitude was not favourable?—I am rather inclined to think that the Hook-worm Commission was shut out by the Council previous to the first Reformed Council. I think it was a Standing Committee that was dealing with it. But I know medical men disagreed; they did not think that there was hook-worm disease in Bengal. They were largely responsible for stopping that.

21424. So, in the present Council, you never made public health proposals?—They are regularly put up. The Director of Public Health does not put up proposals; he is not a member of the Council.

21425. As regards the attitude of the local bodies, are they prepared to tax themselves for public health advance?—The co-operative movement has been instrumental in inducing the people voluntarily to raise money, in other words, to tax themselves.

21426. What about the attitude of the local bodies?—In a few of the Municipalities there is a certain amount of local taxation; a few of the Union Boards are raising money too.

21427. I see the point. They all realise the importance of having a good water supply, better roads and so on. Do they also realise that they cannot get 9 annas worth of comfort by paying 4 annas?—They always try to see what they can get by asking; that comes first.

21428. With regard to dietary research, Sir Thomas Middleton elicited some answers from you. Do you find any change in dietary in Bengal for the last ten years?—I could not give statistical data, but my impression is that there is a decrease in the amount of *ghi* taken, a decrease in the amount of fish consumed, and a decrease in the quantity of milk taken.

21429. As regards Rai Bahadur G. G. Chatterjee's societies; are they really co-operative?—A vast number of them are.

21430. The small village societies?—The societies in the villages I visited a couple of years ago were doing excellent work.

21431. Does the initiative come from within or from Calcutta or any other urban centre?—Originally the initiative for the whole of this movement came from Rai Bahadur G. G. Chatterjee. As I remarked to Mr. Gupta, there are now other societies springing up

Dr. C. A. Bentley,

exactly on the lines he initiated, but they have got no connection whatsoever with him.

21432. Can you now consider this movement organic?—Yes; it is a movement which will not rise and fall with one man only, but can may by his energy and enthusiasm make a great deal of difference.

21433. Do you find the members of these societies developing, if I may say so, a brilliant conscience?—Some of these societies die out; some of them as a matter of fact retain vitality and are doing wonderful work. One of them which was organised as a health society in a village about eight miles away from Calcutta is at the present time on the verge of dying out because the people in the vicinity who are cultivators and depend upon the cultivation of *pau* are in the last straits because there has been a *pau* disease for the last three years.

21434. Do you think this movement has taken root in the rural areas or do they depend upon Calcutta?—Movements like this must depend upon people from Calcutta, if they do not get encouragement from Calcutta it is very easy to kill them.

21435. You think it has taken root in the villages?—Yes.

21436. There are now about 1,000 societies; supposing we take about 50 members per society there will be 50,000 numbers?—No; many of them are smaller than that.

21437. Do you find any change in the habits of the members?—I have seen villages which have been cleared up by the members; they have even cleared the village drains themselves by their own labour. That is something remarkable for Bengal villages to do. They cut down bushes and shrubs and sprinkle kerosene oil over stagnant pools.

21438. Do you consider their work efficient? Do you think the question of malaria can be adequately dealt with in this piecemeal way?—In one of the notes I circulated I refer to this very subject. I myself am not at all convinced by careful investigation that the so-called jungles have very much to do with malaria. I have opposed Government cutting down jungles with a view to reducing malaria, but I will not prevent the village societies cutting down the jungles.

21439. That has an educational value?—Yes; it is not merely for malaria, but it is for other things. If they cut it down, it may not reduce malaria, but it will do no harm.

21440. The whole question of malaria in Bengal cannot be solved by just cutting down a few trees here and there or sprinkling kerosene oil over the stagnant pools?—I do not believe this movement by itself is sufficient, but, on the other hand, I do not believe that we can tackle malaria without it.

21441. With regard to baby shows, do the women-folk attend them?—Yes; the amount of interest shown by women in it is rather surprising; for the *pardah* women we made special arrangements and they came down in crowds.

21442. Do you know the results of your propaganda?—We have no means of testing; it is only time that can show.

21443. With regard to the trained *dais* that you have referred to, are they not mostly Christian converts?—Those that I am speaking of are village *dais*.

21444. What about their religion; are they Hindus?—Hindus mostly, or Mussalmans, as the case may be.

21445. A great deal of discussion took place this afternoon about Village Union Boards; am I right in thinking that you do not seem to be in favour of village Union Boards?—I have explained it in the note, of which the Secretary has asked me to submit copies, but it is not for definite publication. That note will give you my views, and I think it will answer some of the questions which the Chairman asked me. The Commission might read that note; it gives my views and reasons. I do not think that what has failed practically in almost every country where such a movement has grown, will succeed in India. It has failed in Italy, it has failed in France, and so on, and it has also failed in Great Britain. I do not think it can succeed here.

21446. You will agree with me that we have got to strike at this substratum, some unit, for reconstruction?—Yes.

21447. What would be the suitable unit for rural reconstruction in Bengal?—That is the point. I am in favour of a system of *ad hoc* authorities. I would like to see not merely one body dealing with a multiplicity of functions; I believe we should have Local Boards dealing respectively with sanitation and public health matters, and other boards dealing with education, and so on. I believe that it is only by a system of that sort that we can hope to achieve some success.

21448. You have got a Sanitary Board in the Province?—The Sanitary Board is for the Province as a whole. What I want is a smaller local sanitary board of health, for

Dr. C. A. Bentley.

an area of the size of, say, a *thana*, charged with sanitary authority, responsible for public health in that area, and employing a small staff for the purpose.

21449. In this printed note, you make a reference to fruit cultivation and also pisciculture. At any time, did you sit round a table and discuss the problem of fruit cultivation and pisciculture with the Director of Agriculture?—We may have discussed the question of fish, but I do not think we discussed the question from the point of view of pisciculture. A few years ago, when I was taking up the question of the relation of fish to mango breeding, I got some suggestions from the Director of Fisheries; the Director of Fisheries is also the Director of Agriculture.

21450. Do you meet the Irrigation Department sometimes?—We have to do a good deal on behalf of them; we constantly exchange information and assist one another mutually.

21451. *Mr. Kanai:* You said cholera could be wiped out within three years if certain measures were taken?—Yes.

21452. I have also heard a very pathetic story that a good many schemes for rural welfare are held up for lack of finance?—Yes.

21453. At this late hour, I want your opinion only on one point. From your observation of the economic condition of the people and your study of agricultural statistics, do you believe that there is prosperity, considering the present prices which the cultivators get for their products?—There was prosperity last year in Eastern Bengal, when the prices of jute were high, but I understand that there is no longer the same prosperity, and that the price of jute has fallen.

21454. It would not be fair to single out a particular year; I want your opinion generally. Can you say whether, during the last five or ten years, the people are economically rather going down or whether there is some sort of prosperity, whether there is some margin left for them economically?—You mean to say for a term of years?

21455. Say during the last seven or eight years; I would not go far beyond that?—I am afraid I would not like to give you a definite opinion in regard to that, unless I had the opportunity of examining the whole lot of existing statistical data. Provided I could have the time and I could examine that data, I could give you a very definite answer.

21456. I am asking you whether you have any impression on this point. I want to know whether there is, really speaking, unwillingness on the part of the people of this Province to raise additional revenue to save millions of lives from cholera and malaria?—If you ask me that question it is a very difficult matter to raise money in Bengal; the cultivating classes do not ordinarily possess very much money; even when they possess products, they have to sell them for money. Money to the cultivating classes is not what money is to us; they have to purchase money when they require it; money to them is a commodity which they must buy with their produce. That is not enough understood very often on this question of taxation. When we had the system of licensed vaccinators in Bengal, the vaccinators were allowed to exact fees; that was considered an immense hardship by the people, and often enough the vaccinators found it exceedingly difficult to get their fees. Anybody who is familiar with Bengal and who has gone about in the villages knows that if you want to raise a given amount of money from a man, you will find perhaps very great difficulty in doing it; the man has got to go and get it from the *mahajan*, because he has not got it in his hands.

21457. You have just now said that the average amount which a man pays is about 4½ annas for the local areas and about Rs. 2 per head is the general revenue of the Province?—No, excuse me; I said that the total revenue of District Boards is only 4½ annas per head of the population in the area, that is to say, the total income.

21458. And Rs. 2 per head is the general revenue of the Province?—The Province gets Rs. 2 per head as its share of the total amount of revenue raised.

21459. My point is not whether it is Rs. 2 per head or something more or less. I ask you whether there is any margin, from which the man can afford to raise the revenue from Rs. 2 to some higher figure?—If the price of agricultural produce rises, they can do it in the rural areas; if it falls, they will find it exceedingly difficult.

The subject requires closer investigation.

(The witness withdrew.)

The Commission then adjourned till 11 a.m. on Monday, the 6th December, 1926.

Dr. C. A. Bentley.

Monday, December 6th, 1926

## CALCUTTA

## PRESENT :

The MARQUISS OF LINLITHGOW, D.L. (*Chairman*).

Sir HENRY STAVILEY LAWRENCE, K.C.S.I., I.C.S.	Mr. H. CALVERT, C.I.E., I.C.S.
Sir THOMAS MIDDLETON, K.B.E., C.B.	Raj. Sri KRISHNA CHANDRA GAJAPATI
Rai Bahadur Sir GAYDA RAM, Kt., C.I.E., M.V.O.	NARAYANA DRO of Parlakumedi
Sir JAMES MACKEWNA, Kt., C.I.E., I.C.S.	Professor N. GANGULLEE.
	Dr L. K. HYDER.
	Mr. B. S. KAMAT.

Mr J N GUPTA, I.C.S.,	} (Co-opted Members)
Rai A C BANTRAJI Bahadur	
Mr. J A MADAN, I.C.S.,	} (Joint Secretaries).
Mr F. W. H. SMITH	

Mr. G. MORGAN, M.L.C., Proprietor, Morgan, Walker & Co.,  
Calcutta

## Replies to the Questionnaire

QUESTION 4.—ADMINISTRATION.—(b) I consider that each Province should have a complete expert scientific staff of its own. It is not necessary to specially increase the scientific staff of the Government of India. Provinces vary so considerably that the provincial staff could deal with their requirements more effectively. The Government of India can act as a co-ordinating body.

(c) (i) Yes, so far as it is possible at present.

(ii) Yes, except where the railway is apt to starve stations where there is no steamer competition.

(iii) No, there are not enough roads owing to the District Board's fear of increased taxation and to a considerable want of interest. In lower Bengal water ways take the place of roads to a considerable extent.

(iv) Yes.

(v) Yes.

(vi) Yes.

QUESTION 5.—FINANCE.—(a) I consider that only in co-operative credit societies can the better financing of agricultural operations be done, and short and long term loans be given on advantageous terms.

(b) I can explain one difficulty when giving oral evidence.

QUESTION 6.—AGRICULTURAL INDEBTEDNESS.—(a) (i) Marriage ceremonies, *pūjah* celebrations, death ceremonies, seed and cattle purchase generally require considerable borrowing.

(ii) The local moneylender principally and co-operative credit societies to some extent.

(iii) Low prices for produce when there is over-production.

(b) Land mortgage banks might be established, preferably co-operative, to free the cultivators from their mortgages.

QUESTION 10.—FERTILISERS.—(a) Yes, but the cost is practically prohibitive.

(b) Laws can be passed, but adulteration is prevalent in most trades and very difficult to prevent. Only very flagrant cases can be dealt with.

(c) No method would be of any use unless the cost were low enough to enable cultivators to use them freely.

(d) I do not know of any.

(f) This is a necessity and should not be discouraged, unless a substitute could be supplied at practically a gift price.

Mr. G. Morgan.

**QUESTION 11.—CROPS.**—(a) (i) The existing crops are quite all right for this Province. Experts can investigate the question from a pure seed point of view.

(ii) Bengal grows a great variety of crops. Now crops are not necessary but fodder crops could probably be grown on parts of high land during the rains and on other lands during the cold and hot weather.

(iii) This is a very big question but the Agricultural Department is doing its best to make the ryots familiar with good tested seed. I suggest that the co-operative sale and supply societies should be made the local distributors for the Agricultural Department.

**QUESTION 12.—CULTIVATION.**—(i) The present systems are suitable for the land and conditions prevailing.

(ii) The cultivator is quite alive to the question of rotation of crops where it is feasible.

**QUESTION 14.—IMPLEMENTS.**—(a) The implements at present in use are suitable for existing conditions. I know of no new implement or machinery which would be of any use in Bengal.

(b) None.

(c) I know of none.

**QUESTION 16.—ANIMAL HUSBANDRY.**—(a) (i) So far as Bengal is concerned, it is difficult for cultivators to keep a decent breed of cattle owing to conditions during the rains, and having regard to the cost of feeding.

(ii) I would draw attention to the action of the Corporation of Calcutta in this respect. The Corporation has subsidised the Milk Union but I do not know whether the milk reaches the consumer in a pure state.

**QUESTION 17.—AGRICULTURAL INDUSTRIES.**—(a) Cultivators generally begin to prepare their ground in the end of January and during February, according to weather conditions, and from that period their time is fully occupied with jute, and paddy seedlings, till the jute crop and out paddy have to be harvested. After this, the harvesting of aman paddy comes on. During the cold weather, various crops are grown and go on until the ground has again to be prepared for jute, and paddy seedlings. One crop areas, such as Backerganj district, may have a period of unemployed time. This may account for administrative troubles in the said district.

(b) I cannot suggest any other subsidiary industries than those which are being done at present.

(c) These industries are more or less being carried on at present and there are no obstacles in the way of expansion, except the difficulty in selling at a profitable rate.

(d) All these industries are practically in existence where it is possible to work them at present.

(e) This I consider is not possible generally, as industrial concerns require whole-time and skilled labour.

(f) There is no actual unemployment in rural districts, so far as I know.

(g) Even in large towns amongst educated people this is difficult to attain.

**QUESTION 20.—MARKETING.**—(d) There is very little that the people engaged in agricultural pursuits upcountry do not know about markets. Even the state of the London jute market is known in the villages in Bengal.

**QUESTION 22.—CO-OPERATION.**—(a) (i) Government supervision and audit is absolutely necessary, and adequate staff must be provided for this purpose. Each society would have to be started by Government so far as rules and regulations are concerned. The actual working of the society must be done by the members themselves through managers and boards elected in accordance with their rules and regulations.

(ii) No, there will be no confidence in non-official agencies.

(b) (i) As the greater portion of rural areas is unsuitable for ordinary banking operations, the co-operative credit societies are the only channels through which the money in the hands of cultivators can be secured for general operations.

(ii) These should be successful in supplying in bulk articles necessary for village requirements such as corrugated iron, kerosene oil, puice-goods, rice, etc.

(iii) This is quite a new movement and if there is proper administration and close supervision in the rural centres it should prove successful.

**QUESTION 23.—GENERAL EDUCATION.**—(b) There is no method I can suggest, as an agriculturist will lose interest in the land as a business, in which the work has to be done by himself, if he once takes to education higher than the three R's.

Mr. G. Morgan.

I, v 13-18

QUESTION 24.—ATTRACTING CAPITAL.—(a) It is difficult to suggest where more capital and enterprise could be placed so far as area is concerned. The density per square mile is at present more than it should be. More capital could no doubt be employed but the question is could it be done profitably?

(b) What is meant by "owner"? A zamindari can be owned by many people. Joint ownership makes any co-ordination for the improvement of properties almost impossible. Zamindars' main interest is centred in the collection of rents.

QUESTION 25.—STATISTICS.—(a) (i) Unless the whole Province is cadastrally surveyed it is almost impossible to obtain anything approaching correct figures.

(ii) The Agricultural Department claim to do this fairly successfully by tests of crops taken from the fields in various districts.

Mr. G. Morgan.

## Oral Evidence

21460. *The Chairman* : Mr. Morgan, you are proprietor of the firm of Morgan, Walker & Company?—Yes.

21461. You have given the Commission a note of the evidence which you wish to lay before us?—Yes, I am only sorry that it is not so full as I should have wished. I have done my best to give as much information as possible but I have not been able to do justice to it. I did not wish to give evidence but I was told I could not withdraw my name. I had really been too busy to go into any details.

21462. Do you wish to make any statement at this stage or shall I proceed to ask you a few questions?—I have no statement to make.

21463. In answer to our Question 4 (b) you give it as your view that each Province should have a complete expert scientific staff of its own. What is your impression about the co-ordination between Province and Province?—I should think that between Province and Province it ought to go through a central body.

21464. So that you think that the central body would be useful in co-ordination?—Yes.

21465. Would you also suggest that a central research department might well address itself to the problems which are in the main of a fundamental character? There are certain problems which are of general application. Are there not?—I think you want a central body for both but it should be only a co-ordinating body.

21466. Would you amplify a little what you mean when you say in answer to Question 4 (c) (ii), "Yes, except where the railway is apt to starve stations where there is no steamer competition."?—We have got some stations which are entirely served by the railways. The natural feeling is, of course, to supply us with wagons if they have them. I might first explain that jute is a seasonal commodity and therefore there is a tremendous rush for wagons for it. The busy season lasts only for about three months in the year. They might be inclined, I cannot say if it is a fact, to keep the stations in which there is competition better supplied than others. I have been on the Eastern Bengal Railway Advisory Committee and during the last two or three years I have not found any real difficulty in any of the stations so far as the wagon supply was available.

21467. Whom did you represent on the Railway Advisory Committee?—I was one of the representatives of the Bengal Chamber of Commerce. There are two representatives from that Chamber.

21468. Who represents the growers?—There are five or six Indians. Mr. Gupta is one of them. They represent Indian interests.

21469. Are there not elected Members of the Legislative Council who are members of this Advisory Committee?—I think they have got a number of them. The Corporation has got a member and the Indian National Chamber of Commerce has also one.

21470. Do you ever have complaints from the growers on that Committee?—Not from the growers themselves. They could not very well get through to us but we receive their complaints through the people who want to ship jute. These are the people who bale jute at the centre where the railway station is.

21471. On the whole you think that the railways give you satisfactory service?—I think so.

21472. It has been alleged before the Commission that railway wagons are sold by local stationmasters or the persons who are in authority at goods yards. Have you ever come across cases of that sort?—I could not give you any specific cases but it is a general idea that wagons can be got by other means than registration.

21473. How about the supply of wagons?—The supply of wagons is a difficult question because, as I said before, jute is a seasonal crop. You cannot expect any railway to give the full supply of wagons in a period of about three months. The registration is done in such a way as to take off as much jute as is possible from the presses. This is done during August, September and October. The railways are very hard put to it at that time and one of the difficulties is the turning round of wagons at this end. The broad gauge wagons are sometimes held up by all sorts of things and they are not always turned round to the centres where the railways themselves would like to take them. People do not unload in time.

Mr. G. Morgan.

21474 Is the difficulty inherent in the provision of sufficient railway trucks to deal with the seasonal crop? Do you think the railways do reasonably well?—I do.

21475. On page 272 of your note in answer to Question 5 (b) you say that you can explain orally to us how it comes about that cultivators are not always very ready to take advantage of the Government system of *taccari*. Could you please tell us what it is?—That is purely a story. It applies to most of the things. I can not give places or names because it is only a story. Some years ago a Deputy Commissioner was not satisfied that the men who took the *loti* got their full amount. So he said he would do it himself and he did it himself. With his own hand he wrote "Money given in the name of advance" and gave out the *loti*. A short time afterwards one of the people who got money came back and put Rs. 5 on his desk which annoyed the Deputy Commissioner. He said, "What is this? Take it away." The man said, "This is for you." He said, "No, no. Take it away." To make a long story short, the Deputy Commissioner asked him what was his explanation. He said, "A short time ago you gave me Rs. 10 *loti* and I have only got Rs. 5 left and I have not been outside the compound. It is of no use to me and so I will give it back to you." That covers a wide area but it is merely a story.

21476 Sir Henry Lawrence: Is that a verified story or mere go-by?—That is an old story.

21477. The Chairman: Beyond that you do not wish to say anything on the question of *taccari*?—No.

21478. Are you familiar with the agricultural side of the jute industry?—Yes, fairly familiar.

21479. Is it your view that fertilisers might be more generally used with advantage?—The low land jute that comes under water has its own fertilisers in the shape of silt. The difference between low land, middle land and high land is only a question of a few feet. It is not a question of hundreds or thousands of feet. Most of the jute land comes under water. Most of it is covered with river water and the whole of the Brahmaputra water goes right down from the north to the south over the whole of the low land of Bengal and all that silt is a fertiliser in itself. I do not suppose for a moment that it would be of any use putting on artificial fertilisers because the floods would wash them away.

21480 Sir Henry Lawrence: Is jute grown in running water?—The whole of Lower Bengal is under water; it is moving of course all the time but not like a stream.

21481. The Chairman: Would you now turn to page 273 of your note, in answer to our Question 20 on Marketing. Have you yourself examined the avenues of distribution from the grower to that part of the market with which you are familiar?—Yes, I know it.

21482. Would you describe precisely what takes place when a cultivator's crop is ripe? How does he pass it on?—The cultivator, whose crop is ripe, is approached by the smaller man who goes from house to house, and collects small quantities and sells his produce at that particular time. This smaller man supplies the bigger *bepari* who collects in larger quantities and takes it to bigger centres.

21483 Is the purchase outright by the primary collector or the small man?—So far as I am aware, yes.

21484. He does not act as a broker or commission agent?—He might act as a commission agent to the *bepari* but as far as I know he buys the stuff outright.

21485. And he sells it to the big man?—Yes, he sells it to the *bepari*, and the *bepari* brings it into larger centres such as at Chasodpur and other places. If he is advanced money by the *baler* himself, which used to be the universal practice, then he goes straight to his godowns. If he is advanced money by an *aradhar* and if the *aradhar* is going to take his commission, then he has got to go to the *arat* of this man and sell his jute where he is ordered to go. If he is connected with an *aradhar* he cannot go to any godown he likes.

21486 Sir Henry Lawrence: What is an *aradhar*?—A moneylender who has godowns which he lets out on hire for depositing goods in; he also charges a commission for arranging the sale of the *bepari's* goods, and so on.

21487. The Chairman: He is a commission agent in that sense?—Yes. He used to advance money to practically all the *beparis* in the jute trade.

Mr. G. Morgan,

21488. Does that mean, that practically speaking, the *aratdar*, through the *bepari*, finances the cultivation of jute?—No, he finances the *bepari* to bring in a certain quantity of jute. If he had a boat of 1,000 maunds and the price was Rs. 8, the *aratdar* would advance Rs. 4 a maund on the boat's capacity, and when the boat came in he would pay him according to the market rate and less commission.

21489. Who finances the cultivator?—The local moneylender and the co operative credit society.

21490. Is the small *bepari* the same as a moneylender as a rule?—No, moneylending is generally a trade by itself. I fancy the Marwaris in Western Bengal and Assam advance a good deal against the crops.

21491. Is it really the case that a Marwari, if as a moneylender he has advanced money to a cultivator, stands aside when the crop is ripe and allows a small *bepari* to come in and purchase the crop from the cultivator?—Not if he has advanced against the crop. That is done in Western but not in Eastern Bengal.

21492. Let us take Western Bengal first. What happens if the small *bepari* has advanced money against the crop?—Then the other man will not have advanced as well. They will not both have advanced against the crop.

21493. Where a Marwari has advanced, does he take the crop himself?—He works on the system of a certain percentage of it. There is what we call the *burga* system, which is half the crop against a certain amount of money advanced. He has a lien on the crop if he has advanced money against it.

21494. Do you know at all what the effect of those conditions may be on the price obtained by the cultivator?—I think they may have a tendency to make the price he gets lower than it would be if he was free.

21495. How far is the price to the cultivator fixed by supply and demand, and how far is the bargaining power of the cultivator affected by the fact he has borrowed money from these people?—I should say on the whole it is governed by supply and demand.

21496. Even in cases where the cultivator is in debt?—Yes.

21497. Is the price of the raw material at the cultivator's end of the chain of marketing a thing which is well known by the cultivators?—I think so.

21498. Do you think the cultivators are in touch with the market?—I think the cultivators are in touch with all the local markets, and the local market's information comes straight through from Calcutta.

21499. Do the large firms dealing with jute ever buy direct from the cultivator?—Not as a regular business. At one place I was at, a small *dinghy* would occasionally come in from somewhere close by and sell his jute, but that was not the way the business was ordinarily done; it was mostly done through the bigger *beparis*.

21500. Probably there is not enough jute bought from the cultivator by buyers for large firms for the practice to have any effect on the price the grower obtains?—No.

21501. Can you tell the Commission anything about the margins on which these various intermediaries operate?—The intermediaries do not always make a profit, of course, but supposing it is on a profit basis we usually calculate that the difference between the price at Calcutta and the village price is from Rs. 2 to Rs. 2 8. That includes all the charges to land the jute in Calcutta.

21502. *Sir Ganga Ram*: Is that per maund?—Yes.

21503. *The Chairman*: One question about the *aratdar's* godowns. Does the jute lying in one of those godowns still belong to the *bepari*?—He does not take it out of his boat and load it in a godown unless he wants to store his jute and go back for more. What happens is that the boat comes alongside the office of the *aratdar*, and the man waits there until he gets instructions to go to A, B, or C's godowns, wherever the *aratdar* has his business connection.

21504. Where is the pressing done?—In those premises. They land the jute, put it in the import sheds and then it is bought and passes into the assorting sheds and so on to the press house.

21505. Have you experience of the co operative selling of jute?—I have just begun to get experience.

21506. Have you had sufficient experience to come to any view about it?—Of course, it is on its trial at the moment. There are great possibilities in it, and

Mr. G. Morgan.

there is no reason why it should not grow every year, but the upcountry administration must be good and well handled to make it a success.

21507. You have described the chain of intermediaries who handle the jute under non co operative arrangements. Which of these intermediaries is cut out by the operations of the co operative society?—I take it the co operative societies will arrange their own transport. It is transported from the village to the centre of pressing which is the important point. If they have their own co operative people to do the transport and arrange for their own boats, they can carry it straight into the centre. That, I take it, is what it is ultimately hoped to do under the co-operative system.

21508. What plant have these societies? Have they their own godowns?—They have hired godowns in two or three places.

21509. Have they their own presses?—The presses and godowns are one.

21510. They always go together, do they?—Yes.

21511. The co operative societies are taking their jute into the final market?—Yes, to supply it to the mills here.

21512. But it is early yet to give any firm view about it?—I would not care to give any final view about it now. It is too novel; they are simply feeling their way.

21513. Have you any idea what it means to the cultivator in terms of better prices?—It will mean, of course, that all the money from start to finish will go to the society. The *bepari* might buy at a certain price and on a rising market bring it in and get the benefit of that rise, but markets are not always rising; there is always the chance of a falling market. I take it the co operative idea is that the cultivator has the jute in his hands from start to finish, and he can sell when he likes and hold when he likes.

21514. Who takes the trading risk in the case of the co operative society?—If the cultivator is a shareholder in the business, he will take it.

21515. He takes the risk in so far as he is a shareholder, but not as an individual?—The co operative idea, I understand, is that he becomes a shareholder and takes the risk one way or the other; if there is a profit, he gets it; if a loss, he has to bear it.

21516. It makes a good deal of difference whether he obtains the market price as a cultivator, and a dividend or bonus if the society makes a profit, or hands in his jute, obtains a percentage of the estimated price, and gets the balance when it is seen what price the jute actually fetches on the market?—I do not know whether they are going to work right down to the cultivator, or whether the central societies are going to take that risk.

21517. You give us an opening to ask you one or two questions on the subject of the welfare of the rural population. Is there any branch of that subject with which you are particularly familiar?—With regard to villages in the mofussil the main things are drinking water and medical aid. The housing they do themselves; as to hygiene, a great deal is swept away every year with the floods.

21518. Have you considered the practical steps which might be taken to improve the water supply?—Tanks are about the only thing in lower Bengal. In the high lands which are not subject to floods something might be done with the tube wells, especially in the higher places. In most villages tanks are the only thing except in the high lands, where a cheap form of tube well might be used. Tanks must be kept clean and clear, and in the case of wells it is necessary for the water to be carefully tested, because if they ran into bad subsoil water they might all be poisoned. I think the tank will be quite good in Bengal provided there is no contamination, *i.e.*, so long as it is carefully guarded by the people themselves. I think (b) of your question is a matter which could very usefully be undertaken. An economic survey of a typical village in Eastern and Western Bengal might be made. I do not know what the agency should be; they have their own *panchayats* now, and certain officers under the Village Self Government Act passed last year. Where there are co operative societies, it might be done through them.

21519. With what accuracy is it possible to forecast the general trend of movement in the jute market sufficiently far ahead to assist the cultivator in deciding how much of his land he is going to put under jute?—We had a long discussion on Saturday with His Excellency in connection with the jute forecast. As it is at present the cultivator gets a high price one year, and thinking it is going to last

Mr. G. Morgan.

he sows too much; then he gets a lower price, and he cuts down his area. That has been my experience of jute. But the suggestion might be made that the Director of Agriculture might be able to give information about the extent of the old crop in the hands of manufacturers, that is to say, whether they have a three months' stock, four months' stock, and so on, of the raw material in their godowns from the crop which has been held over. That should be made known in January, because they have to begin to sow the jute in February. If that stock was known to the cultivator he might be able to keep a more or less constant sowing, unless one man wanted to sow more than his neighbour.

21520. The consumption of jute is more or less stable?—Everybody knows what the consumption of jute is; the figures are available to anybody, and it is practically stable.

21521. Under existing conditions does anybody know how much jute there is in stock?—You mean in manufacturers' hands?

21522. Yes?—A statement is issued every month. The mills know that. In France, Germany and America they collect these statistics.

21523. And publish them?—I do not know whether they publish them abroad; but they are known to the trade.

21524. So that all the essential facts, which are required in order to be able to give the cultivators an idea as to the probable trend of prices, are available?—They are available.

21525. It is only a question of putting them together and placing them at the cultivator's disposal?—Yes.

21526. In your opinion, would that be a good service to render to the cultivator?—I do not see why he should not understand it. There is no reason why the rural areas should not know what the stock is that is being carried forward out of a big crop or a short crop. What we should like to aim at in jute, although it would do away with the gambling element in the trade, is to have a more or less constant stable supply which we put down at 90 lakhs of bales per annum. This year's estimate is about 108 lakhs. The thing is, in jute, if you get a little over the actual requirements of the mills you get a very much larger proportionate fall in prices.

21527. How long have you been in the trade?—I have been 37 years in India and another four years in Dundee and London.

21528. Do you think the market is more, or less, stable now than it was thirty years ago?—There is a much more speculative element now.

21529. There is more variation in prices?—There is quicker variation in prices. In the early days it fluctuated, but with nothing like the rapidity with which it fluctuates now.

21530. *Sir Henry Lawrence*: You have been working upcountry, I understand?—Yes, for some years.

21531. Do you know the sanitary condition of upcountry towns? You were Chairman of your Municipality?—I was Chairman of the Narayanganj Municipality for many years.

21532. Are the sanitary conditions of upcountry towns satisfactory?—They were quite satisfactory.

21533. Do you get a local supply of sweepers in this part of the world?—Yes.

21534. Have you a regular caste of sweepers?—Are you talking of the rural areas?

21535. Yes?—There is a sweeper caste.

21536. Not only in the Municipalities but also in the villages?—I presume the villages have their own sweeper caste, but I have never gone into that question. In the Municipalities they have their own sweeper caste.

21537. Indigenous or imported?—Some of them are imported; some of them come from Bihar, I think; I do not know where they come from, actually; but there is a lot of imported sweepers.

21538. Imported from what part?—In the Municipalities they come from Bihar or the United Provinces; I cannot tell you from where exactly.

21539. So, to afford effective sanitation you have to depend on imported labour?—For Municipalities, yes. I think I am right in saying that.

Mr. G. Morgan.

21540. You do not know whether those men are available in the smaller villages?—Not to any extent. After all the sweeper's work in the village does not extend to much. As regards the municipalities it is, of course, different.

21541. In other parts of India sweepers are imported from villages into Municipalities—Are they?

21542. You spoke just now of the need of dispensaries which do you regard as more important—medical aid given through dispensaries or sanitary measures?—They are both important. These village people are always clean. As a rule the village is kept comparatively clean, although outside the village you find a lot of rubbish lying about. The people themselves keep their houses very clean indeed. They are very clean in that way, but the cleanliness does not extend very far away from the house. We have periodical flooding out every year in the lowlands.

21543. In your own Municipality of Narayanganj, do they spend more money on dispensaries or on sanitary measures?—I could not tell you the figures. We had sanitary measures and we had a hospital.

21544. Does any considerable proportion of the population take advantage of that hospital?—Yes; it is very well attended. As you know those hospitals are dispensaries as well as wards; they always combine the two.

21545. There is no prejudice in that town against Western medicine?—Not that I know of.

21546. Do not people prefer to go to *hakims* or *vaidys*?—That is a more modern movement; it was not the case in my time, it is an outcome of the last ten or fifteen years.

21547. *Sir Ganga Ram*. Your firm is a firm of brokers?—Yes, jute brokers.

21548. How many jute broking firms are European and how many Indian?—I do not know how many Indian jute broking firms there are.

21549. How many are European?—I should think, if you exclude the jute balers who broke their jute themselves there must be about 20.

21550. You do not know how many Indian firms there are?—No. I could not tell you.

21551. Can you not give a rough idea?—No.

21552. Are the fluctuations in the price of jute very violent from day to day or only occasionally?—It all depends on the market.

21553. I know something about cotton, but not about jute in Bengal?—It is very similar. If you know about cotton, you know what jute does.

21554. Are the fluctuations very violent or only occasional?—Sometimes they are very violent and sometimes they are not. For instance, the market at present has been more or less within a very small margin for the last six weeks. Last year we did not know whether it would be Re 1 or Rs 2.

21555. Are these prices published in the papers?—Yes, people know the market rate.

21556. They say the fluctuations of the finished article are published, but not of the raw material?—If you see the *Statesman*, you will see the fluctuations of the raw material from day to day.

21557. Is there any system of marketing where the fluctuations are published by the Director of Agriculture?—You mean daily?

21558. Yes; we have that system in the Punjab?—We have not got that system.

21559. Do your agents keep up to date knowledge of fluctuations?—Which agents?

21560. The agents who sell on behalf of co-operative societies to the mills. We were told yesterday there are societies whose agents' business is to negotiate with the mills?—Have they an agent in Calcutta?

21561. Yes, the village societies have an agent. That is what Mr. Mitra told us?—The village societies, I understand, appoint their own managing committee.

21562. Where?—In their village or group of villages. I understand that those groups will appoint a central managing committee in big centres like Chandpur and Narayanganj, and they will appoint an agent in Calcutta. But mind you, this is more a future than a present arrangement. I understand that is what they are doing, but I do not know exactly.

Mr. G. Morgan.

21563. You know the fluctuations from hour to hour?—It is our business to find them out, if possible.

21564. Can you tell us what proportion of your jute is exported and what proportion is consumed in the mills?—Roughly 55 lakhs are consumed in the mills and 25 lakhs are exported.

21565. Are you talking of export of raw materials or of the finished article?—I am talking of the raw material.

21566. Is the finished material exported?—The whole of the mills' finished material is exported.

21567. Not the whole; something is consumed in India?—Most of it is exported from Calcutta.

21568. What is the proportion exported overseas?—I do not know the proportion, but it is enormous.

21569. Is there any pooling system between mill managers? Do they come to an arrangement as to what rate they should buy at?—No.

21570. Is there any pooling system between the firms of brokers?—No.

21571. Each works independently of the others?—Yes.

21572. What is the depth of water necessary for the growth of jute?—If I may use a Bengali expression *jag*, if bundles of jute are put together in a *jag*, you want from 3 ft. 6 inches to 4 ft.

21573. Is that a necessity for growing jute?—Jute cannot be ready for fibre unless it is retted, and it cannot be retted unless it has got water.

21574. You stated to the Chairman that jute grows in very deep water?—It grows in all depths up to 8 feet of water; it grows even in 2 feet of water and less.

21575. Does it grow on high land?—Yes.

21576. In the United Provinces, they have started growing it on high land?—They are irrigating it there.

21577. Irrigation does not amount to 8 feet of water?—That is so, but you will not get it of good length unless you have a fair amount of water.

21578. The deeper the water in which it is grown, the greater the length?—A good proportion of water with favourable climatic conditions will certainly encourage a good jute plant.

21579. Is there no system here like the one we have in the Punjab for cotton? You know the grower puts the raw material on the cart, goes to the market and sells direct to the manufacturer?—Practically none; there may be a little of it up and down the river.

21580. He must sell it through the broker?—He does sell it through the broker; he cannot sell it direct. There are many things to be done besides the selling, there is the office work.

21581. You have no other middleman, who is neither the manufacturer nor the broker, but who simply advances some money, gets the jute, and after cleaning it sells it?—You mean the upcountry man who bales?

21582. I mean, in Bengal is there any firm of that kind?—I do not understand the question. First of all there is the buyer, then there is the broker who sells to him, and then there is the baler upcountry who sells the bales.

21583. *Dr. Hyder*: Sells to whom?—The baler upcountry is the seller to the mills, through his broker.

21584. *Sir Ganga Ram*: The mills have no baling presses?—Two or three of them have baling presses.

21585. I understand there is a middleman or a middle firm which advances money beforehand and simply takes the raw material, cleans it, and then sells it to the mills. Is that right?—I have not heard of it.

21586. Is there any association called the European Jute Dealers' Association?—There is the Calcutta Jute Dealers' Association.

21587. Are there any Indians in it?—No.

21588. Is there a similar Jute Association of Indians?—I do not know; as a matter of fact, they have got two associations, they are sellers.

Mr. G. Morgan.

21589. Have the European Jute Dealers' Association got any pooling system?—It is not the European Jute Dealers' Association; it is called the Calcutta Jute Dealers' Association.

21590. I asked whether this association has any Indians in it?—No. We sell; take our own firm, we sell native *mavari* jute on undersigned contracts; we sell *mavari* packed jute on undersigned contracts; that means that the whole liability is on us.

21591. Do you fix a forward rate?—It has nothing to do with that. The reason why this Jute Dealers' Association is in existence is because the Association has to take practically the whole of the risk of all the native jute that is sold to the mills.

21592. That is apart from the brokers?—We do the broking.

21593. For instance, is your broking firm a part of the Jute Dealers' Association?—We are members of it.

21594. You just now referred to the charge of Rs. 280, what does it represent?—Rupees 280 represents the charge for taking the jute from the village and landing it at the mill's jetty in Calcutta.

21595. What is the price of jute?—To day it is Rs. 10 in Calcutta.

21596. Does not that mean 25 per cent. loss to the grower?—It is not a loss; if he carries it himself, he has got to bring it to Calcutta.

21597. Carriage does not cost so much?—Some one has got to do it.

21598. Actually does it cost so much as that?—That is my estimate of what the intermediaries would expect to make out of the transaction, buying from the village and selling at the jetty of the mill. There is the steamer and railway freight, there is insurance, and all sorts of things.

21599. It has come to our notice that last year, for instance, although the price of jute was Rs. 30, the growers got only Rs. 20; is that right?—I could not tell you what the growers got.

21600. Could you not say roughly what they got?—Even roughly I could not possibly tell you what the growers got.

21601. Anyhow, the loss or profit out of the fluctuation goes to the European Dealers' Association, and the grower has nothing to do with it?—We have nothing to do with fluctuation at all; we are brokers.

21602. But you said you were members of the Dealers' Association?—We call ourselves dealers, because we give undersigned contracts on behalf of the native sellers; we have nothing to do with the fluctuations. One of our rules is that we must buy and sell at the prices offered.

21603. Who indulges in this speculation?—Gamblers in the market; the one in the Bhitir Bazar is the leading Association.

21604. Do they also advance money for the purpose of buying?—We are getting on to Calcutta markets and speculation, which has nothing to do with advancing money, you are rather off the line.

21605. Do these people, who you say are gamblers, advance money to the growers?—They have nothing to do with that part of the business.

21606. They do not handle the material at all?—You know what cotton futures are, it is the same thing.

21607. Sir Thomas Middleton: We have heard from the Irrigation Department that they spend a considerable sum on the water-ways of Bengal; are these water-ways of special importance to the jute industry?—They are absolutely essential.

21608. Is the carrying of the jute from the villages to the railways mainly done by water ways?—As a general rule; wherever there is a water way on any railway, it is a road; therefore, if any railway system is in the water way naturally that is used to carry on the stuff to that system.

21609. Are there water ways which carry jute from the producing districts right into Calcutta for example?—Yes, we have that.

21610. Is this mode of conveyance used largely?—I do not think it is used as much as it has been; there is only a very small proportion of it now.

21611. Are the commercial community which handle jute satisfied with the facilities offered by the water ways and with the work which the Irrigation Department is doing for them?—We have individual grumbles here and there. Up in

Mr. G. Morgan,

Elashin, which is a very big pressing centre on this side of the Brahmaputra, and where there are ten or twelve pressing firms exporting, *char* has formed up in front of the godowns, and that is delaying the export; the Government were approached on the point, but they said they could not do anything.

21612. My object was to get some sort of idea whether these complaints were frequent or not frequent?—I should not say that they are frequent.

21613. They are not of special importance?—Every year you may have individual instances, but as a general rule they are not of special importance.

21614. The water-ways are serving you satisfactorily?—Yes.

21615. You expressed the view that because of the deposit of silt, jute soils are not deteriorating: do I interpret your answer correctly?—I did not actually say that it was not deteriorating. I said there was no necessity for fertilisers.

21616. From your long experience, can you say whether there have been any indications of deterioration?—I do not think so.

21617. At any rate, deterioration cannot be proceeding at a rapid rate?—I do not think it is.

21618. From your answers on the question of stocks, I infer that the market for jute is not an elastic market. It is a narrow market, and you stated, I think, that the demand from year to year varied from something like 90 lakhs of bales to 109 lakhs of bales?—This year I said the crop was 108, but 90 lakhs is the normal consumption of the raw material.

21619. Whenever you get a slight over-production, there is immediately a very heavy drop in prices?—I would put it rather differently. For the actual amount which is consumed, it is necessary to maintain what the manufacturers would call satisfactory stocks, that is to say, a stock which will not force them into the market at an unfortunate time. Anything over and above that will certainly cause a heavy drop in prices, for the reason that 10 lakhs of bales is not necessary for the manufacturers' market, unless he buys it cheap as a speculation; he does not want it.

21620. The market is not an elastic one?—No, not in that sense.

21621. With reference to the subject of statistics, you say that the Agricultural Department claim to estimate the yield fairly successfully by tests of crops. I think you are aware that the making of these estimates is very difficult work?—It is very difficult.

21622. I was going to ask you whether the estimates of yield which are provided for you at present give a reasonable degree of satisfaction?—I think I would like to explain what I mean by yield; I meant the actual yield of the crop taken from the field. I am not talking about the acreage or about the extent of sowing. I am talking purely and simply of the actual crop taken off the field and tested in comparison with fibre, in terms of fibre produced. From what I know, the Agricultural Department carries out very extensive tests and quite satisfactorily, as far as the actual yield of the fibre from the jute is concerned. Provided they recorded it correctly when the test is being taken, there is no reason why it should not be absolutely correct.

21623. You know that difficulties have been created in the past by the backward condition of the cadastral survey?—Yes.

21624. That survey is now approaching completion?—Yes.

21625. Do you anticipate that when the Agricultural Department have the exact figures at their disposal, the present methods of estimating the yield are likely to be satisfactory?—Yes, if they have the money to pay for the staff; finance is one of the rocks, of course.

21626. *Dr. Hyder*: I would like you to tell me something about the Calcutta side of the jute market. I understand from your answers that in the organisation there is the cultivator who sells at the *hats* to small *beparis*, the small *beparis* sell to the bigger *beparis* and the bigger *beparis* then sell to the *halers* upcountry. I should like to know what happens to the jute when it gets into the hands of the larger *beparis* and the *halers*?—The larger *bepari*, if he is advanced money by a firm of *halers*, has to go to the godown of that firm because he has got a loan. If he is advanced money by an *aradhar* then he has got to go to the *aradhar's* office to take his instructions as to where he has to take his jute for sale.

Mr. G. Morgan.

21627. This jute when it arrives in Calcutta gets into the godowns of *aratdars* or wherever the godowns may be?—When you talk about the Calcutta bazaar, you are getting on an entirely different side.

21628. I want you to correct me. Let us say, Narayanganj. I understand that at Narayanganj you have got these *aratdars*. Are they Marwaris?—No, they are Bengali *aratdars*.

21629. What happens to the jute when it goes from the godown of an *aratdar*?—There is a special import shed for it.

21630. I should like to know what happens to the jute when it goes into the hands of the firm of balers or whatever it may be called?—I will give you the exact process it goes through. It is landed in an import shed, then it is priced according to the market price, then it is weighed and put into the assorting sheds. It is then sorted into grades and in due course baled and shipped and it then arrives in Calcutta. That is the whole process from start to finish.

21631. Where do you come in?—I am a broker. If the upcountry baler wants me to sell his jute, he gives me his offer through his bond in Calcutta and when I sell his jute he has got to ship it.

21632. *Professor Gangulree*. Is this *aratdar* a commission agent or a broker?—The broker of this loose jute upcountry is entirely separate.

21633. Who is the broker in the jute market?—I should say the jute broker is the man who prices the jute in the import sheds of the balers.

21634. *Dr. Hydr*: This is the trade side of the jute business. I should like you to tell me something about the speculative side also. How and where does that influence the market?—If there is a big speculation, it affects the minds of the sellers of the actual material. If the market is firm and rising the seller of the bales of jute generally hopes by holding the produce to have a higher market.

21635. Please tell me what proportion of the selling you control and what proportion is not under the control of the Calcutta Jute Dealers' Association?—I should think that the Calcutta Jute Dealers' Association include people who sell their own jute like the big Europeans. I suppose in a normal year their share will come to a little less than half. When you come to the total crop, it is just about one fourth of it.

21636. Let us keep our eyes fixed on the 55 lakhs of bales. I want to know what proportion of this total of 55 lakhs does the Calcutta Jute Dealers' Association control?—I should estimate about 25 lakhs but it is quite impossible to give you the exact figure.

21637. Who controls the rest?—The rest, which is about 30 lakhs of bales, must be done by the big European balers.

21638. They sell direct to the mills?—Yes, through their own offices.

21639. There is no direct selling by any associations or body of cultivators to the mills instead of to the balers upcountry in Narayanganj or Chumspur?—No.

21640. I would like you to tell me something about freights. You say you are prepared to give information orally about freights, sea freights as well as river freights. Let us first take sea freights. Are you aware that all the shipping companies which touch the port of Calcutta have an understanding amongst themselves as to freights?—I am afraid you are getting out of my line altogether. I said rates of freights connected with the selling of produce.

21641. Let us keep to the rates of freights between Narayanganj and the Calcutta jute mills on the bank of the Hooghly. Is the whole of this water transport or partly by water and partly by rail?—There is railway transport and steamer transport combined. There is the railway transport from Gouda then there is shipment right down to Calcutta in flats, which are towed by steamers.

21642. How many companies are there which do this business of transport of jute on the rivers of Bengal?—There are four companies.

21643. Do I understand that there is any combination among these or have they got varying rates?—They have got more or less fixed rates.

21644. You say that there is very little which the people in Bengal do not know about the state of jute prices?—I do not think I have said that.

21645. On page 273 of your note you say, "There is very little that the people engaged in agricultural pursuits upcountry do not know about markets. Even

Mr. G. Morgan.

the state of the London Jute market is known in the villages in Bengal"?—That is one part.

21646. Do you think they take advantage of their knowledge? It may be that they are in possession of the knowledge, but they may not be in a position to take advantage of it?—They must be taking advantage according to their own economic condition.

21647. Do I understand that fluctuations are numerous but that they are not large or violent? Is that the position?—I would not say that. What I said was that you can have very violent fluctuations in a very short time. This year the market is fluctuating very very little for weeks and weeks. Last year it fluctuated so violently on two or three occasions during a fortnight that it brought down the bale to the extent of Rs. 5 within an hour and a half.

21648. Please tell me something about the supply of jute to the mills. Is it a continuous supply, or do they buy once for all for the year, or is it by means of forward sales?—The mill buys its jute on contract and it naturally buys according to its own view as to what the market is and also according to the state of its manufactured goods. The firm has its manufactured goods in one book and the raw material in another book and it buys jute according to that book. They are buying for eight months in the year. They may buy some quantity of jute at one period of the year and a big quantity at another period of the year. Sometimes they sit out for two months and do not buy even a bale.

21649. *Mr. Gupta*: You said that as the majority of the land for jute is covered by silt deposits, it is not very necessary to have recourse to artificial means of fertilisation of that land. Do you think about half of the land under jute cultivation is covered by silt?—I should say more than half.

21650. But for the rest, I suppose artificial manuring is very necessary?—I really would not give an opinion about that because you know the difference between low land, middle land, and high land in Bengal. The high land, as you know, is not very high.

21651. It is a very important question. Do you think the land which is producing jute year after year requires any artificial manuring or not?—I should say jute is a very exhausting crop and therefore if it is sown on land which is not manured by silt, then an artificial manure of some description would be very beneficial and necessary.

21652. For instance, Northern Bengal is covered by silt but this is not the case everywhere?—It is also the case in Lower Bengal and practically the whole of Eastern Bengal.

21653. Even in the case of those tracts which are covered by mudallons and silt all that is required is not obtained, nitrogen, for example, which is very essential?—I do not know the analysis of silt at all, but I know it is very beneficial for the jute plant.

21654. If there are some elements not brought by silt, it is necessary to replace them artificially by cowdung, hyacinth or something like that?—Yes.

21655. You calculate at 25 per cent. the percentage of profit which goes into the pockets of the middlemen. Is that only for the handling of the jute, or does it include interest on borrowed money, where the cultivators borrow?—It would include everything down to the actual seller of the jute in the village, the ryot.

21656. *The Chairman*: Everything for trading, but not for cultivating as well?—Purely for trading, from start to finish.

21657. But not borrowing for cultivating?—No, nothing of that sort.

21658. *Mr. Gupta*: You think, therefore, that this co-operative organisation, which will probably do away with some of these intermediate channels of profit, will be a very valuable movement in Bengal?—I think it is.

21659. And from what you know of it you think it has come to stay?—Yes.

21660. *The Raja of Parlatinedi*: On page 272 of your note you say, "I consider that each Province should have a complete expert scientific staff of its own." Do you suggest they should be independent of the central body?—No, not altogether. They should be independent to a certain extent. My idea of the central body is that it should be a co-ordinating body for the provincial bodies, but the latter should have power to deal with their own affairs.

**Mr. G. Morgan.**

21661. But the various provincial bodies should be in touch with each other and with the central body?—Yes.

21662. You do not want each of them to be isolated, they should exchange ideas?—Yes, and carrying on correspondence with each other, but the actual provincial work should be done by the provincial staff.

21663. Would you not welcome periodic conferences of the research workers of the different Provinces?—I think that would be very useful. A five months' exchange of views would give a year of correspondence.

The Chairman: They do not make paper out of jute, do they?

21664. The Raja of Parbhani: As regards meteorology of work, do you not think the public should be more in touch with that?—We find it is good so far as Bengal is concerned. They have some jute spinning mills in wet places which did not exist 15 or 20 years ago. Telephones are installed, and the people know now at all seasons, storm and all, and so on. I have no complaint to make against it at all.

21665. Cultivators may be in touch with the work, but what about the rural districts? I am speaking about the entire in Parbhani, lot of talukas only. The centre get the information, and it is their business to distribute it; you cannot have a committee in every taluka. You would never get the benefit for that.

21666. The districts are in touch with the work?—Yes.

21667. Do the districts publish that sort of information in the vernacular?—I cannot say.

21668. On page 273 you refer to the growing of fodder. Would it be as a rotation crop or a hedge?—It would have to be a rotation crop. You cannot touch land which is under paddy, but when there is a certain amount of land you can (there may be a rent bond in the high lands during the rains, but in the low lands there is always a great deal in the hot and cold weather) it should be utilized, but it is a question of manuring and irrigation. When the rains are almost dry we have miles and miles of land without any water at all, and all crops die. You cannot grow anything there at all unless you can irrigate it. The question is whether it is worth while to live through a few months crop for a few months only, because after that the rain comes and in grows the paddy and jute. I only put that forward as a suggestion for the consideration of the Agricultural Department. Fodder is practically not at home, except for jolly straw and kela.

21669. Sir James Meacham: Have you any experience of the improved varieties of jute evolved by Mr. Pimble?—I have no actual practical experience of them. I have seen various fibres brought down to Calcutta at various times with all sorts of numbers on them, but as far as the state of the work is concerned it is practically left entirely to the Agricultural Department to evolve something which will suit the trade and give us a good weighted and clean fibre jute. My personal experience of seed is that when you have got the seed growing on a certain farm and you bring it to another part where the soil is good and the condition of the soil are different it goes back, at any rate in the second year, to the sort of seed that was there already. I would urge the analysis of seeds more than anything, except the testing of seeds. I think it is essential that a committee should be taken in hand and widely published.

21670. As a basis for the introduction of improved seed, which would also have to be tested under the conditions of soil near Calcutta?—Exactly.

21671. It cannot be easily transported from one place to another?—No.

21672. You cannot say to what extent this improved seed has improved the general quality of the crop?—No, this is too early a stage. A lot of people say it has, and some say it has not. Some villagers say it reverts to type, and that it is no use having Government seed because it reverts to the type they had themselves. It is a matter for the Agricultural Department.

21673. I take it you lay great emphasis on the importance of detailed soil surveys?—Yes.

21674. And on the attention and appointment of fibre experts?—Yes.

21675. Professor Ganguly: You have just referred to the question of soil and the quality of the jute. Is there any difference in the quality of the jute taken Mr. G. Morgan.

by the Dundee as compared with the Calcutta mills?—They buy mostly Northern Bengal jute, and not very much from Eastern Bengal. The export jute trade is mostly carried on in soft fibre jute.

21676. What about the Calcutta mills?—They prefer the harder jute for their spinning. They buy practically the whole of the jute from Eastern Bengal.

21677. Are these improved varieties we hear so much about favoured by the Dundee or the Calcutta mills?—To tell the truth, we cannot trace them individually. I have seen the stuff, and I have seen sacks made from the unproved jute, and they looked very nice; but in the general buying we cannot trace it.

You cannot see the distinction?—No; it all gets mixed up.

21678. *Rai Bahadur Bannerji*: There is not enough of this new variety yet?—It is not distinct enough district by district. If a whole district grew it, we should know everything shipped from a certain place was a certain seed, but there is nothing like that. There is a field here and a field there; and all the stuff gets mixed up.

21679. *Professor Gangulee*: In the event of our getting the improved seed unmixed, would that sort of quality be good for the trade?—I cannot say. There has been no objection taken to it as far as I know at present, but I think it would be more suitable for the mills than for export. I do not think it is soft enough for exporting.

21680. Has the yield of jute per unit of area increased?—It is just about the same, so far as the figures are concerned.

21681. What is your general impression?—I do not think the average has increased; there may have been increases in individual cases.

21682. We occasionally hear something about normal yield. What do you consider to be normal yield?—It depends on the district. We take it roughly as 3 bales to the acre; I think the Agricultural Department takes it as 2½ to 3½. The weight of the fibre varies district by district. If you have the same quantity of fibre from two different areas, you may have two very different weights.

21683. Quite. Do you realise the importance of carrying out experiments in retting?—Yes. I have tried decorticating machinery, but that was no use at all. The whole question with retting is the water. Some districts get plenty of water, because they have canals and rivers; others are in difficulties when they do not get an adequate rainfall. It might not be so difficult if the villagers could only get the land. It is all very well to say a village should start a co-operative society to cut this and that, but you have to be quite sure they are entitled to cut it, which may not be the case under the Bengal Tenancy Act. I am not in a position to say; that must be investigated before one says definitely they should combine to do this. Sleeping pits for the retting of jute are essential to enable the ryot to get his stuff away step by step. This year he could not do that, and it was too long in the field.

21684. One question with regard to demand. Are any serious efforts being made in jute-importing countries to find substitutes for jute?—I do not think so. We have heard of paper bags and things like that, but we have never seen any signs of serious competition in the market.

21685. The Americans are said to be using cotton waste for bags?—That is what we call bluff.

21686. Is the extension of cultivation in the Argentine serious?—No.

21687. With regard to the jute forecast, at what time of the year is it issued?—The first comes out about July 15, and the second (which is the first to give the acreage) between September 15 and 20; it was a little later this year.

21688. The trade people are satisfied with the private forecast they got?—I do not know whether I ought to discuss that just now, because I belong to the Jute Forecast Committee, and we have had an interview with the Agricultural Department and are going into the figures; but as a matter of fact in some cases the margin of difference has been more than it should be, and we hope in future it will be lessened owing to the new way in which the figures are to be collected.

21689. Considerable time is devoted to the jute forecast by the Department of Agriculture. What is the effect of an inaccurate forecast on the trade?—Long before Mr. Finlow brings out his preliminary figures, practically all over Mr. G. Morgan.

the districts we have got jute growing well, and we get our own idea from private sources of what the crop is going to be. If the Government publishes a forecast very divergent to what the trade has made it out to be, then it will be creating a bear or a bull market which as you know causes fluctuations. That is the position.

21690. It has been alleged that jute forecasts have been a very disturbing factor in the market so far as the cultivators are concerned?—That I could not say.

21691. That is the allegation we often hear?—If the figures published create a bear market, then the cultivator will get less than he otherwise would have got; if they create a bull market, he would be getting more than under the ordinary circumstances. You may take it that way.

21692. What is the market season for jute?—We begin exporting from the mofussil about the middle of July. Before that of course there is a certain amount of jute accumulated in the balers' godowns. The balers have to keep a stock before they begin baling; it would not pay them to bale for a day and stop work the next day.

21693. You have two channels through which you obtain your jute, one private, i.e., your own mofussil centres, and the other a broker. Am I right? You buy a certain amount of jute direct from the brokers?—Do you mean "balers"? Balers and brokers are very different people.

21694. I am referring to the broker?—You mean the Calcutta broker?

21695. The mofussil broker?—The broker in the mofussil is merely a man who puts his hand under a cloth and arranges the price.

21696. Who is the man who comes in immediate contact with the cultivator?—The *faria* or *paikar*; he goes to each village.

21697. Can you call the *faria* a broker?—I have always considered him a petty broker. He may have an advance from some one, we have no knowledge of these ramifications, some advance from a *bepari*.

21698. The Chairman: You say that you can never fathom the ramifications of the marketing agent. That being the case, do you not think a survey of the marketing of jute from the cultivator to the mill might be very well carried out?—I am sorry if any of my answers led you to believe that you could not fathom the marketing agent. If there were ten *paikars* working, and they had all received advances from merchants, it is very difficult to find out from whom a *paikar* had received an advance. He might tell you if it suited him; he would not if it did not suit him.

21699. Professor Ganguly: Have you come in contact with *farias*?—I have for over twenty years.

21700. The *faria* is the man who comes in immediate contact with the jute cultivator?—Yes.

21701. Let us find out the relation of the *faria* with the next man. Is the *faria* in touch with the broker or the *bepari*?—The *bepari*.

21702. He is not at all connected with any organised trade?—No.

21703. Do you know whether these *farias* advance a quarter of the price to the cultivators?—I do not know whether the *faria* advances money or not; I doubt it.

21704. Do you know what brokerage is charged by the *faria*?—No.

21705. Can you give us an idea of the time required for the transaction, from the time of selling jute to the *farias* to the time when payment is made by the *farias* to the cultivator?—I do not know that; I do not know when they pass their money at all.

21706. Do you mean when they actually pay for the jute they receive from the villager?—Yes. That was my knowledge of the Kushtia market. They pay one third of the cost when the transaction is made, and two-thirds after they collect the money.

21707. Is there a practice of mixing sand and water?—It is a very bad custom, but it is not universal. If you get high prices you get wet jute. That always happens. Some sand comes in drummed jute from Western Bengal.

21708. Is there a great deal of variation as regards standards of weight from district to district?—Yes; a seer is sometimes 60 sicca, sometimes 80 sicca, sometimes 81 sicca and so on.

Mr. G. Morgan.

21709. There are wide divergences?—Yes, wide divergences.

21710. Do you think some sort of standardisation is possible?—I would not like to say that it is quite possible, but it is worth trying.

21711. What is the percentage of jute purchased by the mills in Calcutta?—55 to 35.

21712. *Rai Bahadur Bannerji*: What happens to the remaining 10?—I did not say 55 per cent. and 35 per cent. I said 55 lakhs of bales and 35 lakhs of bales. The total consumption is 90 lakhs of bales.

21713. *Professor Gaugulec*: Is it possible to regulate the production of jute by better dissemination of market intelligence?—Only that one point I mentioned might be utilised. In January, before they begin to plough, you might let them know that the jute mills are holding so much jute and that it is not worth while producing 110 lakhs of bales.

21714. Is there any system of collecting market information for the benefit of both consumers and producers?—We have no system.

21715. Is there any systematic jute forecast?—We have no system.

21716. You say here "Even the state of the London jute market is known in the villages in Bengal"?—I thought you were talking about the Government Department of Agriculture disseminating knowledge. We have hundreds of people in Calcutta who wire out information through the whole of Eastern Bengal, Western Bengal and Assam.

21717. Those are individual efforts?—Yes.

21718. But there is no organised effort?—No.

21719. Do you think that the combination of buyers that we find in the mofussil areas is responsible to a considerable degree for the unremunerative prices often obtained by the jute growers?—I have never heard of a combination.

21720. We hear of buyers from different groups of jute merchants joining hands and dictating their rates?—I have never heard of it; I have never seen it.

21721. Do you know whether any landlord of jute areas takes part in the sale of the jute of his tenants?—No.

21722. In the event of his getting all the information we are capable of giving him with regard to marketing, do you consider that the jute cultivator is in a position to hold up the jute?—No.

21723. He is not in a position even if he knew that the market was bearish?—That would depend on his monetary condition at that particular time. But generally he will have to sell a certain portion before the October list comes in, there is no doubt about that.

21724. You referred to the jute speculators and their transactions. Do you not think the jute forecast would be of great assistance to them?—It would be a counter in the game of course.

21725. Would this forecast be of great help to the jute millowners?—What we want is an authoritative forecast of a crop for which we have nothing to guide us except private information. Further we want it as nearly correct as possible.

21726. You said that the co-operative marketing of jute is in its infancy. But you say they sold 20 lakhs of maunds of jute?—Twenty lakhs of rupees worth of jute.

21727. Are you aware of such transactions being passed through co-operative markets?—I do the broking for three of the places. As far as our balers are concerned, we have sold on their instructions jute of the value of something about 18 or 20 lakhs of rupees.

21728. So that, co-operative marketing is growing?—It is bound to grow if the organisation is extended.

21729. What is the attitude of your association towards this system of co-operative marketing?—If their business is going to affect you, it will be one of antagonism, but if it is not going to affect you, your attitude will be one of pure sympathy.

21730. *Mr. Calvert*: You give some reasons for agricultural indebtedness on page 272. One of the reasons advanced for increase in rural indebtedness is the

Mr. G. Morgan.

increasing amount of money in the hands of moneylenders seeking investment. Do you find that Calcutta competes for capital with moneylending at all?—You mean in the rural areas?

21731. Yes. You have a huge market for capital?—All these firms send their own money from here.

21732. Upcountry?—Yes.

21733. Is much capital from the rural tracts of Bengal being invested in Calcutta?—That I am not in a position to say.

21734. There is a large amount of Punjab capital coming here?—I do not know that.

21735. Have you any reasons to give us why capital is so readily invested in moneylending and so very sparsely invested in agricultural improvement?—Agricultural improvement is a very difficult thing. I have already mentioned something about the ownership of land. I might be sitting in Calcutta and be the owner of a one anna share, two anna share or three anna share in one estate, and it does not interest me to find out whether the estate is improving. I want to get money out of that; it is after all a rent collecting system. People go into the courts and buy shares in an estate of one anna. They do not know where the particular land is. It is only a one anna share, a courier share and so on; it simply means you are entitled to so many rupees or annas out of the total rent collected.

21736. From the landlord's point of view, rent is the chief producer?—Yes.

21737. You said, I think, that the consumption of jute was stable?—Yes.

21738. Do you mean it is not increasing?—No, it is not increasing to any extent. Of course, it has increased enormously in the last thirty years, but you may take it that now, as far as it is humanly possible to predict, it is more or less stationary, and it will not increase unless there is a very big increase of population all over the world.

21739. Is jute a commodity of which the consumption responds readily to difference in prices?—If the prices are too high, there is no doubt about it that the people use the same thing over and over again, if they can. But that is not always possible, because jute is a thing which has got stuff on it, and they do not like to use it again if it gets dirty. It does respond to a certain extent, and the cheaper the jute manufactures are the better and wider markets they get and there is a more general use for their goods.

21740. The point is the effect of any improved type of jute which might yield 20 per cent. more than the average now obtained: would that 20 per cent. extra, assuming that the area remains constant, have the effect of bringing down prices?—Certainly.

21741. And the cultivator might lose instead of getting any additional profit?—It would not do him any good at all.

21742. Unless he restricted his area?—Yes.

21743. So the only advantage he would get would be a little more area on which to grow other crops?—Yes, if he could: it is not always possible, unfortunately.

21744. What amount of any new type of jute would be required to get separate treatment? About 10,000 maunds?—You mean in the actual area?

21745. What amount of any new type of jute would have to be handed over to any manufacturer in order to ensure separate treatment in the mill?—They would not do it: the whole art of manufacture is the batching of your various qualities, compatible with the strength of the spin; they would not spin anything separately.

21746. Not in a large quantity?—No.

21747. Is there any difficulty in getting a premium for a better type of jute?—There is always a higher price for a better class of jute, provided it has the strength and elasticity for pulling through the soft fibres.

21748. In our cooperative marketing of wheat, big people like Rolli Bros will not look at any amount less than about 10,000 maunds: for 10,000 maunds of better wheat, they will give a special price. Is not there anything corresponding to that in jute?—Of course there is; but the different kinds of fibres are

Mr. G. Morgan.

graded; I may want 25 per cent. of the first kind, 50 per cent. of the second and 25 per cent. of the third, so that the average price spread over the three varieties will be Rs. 12-8-0. That must depend also on the quantity offered and not quality alone.

21749. There is no difficulty in getting a premium for an improved type of jute?—I would not say improved jute altogether: the question is whether the mill can utilise the improved type in the class of goods it is making; in the ordinary Hessians and sacks they use a certain percentage of good Eastern Bengal type of into under which of course this improved type comes, but it does not oust it by any means. I would not give *kakia bombai* for what we call *assai* at any time.

21750. I wanted to prove the possibilities of a type of jute with bigger yield in the matter of prices?—On the same acreage?

21751. For improved quality, you could not possibly get a premium?—It depends on the market.

21752. Mr. Kamat: In this chain of middlemen, I should like to ask you whether you can suggest any means by which it is possible, if it is possible at all, to eliminate some middlemen, say one or two?—To actually eliminate him altogether?

21753. Certainly. I am asking you the question, because in the case of cotton and sugarcane, there are not so many middlemen as you have in the jute trade here?—One of the causes of the jute trade having so many middlemen is that the transport difficulties in the way of getting jute from the village are very considerable. In Eastern Bengal, in the rains these villages are small places divided by water one from the other. If the *bepari* wants 500 maunds of jute, he has to go up to the edge of a small paddy field in order to get 3 or 4 maunds from the village, and then go to another place and get another lot of 3, 4, or 10 maunds and so on; for every lot of a few maunds, he has to go 3 or 4 miles, and this he cannot do. These *paikars* go about in small boats; they collect 5 maunds from one place, 3 maunds from another, and 10 maunds from another, and ultimately go to a big village where the *bepari's* boat is anchored. In the second stage, the *bepari* brings his lot of 500 maunds to a big centre; you cannot eliminate either of them, unless there are railways. The *Mymensingh* jute, for instance, comes by rail, but when you go to Eastern Bengal, where the big rivers are the roadways, you have got to depend on the *paikar* to bring the material.

21754. If your communications were better, the cultivator would take his produce straight to the *aradhar* without the middleman?—I would not say that, because when you talk of improving communications you have to consider a lot of other things. I consider that, in Eastern Bengal, the water-ways are the best. If you banded up Eastern Bengal with railways, you would kill the whole of the cultivators, because they would get 6 feet of water more than they get at present, on account of the banding up; you must remember that the water there travels from north to south.

21755. When, therefore, there is the inherent difficulty of transport, I should like to know whether the co-operative societies could help the problem much?—As I said they would help it in this way; they could bring the whole of the transport into the co-operative system, and all that money which is going from one place to another would be in their own society, and no outsider would be able to hold them up in a bad market or in a good market.

21756. I should like you to make it clear how the co-operative societies would get over the inherent difficulty of transport, which must be a great difficulty?—They would not be able to get over the difficulty of transport; they can do it themselves instead of through other people.

21757. Professor Ganqulee: Does the *paikar* actually go to the villages or does he depend on the *hat*?—He does both.

21758. Mr. Kamat: I want to ask you something about what might be called the leakage between the price ruling in the market for the time being and the actual price which the cultivator gets; how much out of that could be saved to him, if at all?—Nothing could be saved to him. Taking each step of the procedure in connection with the jute business, there would be little saved to him. What I am trying to point out is that all that money would be in one society if the actual transport is done by that society; all that money now goes into the hands of the people who are actually working on behalf of the growers.

Mr. G. Morgan.

L Y-13-19a

I do not see how you can eliminate anything, except probably the *parikar* to a certain extent, because each man could take his jute to a village centre, instead of having a small man taking it for him.

21760. I want to be a little more precise on this point. We were told the other day by the Registrar of Co-operative Societies that if the market price of the jute is Rs 3, the cultivator gets only Rs. 2, so that he is entitled to the extent of one third of the ruling prices which, on the total of your 90 lakhs of bales comes to a great deal of loss to the cultivator. Is it correct, that he gets one third less than the final market price?—I would not like to say that. It all depends on the market price. The price of transport from point A to point Z does not vary as the market price does. The market price may be Rs 20; last year it was Rs 28: Rs. 28 0 off that is not the same as Rs 28 0 off Rs 7.

21760. *Professor Gangulee*: Have you any reliable guide to go by for getting the prices in the mofussil and the prices in Calcutta?—We have enquiries made by our agents in the country. We are always collecting statistics and information, I have not seen any Government figures.

21761. *Mr. Kamat*: Taking all these statements together, let us see where we are led to. In the first place, so far as fluctuations are concerned, all the cables you receive from London here, are transmitted by various private merchants and brokers to their agents in the villages?—I would not say that. I did not say that all the London telegrams were transmitted; I say that they know the state of the London market; Renter's telegrams are public telegrams, and they give the information.

21762. Who sends the telegram is not the point. The information which you receive in Calcutta is not unknown to the growers?—It is not unknown to all the centres where jute business is carried on in the mofussil, they must ultimately get down to the bigger villages.

21763. Your statement is that even the state of the London jute market is known in the villages in Bengal?—Yes, and I will tell you why: when I was in a village in the Faridpur district, I was astonished that the man could tell me what Renter's telegrams said, and what the Bhitur Bazar quotations were.

21764. My own experience is that it is only along railway centres, in big places like, say, Narayanganj that they know what the market is in Bombay or Calcutta, but you say the information goes down to the villages?—They get the information through the *beparis* in time, I do not say that they get it at that particular moment; we have not got wires enough for that.

21765. Is it to the interest either of the *beparis* or of the brokers in Calcutta to immediately communicate to the villages the fluctuations in prices?—I do not think there would be any objection.

21766. Would you do it?—How can you do it?

21767. Nobody can do it?—How can you do it?

21768. Should not some such system as Sir Ganga Ram proposed, that the ruling market prices should be telegraphed to as many centres as possible in the interior, be brought into force?—There is no objection whatever to it.

21769. It would not affect either the brokers or the buyers in Calcutta?—There is no reason why it should.

21770. *Professor Gangulee*: Is it done?—The Marwari knows everything; all the European agents get the telegrams.

21771. *Mr. Kamat*: They wire it for their own interest?—How do you mean? Suppose there is bull market and you are a buyer, you have got to wire the information every day.

21772. If I know that the Calcutta market is likely to rise, I ask the man to buy a certain quantity, but that telegram does not help the cultivator?—I do not say it is absolutely possible to give information about every single forecast.

21773. I never say in my telegram that the market is rising, I simply send a code word, and the man understands. Am I right?—That is not exactly what I mean. If the official department did it, they would do it in an impartial manner.

21774. I want to know whether that could be done in this Presidency?—I would not like to say that because distances, communications and everything else are

Mr. G. Morgan.

so enormous that you would have to be very careful that you did give the information to one lot of people and the other lot of people did not get it. That would be most unfair.

21775. Would not some such system be practicable?—I would not even say that, I do not consider that anything is not practical. I say that it requires investigation before deciding whether it is feasible or not. I do not see why it should not be feasible.

21776. Supposing the Director of Agriculture telegraphs to every village where there is a post office and puts up in the post office a notification that the rate is so and so, how would that work?—It would work all right as far as that is concerned.

21777. Would all merchants welcome it?—If it suited their book, they would welcome it.

21778. With regard to speculation in jute in the Calcutta market. When the people form a ring to push up the prices, do the brokers or the brokers' firms join in the ring?—There is no such thing as a ring.

21779. You do not form rings here to push up the prices?—No.

21780. *Professor Gangulee*: Even among the jute millowners there is no ring?—Not that I know of.

21781. *Mr. Kamat*: A question or two about the jute cess. You know the export jute cess, May I know how much that is?—It is so much per bale and it is so much on manufactured jute per ton. It comes to about 3 crores of rupees.

21782. Could you tell me how much it is per bale?—I think it is Rs. 4-8-0 per bale but I am not certain about it.

21783. Supposing this present cess were enhanced a little bit, would you as a man in the trade tell me whether the consumer would feel the burden?—That depends on the position of the market. Your market position to day is such that the cultivator, the man who grows the jute, is bound to feel it because there is a lot of jute which is unsaleable except at a particular price. If you could get higher prices for their crop and a keen demand then if you put on a little it will not affect them much.

21784. Taking the present price at, say, about Rs. 10, I am not talking of Rs. 30, would it be fair to increase the cess?—I do not think they should put anything on the ten-rupee basis. It would not be fair.

21785. *Sir Henry Lawrence*: What is the present percentage value?—It is Rs. 55 a bale and Rs. 4-8-0 a bale duty. The price is Rs. 55 f. o. b. That reduces it nearly by 8 annas a maund.

21786. *Rai Bahadur Bannerji*: I will tell you something about my experience of this *kakia bombai* variety of jute and the feeling about it in the country. Last year I went to have a look round at a certain farm and I found on about 5 acres of land they were growing this *kakia* jute in the district of Hooghly. Side by side, they had the country variety with red stems. This *kakia* was at least 3 feet taller than the other variety. I was talking with the cultivators and they said that they had a feeling that not only would this *kakia bombai* give them a better yield in quantity but also in quality. Do you think this feeling is correct?—According to all the statistics that we have had with regard to *kakia bombai*, there is no doubt that it will give a better yield. In regard to quality, it is doubtful whether it is not of a slightly brittle nature. I do not think consumers have quite made up their mind on that point yet. But there is a suggestion that if everything was *kakia bombai*, they would not get the spin of the manufacturers satisfactorily. I have seen one spin but that is all I saw of it. I have never seen the actual results but they certainly thought that it was too brittle on the spin.

21787. Perhaps it is too early yet to say what the nature of the quality of *kakia bombai* is going to be?—I really do not know. The Agricultural Department are the people who are in a position to give detailed information on quality and fibre and so on. Mr. Finlow has got that at his finger's ends. What we know in this that if you are going to have the same acreage and increase your percentage by 20 per cent. then you are going to knock down the prices.

21788. If jute has brought some prosperity to Bengal, has not it also brought malaria along with it?—I have lived in the jute districts for 23 years and I have

Mr. G. Morgan.

smell all kinds of smells connected with jute and I have never suffered from malaria.

21789. Europeans do not generally suffer because their style of living is quite different and they take preventive measures which the Indian do not and cannot take?—If you are going to live in water as the people in Eastern Bengal do, you are sure to get malaria even if you live in a *pucca* honso. The people of Eastern Bengal will always have malaria because they practically live in water.

21790. So it is quite independent of the steeping of jute?—The steeping of jute has not harmed them in any way.

21791. *Dr. Hyder*: You said that the difference between the price of jute paid to the grower and the actual price was Rs 280. I ask you how much out of this Rs 280 represents the cost of carriage on the average?—You mean carriage from the baler to Calcutta mills. I was talking of right from the village up to the jetties. Mind you, every boat has got its own rates.

21792. Let us get these things clear, whatever the quantity may be, how much would be the cost of carriage so that we may have some idea of the total amount available for the dealers in jute?—I do not know what it exactly comes to, but I suppose it is 4 annas a maund overhead. You have got to go from Siliguri to Calcutta by railway, then you have got a combined service. They are all varying rates of freight.

21793. Have not the manufacturers of jute got their own agents just as cotton people have their own agents?—Some of the mills have got upcountry agents.

21794. How many grades are recognised in the trade?—The trade recognises four grades. That is the real grading of jute.

21795. Please tell me how many maunds would a baler require to keep his plant going?—If he has got a *kutchra* press, he would want about 700 maunds a day. To find out his total requirement you can multiply it by the number of presses he is in a position to put up.

21796. With regard to the question of the improvement of jute, do I understand that you are of opinion that any increase in the production of improved seeds would simply mean a curtailment of the area? What about getting an increased outturn and devoting the area so set free to the cultivation of food crops and fodder crops?—What I said was this that if they are going to get any fibre which the Agricultural Department might evolve then they are going to get 20 per cent increase in the outturn.

21797. Has any attempt been made by the Government or by other non-official people in the Bengal Legislative Council to control the gambling operations in the jute trade?—A Bill was withdrawn; that is all that has been done.

21798. You have not proceeded beyond that?—No.

21799. *Sir Henry Lawrence*: Have you any special view as to the manner in which Government can assist the jute cultivators in their prosperity?—The main thing is finance. If he can get easy finance, he will be able to free himself from heavy indebtedness such as is caused by the mounting up of interest which he cannot pay. That is the real relief that is wanted, and that is why I am of opinion that if these co-operative credit societies are really worked properly and thoroughly there is no reason why the ryot should not become free, I do not say to day or to morrow, but at sometime in the not too remote future, and become self-reliant and self-supporting through money circulating amongst their own people, provided the rates of interest are not too high and that the ryot can always get a loan when he needs it, though not for spending unproductively, and provided he put his money in when he has got it, and borrow when he has not, at a fair rate of interest.

21800. Oppression by small men to whom he is tied by debt is the greatest evil from which he suffers?—Yes, and when he does get money he spends it. Last year they must have got a lot of money, but beyond buying corrugated iron and a few things like that it seems to have been frittered away.

21801. It is said they have paid off a lot of debt?—Yes, but on the price of jute last year they must have made a lot of money.

21802. *Professor Gangulee*: What is the basis of your grading?—The top number is 70 warp, the next 60, the next 30 and last is swift pure and sample.

*Mr. G. Morgan.*

21803. *The Chairman* : I notice among your various activities, you are President of the Agricultural Society of India. You have been good enough to extend an invitation to the Commission to come round to your gardens, but hitherto we have not been able to fit that in owing to our programme being so overloaded. I should like to ask you, however, whether you are carrying on any economic work at the Horticultural Association gardens?—Not as regards agriculture at all; we are doing no work of that description. This society was started before there was such a thing as an Agricultural Department at all; it was founded in 1820.

21804. Do you do any fruit-growing?—Only to a small extent. That is what we want to get on to now, because there is great scope for it.

21805. You would like to undertake some experiments in horticulture?—Yes, we are doing something in a small way.

21806. Could you undertake fruit-growing experiments?—Yes.

21807. On a sufficiently large scale?—Government wanted us to take it up, but wanted to give us a garden in the middle of Bihar, which was too far away. We offered to give periodical visits and advice and so on, but they did not want that.

(The witness withdrew.)

Mr. G. Morgan.

**Mr. C. M. HUTCHINSON, C.I.E., late Imperial Agricultural  
Bacteriologist, Calcutta**

**Memorandum**

It is generally admitted that the development of Indian Agriculture will depend largely upon research work. I have pointed out elsewhere in my evidence that the Provincial Departments of Agriculture have been understaffed and overworked, notwithstanding this, much valuable research work has been done in the Provinces as well as at Pusa but at present owing to the loss of a large number of experienced men, the Provincial departments are not in such a good position to deal with research problems as they were formerly. The adoption of the recommendations of the Lee Commission which stopped recruitment to the Agricultural Service in England, taken together with the fact that the comparatively low rate of remuneration has failed to attract a sufficient number of the best class of Indians to the department, has militated against the progress of research in the Provincial Departments. For this reason amongst others it is all the more necessary to strengthen the position of Pusa, so that this institution may effectively fulfil one of its most valuable functions in the Department of Agriculture, namely the maintenance of a high standard of research work for the benefit of the country as a whole. This has been done in the past and should be continued in the future, partly by contact between the personnel and that of Provincial Departments to their mutual benefit, and partly by the control exercised by the Editorial Council of the Director of Pusa over the scientific members of the Department of Agriculture. To the outside world of agricultural science, the Department of Agriculture in India, so far as its research work is concerned, is known through the Pusa Institute, which record the work not only of the Pusa staff but of that of all the agricultural workers throughout India; Pusa is the Bathurst of India and it is vitally important in the interests of Indian Agriculture that this institution should carry weight with the Central Government so that the decisions of the latter on agricultural matters should be influenced by a recognized authority. A further important function of Pusa should be to afford educational facilities to Indian research workers of such a standard as to make it unnecessary for them to go to England or elsewhere for post-graduate instruction in research methods. The present condition of affairs which leads to the export of Indians to research institutions, such as Rothamsted, is highly unsatisfactory for many reasons. It is liable to lead to the assumption on the part of the student that because he has been to England and obtained testimonials there, he is therefore better qualified to obtain employment under Government in India than another who has had all his training in this country. As an ex-member of the Pusa staff, and one who has trained students from every Province in India, I am prepared to maintain that Pusa is better equipped to provide instruction in research work on Indian agricultural problems than any institution in England or elsewhere. It is in my opinion of the highest importance not only that the standard of research at Pusa should be maintained at its present high level, but that everything possible should be done to strengthen its position and prestige both with the Central Government and throughout the country. As a result of my experience extending over seventeen years as head of a section at Pusa, I am of opinion that the position of Pusa, and to some extent its efficiency as a research institute, has been prejudiced by the want of a Director whose whole time could be given not only to co-ordination of the work of the various sections and to the creation of a continuous policy in regard to the directions of research but to represent agricultural science as distinct from administration. The present position in which the posts of Agricultural Adviser and Director of Pusa are doubled is unsatisfactory if only for the reason that the incumbent of this onerous position has very much more to do than any one man can adequately carry out. Nor has the adoption of the make shift device of a Joint Directorship done anything to improve the position, as this involves the diversion of part of the energies of a highly trained scientist into petty administrative channels with the implication that his proper sphere of action as head of a section requires only part of his time.

With regard to the educational function of Pusa, the importance of which I have mentioned above, I should like to record my opinion that the operation of this part of the work at Pusa should not be allowed to interfere with the research work of the various experts; in my experience a research worker who is

Mr. C. M. Hutchinson.

obliged to give much of his time to instruction is liable to lose value as a research worker, not only on account of the diversion of his time and energies into the educational channel, but because the attitude of mind of the teacher is fundamentally opposed to that of the humble seeker after truth. Many of our greatest scientists have no doubt been teachers, but in the majority of instances, this has been from necessity and not from aptitude or inclination, and although there have no doubt been brilliant exceptions to this rule, there can be no doubt that on the whole the addition of educational duties lowers not only the quantity but the quality of a research worker's output. For this reason I would urge the provision of an additional teaching staff at Pusa; this staff should be under the Director and should be supervised by and receive advice from the research experts.

As I have stated above, one of the prime functions of Pusa as a research institute is to set a high standard of research for India as a whole. In addition to this, it should serve as a nucleus for the co-ordination of research in Indian agriculture. The present position with regard to this important subject is unsatisfactory, in as much as the independent operations of research workers in the various Provinces are liable to lead not only to duplication of work but to loss of that higher standard of efficiency which may be attained as a result of the pooling of scientific knowledge and results. Although great variations in climate and soil are found in the country as a whole, nevertheless numerous fundamental problems connected with soil fertility and crop production arise and are suitable for investigation by capable research workers in any part of India. It is in my opinion important that the selection of these problems and the inception of research work to deal with them should not be left to the haphazard choice of experts all over the country. In the past history of the Agricultural Department much excellent and valuable work has resulted from this method but now that the virgin soil of Indian agricultural research has to some extent been brought into cultivation it becomes necessary to take stock of the situation and co-ordinate our efforts so as to make the best use of our energy and material. Probably the creation by the Government of India of an Advisory Council representative of the various Provinces would help to ensure co-ordination of research in India; in any event some such provision should be made to secure this result.

Finally I should like to point out that the unfortunate geographical position of Pusa has done much to detract from its general usefulness, not only on account of its distance in railway time from Simla and Delhi, but as reducing accessibility to the general public. It would of course be a drastic measure to scrap the present buildings and equipment and recreate it elsewhere, but I am of opinion that should the finances of Government or the generosity of a second Phipps ever admit of such a step, it should be taken unhesitatingly in the interests of Indian Agriculture.

The future prosperity of India as an agricultural country depends mainly upon the maintenance and enhancement of the productive power of the soil. This can be effected by the use of three main lines of operation :—

By the use of (1) improved methods of cultivation and improved tillage implements; (2) improved varieties of crops; and (3) fertilisers, whether indigenous or imported.

All three methods depend for their effectiveness upon adequate research work as a basis for the introduction of improved methods. As is well known, much valuable work has been done by the Agricultural Department on the first two of the above methods but, in my opinion, the importance of the third, i.e., the use of fertilisers, has not received adequate recognition for various reasons of which the following may be cited as outstanding :—

1. A general tendency to assume that, owing to the poverty of the cultivator and his general condition of indebtedness, it is out of the question for him to spend money on fertilisers.

2. A similar assumption that owing to general conditions in India especially with regard to prohibitive rail freights, the use of fertilisers on field crops is not an economic proposition.

3. Absence of sufficient information to form reliable judgments as to the economic returns from the use of fertilisers.

I have no remarks to offer with regard to 1 as this subject has been dealt with by more competent witnesses, but it is clear that the institution of co operative

**Mr. C. M. Hutchinson.**

credit and the various systems of Government loans serve to indicate recognition of the importance of this point.

With regard to 2, the geographical situation so far as the great distance between ports and much of the arable districts is concerned makes it necessary to take into consideration the possibility of reducing railway freights on fertilisers so far as this is compatible with economic considerations. This point has been raised by the Board of Agriculture in India on more than one occasion and the increasing importance of the question makes it all the more necessary that the attention of Government should be drawn to the subject.

3 Information as to economic returns from the use of fertilisers is naturally the basis and necessary preliminary to any attempt to introduce their use into this country, where they are at present practically unknown. The fact that such information is very generally lacking throughout the country is due to various causes. Of these, I should be inclined to say that the principal one has been the understaffing of the Departments of Agriculture in the various Provinces; the natural sources of such information would be the Deputy Directors of Agriculture, but when we come to examine their duties we find that they are so numerous and cover such disproportionately large areas of land that every expense can be found for the paucity of information as to the economic possibilities of the use of fertilisers which they could provide. So far their principal activities have been in the direction of the distribution and popularising of improved and higher yielding varieties of crops and of testing and recommending the use of improved implements and better methods of cultivation. As is well known, notable success has attended these efforts and it is only necessary to refer to the well known improved varieties of wheat, rice, jute, and sugarcane and the numerous improved implements in the form of ploughs, harrows and cultivators to substantiate this statement. Education has also taken large toll of the activities of the Department of Agriculture in every Province in India as a necessary forerunner of any improvement in the general condition and agricultural efficiency of the cultivator. Numerous manual experiments have been carried out on the Agricultural Department's farms, but inspection of the results is disappointing and leads to the general conclusion that the information so obtained is not only meagre and entirely out of proportion to the importance of the issues involved, but that much of it is valueless owing either to faulty design of the experiments or to incorrect interpretation of the results. On the other hand, results are to be found which clearly suggest that fertilisers, including artificials, can be used with economic success on a large number of crops and soils in this country; this is naturally more obvious in the case of revenue crops such as sugarcane, jute, tobacco and tea, but there is also evidence that such a widely distributed field crop as rice, which is known to require organic manures, generally as green manures, will also respond to the use of sulphate of ammonia and phosphates with economic advantage. It is therefore desirable that complete and accurate investigations should be made of the economic possibilities of the use of fertilisers and this can only be done on any sufficient scale at present by the Agricultural Departments in the various Provinces.

Some seven years ago, I expressed the opinion in a paper read before the Indian Science Congress at Bombay that the introduction into Indian agricultural practice of high-yielding varieties of crops and of improved implements of tillage rendered it necessary to make corresponding provision, to avoid depletion of soil fertility, by replacement of the extra amounts of plantfood removed from the soil by these improved crops and implements. I had come to the conclusion that, as a result of experience, the Indian cultivator had adopted a system of cultivation which deliberately aimed at securing a medium rather than a maximum crop, as his experience showed that intensive cultivation in many cases resulted in loss of fertility shown by reduction of yield in succeeding seasons. In adopting this procedure, the ryot appears to have been unconsciously recognising the existence of natural recuperative forces and adapting his agricultural methods to their rate of operation. The principal factor involved is no doubt the fixation of atmospheric nitrogen by soil bacteria which is in constant operation in all soils, but assumes a highly important rôle in India on account of the relatively high soil temperatures. The use of legumes in a rotation is of course another instance of unconscious utilisation of a similar natural process, but is probably of lesser importance so far as nitrogen supply is concerned than the symbiotic nitrogen fixation which is in continuous operation. This latter process adds nitrogen to the soil at rates which vary not only in different soils but from season to season, and actual experience has shown that in certain soils the use of improved tillage

Mr. C. M. Hutchinson.

and higher yielding varieties of crops leads to reduction of fertility, whereas in others this effect is not apparent over considerable periods of time. This difference between soils may be due to a higher initial content of nitrogenous organic matter, or to higher rates of nitrogen fixation in the stronger soils, but in any event it is obvious that it is vital to the interests of Indian agriculture that due recognition should be accorded to the fact that improved varieties of crops and tillage implements tend to exhaust soil fertility and that it is necessary to make provision against such depletion. So far as nitrogen exhaustion is concerned, it has been the aim of the Bacteriological Section at Pusa to investigate the possibilities of enhancing the rate of natural nitrogen fixation by the use of appropriate methods of soil management; a considerable amount of useful and suggestive information has been obtained and it is to be hoped that this line of enquiry will be carried to a successful issue. Here I should like to draw attention to the importance of research in soil bacteriology which, in my opinion, has so far received inadequate recognition in this country. The science of soil bacteriology is still in a relatively early stage of development, but, although in other countries its possibilities are generally recognised, in India, where, owing to climatic conditions the relation between bacterial activities and soil fertility is abundantly obvious, work on this highly important subject has been almost entirely confined to the Bacteriological Section at Pusa. This has not been due so much to lack of recognition of its importance by the officers of the provincial departments as to lack of the funds necessary to create posts for bacteriologists. On the other hand, it has been want of conviction of the importance of the subject that has prevented the allocation of funds for this purpose; the position so far has been that various Provinces have sent assistants, generally Chemists, to Pusa to be trained in bacteriological technique, but these men on returning to their Province have worked under the Soil Chemist, and although many of them have done excellent work, yet this has been limited by reason of engaging only part of the attention of the expert in charge, who as a chemist has other duties which to him are of superior interest. In my opinion, the importance of soil bacteriology in India is sufficiently great to demand the attention and justify the appointment of experts in the subject in every Province in the country, as, until we are more fully acquainted with the vital processes in the soil upon which its fertility so closely depends, we are merely groping in the dark and cannot expect to secure that necessary foundation of ascertained facts upon which the stability of any system of scientific agriculture must depend.

As I have already pointed out, the fixation of atmospheric nitrogen by bacterial agency is one of the most important problems requiring the attention of the Soil Bacteriologist and it is hoped that further knowledge of this subject may lead to the introduction of practical measures tending to reduce the depletion of the nitrogen content of the soil; in the meantime, however, it is vitally necessary not only that provision should be made against depletion of existing soil fertility but that the general level of crop production should be raised by the use of improved methods and, so far as is economically possible, by the use of fertilisers. It may be pointed out that one of the important functions of fertilisers in India should be to increase the quantity and quality of the cattle fodder available. Apart entirely from any increase in the food and revenue crops of the country, improvement in the general condition of the cattle upon which not only the welfare of the population as affecting the milk-supply, but also the efficiency of agricultural operations themselves so largely depend, is a vital factor in determining the prosperity and well-being of the community as a whole. It is one of the outstanding and most widely recognised facts determining the condition of the agricultural population that the general state of malnutrition of their cattle lowers the efficiency of the latter both as milk producers and for draught purposes. It is this factor which tends to nullify all efforts to improve the breed of Indian cattle by hybridisation or otherwise, and it is only necessary to refer to the well-known prevalence of malnutrition amongst the human population and its obvious connection with defective milk-supply, to draw attention to the important part which the use of fertilisers might play in this connection. The best method of introducing the practice of manuring for improvement of fodder crops and grazing areas would naturally be a subject for study by local Departments of Agriculture, who would also have to exercise their influence in the direction of convincing the cultivators of the ultimate economy of such an operation. This no doubt would be difficult but it is worth while placing on record an expression of opinion to the effect that this particular application of the use of fertilisers in India should form part of the future policy of the Department of Agriculture by reason of its undoubted importance to the prosperity of the country as a whole.

Mr. C. M. Hutchinson.

It is an unfortunate fact that at the present time the use of fertilisers is practically non-existent in India. This is not due to complete ignorance of their value: the ryot knows the value of cowdung but the scarcity of fuel which leads to the burning of cattle manure has been one of the most potent factors in keeping down the fertility of Indian soils; this was pointed out many years ago by Voelcker but his suggestion of importing firewood to remedy this defect was unfortunately an impracticable one. I have already referred to the fact that the operations of the Agricultural Department have not resulted in the use of fertilisers to any appreciable extent and have suggested reasons for this condition of affairs. It is further to be remarked that the whole position has been prejudiced by the lack of co-operation between the Agricultural Department on the one hand and the fertiliser industry on the other. The extensive and increasing use of fertilisers by the tea industry led to the creation of a fertiliser industry in India to satisfy its needs, by a natural process of trade, attempts were made to extend the sale of fertilisers to Indian cultivators as well as to European planters; unfortunately this was done at a time when information as to the manurial requirements of Indian field crops was almost wholly lacking, the consequences in many cases being disastrous to the expansion of this branch of the industry. Not only was the confidence of the cultivator forfeited but the attitude of the Agricultural Department became quite naturally, in many cases, antagonistic to the trade. At the present moment, however, a different state of affairs exists; the Provincial Departments of Agriculture are turning their attention more and more to the possibilities of the use of fertilisers not only for revenue but for food crops, whilst the fertiliser industry is consulting Officers of the Agricultural Department as to the kinds of manures required and the price which the cultivator can afford to pay for them with economic advantage. It has further been realised by the trade that fertilisers in India must come into that class of goods the sale of which can only bring in small profits. The position, therefore, now is that expansion of the use of fertilisers in India depends almost entirely upon the provision of reliable information as to the economic use of fertilisers by the cultivator. This information at present can only be supplied by the Department of Agriculture and it is upon co-operation between the officers of this department and the fertiliser industry that any expansion of the use of fertilisers in India must depend. It is for consideration in what manner this co-operation may best be effected; probably in the initial stages of development the appointment of special liaison officers between the departments and the trade would facilitate matters. At the present moment the position with regard to the use of fertilisers in India is unsatisfactory chiefly for the reason that sufficient and reliable information as to their economic utility is not available; without such information the Department of Agriculture cannot confidently recommend their use nor can the fertiliser industry make satisfactory arrangements for their supply at economic rates. Such information as is in existence in the records of the Agricultural Departments is at the disposal of the trade and much invaluable advice based on their experience is freely given by the officers of the department but at present the information is limited and this limitation serves as a check not only upon the activities of the fertiliser merchant but upon the freedom of intercourse and co-operation between the latter and the Department of Agriculture. To sum up the situation, it may be said that the introduction of improved varieties of crops and implements and methods of cultivation has as a necessary corollary the use of fertilisers to maintain soil fertility. To make this possible in this country as an economic proposition reliable information as to the proper use of manures is essential both in the interests of the cultivator and of the trader. Such information is at present in a very incomplete condition and until this state of affairs is remedied, no considerable advance in the direction of the introduction of fertilisers into general practice in this country can be expected.

*Propaganda.*—Critics of the agricultural situation in this country are prone to regard the Indian cultivator as hopelessly conservative in his ideas; it is of course natural that a ryot depending for his livelihood and indeed his very existence upon the success of his agricultural operations should be extremely unwilling to experiment with untried and unknown methods. On the other hand, experience has shown that the cultivator is prepared to take an active interest in any new agricultural methods which seem likely to give him an adequate return; as Sir Valentine Chirol points out, he is ignorant but not unintelligent. It is of course necessary to convince him of the practical value of innovations, generally by actual demonstration on soils similar to his in his own district; this has been the method of the Agricultural Departments for many years, and the extensive adoption of improved varieties of crops and of modern implements is the measure

Mr. C. M. Hutchinson.

and indication of the success of such propaganda. That equal success has not been attained in the direction of the use of fertilisers is due partly to the lack of information as to their economic possibilities in the possession of the agricultural officers themselves, with a consequent want of faith in their value, and partly to lack of stability in the price of manures as a result of the effect of the War during the past decade. A further factor has been the understaffing of the Agricultural Department which has made it impossible for its officers to deal with all the subjects to which their attention might have been turned with profit. As I have suggested above, this has led to comparative neglect of the fertiliser problem, so far as we can judge from the paucity of information available after twenty years' work, in favour of popularisation of improved varieties of crops and implements. This condition of affairs must be remedied if Indian agriculture is to make any advance in economic efficiency, and in my opinion the first requirement is the establishment of effective collaboration between the Department of Agriculture and the fertiliser industry. Such collaboration would be facilitated by the appointment of liaison officers between Government departments and the fertiliser industry, and as a first step in the direction of the creation of a satisfactory situation the appointment of a representative committee to examine and report upon the situation may be suggested.

Any extension and adoption of the use of fertilisers, along with improved methods of cultivation, will depend largely upon effective propaganda work throughout the country, such work must be carried out both by Government departments and by the fertiliser merchants and the measure of its success will largely depend upon co-operation between them. It would seem necessary to arouse the interest not only of the ryot but of the landholders both large and small and especially to convince the latter of the economic advantages of improved methods. Whatever means may be adopted to effect this, it may be said that co-ordinated and well-directed effort is essential to success and, as I have suggested above, the whole question could be most effectively dealt with by a special committee on which all the interests involved should be represented. Such a body would include officers of the Agricultural Department, and merchants interested in the fertiliser and agricultural industries, and should be appointed by and receive the full support of the Central Government.

*Irrigation.*—As a result of study of soil fertility problems in India from the bacteriological standpoint, I came to the conclusion that the utilisation of irrigation water to the best advantage depended very largely upon accurate knowledge of the relationship existing between the soil water-supply and the activities of soil bacteria. Owing to the relatively high soil temperatures in this country and the consequent rapid development and activity of soil micro-organisms, the influence of the latter upon soil fertility has a very special significance and importance in India. This influence may be good or bad and one of the most important factors in determining its direction is the management and distribution of the water-supply. In unirrigated areas control of this important factor is naturally limited but irrigation offers opportunities of providing optimal conditions, so far as water-supply is concerned with bacterial action in the soil. At present our information on this point, although considerable, is not sufficiently accurate to enable full advantage to be taken of the control over soil water-supply afforded by irrigation. We know for instance that excess of water in some soils may reduce the whole supply of nitrates present in some 48 hours and that if such conditions of water-logging persist for any length of time, fertility may be greatly reduced by the undue development of anaerobic bacteria and the deleterious by-products of their metabolism. Conversely proper regulation of the water-supply will promote the beneficial processes of nitrification and nitrogen fixation. Before making use of this knowledge in the field it will be necessary to study the subject further under irrigation conditions, and for this purpose I suggested some years ago the institution of a special laboratory for the purpose situated in a typical irrigation area. A note on this point was published in the *Agricultural Journal of India* in July 1925 and I should wish to reiterate here my opinion therein expressed that the establishment of a special laboratory in an irrigation tract for the study of the above and other problems connected with the use of irrigation water would be of very great utility and advantage to Indian agriculture.

Mr. C. M. Hutchinson.

**Mr. C. M. HUTCHINSON, C.I.E., late Imperial Agricultural  
Bacteriologist,**

**and**

**Mr. F. E. MAURER, Manager, Fertiliser Department,  
Messrs. Shaw Wallace and Company, Calcutta**

**Oral Evidence**

21805 *The Chairman* : Mr Hutchinson, you are late Imperial Agricultural Bacteriologist to the Government of India?—Yes.

21809 I understand it is convenient to both of you that you should appear with Mr Maurer, who is Manager of the Fertiliser Department of Messrs. Shaw Wallace and Company?—Yes.

21810 Mr Hutchinson, you are at present Chief Scientific Adviser to the Fertiliser Propaganda of India, Limited, is that right?—Yes.

21811 Have either of you gentlemen any observations of a general character which you desire to make before I proceed to ask some questions?—(Mr. Hutchinson) I have none. (Mr. Maurer) I have none.

21812 Mr Hutchinson, I propose to proceed with your memorandum for some time I am greatly obliged to you for the very complete and interesting note you have put before us on the points with which you deal, and I think you have made your views very plain. But there are one or two questions which I should like to ask you. You worked, I take it, as a research officer in the term of your service with Government?—Yes.

21813 Do you think that the prestige of Pusa as a research organisation stands high?—Yes.

21814 Do you think that prestige stands as high to day as it has done at any time that you have known Pusa?—Yes, I do.

21815 May I ask you one or two questions about your views as to the training of Indians. On page 296 of your memorandum you say, "The present condition of affairs which leads to the resort of Indians to research institutions such as Rothamsted is largely unsatisfactory for many reasons," and you go on to detail the reasons. I take it that you divide the matter of training into two parts, the earlier education, and the sort of improvement that results from study leave and travelling about after the ordinary post graduate period is over with a view to seeing what is being done in other parts of the world. I want to know from you whether these words of yours, which I have quoted, ought to be taken as including study-leave for travelling about after the ordinary post graduate training?—I am referring entirely to post-graduate work, and my remarks are based on my personal experience in the Agricultural Service, and especially at Pusa. There we have had instances of Indians in the Agricultural Service going to England in order to get testimonials which would help them in the future in the Agricultural Service. That is to say, I found men going to Rothamsted to be trained in bacteriology and coming back with the impression that they had a better chance of advancement in the service because they had been to England and Rothamsted than they would have had if they had gone to Pusa and been trained there. The instances in my mind are of this sort; I would not particularise. An Indian comes into my section from a Province to have a post-graduate course in Bacteriology: he puts in two years in my laboratory and goes away. Afterwards he goes to England, does some work there, gets testimonials, comes back to India, and expects to be appointed to a post over the heads of the people in my laboratory from whom he learnt most of what he knows, merely because he has been to England. I maintain not only that this is bad from many points of view, but that at Pusa we shall teach that man, if he stays here for those two years, more about the soil conditions and soil fertility in India than he can learn in other places outside.

21816 Would you go so far as to say that you do not attach any value to the granting of study leave?—I would not say that; that is a different proposition.

21817 I want to know how you would classify these two matters, study-leave and that which you are referring to?—So long as study-leave is not taken for getting testimonials which would tend to give the man a higher position, I would

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

not object. As long as study-leave is not taken for that purpose there should be no complaint.

21818. But may it not be that those who seek the opportunity afforded by study-leave are concerned more with increasing their knowledge than obtaining a mere testimonial?—There cannot be any objection to that. I am only speaking of this particular point as I find it in my experience; and I think it is very necessary to draw attention to it, because it does arise and is likely to arise in the future. I mention it in connection with the suggestion that the aim of the Government of India should be to make Pusa so efficient that it would take the place of institutions in other countries. I do not see any reason why they should not do so.

21819. And you think it would come to that point of efficiency that journeys abroad for training in research work would be unnecessary?—Yes.

21820. On page 206 you say that the position of Pusa, and to some extent its efficiency as a research institute, has been prejudiced by the want of a Director whose whole time could be given to co-ordination of the work of the various sections and to the creation of a continuous policy in regard to the direction of research. Do you think it is conceivable that any man holding the position of Agricultural Adviser to the Government of India could, under any circumstances, give sufficient attention to the work of direction at Pusa to bring that Institute to a high pitch of efficiency?—No; I do not think it is. I think the post of Agricultural Adviser is so important and his duties so onerous that it is impossible for him to do the other job as well.

21821. Does that mean that you would divorce the holder of the post of Agricultural Adviser to the Government of India altogether from research at Pusa?—From the Directorship of research, yes.

21822. From the immediate direction of research?—Yes.

21823. But you would, I take it, give the Agricultural Adviser to the Government of India some responsibility for the general conduct of and policy in research?—Yes, for co-ordinating research.

21824. You do not conceive the Agricultural Adviser to the Government of India having nothing to do with Pusa?—No.

21825. Your idea is that immediately subordinate to him there should be a scientist, or an administrator, I take it, holding both the qualifications required, who would be capable of co-ordinating the conduct of research work at Pusa?—Yes. May I say that the creation of a continuous policy for the work at Pusa seems to me to be a very important point? In the seventeen years I was there, I was under nine separate heads of the Department of Agriculture.

21826. Your hope would be that the man immediately charged with the duty of directing research would stay there for a longer period than do many of the officers?—Yes.

21827. On the same page you point out that teaching is apt to interfere with research work. Would you go so far as to say that the influence of teaching and of a teaching school upon research work is, on the whole, disturbing and ought to be avoided?—Not on research work, but on the research worker if he has got to do teaching as well.

21828. You would not mind his giving two or three lectures in a week?—No, he would be just infusing the spirit of research into the students.

21829. That is valuable to him as well as to the students?—Yes, so long as he does not adopt the *ex-cathedra* attitude of mind which is so prejudicial to research, and which is very characteristic of the teacher.

21830. It is a question of having sufficient staff for the work, reasonably divided between research and teaching?—There should be a duplicate staff.

21831. Otherwise, your research staff is going to be overloaded with educational responsibilities?—Yes, just as in the case of Universities.

21832. About the inaccessibility of Pusa in relation to its future as a teaching centre, do you think that with right teaching and right teachers at Pusa there is anything to prevent students who really mean business going to the place where it is at present situated?—No, not students; I was not thinking of the students, I was thinking of the people who are interested in what is being done at Pusa, and who want to go there, especially Government servants; it is rather out of the way.

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

21833 Upon the teaching side, you do not think its position is inimical to development as a teaching centre?—No.

21834 On page 297 you give three reasons why, in your view, the use of fertilisers in India has not received adequate recognition, and I want to ask you whether No 3, which you enlarge upon on page 298, really amounts to this, that there is an absence of sufficient knowledge as to practice and sufficient information as to the scientific aspect of this question at present, upon which to proceed?—Yes, that is my opinion.

21835 You think that more research and closer knowledge in regard to what is going on at the moment in the cultivators' fields must precede any propaganda on a large scale directed towards encouraging the use of fertilisers?—Yes.

21836 Would you like to develop at all the statement that you make that the failure of many of the experiments that have been carried on on this problem of the use of fertilisers in India has been due, as you say, to faulty design of the experiments? I am concerned rather to discover from you whether there is some idea in your mind that the organisation of research is faulty in that respect; mistakes always occur?—Yes, I think you cannot get away from the fact that information on this subject is generally lacking. I find that experiments have been carried out, and yet the information is not there. That must be due to one of these causes. I had done a lot of experimental work myself in connection with various jobs, and a great many of my field experiments had been of no value owing to faulty design, that is to say, my ignorance of the best way of carrying out field experiments in India; and to get that experience takes a very long time and rather specialised training. I think one may say that a great deal of more or less haphazard experimental field work must have been done, judging by experimental results that have been obtained on the use of manure.

21837 Do you think there has been any failure to apply the experience obtained under different conditions in other countries?—I think the failure to apply information obtained in other countries must be largely due to the progressive realisation of the difficulty of applying agricultural knowledge obtained anywhere else than in India, and one might almost say in a particular district in India, to Indian conditions. I think experience in other countries has an extremely limited value in this particular matter.

21838 In many matters you have to start afresh in this country?—Yes.

21839 Do you think there is want of co-ordination and inter-communication between Pusa and the Provinces and between Province and Province?—Yes, I am afraid there is that want.

21840 You attach importance to that?—Yes.

21841 You think there has been lack of what I may term higher direction in this problem?—Yes, I think there has been lack of the realisation of its importance, to start with, and I think one of the reasons I gave is a fair one, that the Agricultural Departments are so understaffed that they have been obliged to turn their attention to what appears on the face of it more important subjects, that is, improvements in crops and improvements in methods of cultivation. That has excluded the possibility of giving so much attention to the use of fertilisers; these two were thought of more importance, and the use of fertilisers was considered as being out of the sphere of practical politics.

21842 Are these problems that you are talking of, the use of fertilisers and the fundamental soil problems, problems which in your view can well be dealt with by a Central Research Institute, or ought they to be dealt with locally, area by area?—They can undoubtedly be dealt with by a Central Research Institute, but there is no reason why they should not also be dealt with in the Provinces. That, I think, should be the future aim, to create a staff which can carry them further. There are certain problems of enormous importance; take the fixation of nitrogen for instance; that has been dealt with practically up to date at only one centre, whereas the chances of its solution would have been greatly increased if there had been more men working on it, necessarily at different places and possibly under different conditions over a larger area in India.

21843 Professor Gangulee: You suggest the repetition of the experiments done at Pusa?—Yes.

21844 The Chairman: With a view to ascertaining all the information about their local application?—Yes.

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

21815. May I take it, Mr. Maurer, if you do not say anything, that you agree, broadly speaking, with what Mr. Hutchinson says?—Yes.

21816. On page 293, you say that in adopting the procedure of going in for a moderate degree of fertility, the ryot appears to have been unconsciously recognising the existence of natural recuperative forces and adapting his agricultural methods to their rate of operation. To look at the thing from another point of view, does that mean that with improved varieties or better feeders the problem of providing sufficient food for these new varieties arises, and that before you can economically over a series of years adopt new and better varieties of crop, you must face the problem of nutrition?—Yes; that is the view that I have held for some years now. I may say that when I first put forward that view in Bombay, it was a very unpopular one; I was very heavily jumped on for having suggested that the general policy of the department had been wrong in producing these high-yielding varieties of crops and of improved implements, and not making any provision for putting back into the soil the extra amounts of plant food removed from it. I do not think there is any getting away from that point of view that, if you are going to take more out of the soil than is put back by natural processes, you must sooner or later arrive at a point when you will get reductions of yield.

21817. You may escape punishment for a year or two, but sooner or later nemesis is on you?—Yes. We have had an interesting case of that in the improved Punjab wheats. Those wheats are used with great success in many places in India, but they cannot be grown by the ryot round Pusa, except on one or two very strong soils. He finds if he grows those wheats on his ordinary wheat soil he gets a smaller crop, not in ten years but the next year. That is a very best wheat indication of what may happen, and will happen in time, on the very best wheat soils, and I think there is no getting away from the fact that you have to take cognisance of the possibility of its becoming a general phenomenon in India.

21818. Do you regard artificial fertilisers as an alternative to cattle manure or as supplementary to it?—Certainly supplementary; nothing can take the place of organic matter in the soil; you can increase the amount of organic matter by stimulating the growth of crops by mineral manure, but you cannot replace it altogether.

21819. In your knowledge, have sufficient experiments on the economic side of the use of fertilisers in India been carried out?—I am aware of the fact that they have been carried out, but I am not sufficiently informed as to the details to give any information on it. I know that they have been carried out and that they are being carried out; of course, you have the outstanding case of the tea industry where they could not do without them.

21820. The economic problem is complicated and aggravated to some extent by the fact that over large tracts the whole season's crops may fail as a result of the failure of the monsoon, which means of course that if expensive artificial fertilisers have been bought and applied and no return accrues, a more serious net loss has to be faced?—It will depend on the character of the fertiliser whether it remains in the soil or not.

21821. Might not that be a very important consideration in certain areas?—Yes.

21822. Would you suggest the creation of some committee or council which would bring the organisations commercially interested in the sale and distribution of fertilisers into touch with Government? Have you ever suggested, or has anybody in your knowledge suggested any scheme of that sort to Government?—Yes; there was a suggestion of that sort. I think it was two years ago, and it was actually put up to the Government of India, I think, by the Agricultural Adviser as a concrete suggestion, that a committee should be formed, especially to deal with the subject of manures. What the composition of the committee was I do not know; I know that it was suggested.

21823. Do you know that agricultural authorities very often lament the fact that the distribution of seeds cannot be handed over to concerns working on a commercial basis? Have you heard that?—I do not think I have heard of it.

21824. You make a strong plea for further research into the agricultural aspect of irrigation?—Yes.

21825. Is that a line upon which you have done much work yourself?—Only in so far as it affects my particular subject of bacteriology. They are so closely allied to each other. The influence of the amount of water in the soil on the

Mr. G. M. Hutchinson and  
Mr. F. E. Maurer.

fertilising activity of bacteria is so marked that you cannot get away from it. It seems to me so vital that people who are using irrigation water should know exactly what is happening when they are using it and what is likely to happen if they use too little or too much and the advantages in different small doses and big doses. Our ignorance on that subject in the field seems to be profound. That is to say, the local application of one's laboratory knowledge is a thing that has got to be worked out in all the irrigation tracts in India.

21856 Is that a field in which, in your view, there are fundamental problems which might well be dealt with by a Central Research Institute?—I think so. It is not only connected with irrigation areas but also with other wet areas and even with dry areas.

21857 The process by which nature restores the nitrogenous matter taken out by crops such as rice is rather a mystery, is it not?—We have got some glimmering of the general method. We know that it is a different class of soil. But it is fairly clear that such an action must go on in paddy soil.

21858 Would you go so far as to say that that is a problem of great importance upon which very little work has been done so far?—I should like to go further than that if possible and say that what little work has been done has been of such importance as to show the prime necessity for carrying it on further. There was some work done by Dr. Harrison in Madras many years ago. It has remarkably demonstrated the value of pure research work on the field problem.

21859 Have you ever pondered over the problems of propaganda in agricultural matters?—The only connection I have had so far, just before I left Pusa, was that the Government of India made the making of cinema films one of the functions of the Bacteriologist. That is the only connection I have had with propaganda work.

21860 For how many years have you been engaged in soil chemistry?—For about 28 years.

21861 How much experience of making films have you had?—I had never made them before.

21862 And yet the Government of India put you on to making those films?—Yes.

21863 Did you make a success of it?—They have been exhibited before the Viceroy but I have not heard his opinion. That was a very small affair.

21864 *The Raja of Parakimedi*: Are you satisfied with the position of Pusa as regards its accessibility by the ryot?—All the ryots round Bihar come and look at our experimental crops at Pusa. They walk through our laboratories and take interest in our work.

21865 Have they been told what the effects of your experiments have been?—I think when one is in the immediate neighbourhood one gets to know what is going on there by asking the staff. They nearly always know what is going on. A gentleman whom I had the privilege of knowing took a very keen interest in the research work. He wanted to know what the effect of our research will be on their own particular style of irrigation. The best way is to ask the cultivator what he believes and what his superstitions are. He has all sorts of queer superstitions. If you find these out and ask enough questions about them you very often find that you are getting information that you did not possess before.

21866 Do you know of any cases in which they have actually adopted the methods shown to them in Pusa research work?—You mean any cases of alterations.

21867 For instance, the use of fertilisers?—They do use fertilisers.

21868 What about the production of crops by means of artificial cross-breeding?—You mean the use of improved variety of crops. They do not employ it except on certain lands where the soil is very strong. There they do not very much care for the varieties of Pusa wheats. But they use some other crops. For instance, there is a large tobacco area in North Bihar where improved varieties of cigarette tobacco have been introduced from Pusa now. Then there is the outstanding case of cane which is being taken up now for the whole of that district. These are Coimbatore canes which are being distributed from Pusa.

21869 Do these private people come to you for assistance on any point?—You mean locally or by correspondence?

Mr. C. M. Hutchinson and  
Mr. F. E. Maturer.

21870. In both ways?—Personally we are limited almost entirely to research work on fertility. I should naturally be the recipient of inquiries as to the use of new varieties of crops and improved implements and that sort of thing. If the matter touches my subject, then the correspondence is referred to me. I have correspondence with people all over India.

21871. Do you encourage this sort of practice?—Yes. It is naturally of extreme interest to anybody who is doing research work to be in touch with the people who are possibly going to make use of it. I have had experience before I went to Pusa because I was with the tea industry in Assam, so that I had a very thorough drilling there by being in touch with the people who are actually working on the soil.

21872. Was any portion of your work translated into the vernacular and published by the Government in the shape of bulletins?—I am afraid there will be certain technical difficulties in connection with technical terms and so on. There was however one exception to that. I had the privilege of introducing a method of dealing with green manures twelve years ago in India and that method was adopted all over India and I understand that some vernacular translations of it were also published.

21873. When you do discover anything really useful, do you have it published in English bulletins?—As soon as one gets any results, they are published in the form of either memoirs or bulletins, or in the *Agricultural Journal of India*. That is circulated all over India.

21874. Sir James MacKenna: With reference to your operations in the silk manufacturing line, was not that duty imposed upon you by virtue of the fact that you are a well known photographer and artist as well as an Imperial Bacteriologist?—Yes; that was a coincidence.

21875. One or two questions arising out of the questions which the Chairman has put to you. You were very emphatic about the training of Indians in England?—Yes.

21876. We have heard a good deal of evidence favouring a scheme such as follows; to pass through the course of a local agricultural college, to work for some years in the section on the field in the case of an agricultural assistant, and then to go to Europe to the best man on the subject which he proposes to take up. That, of course, refers to men in the Service who are qualifying themselves for promotion to the higher centre. Do you like that method?—It depends on the subject they have proposed to take up.

21877. You will limit it to the subject?—Yes.

21878. Then your original statement would not be general?—I should not like to make it general because I am not in a position to do so. As far as my subject is concerned, I am prepared to maintain that at Pusa he will learn more about soil bacteriology than he could learn anywhere else.

21879. In the case of soil bacteriology, a man's training could be absolutely complete in India. You would not give him the advantage of learning what the leading authorities at Home do for the simple reason that he would possibly not be benefited by it?—I do not know of any one at Home.

21880. So far as soil bacteriology in India is concerned, India can provide all the training necessary?—That is my opinion.

21881. What type of Director would you like to have at Pusa? You have seen many kinds?—I am afraid he would have to be a sort of angel! Do you mean whether he should be more of an administrator or a scientist?

21882. Yes?—The first thing he has to do is to carry weight as a scientific authority not only with the men under him at Pusa, but with the men in the Provinces and the Government of India.

21883. It is rather a direct question, and I do not want you to mention names, but have you had anyone in the Agricultural Department who could meet the requirements?—We have had somebody who could have done so, but I doubt if it is possible now.

21884. It looks as if it would be necessary to comb out England to get the best type of man as Director?—The position now is that everyone connected with Pusa has become a prophet in his own country.

21885. I see that as a solution of the geographical and other difficulties of Pusa you recommend its complete annihilation, if and when the Government of India

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

L. V. 18—20a

can afford to turn it into a brickheap. Do you not think it would be better to have the institute in Southern India, in surroundings similar to those prevailing in a very large area of India: wet conditions as against the semi dry conditions of Pusa?—I am afraid I do not, not only for administrative reasons but because of one very important thing, the library. It is not often thought of, but a really first class library such as that existing at Pusa could not be duplicated.

21886. What are your views as to the functioning of the Pusa Council?—I have had very little experience of it.

21887. Is it seven men expressing seven different opinions, or seven men expressing views which can be welded into one corporate opinion?—It depends on the Chairman of the Council, i.e., the Director.

21888. That again indicates the need for a man of wide outlook as well as scientific insight?—Yes.

21889. What happened to your work on indigo?—That was axed.

21890. Did the planters make any outcry about that?—Not more than usual, they expressed regret.

21891. That has gone completely?—That has gone altogether. The whole of the special staff was dismissed, and some of it absorbed into the sections.

21892. Have you also had to stop your investigations with regard to sericulture?—I think some of the results have been made use of; in fact, I know they have in Bengal.

21893. So far as you are concerned, I think you had finished that subject?—Yes, I handed it over to the Protozoologist.

21894. What happened to him?—He only stayed about a year, I think 18 months, I think.

21895. Did he finish it?—He presented a report on it.

21896. You have been a member of the Board of Agriculture for many years; what do you think of it? Do you think it could be improved in any way? Should its numbers be increased or diminished, for example?—I think it is a pity it does not have an annual meeting. Its most valuable function is interchange of information and working in the direction of co-operation and co-ordination and the prevention of redundancy in work.

21897. You would go back to the old custom of having an annual meeting?—Certainly.

21898. Would you reduce the representation or increase it?—I should certainly not reduce it.

21899. Do you think the sectional meetings serve a useful purpose?—They might, but in practical working they do not, because of the lack of interest on the part of certain individuals.

21900. It would be better to have these people on a general board than to risk the chance of their crabbing the section?—Not only that, but the difficulty in moving from one subject to another is felt when it comes to a sectional conference.

21901. With regard to artificial fertilisers, is it your idea that Government and the trade should co-operate in the dissemination and distribution of these fertilisers? What should the relations between the two be in the matter?—The first point that arises is the necessity of Government departments giving information to the trade as to what manures are wanted, for what crops they are wanted, and what the ryot can afford to pay for the manures and whether they can be used economically. That is for the Government to do. Then, as far as I can see (I do not know much about it yet), it is a question for the trade to see what they can do in the way of providing these fertilisers at an economic rate.

21902. Do the trade expect any financial assistance from Government in the matter?—(Mr. Maurer) Ultimately Government will probably have to come in and help the trade.

21903. In what way?—Financially.

21904. To what extent?—The distribution of fertilisers upon country necessitates the storing of colossal quantities in the interior. It will be so in five or ten years; it is not so at the moment.

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer,

21905. To what extent would you expect Government to step in financially?—That is a matter which will have to be thought out.

21906. Have you any views on it?—Not yet.

21907. You would rather say nothing about that?—I would rather see the thing going on for a few years and then devise a scheme to put before Government; but it is possible the trade will require financial assistance from Government later on.

21908. When it comes to deal with the problem on a big scale?—That is it  
21909. *Professor Gangulee*: You have had a number of students under you as research scholars in Pusa?—(*Mr. Hutchinson*) Yes.

21910. In the department of soil bacteriology?—Yes.

21911. What scientific education did they have before they came to you?—I think they were practically all graduates of one or other of the Indian Universities.

21912. B.Sc. or M.Sc.?—Both.

21913. They had a fairly good scientific equipment to begin with?—Yes, because I made a provision that before they came to the laboratory to learn soil bacteriology they should have a training in chemistry first.

21914. Organic chemistry?—Not necessarily, but a sound training in chemistry.

21915. Do you find that the scientific mind develops among your students?—It is my business to develop it.

21916. Do you therefore attach importance to a research atmosphere, as being an efficient means of developing the scientific mind?—The atmosphere will not develop it if it is not there to start with.

21917. But you must have an atmosphere to develop that mind?—Yes, if they have the mind to develop you require the atmosphere to develop it.

21918. Do you notice any change in the outlook of men who have returned from abroad?—Yes.

21919. So that they bring back not merely testimonials but change in mental attitude as well?—Yes.

21920. Can you say the necessary atmosphere to give our students a scientific bent of mind exists at Pusa at present?—Yes, definitely. Students belong to an association at Pusa which has lectures on scientific subjects from its members and from the staff once a fortnight.

21921. You are of the definite opinion that we have at Pusa that research atmosphere which is necessary for development?—Yes, it is very strongly marked there.

21922. Could you mention one or two research problems the Provincial Governments are not now in so good a position to deal with as they were formerly? Can you mention any, for instance, which the Government of Bengal have had to discontinue or are unable to undertake?—I have nothing to do with the Government of Bengal.

21923. You have recently left Pusa, where you were, I take it, in touch with the research work being done by the Government of Bengal?—I have done some myself.

21924. Do you know of any research work in the Provinces which has had to be discontinued?—Yes, I think I do.

21925. Will you mention some?—I would rather not mention it.

21926. You make the statement here that students sent abroad come back with testimonials and try to supersede the men already working at Pusa; but because these boys have been to other countries does it not follow they have acquired a decided change in their outlook and therefore are, in a way, better equipped than the men already in Pusa?—It depends what the change is.

21927. You agreed with me there was a change in their outlook?—I did not say it was a change for the better.

21928. You say the standard of research at Pusa should be maintained at its present high level. Would you say the standard and quality of research are gradually being improved at Pusa?—The sources of knowledge are being improved.

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

21929. Do you think at the present time there are men carrying on the tradition of the Howards, Butler and others who acquired an international reputation?—Certainly, yes.

21930. Do you find there is plenty of team work in the research work at Pusa?—Not as much as I should like, but that is a personal view.

21931. Do you find continuity of research?—No

21932. Without continuity of research, how can you create a research atmosphere?—I do not think they are connected at all.

21933. Take the question of the fixation of nitrogen, in which you are interested. If that work has been discontinued to day, how would you maintain the interest of the students who had begun to take an interest in it? They are still there though you have gone. I think there has been a decided break in the atmosphere so far as the fixation of nitrogen is concerned: so I maintain that in order to have an atmosphere of research there must be continuity of research?—Such as you would not get by sending a man from India to England!

21934. They carry on the same work; they go from one atmosphere to another and perhaps a better one?—No, I think it is a different atmosphere, and that there is a very big break.

21935. You agree there is no continuity of research work at Pusa?—Not as much as I should like to see.

21936. Who is carrying on with the nitrogen fixation question now?—My successor, who was my assistant for twelve years and took over from me.

21937. You say the mind of the teacher is fundamentally opposed to the mind of the humble seeker after truth. Will you amplify that?—Perhaps that is a matter of experience.

21938. Both are humble students after truth, are they not?—The reaction of teaching upon the mind of the person who teaches is to produce the dogmatic attitude of mind which is incompatible with the attitude necessary for research.

21939. Turning to the memorandum that was submitted to us sometime back by Messrs. Shaw Wallace and Company, and the précis that you have submitted to me, do you think adequate attention has been given to the nitrogen problem?—Do you mean the use of nitrogen as manure?

21940. The use of nitrogen as manure and the investigation of problems relating to nitrogen?—I do not think so.

21941. The use of artificial manures in India is still confined to tea plantations and rubber plantations?—(Mr. Maurer). Eighty or ninety per cent. is taken by the plantations.

21942. That work is not the work of the Department of Agriculture, but the work of commercial enterprise?—As regards tea, it is the work of their own Scientific Department; there is no commercial propaganda except ordinary advertisement.

21943. What part have the Provincial Departments of Agriculture played in the introduction of artificial manures in the plantations?—Very little with regard to tea and coffee.

21944. The Tea Association has its own organisation; as to others the commercial firms undertake the work of propaganda?—Beyond ordinary advertisement and the issue of pamphlets, we have not done any propaganda.

21945. In memorandum\* "B" of Messrs. Shaw Wallace and Company, you state, "Agricultural Departments have, at no time in the past, shown any inclination or ability to assist commercial enterprise directly in establishing a demand for artificial manures." Is that your experience?—That has been our experience; we have tried for ten years.

21946. Did you seek the assistance of the Department of Agriculture?—Yes.

21947. With what result?—We have never been able to get hold of the ryot through the Agricultural Department in the past.

21948. What is the attitude of the department as an official body?—They do not give sufficient information on the subject of manure to the ordinary cultivator.

21949. Do they join in the propaganda carried on by your company?—Not in the past.

---

\*Not reprinted: Central Government Memorandum dealing with Fertilisers prepared for the Commission.

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

21950. The British Sulphate of Ammonia Federation, Limited, have sanctioned £20,000 for propaganda. When you had a similar propaganda campaign, did you seek the assistance of the Department of Agriculture?—Yes.

21951. With what result?—They promised their support.

21952. Did they do anything in action?—We have been going only for the past six months, and it is very difficult to express an opinion on that.

21953. The Indo-Agri, Limited, I take it, is chiefly organised for the purpose of retail selling?—That is right.

21954. Not wholesale?—For selling to the small men in small quantities.

21955. You have a flat rate of profit of Rs. 7-8-0 per ton?—Yes.

21956. What is the organisation which you have created for distribution?—The organisation is a distribution combination which will have a large number of depôts in the interior of India, and in these depôts the fertilisers recommended by the Agricultural Department in particular districts will be sold, and will invariably be sold on a basis of profit, which is not intended to exceed Rs. 7-8-0 per ton for the time being, but we will have to feel our way. This profit may be cut down later on if the profit is increased; we may have to put it up if the losses for the next two or three months were considerable.

21957. You consider that a policy of a flat rate is good?—We are elastic. If we find the flat rate does not work we shall revert to district rates or provincial rates. We are merely feeling our way; we have adopted the system of a flat rate tentatively; if we find it does not work, we can alter that.

21958. Do you propose to ask the Agricultural Department here to assist you?—We are doing so wherever possible. In fact the Indo-Agri will have depôts in the interior; in a large number of instances we shall be working with co-operative banks and societies wherever they are capable of taking up the business from the financial point of view and the working point of view.

21959. That will help you to eliminate the intermediaries?—It will, although we find our own upcountry agents are really as cheap as, if not cheaper than, the co-operative societies in their charges. That is our experience.

21960. When did the idea of Indo Agri occur to you? Is it recent?—It is a recent idea, only a year old.

21961. It is not in working order yet?—We are working; we have a hundred depôts in the interior all over India.

21962. Do you think anything can be done by way of cheaper railway freight to popularise manures?—We had intended moving with regard to railway freights, but the Royal Commission was appointed and as we expected they would take up the problem, we thought it would be unwise to take it up ourselves.

21963. Have you any definite suggestions to make?—I have not looked into the problem.

21964. Are you satisfied with railway facilities?—It is rather difficult to say. Of course the railway facility from the point of view of fertilisers is too small.

21965. How do you distribute the fertiliser depôts?—We distribute them along the railways. We have also a few depôts in thickly populated agricultural tracts which are not on the railway lines; and we carry the manure there in carts or motor lorries. As far as possible we confine ourselves to the railway lines.

21966. What about phosphatic manure?—Wherever they are required, we store them at the depôts. At the moment we are selling superphosphates in the Madras Presidency wherever the Agricultural Department prescribe it along with nitrogenous fertilisers.

21967. Do you manufacture superphosphate in India?—Superphosphate is imported. It is not a paying proposition for manufacture in India.

21968. Because of sulphuric acid not being available?—Because there is no suitable rock-phosphate.

21969. Could you not utilise bones?—That is not an economic superphosphate. Bones are exported for the manufacture of gelatine and they command a price which they can never get if used as a fertiliser. Imported superphosphate is cheaper as a fertiliser.

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

21970 Would you ascribe the high price of bones to the fact that they are exported from this country?—The price of bones is high because they are exported for a purpose which has nothing to do with their manufacture as a fertiliser, they are exported for the extraction of gelatine.

21971. You are not in favour of prohibition of export of bones from this country?—I am not in favour of that, although I am not personally interested in the export of bones. I can see no benefit which can be derived from stopping exports.

21972 While the sulphate of ammonia will replenish our soil with a lot of nitrogen we shall have to starve for phosphates?—Not necessarily; you can import phosphates.

21973 We will have to depend on imported phosphates if we export our bones?—You are merely replacing the bones you export and at a cheaper price than the price you get for your exports.

21974 Mr. Kamat: On page 296 of your memorandum you say, "The adoption of the recommendations of the Lee Commission which stopped recruitment to the Agricultural Service in England, taken together with the fact that the comparatively low rate of remuneration has failed to attract a sufficient number of the best class of Indians....." I should like to know whether this diagnosis is quite correct. Have you really noticed that the number of Indians attracted is distinctly smaller and that the quality is not the best?—(Mr. Hutchinson) The cadre of the Imperial Agricultural Service is 150, and there are 19 vacancies, because there are not qualified Indians to fill them. You may infer from that that there are not sufficient Indians taking interest in scientific agriculture.

21975 The Lee Commission's recommendations came into operation only a couple of years ago?—Yes.

21976. Is there sufficient time to make an inference?—It gives a sufficient indication to be referred to as one of the reasons.

21977 Have you had sufficient indication before the Lee Commission's recommendations came into operation that the recruitment in England helped you in this respect?—There was distinct indication of the difficulty of getting Indians of sufficiently good education for the posts we wanted them to fill.

21978 Is it not possible that probably, as you suggest in the absence of a Director of great scientific reputation, Indians might not have been attracted to Pusa?—They were attracted, but they were not of the class we wanted.

21979 You mean they are attracted, but they are not of the best class?—Yes: I do think so.

21980 Do you not look to the other factor for your diagnosis, that you have not a whole time Director and a man of distinctly high reputation as you yourself admitted in one of your answers?—I think we do want a man of that type, and it is one of the factors that would affect it.

21981. Would you get the best class of Indians if you increase the pay?—I think the best class of Indian must react to the economic basis. If they are going to get higher pay by going into law, they are not going to take up agricultural research.

21982 Sir Henry Lawrence: You have laid some emphasis on bacteriological study in relation to irrigation, and you suggest, I understand, that irrigation problems should be examined in relation to the soils. Is it not necessary to have the irrigational problems examined near the canals?—The advantages of having a separate Institute for this purpose would be that that Institute would be in a typical irrigation area and would be working on the soils which have been under irrigation for some time, and it would be possible to compare the condition of those soils from all points of view, physical, chemical and biological. I think there would be undoubted advantages in applying the fundamental knowledge that is going to be acquired at Pusa to specific problems that would arise in an irrigation area.

21983 Those problems ought to be investigated by subsidiary Institutes working on the canal areas?—What I mean is that they have far too much work at Pusa; there would be so much to be done in regard to the investigation of the condition of the soils and irrigation that it justifies a special staff which would be able to devote more attention than the Central Research Institute could.

21984 You advocate that that special staff should be engaged in every important canal area, for instance, separately in the Punjab, separately in Sind, separately

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

in Madras, separately in the Bombay Deccan?—If the money could be provided, undoubtedly that would be the best way of doing it.

21985. Are those problems somewhat different according to the climate and soil?—Yes, but not so very different that all of them would not benefit by the institution of one laboratory, if they could not have one of their own.

21986. Can these irrigation problems be examined where there is no canal? Have you a canal at Pusa?—We have got a sort of semi-defunct canal.

21987. Is it sufficient for the purpose of examining these problems?—I would not say so, it is not a normal canal at all.

21988. I am not quite clear as to your definite suggestion. Would you like to have this special officer working in a canal area, or do you want him to work at Pusa?—I am suggesting that a special Irrigation Laboratory should be set up in a typical irrigation area, preferably in the Punjab.

21989. Would that officer be able to throw light on all those problems that arise in irrigational areas, for instance, water-logging?—It would not be one officer; you have got to have a complete staff to deal with fertility problems.

21990. One would be water-logging?—Yes.

21991. Another would be soil efflorescence?—Yes

21992. And the alleged decrease of the fertility of soil under canal irrigation?—Yes; that is very important.

21993. Have you any views on that point? Recently, a statement has been made by an eminent scientist that the fertility of lands decreased under irrigation, and he based that, as I understand it, on his own experience in the Punjab and in Sind, and he quoted the case of Egypt. Have you any information yourself on that question?—Do you mean as to the possible production of alkali?

21994. Actual decrease in the yield of crops?—I am afraid I have not any personal knowledge of that. I am afraid I really do not know enough about the field side of that question to deal with it at all effectively. But there was a suggestion coming from a scientific authority that irrigation might produce a serious condition of unfertility, and that, I think, has special reference to the Sukkur Barrage. To my mind, that particular reference would justify the setting up of a research laboratory in order to find out whether what that scientist had said was true or not. I am afraid that I could not agree with almost anything that he said on the bacteriological side; it was a series of generalisations based on imperfect knowledge of the facts of the case.

21995. You remember Mr. Howard's presidential address to the Indian Science Congress last January?—Yes; I am afraid his enthusiasm carries him beyond his knowledge in that particular point.

21996. *Dr. Hyder*: Is that quite correct? I wonder if you have heard that so long ago as 1854 or 1855, the people in the district of Agra and other districts along the Ganges Canal complained that their lands had become cold. I wonder whether you have come across any such complaints?—Their feet might become cold.

21997. You think it is one of the general superstitions.

21998. I wonder whether the subject was taken up by the Government of India. Did not Sir Edward Buck take it up?—Did he come to any conclusion?

21999. *Professor Gangulee*: His work was chiefly in connection with the formation of alkali deposits. Mr. Ball carried on some work and it was followed by Sir Edward Buck's efforts?—I think the general conclusion was that we want more information; that is all that we have got about it.

22000. *Sir Henry Lawrence*: That information should be obtained before these big schemes are put in hand?—That is my general impression, and I give it for what it is worth. These dreadful things about new irrigation schemes may, be, avoided by a proper utilisation of irrigation water. You can ruin the land by over irrigation, but it does not follow from that that irrigation is a mistake; you do want information as to the best way to use it.

22001. In your note on page 300, you state that Dr. Voelcker's suggestion of importing firewood to remedy the defects of burning cattle manure is unfortunately an impracticable one. Is there any other remedy that you can suggest?—You mean for the lack of firewood?

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

22002 To avoid the burning of cowdung?—No; I cannot think of anything. It is a deep rooted habit, and it is so obvious a thing to depend upon for the people. The alternative is to let it go on and use artificial manure instead. In an area like North Bihar, round about Pusa, you have one of our fertile tracts in India. It is so fertile that every square yard is under cultivation. There is no jungle for firewood and no grazing for the cattle, and as a result of the fertility the condition of the people is very bad. They suffer from malnutrition, malaria, and everything of that sort as the direct consequence of the extreme fertility. One of the things they do is that they burn their cowdung, and because they have no other fuel they suffer from malnutrition as they cannot cook their food properly. I do not see any way of avoiding the use of cowdung fuel in an area where that sort of thing is liable to happen.

22003 There is no other alternative?—No

22004. *Sir Ganga Ram*. On page 297, you give three important lines of operation for the maintenance and enhancement of the productive power of the soil; the first one is improved methods of cultivation and improved tillage implements. Can you briefly explain what you mean by methods of cultivation?—I am afraid it would take rather a long time.

22005. I want to know briefly what you mean; do you mean turning of the soil?—Yes, practically.

22006 Is that all that is in your mind?—It practically comes to that; you may take it as the best way, the best time, and the best depth.

22007. You know that in some places turning of the soil is condemned?—I know it is; in those places you should not do it.

22008. You have given only three important lines of operation; do you not think you should add another important thing, namely, proper knowledge of rotation?—That would come under the head of methods of cultivation.

22009 Under that head everything will come?—Yes.

22010 Do you not think that it should be prominently put down?—I quite agree.

22011 I only wanted to know whether you would not put down as No. 4, proper knowledge of rotation?—Certainly, yes

22012. You have put down a point about the fixation of nitrogen, with which I agree. Do you not think that fixation of nitrogen from the air can best be done by exposing the soil many times to the air?—Generally speaking, that is so.

22013 That is our knowledge, and I have made experiments in that direction. By turning over the soil twenty times I got double the yield?—I know, but you confuse cause and effect there. You might be doing the same thing with improved tillage implements.

22014 Mr. Howard stayed in Manipur for one month; at that time there were four waterings for wheat; he had only two waterings, and with the two waterings he produced 50 per cent. more. The effect of the experiment has been rather unfortunate, because our water has been reduced by 25 per cent. First of all, the Irrigation Department fixed the duty of water for wheat at 270, and now we are reduced to 333. Really, the increased yield was due to constant harrowing and a very skilled staff. I was only drawing your attention to constant harrowing and exposing the soil to the atmosphere. You agree that it has a very marked effect?—It has a marked effect on the immediate return.

22015. It cannot be done without fixation of nitrogen?—It can be used for making available the nitrogen you already have.

22016. You accept the statement in the agricultural books that each acre of wheat cut takes away 180 lbs of nitrogen?—No.

22017. In Lyallpur experiments were made, and they have found it to be 95 lbs.?—You have got very fine wheat in the Punjab.

22018. You accept this as one of the natural methods of attracting nitrogen to the soil?—Yes

22019. Another method was suggested to me this year by an ordinary peasant, that the soaking of the seed for one week in cattle urine produced bacteria; is there anything in it?—It would be much better to find out for yourself than for me to tell you.

**Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.**

22020. That I will; then I would not want your opinion about the scientific side?—I have not tried it in Pusa, it would not do in Bihar.

I am not familiar with Bihar.

22021. Mr. Maurer, you are a representative of Messrs. Shaw Wallace and Company?—Yes,

22022. We were told in Madras by Messrs. Parry and Company that they were making superphosphates; is that right?—Yes, they are manufacturing small quantities of it.

22023. How is it that other firms are not making it?—Messrs. Parry and Company have got certain rock-phosphates; they manufacture sulphuric acid and therefore they are able to produce superphosphate.

22024. I think it was your firm which wrote to me that the question of railway freight was a difficult question, and recommended my taking it up. I want to know whether, in the fertilisers sent out by your firm, there is a good deal of adulteration with river silt?—Adulteration! Where?

22025. In your firm, or by whoever sends it to the Punjab; we have found it containing a good percentage of river silt?—In what material?

22026. In the fertilisers?—What type of fertiliser?

22027. I cannot tell you the name. You deny that there is any adulteration?—There is no adulteration at all, so far as I am aware.

22028. That is rather a qualifying statement. I can prove to you if you ever go to the Punjab that it contains a good percentage of river silt?—It must have been travelling up by river then.

22029. Are you suffering from excess of railway freight?—No, we are not.

22030. I have had letters from two or three firms to that effect?—I do not remember having sent any. Anyway, freight does not affect us.

22031. Your interest lies in fertilisers and the zamindar's interest lies in having it of local manufacture. How far can you reconcile the two opposing factors. Can you manufacture fertilisers from some raw material in India?—Fertilisers are being manufactured in India.

22032. Do you use all Indian raw materials in them?—Sulphate of ammonia is manufactured here.

22033. Some fertilisers are very dear and unless you are going to make them cheap, there is no prospect of the propaganda work appealing to the people?—We are aware of that fact.

22034. So, there are two things against it. First adulteration and, second, the fact that you are trying to import everything ready made?—What we are selling to-day in the way of sulphate of ammonia is all made in India.

22035. But nitrate of soda is all imported?—Yes.

That is a very important fertiliser for wheat in our part of the country.

22036. *Sir Thomas Middleton*: You have pointed out that there are a large number of vacancies which have not been filled in the Superior Agricultural Service and also that facilities for post-graduate instruction can well be provided in India. Do you not think that as these vacancies have appeared only during the last year or two students have not had time to prepare themselves to fill them?—(*Mr. Hutchinson*). It is quite possible.

22037. Would you accept the statement that you have now a number of suitable graduates who are turned out by Indian Universities and therefore there should be no lack of well qualified candidates for post-graduate study, who would afterwards qualify for posts in the Superior Service?—I think so.

22038. It is difficult to reconcile the economic position of the students with the fact that so few applicants seem to be coming forward for these higher posts?—I do not say that they are not coming forward but that they have not got the qualifications for the appointments.

22039. If a sufficient number is coming forward, then one would suppose that you would find among them some persons suitably qualified?—I am afraid that is not the case because you require rather special qualifications.

22040. They do require special qualifications but for these special qualifications they could have or might have had post-graduate instruction at Pusa, for instance?—Yes.

**Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.**

22041 Do you not think that when the position is realised there will be a great many more candidates for post graduate training at Pusa? Will not vacancies tend to draw students?—It would certainly increase the number of students.

22042 What period of post graduate study would you regard as necessary for a student who has got his Bachelor of Science or Master of Science Degree at a University here?—I should think two years is the minimum.

22043 You know that in Britain we aim generally at three years?—Yes.

22044 What are the essential points that one has got to look to during the student's post graduate course? What are the reasons which have led you to say that work can be better done at Pusa than it could be done in England, for example?—I am dealing with my own particular subject. Do you know who lectures on soil bacteriology at the Cambridge University?

22045. I could not name him?—It is Professor Biffen.

22046 Your point is this that in India you have got the problem ready-made for the student?—Yes

22047. You may or you may not have the teacher. Assuming that you have the qualified teacher, you could more easily provide the post-graduate student with a suitable problem in India than you can in Britain?—That is so.

22048 Coming to another question, you have drawn attention in an interesting way to the theory of depletion of soil fertility. The Indian cultivator has a size of crop which he can afford to grow safely but if you pass that limit there is a danger of depletion of fertility. You have given us one instance in the case of the Pusa wheats. Can you give us any other instances from your experience?—Not with the same amount of confidence.

22049 You have come across indications?—Yes

22050 Is it not quite a likely thing that in newly irrigated areas that phenomenon should show itself?—It depends. For instance, rice irrigation by streams coming through the jungle implies deposition of fertilising silt.

22051. I was thinking of the wheat?—In canal areas, irrigation might result in depleted fertility.

22052 I rather expected that you would be able to give cases from these irrigated areas?—I have not got them. I only wrote this note in the last few days since I arrived in India

22053 In making this general statement would you exclude leguminous crops from the statement that there is a danger in growing more than a certain amount?—I would exclude them because of their useful addition in the form of leaf mould during their growth.

22054 Your dictum applies chiefly to the cereals?—Yes.

22055. You point out how necessary it is to get reliable information as to the value of fertilisers before you can get ahead with propaganda in any form. What steps do you think are necessary in order to get that reliable information in this country? Do you think that it would be necessary to have a very considerable number of permanent stations representing different areas or would you prefer to follow the method which has been commonly followed in Great Britain of taking up temporary areas on cultivator's land and testing out the problem there?—My limited experience would suggest the latter course as being the better of the two.

22056 Do you think that information would be sufficient and reliable in the case of the Indian crop?—It is as reliable, I think, as you can expect to get it anyhow. The great difficulty in field experiment in India in nearly every case is the difficulty of designing your experiments so as to make due allowance for the extraordinary variation in the soil from one plot to the next

22057. In that connection have you studied the recent movement in the United States by which the State Expert has got into contact with the manufacturer, has had a standard formula for manures for particular areas prepared and has recommended the use of manures made according to the formula?—I do not know how it is worked out.

22058. It has been done to a considerable extent?—Is that a reliable method in the States?

22059. It is a method which they have adopted after a great deal of experience?—I see.

Mr. C. M. Hutchinson and

Mr. F. E. Maurer.

22060. You realise, of course, that the Export first gets his facts. He knows how to prepare his formula and the object of the combination is to effectively carry out propaganda?—Yes.

22061. You emphasise the need for some sort of advisory council, which you say should be representative. In what sense do you use the term 'representative'? Do you mean representative of the technical workers or of the administrators?—I think of both.

22062. Have you worked out the size of the council for India?—No. That is probably a difficulty you cannot get away from in dealing with Indian things.

22063. Have you studied the methods by which we attempt to deal with the situation in Britain?—No.

22064. Then I recommend you to do so. You draw attention to the need for further work in soil bacteriology?—Yes.

22065. There are two courses open to you; to increase the number of central institutions such as Pusa, or immediately to proceed to furnish bacteriologists to work in conjunction with the Agricultural Department in the different Provinces. In order of development, which would you select first?—You have the one at Pusa already.

22066. Would you add a second and third institution of a similar kind in other areas in India, or would you prefer to begin Province by Province to make appointments of bacteriologists on the agricultural staff of the Provinces?—I think the second method would be easier to adopt, and you would get results more quickly by it.

22067. Do you think you would have difficulty in finding candidates?—I am afraid you might.

22068. Would it not mean that a scheme would have to be prepared and men put into training for the work?—Possibly, yes.

22069. You point out the value of fertilisers in connection with the production of fodders. I would like some indication of the fodders you have in mind?—I am not sure I should like to particularise. It was merely a general suggestion which I feel is obviously a sound one.

22070. On page 299 you refer to the fact that a considerable amount of information has been obtained on the subject of nitrogen exhaustion. Do you mind giving references?—You will find that in the Pusa reports from year to year.

22071. Would you mind sending in a list of references to the Secretaries on that particular point?—I will try. I may have to refer you to Pusa, because I have not the documents in Calcutta.

22072. *The Chairman*: Help us as far as you can, and we will go to Pusa if necessary?—I shall do so.

22073. *Sir Thomas Middleton*: When we first met I was a teacher and you were beginning your career as a humble seeker after truth. I hope you did not form this estimate of the teacher's mind which I find in your précis while you were at Cambridge?—No, not of the teacher's mind, but of the interference with research work by teaching and administrative duties, with which I think you will agree.

22074. Do you not agree that the danger is in connection with elementary teaching, preparing undergraduates for examination; that is the teaching you had in view?—I do not know if was entirely that.

22075. You do not always find the dogmatic type of mind in the University teacher, do you?—No.

22076. *Dr. Hyder*: I do not know whether you advocate the use of sulphate of ammonia?—No, I am not concerned with the use of any particular form of manure.

22077. You as a scientist say the use of these artificial manures should be encouraged, but the gentleman who represents the commercial side says the tea-planting industry cannot make further use of this particular material, because they are afraid their prices would go down. I cannot reconcile the conflict there, and I do not know how you will solve it between you?—(*Mr. Maurer*). That is not what is meant. The demand for sulphate of ammonia for tea plantations, just like the demand for any other particular fertiliser, is limited. Probably more types of fertilisers are need with tea than with any other crop. Something like ten varieties of fertilisers are used with tea, of which sulphate of ammonia is only one.

*Mr. C. M. Hutchinson and  
Mr. F. L. Maurer,*

22078 I do not see, Mr. Hutchinson, what would be the good of a committee in the absence of definite information with regard to the deficiencies of different types of Indian soils; knowledge we have not yet got. The first thing is to find out what are the deficiencies, and then it may be worth while for scientists, commercial men and propagandists to meet round a table?—(Mr. Hutchinson). When I suggested a committee my idea of its functions was that it should draw attention to this want and suggest means of getting that information. The committee is not to control the way in which it should be obtained, but to make suggestions.

22079. With regard to the control exercised by the editorial board of the Director at Pusa, what is its nature? Does it mean that if something does not come up to the required standard it will be put in the wastepaper basket, or does the Council send suggestions to workers in the Provinces pointing out where they are wrong and making suggestions?—The editorial function is merely to set a standard. They are not concerned with the opinions expressed at all, but with the standard of research work exhibited by the experiments conducted and the memoir submitted. If the standard of work sent up is not what the Council considers sufficient it is not published, and suggestions are made for alterations or improvements.

22080 With regard to the statement that nitrate of soda is washed away on account of heavy rainfall, have you any evidence of that?—(Mr. Maurer). It is known to be liable to be washed away, that is a scientific fact.

22081. Is not it used in other tropical countries?—To a certain extent.

22082 In Cuba and the West Indies?—Yes.

22083. There is heavy rainfall there?—They use far more sulphate of ammonia in the West Indies.

22084. Not Chilean nitrates?—Very little. It is the same in Java.

22085. *Sir Ganga Ram* : For what crops?—Sugar.

22086 *Mr. Gupta* : You say you have 100 depôts in various parts of India?—Over 100; about 120.

22087. How many have you in Bengal?—Roughly 30.

22088. Have you any near Calcutta in the Presidency Division, these five districts?—No, they are chiefly in Northern Bengal.

22089. *Sir Ganga Ram* : Have you any in the Punjab?—No, not yet.

22090 *Mr. Gupta* : If you have any, there are other organisations besides Government which may help you. The District Boards are very keen on helping the ryots to get artificial manures?—Yes. We are in touch with some of them.

22091. If you would like me to put you in touch with District Boards in this Division, I shall be very glad to do so?—Thank you very much.

22092. *The Chairman* : There is nothing you wish to add?—No.

(The witnesses withdrew.)

*The Commission then adjourned till 10.30 a.m. on Tuesday, the 7th December, 1926.*

Mr. C. M. Hutchinson and  
Mr. F. E. Maurer.

Tuesday, December 7th, 1926

## CALCUTTA

## PRESENT :

The MARQUESS OF LINLITHGOW, D.L. (*Chairman*)

Sir HENRY STAVELEY LAWRENCE, K.C.S.I., I.C.S.	Mr. H. CALVERT, C.I.E., I.C.S.
Sir THOMAS MIDDLETON, K.B.E., C.B.	Raja Sri KRISHNA CHANDRA GAJAPATI NARAYANA DEO of Parlakimedi.
Rai Bahadur Sir GANGA RAM, Kt., C.I.E., M.V.O.	Professor N. GANGULEP.
Sir JAMES MACKENNA, Kt., C.I.E., I.C.S.	Dr. L. K. HYDER.
	Mr. B. S. KANAT.
Mr. J. N. GUPTA, I.C.S.	} ( <i>Co-opted Members</i> ).
Rai A. C. BANERJI Bahadur	
Mr. J. A. MADAN, I.C.S.	} ( <i>Joint Secretaries</i> ).
Mr. F. W. H. SMITH.	

Khan Bahadur M. A. MOMEN, Magistrate-Collector (on leave)  
and late Offg. Director of Land Records and Surveys, Bengal

## Replies to the questionnaire

QUESTION 1.—RESEARCH.—(a) (i) No special agency is necessary for carrying on research affecting the welfare of the agriculturist. Settlement operations have been completed in two-thirds of the Province and will soon be completed in the rest. Careful investigations are made by Settlement Officers into the economic conditions of the agriculturists and the results of such investigations are embodied in their final reports. It is a pity that these reports are not more widely read or utilised, but it is hardly necessary or possible to make better investigations.

Improvements in the economic condition of the agriculturists can be most suitably done by the Union Boards under the guidance of the Collectors of the districts who ought to take more interest in them than they generally do at present. The department of Government which can render the greatest good to the agriculturist and in fact is their only saviour is the Co operative Department, and Government ought to give much greater facilities to it than is done at present.

Scientific research affecting crop yields, crop values, soil selection, suitability of crops, must be centred in the Director of Agriculture. I am in favour of a research institution for each Province as conditions in Bengal differ so greatly from the rest of India. All advanced scientific research should be done at one centre, as is done now at Decca, but District Agricultural Officers should be encouraged to experiment with different crops and given much more freedom of action than they have at present.

The District Agricultural Officers should be required to make careful enquiries into the requirements of agriculturists in particular localities within the districts, and into the possibilities of improvements of agriculture there either by irrigation, embankments or introduction of new crops, etc. Their reports and recommendations should be submitted to the Collector and the Director of Agriculture and tested by departmental officers. District Officers can then take these in hand and try to effect the suggested improvements either themselves or through local agencies.

QUESTION 2.—AGRICULTURAL EDUCATION.—(i) I have no personal experience of any agricultural educational institution in the Province. There is no agricultural college in the Province and there is only one elementary school at Chinsura.

(ii) I do not think it is necessary to have too many agricultural institutions in the country. The boys of the agriculturist classes who attend rural schools hardly require any elementary agricultural education which such schools can impart. I do not think real agriculturists will send their boys to agricultural schools only to learn agriculture with a view to improve their farms. Centuries of experience have given the agriculturists a practical knowledge of their vocation

K. B. M. A. Momen.

which can hardly be improved upon by elementary education in a school. What they need to learn is not the botanical names of plants or chemical analysis of the soil, but new methods of cultivation by improved implements, cultivation of new and paying crops and animal husbandry and these should be taught by demonstration and not through books.

I consider only one central agricultural college in the Province necessary, preferably at Dacca, attached to the Manipur farm where both elementary and advanced scientific agricultural education can be imparted to the boys who wish to take to agriculture as a profession. This institution will supply officers and field demonstrators for the Agricultural Department and this will be the incentive to attract boys to it. It is futile to expect that in Bengal boys will flock to the agricultural college to learn scientific agriculture only to become practical agriculturists. This main incentive will be Government service but the surplus will enter private service under zamindars and will start farms of their own. Some middle class people may send their boys with the sole intention of starting home farms, but the number of such will be very small. Whatever may be the incentive, the indirect result will be that in a short time there will be many scientifically trained agriculturists in the country and this will go a good deal in disseminating improved agricultural knowledge among actual agriculturists. The farms which such men will start will also serve as demonstration farms to the cultivators and will be more useful to the country than Government farms.

Every district of which I have experience requires facilities for learning improved agriculture. I do not, however, mean that this learning is to be imparted in agricultural schools. I consider it necessary to have a demonstration farm not only in every district but in every sub division, where cultivators and others can obtain a first-hand knowledge of new methods and of new crops and can be taught how to exterminate insect pests and crop diseases.

Much is being made of nowadays about inducing boys of the agricultural classes to join agricultural institutions with the view that they will return to the farm with improved agricultural knowledge. Those who insist on this do not take into account the peasant psychology of Bengal. An agriculturist who sends his boys to school does so not with the intention of improving his farm but with the ambition that his sons by becoming Government officers or lawyers will improve the social position of the family. A boy who belongs to an agriculturist class joins the agricultural school with a Government stipend not because he wants to go back to his field with improved scientific agricultural knowledge but because he finds it difficult to attain higher cultural education and expects to get a job of field demonstrator under Government by passing through an agricultural institution and not with a bona fide intention of adopting agriculture as a profession. It is the sons of the middle class gentlemen who have now turned their attention to this industry finding other avenues of employment overcrowded. It is better to face facts than wallow in theories.

As regards the introduction of agricultural teaching in primary schools, I think all that is necessary is to add a book on agriculture to the ordinary school curriculum dealing with elementary agricultural sciences such as soil moisture, insect pest, and selection of crops.

(iii) Not necessary. There is no point in giving preference to teachers drawn from agricultural classes. This will lead to more harm than good as it will encourage agriculturists to give up their profession and become teachers.

(iv) There is no suitable institution in the Province.

(v) Already mentioned under (ii) above.

(vi) No. Reasons given in (ii) above.

(vii) Suggested in (ii) above. I also advocate that a small agricultural and horticultural farm be attached to each high school in the country. Teaching of vocational subjects should be compulsory and agriculture should be one of them. It is more important that the middle class boys should learn here to use the plough and the spade and realise the dignity of manual labour than that a boy of the agriculturist class should be taught how to grow crops.

(viii) I have no knowledge of nature study. I prefer school farms to school plots. My idea of a school farm is that boys who take agriculture as a compulsory vocational subject in high schools should in addition to theoretical study of the subject, have a hand in the practical management of the farm; each boy or hatch of boys having a small plot to grow their own crops or vegetables by which means they can earn something while they study.

(ix) Government services and some of them quite unconnected with the agriculture. Several of the graduates who graduated from the Sibpur College in agriculture

K. B. M. A. Momen,

were made Deputy Magistrates. I know of no one who has taken to agriculture as a profession.

(r) Agriculture can be made attractive to middle-class boys if it can be demonstrated to them that it will pay its way. Middle class boys are already being attracted to agriculture but want of suitable land, sufficient working capital and, above all, want of experience stand in their way.

The present policy of Government is not to let out lands in bigger plots than 25 bighas to one family. It is difficult for a middle-class youth to earn enough from such a plot. I would recommend leasing of a plot up to 50 bighas to a prospective farmer of the middle class with substantial monetary assistance by way of loan without interest for two years to meet the cost of reclamation, cattle and implements and maintenance. Such a farm should be under the direct management of the District Agricultural Officer, who should control its management and finance till the Government loan is recovered. Arrangements for water-supply by the excavation of tanks and prevention of inundation by erection of embankments where necessary will have to be done by Government. Only those youths who have had an agricultural training in Government schools should be given lands on these concessional terms.

(xi) Adult education can only be done by demonstration in central farms and field demonstration in villages on lands of agriculturists themselves.

QUESTION 3.—**DEMONSTRATION AND PROPAGANDA.**—(a) I do not think the activities of the Agricultural Department have influenced to any marked extent the activities of the agriculturists in the Province. The only tangible improvement has been the introduction of the *kakia bombai* jute seed and the *indrasail* paddy in some Eastern Bengal districts. Improved varieties of sugarcane have also been introduced in some localities. The measures which led to these improvements are field demonstration by District Agricultural Officers and the distribution of seeds through *prachayats*.

(b) Effectiveness of field demonstration depends largely on the result and also to a great extent on the personal equation of the demonstrator himself. It is essential that the officer should be keen on his work to carry the people with him in his conviction. I have known few District Agricultural Officers who take that amount of personal interest in the work as they should. The essential qualification in the officer should be his capacity for mixing with the cultivators freely and for convincing them that his intention as well as his duty is to work in their best interest. The next thing is for him to use the very best seed so that the improved method could be easily demonstrated.

(c) Cultivators will take and adopt expert advice if it is easily available and found helpful. Bengal agriculturists are extremely conservative and unless the usefulness of the advice is well demonstrated they will not accept any innovations. At present agricultural experts are few and not easily accessible and the advice required can hardly be obtained. It is no use advising a cultivator whose jute is being damaged by insects to exterminate the evil by catching the insects and killing them. It is not advice so much as assistance that the cultivators require.

QUESTION 4.—**ADMINISTRATION.**—(a) I do not recommend more centralisation in the Agricultural Department as has been suggested by some witnesses. On the other hand I consider each Province should be more independent and carry on its own research. The reasons for this suggestion is the totally different climatic and soil conditions prevalent in Bengal. I do not think there need be any all-India agricultural service at all. Facilities should, however, be given for the provincial officers to confer with each other and have a joint agricultural conference in different Provinces to compare and discuss experiments carried on by different officers. Advanced students should also have facilities of acquiring experience in other Provinces so that they may be able to introduce from there new crops and adopt new methods of cultivation.

(b) I do not consider a central all-India scientific organisation necessary. Each Province should have its own scientific experts, and they may compare notes by mutual correspondence and conferences. This scientific organisation need not be over-staffed. More money should be available for rural agricultural improvements than for scientific research. My views on the point will perhaps be considered conservative but that is the popular view in this Province.

(c) (i) Both the Agricultural and Veterinary Departments are undermanned and not properly financed. The Veterinary Department is certainly doing useful work but the want of proper hospitals and the insufficient number of veterinary surgeons and inadequate equipments stand in the way of doing still more useful work.

K. B. M. A. Noman.

L. v 13--21

The Agricultural Service is perhaps top-heavy. We want more District Agricultural Officers and demonstrators than Deputy Directors and experts, but above all more money for agricultural farms and demonstrations. The Agricultural Department is not very popular with the people and there are many conservative people who honestly think that the money spent by Government on it is wasted. The reason is this that, like other departments, the Agricultural Department cannot show the result of their activities in one or two years. The agricultural farms have not been able to show much tangible result to the country and are generally considered to be working at a loss. The people do not feel that they get their money's worth from this department. The Agricultural Service on the whole cannot be blamed for this, as it is not in its power to show tangible results at short notices without adequate finance and proper equipments. They cannot be expected to prevent failure of crops nor to provide means for the agriculturists to raise bumper crops. There is, however, noticeable in most agricultural officers a want of enthusiasm and keenness due probably to the indefinite nature of their duties. The District Agricultural Officers appear to have a sort of roving commission without fixed definite duties to do and the people think they do not do any useful work at all. The Deputy Directors seldom meet the agriculturists and come and go unnoticed. I have known officers coming to districts for inspection work but not travelling beyond the railway station. Most District Agricultural Officers have no practical work to show beyond meeting a panchayat and discussing improved methods of cultivation with them. The agricultural farms I have seen are all run at a loss and have hardly anything in them to impress a cultivator due to wrong selection of the soil. The department advocated the use of improved agricultural implements but I have seen them use country ploughs in preference to the improved ones. If agricultural farms are to be useful, they ought to be really model ones. The Agricultural Department must show more tangible work if it wants to be popular. *Kakia bombai* and *indrasail* paddy will not carry them any further with the people.

If the Agriculture Department is to be really useful to the people and appreciated by them, its work will have to be modelled on more practical lines. There should be more demonstration and supplies of wants than propaganda as at present. There ought to be an agricultural farm in each district or still better in each sub-division in charge of a District Agricultural Officer where not only improved methods of agriculture should be adopted but new crops suitable to the locality should be grown. There should be different sorts of implements for irrigation and the farm should be able to recommend a particular type most suitable to the locality. The agricultural farm should not only be the centre of agricultural activities for the area but should also be a sort of agricultural emporium which can supply the country around with implements, seeds, manures and necessary advice. People are advised to grow fodder crops, but they do not know when to get the seeds and which is the most suitable for a particular area. The agricultural farm ought to be able to supply not only information but the materials also. A man has got a piece of high land not suitable for jute or paddy, the agricultural officer ought to be able not only to tell him what to do with it and what crops to grow on it but also to supply him the seeds. A particular tract of land otherwise lying unprofitable would grow splendid crops if properly irrigated. The District Agricultural Officer ought to be able to advise how to irrigate it and not only this but to arrange either by forming an Irrigation Co-operative Society or through Government help to set up the necessary irrigation plant and machinery. In brief, the farm ought to supply all the agricultural needs of the country around and unless it does so its existence is hardly justified.

As improved cattle are essential for improved agriculture the farm ought to have stud bulls to improve the local breed. This is very important.

(iv) At present the agriculturists do not get any assistance from the Meteorological Department and it is not very likely that they will ever do so.

**QUESTION 5.—FINANCE.**—(a) The co-operative credit societies are by far the best media for financing cultivators in their temporary difficulties for tiding over seasonable wants. But the resources of such societies are limited and cannot meet the demands of large projects. I would recommend the establishment of a District Land Improvement Fund from an annual contribution of about one anna per bigha from tenants and landlords, supplemented by a contribution by the District Board. The cost of large organisation, drainage and other beneficial measures should be met from this fund which should also finance rural agricultural co-operative societies at very low rates of interest.

**K. B. M. A. Momen.**

(b) The Government *taccavi* loans are very inelastic and are not popular. I do not recommend popularisation of this system of loan and, if the Land Improvement Fund suggested above be established, there will be no necessity for the *taccavi* loans. In unreclaimed areas, however, it may be necessary for Government to render substantial pecuniary assistance to new ventures as I have suggested in my answer to 2 (x) above. In such case, and when no other fund exists and a man wants money for re-excavation of tanks for agricultural purposes or some similar project *taccavi* loans should be given on liberal terms on the security of immovable property. At present the amount allowed is not sufficient to cover cost of projects and the borrower has also to seek assistance elsewhere.

In time of distress agricultural loans are given out to agriculturists on joint security and this prevents such assistance from reaching the really needy person who finds it difficult to get others to join with him. The joint liability system should be abolished or greatly relaxed.

QUESTION 6.—AGRICULTURAL INDEBTEDNESS.—(1) The main causes of borrowing are—(1) want and (2) improvidence.

(a) The resisting power of the Bengal cultivators is very small. The average annual income of an agriculturist in Bengal is about Rs. 200 per year for a family of four. If we take 80 per cent of the agriculturist population to be well off and in affluent circumstances, the income of the 70 per cent will be considerably less than the average given. The cost of food and clothing of a convict in jail is about Rs. 58 per year, so that the majority of the cultivators in Bengal have to maintain themselves and their family on much less than what Government spends on the food and clothing alone of a prisoner. It will therefore be evident that a ryot's reserve fund is practically nil when there is a failure of crop which on an average happens once in three years or when his cattle die or there is sickness in the family which prevents the working member from working, he has to borrow to live and cultivate his fields.

(b) The Bengal peasant is often blamed for improvidence. This charge however is not correct with regard to the large majority of the 70 per cent of the peasantry who cannot afford to have even the bare necessities of life. Perhaps it is true to some extent with regard to the well-to-do cultivators in Eastern and Northern Bengal. Such tenants get a good deal of cash when the price of jute is high and the paddy crop is good and get into the habit of spending money on luxuries. Successive good seasons make them optimistic and careless and they borrow on the expectation of a good crop. If this fails, they get into debt and as this is generally at high rates of interest and as their improvident habits make them reckless and uneconomical they generally get badly involved and finally go under.

(ii) The chief and perhaps the only source of the peasants' credit is their land and crops.

(iii) (a) As I have mentioned under (i) (a) above the resisting power of the cultivator is so small that once the ryot gets into debt it is very difficult for him to get out of it unless there is a windfall. The crops he gets are hardly sufficient to nourish him and his family and to meet the landlord's demand. There is no surplus to pay interest and repay the principal. The ryot's land not being transferable by law, his credit is very small and consequently on account of the risk involved the rate of interest is very high, which is the main cause of his inability to repay his debt which increases very rapidly.

(b) The only measure which can lighten the burden of debts of the Bengal peasantry is the establishment of a regular net-work of rural co operative credit societies with the firm determination of redeeming the lands of the ryots and looking after them in future. Once the rural societies take the indebted ryots under their wings no private moneylender will lend them money and this will keep the ryots away from improvidence. In case of real need they will get help from the societies. If such societies are financed by the Land Improvement Fund mentioned before at nominal interest, they can lend money to their members at much lower rates of interest than at present and can relieve the tenantry very greatly from their difficulties.

I do not think artificial measures like the Usurious Loans Act will be of much avail as the ryot in need and the *muhajan* in many ways defeat the law by circumvention.

(c) I am strongly against restricting or limiting powers of ryots to transfer their lands by sale or mortgage. Theorists think that such powers will lead ryots to more improvidence and their land will pass into the hands of the *muhajans* and convert the ryots into landless labourers. In practice, however, lands are freely transferred but as the law gives the power of veto to landlords the risk involved in such transfer greatly reduces the value of the land and consequently

K. B. M. A. Momen.

the credit of the cultivators with the result that when the sale of one *bigha* of land would have cleared a ryot's debts, he has to sell three or four *bighas*. It is essential therefore that his credit should be increased by improving the tangible value of his land.

As regards mortgage, I think his power should be restricted to a certain period, say nine years. The ryot is very reluctant to part with his land for good and if mortgages are allowed for indefinite periods he would reduce his income and with it his retaining power by mortgaging a larger quantity of land than selling half the quantity and thus get more and more involved. Non-terminable mortgages and for indefinite periods should be prohibited.

QUESTION 7—FRAGMENTATION OF HOLDINGS.—I have already submitted a note\* on this subject and on consolidation of holdings.

QUESTION 8—IRRIGATION.—Irrigation and drainage are the two most important problems in connection with the agricultural needs of the Province. In fact the prosperity of the agricultural classes depends mainly on their correct solution. The staple food crop of Bengal is paddy which covers perhaps 80 per cent. of the cultivated area. There is very little to teach the agriculturists about the cultivation of paddy which they know from centuries of experience. The paddy crop fails either on account of drought or inundation and if measures are introduced to guard against these two risks, paddy crop will never fail and the peasantry will never starve. For spring crops also irrigation is of the greatest importance. There are many acres of lands in Northern and Western Bengal which could yield valuable spring crops if proper arrangements for irrigation could be made.

There are very few irrigation canals in Bengal, Midnapore and Burdwan being the only two districts partially served by them. The old system of irrigation in Western Bengal was from tanks. Formerly when landlords used to live in the villages and took interest in the welfare of the tenantry they considered it an act of merit to excavate large tanks both for the supply of drinking water for men and cattle and for purposes of irrigation. Their income from rents not being dependent on the crops and they having migrated for greater luxury to towns, the zamindars have lost all interest in the tenants or their needs. The old tanks have gradually silted and have ceased to supply water. The tenants have no means for excavating new tanks or re-excavating old ones with the result that sources of irrigation are generally becoming scarce and those that still are available only serve a very small area. Increased pressure of the population on land has necessitated the reclamation and cultivation of all areas which used to be fallow before and though the area under cultivation has considerably increased, sources of irrigation have not kept pace with it, so that the large areas now opened up are entirely dependent on rain for moisture. It therefore happens that crops in large tracts in the districts of Burdwan and in the Presidency Division occasionally suffer from drought and this is impoverishing the tenants year after year.

It is of vital importance that Government in the Agricultural Department should seriously take up the question of irrigation which should form the main item in the activities of the department. It is for the experts to suggest the proper methods of irrigation suitable for this province. Personally I think no one system will be suitable for all districts and the best way is to utilise the existing sources first and then launch on more expensive systems such as canals, etc. Well irrigation is perhaps not very suitable for Bengal. It means an amount of manual labour which the Bengal peasants will not be able to endure. Tanks, canals and streams, are the most suitable.

A good deal can be done by starting irrigation societies on co-operative principles but the surplus resources of the Bengal peasant have fallen so low that it is very difficult for them to find the capital necessary for launching original schemes of irrigation. e.g. excavation of tanks, canals, etc. Government should in the first place find the sources of supply and may recover costs afterwards from the people benefited. Much could be done if the people would co-operate and work the existing natural sources but they lack the spirit of co-operation and feel shy of launching any new schemes. In my own village there is a stream which skirts an area of about thousand *bighas* of good land which could be turned into good *dofari* or twice cropped land if the cultivators would co-operate and throw a dam across the stream to bring the water up to a level suitable for irrigation. But the initiative and the spirit of co-operation are wanting. If the Agricultural Department could take the matter up and after obtaining proper technical advice utilise this source of water, the tenants will gladly pay the costs in instalments.

\*Not reprinted.

It is possible to take up such projects under the Bengal Village Sanitary and Agriculture Improvements Act, but the procedure provided therein is so onerous that hardly any projects have yet been started in Bengal under this Act. The main difficulty is the lack of initiative and the want of funds to meet initial expenses. If the Agriculture Department supply these, they will be the saviours of the Bengal peasants.

**QUESTION 9.—SOILS.**—(a) (1) In the Burdwan Division great damage is done to agriculture year after year by floods. These inundations are preventable by a proper system of embankment and I consider it the duty of Government to erect them and keep them under repairs. These annual floods have made thousands of cultivators homeless and destitute.

In the districts of Jessore and Nadia, there are many water-logged areas which by proper drainage can be turned into valuable land yielding good crops. There are several schemes for the drainage of these *jhils* before Government but not one has so far completely materialised. The population of these two districts is dwindling very fast and the bad climate of the districts and their poverty have become proverbial. The reclamation of these *jhils* is their only salvation and yet nothing has been done so far. Government ought to take the projects up vigorously and before it is too late.

(b) The above conditions in the two districts mentioned above have been brought about by the gradual silting of flowing rivers.

(c) If necessary embankments are thrown up, considerable areas in Burdwan and Midnapore which have gone out of cultivation will again be reclaimed. Similarly, if the *jhils* are drained by means of canals, large areas will again come under cultivation.

**QUESTION 10.—FERTILISERS.**—(c) By demonstration at first in agricultural farms and then in the villagers' own fields.

(f) The use of cowdung cakes as fuel in Bengal is very inconsiderable.

**QUESTION 11.—CROPS.**—(a) (i) I do not think there is much scope of improving the main crops grown in Bengal. Something, however, can be done by proper seed selection but a good deal depends on irrigation and manuring and attention should be paid to these two.

(ii) The introduction of new crops for areas which are not suitable for ordinary crops like paddy and jute should also be one of the main subjects for investigation by the Agriculture Department. Efforts should be made to popularise crops like maize, castor seeds, ground-nuts, etc., on such lands.

(iii) The growing and distribution of seeds should be one of the chief items of work of the agricultural farms. Seed farms can be run very profitably. I know of a private farm at Ranaghat which derives some profits from the sale of seeds through Government agency.

**QUESTION 12.—VETERINARY.**—(a) The Veterinary Department should be under the Director of Agriculture.

(b) (i) Yes. The system works satisfactorily but the dispensaries suffer from the lack of support and of financial aid.

(ii) No.

(iii) No.

(c) (i) Yes.

(ii) There are no touring dispensaries as far as I know though the veterinary surgeons go about when there is a report of an epidemic from any quarter.

(d) The conservatism of the people is the chief obstacle but this is gradually being overcome. I do not advocate any legislation at present. The people are not averse to advice in such cases.

(e) Yes. Very great difficulties. The serum is not promptly supplied and not in sufficient quantities.

(f) No other obstacles, except the conservatism of the people and the want of an adequate agency. No fee is charged.

**QUESTION 13.—ANIMAL HYGIENE.**—(a) It is in this branch where the Bengal peasant is most negligent. Proper care and feeding of cattle are rare and this fact accounts for the poor specimens of cattle we come across in this province.

(i) The chief method of improving the breed of live-stock is to import good stud bulls and make their services easily available to the agriculturists. But the improvement will not be lasting or continuous unless the agriculturists learn to take proper care of the cattle and properly feed them. To rear good cattle the agriculturist should have to raise fodder crops which are practically unknown in Bengal. This is one of the things which can be introduced by proper propaganda and demonstration.

K. B. M. A. Momen,

(ii) Dairying as an industry is practically unknown in Bengal. This probably is due to the absence of pasture grounds in the country and want of fodder crops. Still feeding of milch cows is rare except in towns. The *goalas* who supply milk keep a large number of inferior cows yielding between half a peer to two seers of milk which live by grazing on fallow lands or road side strips. No selection of milch cows is made and when they grow old and cease to give milk they are sold to butchers. Dairying as an industry is one of the subjects which the Agriculture Department should teach and demonstrate.

(iii) The *goalas* and the agriculturists are the only people who rear and keep cows. They sell the calves suitable for agriculture and keep the cows for milk and when the latter grow old, sell them to butchers. The cultivators also keep cows for milk and manure. But the Bengal breed is of a very poor variety due to climate as well as want of proper food and care. Another reason is excessive pressure of the number of cattle on the land specially as pasture is scarce and fodder crops unknown. Those who advocate stoppage of cow slaughter and cattle export do not realise the economic effect of such measures. As it is, the number of useless cattle is excessive and they cause harm to the useful ones by robbing them of their share of fodder.

(b) In most districts of Bengal, there is hardly any recognised common pasture grounds. Owing to pressure of population, the landlords have settled all available cultivated lands with tenants and these are being fast reclaimed. In Eastern Bengal, the lowlying lands which go under water during the rains provide good grazing to the cattle during the cold weather months and the cattle thrive between November and February. For the rest of the year there is hardly any pasture and the cattle get very little to live upon. The plough cattle are stall fed on a meagre allowance of paddy straw and green grass cut from the ridge of fields. In districts bordering on the Bay of Bengal like Bicharganj and Noakhali, the cattle are sent to the char when the mainland areas are under crops. In Western Bengal districts plots of high land and sal jungles afford indifferent grazing. But in most villages the cattle are let loose on the fields and mango groves or banks of tanks from which they pick up what they can get. The plough cattle are stall fed on paddy straw and oil cakes. Fodder crops are practically unknown and are nowhere grown in Bengal purely as such.

(c) In Western Bengal, the months of February to May afford no green fodder to cattle and in Eastern Bengal the months of June to November are the worst in this respect. There is great dearth of fodder of any sort during the months of June to October generally throughout.

(d) The growing of fodder crops is one of the most essential necessities in Bengal and the agriculturists should be encouraged to set apart at least a tenth of their holdings for this purpose. The Agricultural Department should pay particular attention to this matter and instruct the cultivators as to the best methods and the best crop suitable for particular localities. The storage of green fodder should be demonstrated. I have not seen any attempt to do this even in the Government agricultural farms I have come across.

QUESTION 17.—AGRICULTURAL IMPROVEMENTS.—I have discussed this in my Settlement Report of Jessore and valuable information will be available in the Settlement Reports of other districts.

(a) In Western Bengal the busiest season for a cultivator is from June to September when he is engaged in the preparation and sowing of his fields and December to February when paddy is reaped and harvested. In the slack season he manures his fields and repairs his house and those who have *dofachi* lands are engaged in digging for potatoes or pressing sugarcane.

(b) The most suitable home industry for the agriculturists is spinning and weaving, preferably the latter, rope making, poultry-rearing and where climatic conditions are favourable, sericulture. I consider these industries most suitable in which the women folk can assist. Government can do a great deal to foster and encourage such home industries by sending out itinerant teachers to the villages and by providing raw materials on credit at favourable rates. Government can also establish small factories for carpet making, lace making, silk reeling and ironing. In suitable centres, Government can afford much relief to the people by starting jute mills and spinning mills and by subsidising small factories for mat-making and paper mills and the like.

(c) There are no great obstacles and people are engaged in many places in these home industries. The reason why they are not resorted to on an extensive scale is the ignorance of the people rather than want of resources, and lack of method and industry.

K. B. M. A. Momen,

(d) Certainly I do not advocate the establishment of rice-hulling mills as they directly ruin the home industries of the agriculturists and also the health of the people. In fact, I would recommend a taxing of such mills to discourage them.

(e) Communication facilities will stand in the way of private industrial concerns moving to rural areas but much can be done to keep the villagers in their homes by Government either starting mills and factories in rural areas or by subsidising them.

(f) Yes; I think research on this point is the legitimate work of the Industries Department of Government.

(g) If irrigation works such as excavation of tanks and canals are started they will lead to greater employment in rural areas besides being directly beneficial to the agriculturists.

(h) Mass education is the only means.

QUESTION 18.—**AGRICULTURAL LABOUR.**—It is a question of demand and supply. People will migrate to places where they can earn more and they do so now when they find it impossible to find sufficient sustenance in their own homes. Perhaps a little publicity might accelerate migration and Government can adopt measures to this end.

QUESTION 22.—**CO-OPERATION.**—(a) The co-operative movement, though it has made great progress in recent years, has only touched the fringe of the problem, as to how to relieve agricultural indebtedness of the Province. It is therefore essential that everything possible should be done to increase the activities of the department. The two factors necessary to widen its scope are financial aid by Government and non official propaganda.

(b) The type of societies which directly stimulate agriculture are those formed for the purpose of effecting improvements and for the supply of agricultural requirements. Such societies have not yet been established in any considerable number in the Province but the department have now begun to establish them.

(c) I certainly think that legislative measures are necessary to compel obstructive persons to acquiesce in measures designed to improve the agricultural and sanitary condition of the villages. It very often happens in Bengal that the recalcancy or obstinacy of an individual stands in the way of an improvement likely to lead to the greatest good of the greatest number. Though Government should not ordinarily interfere, there ought to be some legislation which may give necessary authority for effecting an improvement when public utility demands it. I have known of cases where a fractional owner of a silted tank prevents the other co-sharers from re-excavating it or the owner of a plot of land obstructing others from erecting a bund to prevent inundation.

QUESTION 23.—**ATTRACTING CAPITAL.**—(a) Want of agricultural facilities, e.g., irrigation, dearth of labour, want of suitable land in large plots, etc., stands in the way of middle-class people taking to agriculture as a profession. Moreover agriculture does not yield a sufficient dividend on one's outlay and therefore capitalists are not encouraged to invest their money in agricultural concerns. Unemployment among the middle-classes however is becoming more and more acute and young men are now turning their faces towards agriculture. Unless, however, the problems of irrigation and embankment are solved they will not find agriculture paying.

I have personal experience of agricultural conditions and my intention is to settle down as a practical farmer when I retire. I have got sufficient lands and do some cultivation myself. I find however that letting them out on half the produce is more paying than cultivating the lands with my own rattle and by hired servants. The main reason is want of honest labour, the cost of cultivation and the failure of crops brought on by drought and inundation. I think, however, that agriculture can be made to pay if one supervises the operations himself and pays his whole attention to it.

People will begin to take to agriculture when they find that it pays. I think it is worth while for Government to start some willing young men in agricultural enterprises by giving them suitable land or where they have their own land by giving them substantial monetary aid. When I was Collector of Nadia, I made arrangements to experiment with two blocks of lands but was transferred before I could take it up.

(b) Want of capital, absence of sufficient return in the shape of increased rent and general lack of interest in the tenants' welfare.

QUESTION 25.—**WIDESPREAD OF RURAL POPULATION.**—(a) The solution is summed up in one word "Education". Unless the masses are educated it is difficult to expect any improvement in the sanitary and economic conditions in the rural areas.

K. B. M. A. Momen.

(b) I do not think any elaborate investigation is necessary. As I have mentioned before, such investigations have been made by Settlement Officers and embodied in their reports.

(c) I did make intensive enquiries in the district of Jessore the result of which has been embodied in paragraphs 64 and 65 of my Final Report on the Survey and Settlement Operations in the district of Jessore, 1920-24. The conclusions I have arrived at are briefly as follows:—

64 Material condition of the people.—During the course of investigation into the economic condition of the people, out of 1,643 families comprising 10,619 souls inspected, 245 were reported to be in comfort, 552 below comfort, 655 above want, or, in other words, living from hand to mouth, and 331 as starving. Their percentage would work out as follows:—

In comfort	...	...	...	15 per cent
Below comfort	...	...	...	32 per cent
Above want	...	...	...	33 per cent.
In want	...	...	...	20 per cent.

The above figures compare very unfavourably with the figures arrived at by the late Major Jack in respect of the Faridpur district. In Faridpur, according to Major Jack, 49 per cent were in comfort, 24½ per cent, below comfort, 18 per cent above want, and only 1 per cent in want. The percentage of persons in actual want in Jessore is just five times that of Faridpur, although the indebtedness in Jessore is not much heavier than that in Faridpur. The indebtedness in Jessore is probably more unequally distributed, and a large proportion of the debts is incurred by the poorer ryots, as is indicated by the enormous number of simple bonds executed every year in Jessore district. This is why the percentage of persons in want is so high. The percentage of people in prosperity cannot also be expected to be higher than 15 in a country in which the average income of the agriculturists, who form 77 per cent of the population on a more liberal calculation, is only Rs. 51 per head and the annual income of population as a whole is only Rs. 60, which is 25 per cent, less than what the Government thinks necessary to spend on an ordinary convict in jail for his food, clothing, and bedding only. No wonder that the condition of the Jessore peasant is so miserable and his power of recuperation so small. Having no spare capital, he finds himself stranded whenever there is a failure of crops or whenever one out of two herds of cattle dies. He has to borrow at a high rate of interest, the average rate in this district being 25 per cent. And once in debt, he can never extricate himself, and finally becomes a landless labourer. The incidence of debt, which is found to be Rs. 12-2-10 per head and which works out at only one-fourth of the annual income, though it may not appear so, is certainly heavy, considering that the average total value of an individual ryot's stock (which consists of 1½ acres of land, 2/5ths of plough cattle) is not more than Rs. 100. The ryot's indebtedness is more than 12 per cent. of the total value of his land and stock, and as he has practically no savings from which to pay off the capital as well as interest, this cannot but be a matter of great concern. Then, again, it must be remembered that the average income of an agriculturist is Rs. 51 and his debt Rs. 12-2, but this income and debt will vary inversely accordingly as a cultivator is in comfort or in want. The income of the 15 per cent of the population who are in comfort will probably be Rs. 80 per head and no debts. The 32 per cent who are below comfort will have an income of Rs. 65 per head and Rs. 8 as debt, the 33 per cent who are just above want will have an income of Rs. 50 per head and Rs. 12 as debt, and the 20 per cent, who are in want will have an income of Rs. 35 per head and a debt of Rs. 30. It is not therefore difficult to conceive that this last class will rapidly become landless and their proportion will fast increase unless something is done to increase their income to pay off debts.

It is erroneously supposed by men who have not carefully examined the economic condition of the people that the actual cultivators are as a rule prosperous and happy. The middle-class people whose condition is still more deplorable, notice some of the 15 per cent well to do peasants indulge in luxuries which formerly were the monopoly of the upper class, and consider—not without cause—that the peasant class as a rule are getting more prosperous than themselves. They, however, do not consider the condition of the 20 per cent in want who scarcely get two full meals a day and have scarcely enough clothing to cover their nakedness. It is a fact that 50 years ago, although ill-housed and ill-clad, the ryots of Jessore had no difficulty in getting two full meals, and though their income was small,

K. B. M. A. Momen.

their expenditure was less. They used to grow enough food crops for their subsistence and did not care so much for ready money to buy cheap luxuries as is the case nowadays. Their income has now increased, but this increase is only nominal and not real, as 50 per cent. of them, who cannot sell any paddy at all except for the bare necessities of life, do not get any benefit from the rise in prices of crops. On the other hand, they have got a higher standard of living and in consequence their expenditure has increased, and not being able to meet their wants with their income, they are gradually getting more and more into debt. Any casual observer who has experience of the Eastern Bengal districts will be at once struck with the general poverty of the average Jessore cultivator. The low-roofed thatched houses of the Jessore cultivator, surrounded by jungle and having a general desolate look about them, and his scanty and ill-fed cattle and live stock stand out in very unfavourable contrast to the big and airy tin roofed houses of the Myinsingh or Dacca cultivator, surrounded by his garden and having a general look of prosperity about them. The cultivators of Narail generally, and some of them in Magura and Balhara are appreciably better off than the rest, but even these cannot come up to the standard of prosperity of the cultivators of Myinsingh and Dacca.

*Summary.*—The enquiry into the material condition of the people thus discloses that the average gross income of an agriculturist from agricultural produce is Rs. 74, including the income derived from fish and poultry; that his net income is Rs. 54 and his indebtedness works out at Rs. 12.2 10 or 12 per cent. of the total value of his land and cattle; that his average income is just sufficient to keep him above want if he is very economical and provident and if he is satisfied with only the barest necessities of life; that 20 per cent. of the agriculturists who have already been reduced to very straitened circumstances are dragging on a life of perpetual want and are fast becoming reduced to the position of landless farm labourers.

65. *The landholding classes.*—The majority of the landholding classes which constitute the middlemen *bhadralog* are in severer plight. In Jessore, the number of petty landlords including tenure holders, is very large, being according to the census of 1911 as many as 116,918 or 6.65 per cent. of the total population. According to the statistics gathered during the settlement operations, the total cash rent paid by ryots to the middlemen is Rs. 36,33,610. The total quantity of arable *khas* lands in the immediate possession of the landlords is 85,916 acres. The net income per acre being Rs. 20, we may assess the total income from *khas* lands at Rs. 17,18,300. The total amount of land let out on produce rent is 17,579 acres, which assessed at Rs. 15 per acre, bring them Rs. 2,63,550. The other sources of income are *nazars* and *abwabs*. The bulk of the *nazars* is the amount paid on transfers of ryoti lands by ryots. The area annually transferred by sale is about 26,000 acres. The average price of an acre in this district being Rs. 50 and the rate of *salami* 25 per cent., we may calculate the *salami* paid at Rs. 12.5-0 per acre transferred, though the landlord does not get more than Rs. 10, the rest going to the agents and *amlas* as *tahari*. The total income from *nazars* will thus be Rs. 2,60,000. Two to six annas per rupee of rent is the general rate of *abwabs*. Taking four annas per rupee as the average, of which half goes to the pockets of the *amlas*, we may guess that the landlords get two annas in the rupee or about Rs. 4½ lakhs in all. The total gross income of the landholders from all sources therefore come to Rs. 63,25,460. Deducting Rs. 8,86,213 as revenue and Rs. 5 lakhs as collection charges, the net income comes to Rs. 49,39,247 in all or Rs. 42 per head, which is even lower than that of an agriculturist. This, however, does not include income from service and profession, as the bulk of the middle-class landholders are dependent on these for their livelihood, it can easily be considered how hard the lot of these middle-class *bhadralog* must be. The average income excluding income from service and profession, per family, comes to Rs. 210 a year, supposing the income is equally divided among the whole class. This is scanty enough. As a matter of fact, however, the income of the majority of the middle-classes is much less, considering that the income of the big landlords of the district is also included in the total income. It is, therefore, easy to understand the great scramble for Government and other services and the all-round struggle for existence.

The income of the landholding classes from the land has been fairly stationary since the time of the Permanent Settlement, rates of rents having increased very little; but the population has increased and so has the cost of living. Nor is there much room for increase in this income from lands in this district, as there is very little unassessed land and the existing rents are hardly capable of being

enhanced. One of the reasons, and a very good reason too, against the commutation of *burga* land is that it will further reduce the income of the *bhadralog* classes. The profession and the services, both Government and private, are not inexhaustible and can only provide for a very small percentage of the indigent middle classes. The outlook is, therefore, serious in the extreme, and unless new sources of employment and income are tapped, the result in the very near future will be disastrous.

It is evident that if the middle classes of Jessore wish to survive, they must engage in trade and handicrafts and learn the dignity of manual labour. In recent years they have turned their attention to business, and the prejudice against handicrafts is also slowly dying out. But their lack of training, dearth of capital and want of proper guidance are obstacles in the way of their success.

### Oral Evidence

22093. *The Chairman* : Mr. Momen, you are Magistrate-Collector and late Officiating Director of Land Records and Surveys in the Presidency of Bengal?—Yes.

22094. You have been good enough to lay before the Commission a note of the evidence which you wish to give, and we are indebted to you for that. Do you want to say anything in a general way before we proceed to ask you one or two questions?—I would prefer to say anything I may have to say afterwards, not at present.

22095. You are an experienced officer and you have seen the Agricultural Department at work in the mofussil. What do you think about the efficiency of the men engaged in demonstration and propaganda?—They are fairly efficient as far as their training goes, but I do not think they got enough opportunity till recently to show any initiative.

22096. What do you mean when you say “not enough opportunity”?—Heretofore they had not very much chance, because to begin with they had not the people with them.

22097. They have not the people with them?—They had not so far.

22098. Do you mean the people were against them?—Not against them. They are not very willing to co-operate with agricultural officers because perhaps in most places their conservatism leads them to think that it is not likely they can benefit much from their advice.

22099. Would you suggest that the cultivator is over-conservative or that he is just prudent?—He is conservative; I cannot say about the degree of conservatism. He is conservative, but is very willing to take to new inventions.

22100. He is not, financially speaking, in a position to make dangerous experiments? Is that it?—He is not financially in a position to make any experiments.

22101. Would you turn to page 331 of your note to the answer to Question 4. Have you studied this question of the organisation of research closely?—No; I have not. I have mentioned it in a general way; I am not in personal touch with the work.

22102. Do you know anything about the work of the Central Cotton Committee in the matter of research?—No.

22103. Have you studied this question as it applies to America, and this problem as it has been worked out and evolved in America?—No.

22104. On what do you found yourself when you say in answer to Question 4 (b), “I do not consider a central all-India scientific organisation necessary”?—What I meant to say was, in the present condition of our Province a central organisation is only an ideal. If we had enough to spare, we could have any amount of organisations. Owing to the financial condition of the Local Government at present, all the money we can get should be diverted to field demonstration and such other things. We must utilise whatever knowledge we have already got, and afterwards we can go further ahead. If the Agricultural Department could get more financial assistance they could do much more useful work. I do not say that an all-India organisation will not be useful, but it can come in after some time, not immediately.

22105. Would you tell the Commission what you think might be the solution of the difficult problem brought about by the use of the main roads by heavy motor vehicles? Is that a problem in the rural districts?—I do not think so, as far as agricultural improvements are concerned.

22106. You do not think the heavy vehicles are wearing the roads?—They do wear the roads to a certain extent, but I do not think they affect the agricultural system of the country. We have got motor vehicles and motor buses running wherever there are roads fit for them in the mofussil, but they are only for passenger traffic.

22107. What do you think is the effect of the motor traffic on the condition of the roads?—The condition of the roads is certainly deteriorating.

22108. And do you think the motor vehicles are making a fair contribution towards the upkeep and cost of the upcountry roads?—They are not.

22109. Have you any proposals to make in that direction?—There was a proposal some time ago for giving power to the District Boards to tax motor vehicles and I supported that idea.

K. B. M. A. Momen.

22110 What happened to that?—The Bill has not been passed; it is still under consideration.

22111 *Sir Henry Lawrence*: Cannot licences be issued by executive action?—The licences for these buses are issued from Calcutta. They are registered, there is nothing in the Act to prohibit the traffic of these motors.

22112 *The Chairman*: What was this Act designed to do, give powers to local authorities to levy a tax or to give powers to local authorities to prohibit the traffic?—To prohibit and regulate traffic.

22113 *Mr Gupta*: What Act are you referring to?—The Motor Vehicles Act.

22114 You are not referring to the proposed amendment of the Local Self-Government Act?—No.

22115 *The Chairman*: How would you view a proposal to give power to local authorities to levy a toll?—They ought to have that power. In the district of Bogra where I was Collector last year, there are no metalled roads at all; all are kutchra roads, and they have very much deteriorated on account of the large motor traffic. There is a strong feeling against these motor vehicles being allowed to use these roads without any tax on them.

22116 In what quarters?—Among the people and the members of the District Boards.

22117 How about the condition of roads under the District Boards? Have they deteriorated in recent years?—I think they are deteriorating every year.

22118 Getting worse and worse?—Yes.

22119 How do you account for that deterioration?—My own personal views are that the roads do not now receive as much attention from the District Board authorities as they used to do when there was an official Chairman.

22120 You do not think the District Board authorities attend as closely to these administrative problems as they might?—Especially the communication problem. The income of the District Boards remains practically stationary, and every member has got some special scheme, some tube wells, others extension of medical help, some education, but the communication branch is nearly everywhere started.

22121 Is there any pressure put upon these Boards by their constituents to pay attention to the roads?—Very little. The constituents have no means of exercising any pressure; once the members are elected they lose all touch with their constituents.

22122 I gather that you are not very hopeful about the future of these District Boards?—Not unless the Chairman and Vice Chairman are more energetic and give more time and attention to the affairs of the Boards. At present the non-official Chairman in many districts are either pleaders with large practices or men belonging to other professions, and they cannot give the same amount of time and attention to the Boards that they used to get when the Chairmen were official.

22123 Is there a paid Secretary?—No.

22124 You think it would be better to have a paid Secretary?—I strongly think that there ought to be a paid Secretary. I have known of some districts where the Chairman tours only one or two days in the whole year. He remains away from the district all the time, and the ordinary routine work is done by the Vice Chairman, the important files are sent to the Chairman wherever he is, either at Darjeeling or Calcutta, and he still continues to be Chairman.

22125 When the time comes and he presents himself before his constituency, is he duly re-elected?—Yes, through other influences; he may be an influential landlord. I do not think the constituencies are sufficiently educated to elect the proper man always.

22126 How large are these District Boards? What is the size of the bodies themselves? What is the number of members?—24 to 32.

22127 Have they any executive body or committee?—They have small committees, the education committee, the finance committee, and so forth.

22128 Do they sit under their own Chairman or under the chairmanship of the Chairman of the District Board?—I think they sit under the Chairman of the Board, but I am not quite sure.

*Mr. Gupta*: Not now.

22129 *Professor Gangulee*: They have their own Chairman?—I think so.

K. B. M. A. Momen.

22130. *Rai Bahadur Bannerji*: While you were District Magistrate of Bogra, were there not official Chairmen of the Boards?—No.

22131. *Prof. Gangulee*: How many of the members are elected and how many nominated?—Not more than one-third of the members are nominated; they are mostly *ex-officio*, like the Civil Surgeon and the Sub-divisional Officers, but the District Magistrate is not a member of the Board.

22132. *The Chairman*: There is no paid officer attached to the District Board?—No, except the clerical staff and the District Board Engineer and Overseers.

22133. *Rai Bahadur Bannerji*: The big District Boards have got their paid Secretaries?—Not in all cases.

22134. *Sir Henry Lawrence*: Who are these Overseers?—They are road Overseers occupying a subordinate position.

22135. *Rai Bahadur Bannerji*: The big District Boards like Burdwan have got paid Secretaries?—Only Burdwan.

22136. *Mymensingh* has got one, most probably?—I am not sure that it has got one.

22137. All the big District Boards have paid Secretaries?—It may be that two or three District Boards have.

22138. The small District Boards cannot afford to have a paid Secretary?—Out of 26 District Boards perhaps three have them.

22139. *Mr. Gupta*: The Secretaries are not out-door officers; they are entirely in charge of the office?—Yes.

22140. *The Chairman*: Is any inspection of the work of these District Boards carried out by Government?—The District Officers inspect the office once a year, and the Commissioner of the Division inspects it when he visits the place.

22141. *Mr. Gupta*: Do not the Sub-divisional Officers inspect the District?—They inspect only the Local Boards.

22142. *Rai Bahadur Bannerji*: Are not Sub-divisional Officers *ex-officio* nominated members?—Yes they are; not all the Sub-divisional Officers, but most of them.

22143. *The Chairman*: Do you think that your figure of 4·8 acres of holding per family, consisting of 4 persons, which you have given in paragraph 5 of your note on 'Fragmentation of holdings,' is an accurate figure?—It is absolutely accurate for Jessore where I was a Settlement Officer; I worked it out.

22144. How did you work that out; by taking the total number of agriculturists or the total population in the village?—By taking the total agricultural population of the village; I arrived at the figure by taking the total agricultural area which is cultivable and dividing it by the agricultural population.

22145. Did you cut out the village community the craftsmen and their families?—Yes; I dealt with the agriculturists in a separate chapter altogether from the other people; I took the population of agriculturists as 77 per cent. of the total.

22146. Of the total agricultural community?—Yes.

22147. I gather that you are not very hopeful about the efficacy of any measures which might be taken to consolidate fragmented holdings in Bengal?—That is so; I do not think it is a practicable proposition at all. As I have suggested, we might do it in a few cases in *khas mahal* land when a new settlement is made, but as a general proposition it is impracticable.

22148. Do you know of the attempts that have been made to bring about consolidation of fragmented holdings on co-operative lines in the Punjab?—I have heard about it.

22149. Have you read about it?—No; an officer from here was sent there for training.

22150. *Professor Gangulee*: For training?—I think so; I had a talk with Mr. Calvert at Delhi.

22151. *The Chairman*: Have you ever noticed amongst the villagers themselves any appreciation of the disadvantages under which they work their holdings?—Yes, they understand it. They know that there is greater demand for a bigger size plot than two or three small plots aggregating to the same size in different localities. I have myself done it by levelling up two or three small plots and making them into a big plot. They understand the value of a big plot in one place.

K. B. M. A. Momen,

22152. You do not think that a patient effort over a series of months to persuade one or two villages, carefully chosen, to make this experiment would be successful?—No, I do not think it will be successful, because it is not the actual cultivators alone who are concerned. Consolidation can only be made, as I have submitted, by exchange, or purchase. If there is an exchange, generally it is between two persons, but in the case of an agricultural holding in Bengal there will be about 16 to 20 persons interested in the land, and there must be exchange between each one of them before there can be consolidation, unless of course the State cares to buy up the whole area and reappropriate it.

22153. I will leave that point. I observe that under Irrigation, on page 324, you are quite definitely of opinion that a forward move ought to be taken in respect of irrigation in the Presidency?—Decidedly, I think irrigation and drainage are the two most important things and ought to be given precedence over everything else.

22154. *The Raja of Parlakimedi*: In your settlement work, have you come across large areas of waste lands anywhere?—In the district of Jessore, the waste land area, is very little, except those areas which have become water-logged by the action of the rivers being silted up. Rivers which formerly used to flow have now changed their beds and at places they have left big water-logged areas; these areas have ceased to be cultivated; not only the original beds of the rivers, but other areas which used to be drained are no longer drained.

22155. Is that generally the case?—In Jessore and Nadia, there are any number of big *phirae* water-logged areas which can be reclaimed if drained.

22156. Are they cultivable?—They will become very fertile lands.

22157. Are there no cultivable waste lands in any of the districts where settlement work has already been done?—In Jalpaiguri, perhaps there are some; in Mymensingh, we have got forests, but it will be very unwise to reclaim that. In West Bengal, there are high lands, *dangas*, in Birbhum and Burdwan districts which may be reclaimed and brought under the plough.

22158. What will be the extent of such land?—In Birbhum and Burdwan the settlement has not been completed.

22159. What will it be in the area you have just mentioned in the other place?—Water-logged areas?

22160. You said that in some districts settlement work has been done; how much will it be in that district?—In Jalpaiguri, there may be something like 150 square miles of it.

22161. Why has it not been taken up for cultivation?—Formerly, Jalpaiguri was rather thinly populated; gradually it is being taken up.

22162. What is the usual procedure to be adopted for a ryot to get the land?—He approaches the landlord.

22163. Is it zamindari area?—Mostly zamindari; there is some *khas mahal* land also, but that also is let out to big *jotedars*.

22164. Do they demand any premium?—The private zamindars demand a premium.

22165. What is the practice in ryotwari areas?—We have got very little of what is known as *khas mahal* land in Bengal. That which is not permanently settled, but directly ryotwari settled, is called *khas mahal* land in Bengal.

22166. If in ryotwari areas, there was cultivable waste land, and a ryot applied for a *patta* on that piece of land, what would be the premium charged?—There is very little premium charged by Government. Up to now we have never realised any premium for settling new lands in *chars* and other areas.

22167. What would be the premium if it was situated in a thickly populated area?—There is very little of *khas mahal* land except in Noakhali where the big *chars* are, but there is very great demand because the pressure of the population on the land is very high, 900 to the square mile.

22168. What is the procedure adopted?—A large number of applications are received by the Collector; he enquires into them, and gives these lands to those who are most deserving, that is, to those whose lands have been washed away, or who were *khas mahal* tenants, or who have not enough land to maintain themselves; the policy is to give it to the actual cultivators.

K. B. M. A. Momen.

22169. To the neighbouring cultivators?—To those who are actually of that class.

22170. If there are cultivators in the neighbourhood, is it not given to them?—Preference is given to them.

22171. What is the premium charged?—No premium is charged.

22172. Are such lands ever put up to auction?—Never; no settlement is done in Bengal by auction; all is done by selection of tenants.

22173. In your settlement work have you found encroachment by the cultivators upon neighbouring lands? Suppose there was a big field bound between two cultivators' lands, or a communal *paramboke*, that is to say, a piece of land set apart as a communal threshing floor, would they encroach upon it?—There is no such land in Bengal, what you call common land or common pasture ground, or communal land, belonging to the community.

22174. How do they manage it?—Everybody has his own threshing ground, mostly in the courtyard of his own house.

22175. Is that included in the *patta*?—That is part of his holding, he pays rent for it.

22176. During your tours, have you found by-industries being taken up?—They do a little industry also. It is however on a small scale and is not done everywhere. Some people, for instance, do poultry raising and some basket work.

22177. Which is most popular?—It depends on the locality. In some districts where the population is mostly Mahomedan, everyone has got some poultry.

22178. Is not silk-rearing popular?—In Malda it was very popular at one time but the industry did not flourish. The Government are now trying to improve it.

22179. What is the reason of the progress of the industry being retarded?—Perhaps foreign competition; I am not an expert on it.

22180. It is not due to the diseases of silk worms?—The diseases of cocoons are also responsible for hindering the progress of the silk industry but now Government sericultural farms are supplying cocoons.

22181. What work do the co-operative societies generally take up apart from money-lending and so on?—Their activities are now being enlarged and they are now taking interest in every branch. They are trying jute purchase and sale societies in Serajganj. In Bankura, they have agricultural co-operative societies; they have sale and purchase societies in some places, but the number is very small. As I have said, the Co-operative Department has only touched the fringe of the question.

22182. Can you put your ideas more clearly as to what you actually want from the Co-operative Department?—The number of societies should be increased. The ideal should be that each Union Board should have a Central Bank. We have got Central Banks in district headquarters and sometimes in sub-divisional headquarters but they ought to be in every Union. A Union is about ten to fifteen square miles in area.

22183. How many societies will there be?—There ought to be ten societies, one in each village.

22184. Have you any suggestions to make as regards auditing?—It is too technical a subject for me to offer any suggestions. I do not know the details of the work.

22185. As far as your knowledge goes, are you satisfied with the work that is being done about the accounts and so on?—I think the auditing is perhaps the chief work that they are doing. I would rather have more propaganda and more organisation than auditing.

22186. We have been hearing that it is a thing which is very badly needed?—Perhaps the staff is not enough. I could not tell you as I have no personal experience of it.

22187. Have you had any knowledge of the villagers complaining that they do not receive proper attention when they go to the office of the co-operative societies?—No. As a matter of fact, in a village all the villagers are not members of the co-operative society. Only about 15 or 20 are members of it.

22188. How are they selected?—The villagers form into a society and then gradually the organisers of that society enlarge the membership. But, as yet, we have not got all the possible members to form these co-operative societies.

K. B. M. A. Momen,

22189. Does caste act as an obstacle for selection? Have such people as *panchamas* any difficulty in getting into the society?—We have not got any *panchamas* here and there is no difficulty on the score of caste.

22190. Suppose a member of a low caste is taken into the society will there be any objection to it?—We do not make any difference at all about castes.

22191. Do these co operative societies take up animal husbandry also?—They have not taken it up so far as I know.

22192. Do you not think it would be a good thing if they did so?—Animal husbandry is a most important subject and the Department of Agriculture have neglected it so far.

22193. So, in your opinion, it would be a good thing if the co operative societies took up animal husbandry?—If the co operative societies could keep good bulls, or breed good cattle, or arrange for the milk to be collected and sold, they would do immense good.

22194. As regards demonstration, do you prefer its being done in the field of the cultivator or done on separate areas?—It should be done in both ways. The ideal ought to be that we should have a demonstration farm in every Union and in addition to this there ought to be demonstration in the cultivators' own fields.

22195. You wish to have the number of demonstrators increased?—Yes; both of demonstrators and agricultural officers.

22196. How many demonstrators are there in this Presidency per district?—In Bogra, there were four or five demonstrators. I am not sure of the number now but there are not enough by any means.

22197. So far as you know, four is the highest number?—In Bogra there were four or five. In some districts there are no agricultural farms and also no demonstration farms, and demonstration without a farm is not very satisfactory.

22198. Sir James MacKenna: I should like to know what the opinion expressed by you in replying to Question 3 on page 321 is based on?—It is based on my own personal knowledge as a layman and also on the experience I have had in several districts where I have worked. It is also based on my own experience as a small cultivator.

22199. Have you visited any of the agricultural stations in the Presidency?—I have visited only the farms in those districts in which I was a Collector. I have visited the Jessore farm and I have seen the Bogra farm.

22200. Have you visited Dacca?—No.

22201. Do you not think that this is rather a severe stricture on an important department of the Government by an officer holding a responsible position like yourself?—I have said what the people think. I have given the reason for its unpopularity. Are you referring to that portion of my statement on page 322 where I have said that the Agricultural Department is not popular?

22202. I am prepared to say that there are a large number of gross inaccuracies in your statement?—There may perhaps be one or two inaccuracies.

22203. You have a full sense of responsibility and still you maintain that this is your considered opinion?—Unless you tell me the portion to which you are referring I cannot say one way or the other.

22204. I am afraid it will take a long time; I have marked several passages?—The only objectionable portion perhaps is the place where I have said that the Agricultural Department is unpopular with the people. I have however given my reasons for its unpopularity. Of course, it is not possible for the department to show tangible results in a short time.

22205. Professor Gangulee: You are familiar with the Department of Agriculture more on its organisation side than on its research side?—That is so. I have not got much personal knowledge of research work.

22206. As an officer you have been in touch with rural life for a considerable time. May I know what particular aspect of the rural problem attracted your attention most?—You mean the agricultural side?

22207. All its sides?—In the agricultural branch, I think the failure of the crop on account of drought is the most noticeable.

22208. Perhaps you have not understood me. You have been a Settlement Officer, a District Officer and also Director of Land Records. I want to know what particular aspects of rural problems attracted your attention most. Is it

K. B. M. A. Momen.

agriculture, or improvement of sanitation, or better roads, or agricultural education, or what?—The thing that attracted my attention was the agricultural and the economic position of the agriculturists.

22209. So you were concerned with the development of agriculture and the economic position of the agriculturists. Therefore I cannot reconcile these two facts, namely, your interest in agriculture and in agricultural improvement and your not taking adequate interest in the Department of Agriculture itself?—I had no opportunity of taking any interest in the scientific side of the Agricultural Department.

22210. Have you been in any area where better seeds were in demand?—Everywhere better seeds are in demand and they are supplied as far as possible by the Agricultural Department.

22211. Has at any time any part of the rural population come to you for any information with regard to better manure?—No.

22212. You refer in your statement to the Union Boards. You say that Union Boards under the guidance of the Collector of the district ought to take more interest than they do at present. Do you consider the Union Board to be a unit of organisation suitable for rural reconstruction?—Very suitable.

22213. Are you in touch with any Union Board?—As a Collector, I am in touch with every Union Board.

22214. You think that the Union Board as a unit of organisation can undertake the task of rural reconstruction?—Yes. In fact, that is the body which ought to take up this rural reconstruction work more effectively than anybody else.

22215. You also emphasise the importance of the Collector taking more interest than he does at present?—I mean he should take more interest in agriculture.

22216. Do you mean to suggest that they do not take interest now?—They do. Some of them do take interest and some of them do not. They ought to take more interest.

22217. You were a Collector yourself. Did you not take any interest in agriculture yourself?—I took very great interest in agricultural farms wherever I could.

22218. Did you take interest in Jessore farm?—I was not a Collector there; I was a Settlement Officer; I had nothing to do with the agricultural farm there.

22219. As a Collector, did you come in contact with the District Agricultural Officers?—Yes.

22220. Could you tell us something about the work done by these District Agricultural Officers?—I asked some of them what work they were doing actually. They said that they went about in the village, talked to the people, did propaganda work and tried to instil in their minds the usefulness of the improved seeds which are supplied by Government and so forth. I understand instructions have now been given by the Director of Agriculture laying down their duties properly.

22221. I understand that, but I want to know what your relationship was with the District Agricultural Officer in the district where you were Collector?—More or less advisory; Collectors do not have control over them.

22222. What assistance did you give to the District Agricultural Officer?—No particular assistance, but if I was asked to assist, say in the way of helping them to acquire land and so on, I did so.

22223. Did you accompany them to any demonstration farm?—Yes, I used often to visit the agricultural farm at Jessore and Bogra. Whenever the Deputy Director came, I always accompanied him.

22224. Were you present at any demonstration yourself?—The demonstrations were done in the fields. They sow seed in the field of some cultivator and afterwards come and visit it. I never went with them and I do not think people were ever invited.

22225. You did not go with the District Agricultural Officer to attend any of these demonstrations?—No.

22226. Did you take an interest in agricultural education?—A general sort of interest.

22227. Is there any school in your district of that kind?—No.

22228. Are you in favour of agriculture being taught in secondary schools?—I am in favour of having some vocational subject in each secondary school.

K. B. M. A. Momen.

I, r 18—22

22229. Have you given any special thought to these problems?—I tried to do so when I was Collector of Nadia. There is one school started by a gentleman here which has one vocational compulsory subject attached to the ordinary curriculum, and agriculture is one of them.

22230. What has happened to that school?—It has only just been started; I do not know how it is progressing.

22231. You are not in touch with it now?—No.

22232. Are you in touch with any co-operative societies here?—Not now; not as Director of Land Records. As Collector, I was in touch with them.

22233. Have you any criticisms to offer upon the working of the co-operative societies?—I am not in a position to criticise.

22234. You are not aware of the details?—They are doing useful work and are well spoken of everywhere.

22235. You have not closely studied the movement?—No.

22236. Have you any experience of sale societies?—No. They are being started now, but it is a new thing here.

22237. In your work as Settlement Officer you must have come in touch with both landlords and tenants. Can you tell us what the relationship is between landlords and tenants in this Presidency?—There is a lack of sympathy, or perhaps I should say a lack of interest, on the part of many landlords, and especially the big landlords, who are mostly non-resident.

22238. Absentee landlords?—Yes.

22239. You are aware of the existence of the Land Improvement Act?—Yes.

22240. Do you think the Bengal peasant is able to derive any benefit from this Act?—He is capable of doing so, but as a rule the peasants do not take advantage of it.

22241. Why?—They can take the land improvement loans, but there are so many difficulties in the way. First they have to apply for the loan, and then there is an inquiry by a Government official and then they have to give proper security for the loan. That is the chief obstacle; there is not enough security offered by rural property. The people who generally apply for these loans are those who want to excavate tanks and so on but there again the difficulty is that the amount we generally recommend is not sufficient; and once they take the money of Government no moneylender will lend them any money.

22242. You refer in your note to agricultural income being this and that. How do you define "agricultural income"?—The income which is derived from cultivating the land, from the produce of agriculture. I do not include any income obtained from rents for agricultural land.

22243. These figures were obtained from your Jessore settlement survey?—It was a very easy matter in some ways. You know the actual total area under crops, and also what the average yield is per acre with a given crop.

22244. *Mr. Calvert*: Do you?—Roughly. You can never be exact in these things.

22245. Within 50 per cent?—It depends on the personal equation of the man who does it. You also know the total value.

22246. *Professor Gangulee*: That is the way you do it?—Yes, and I made an inquiry in the case of several typical villages and got typical budgets, and compared the results.

22247. Could you give us one of your account sheets, showing all the details of how you arrive at the figures given here?—They are contained in my settlement report of Jessore. All the details are given there. On page 68 you will find a budget showing actual income and expenditure, and in another place you will find the actual value of the crops and so on. On comparing the two figures it will be found that they come to very much the same.

22248. *Mr. Calvert*: I gather you think all the economic information which could be wanted has already been obtained by the Settlement Officers, and is available?—I think so.

22249. I am glad to meet you; you will be able to answer all my questions. Can you tell us roughly what is the average cultivated area per cultivator, whether as owner or tenant?—As tenant I have said it is 1.2 acres.

K. B. M. A. Momen.

22250. That is the net cultivated area per cultivator, whether he cultivates the land as owner or tenant?—It is nearly all ryots land.

22251. Do not your owners also take on land as tenants?—People who own land may also take on some as tenants?

22252. A man may be the owner of one piece of land and the tenant of another?—Owner as a proprietor?

22253. Yes?—Proprietors' land is not taken into consideration in this; it is only land which is cultivated and held by people who pay rent to another.

22254. These figures are for average holdings of tenants of owners?—Yes, and that covers practically all the land. None of the Jessore landlords cultivate land themselves.

22255. Have you in the course of your settlement work worked out the costs of cultivating an acre of paddy, for example?—Yes, and I have given that in my report. I worked it out for every crop, including sugarcane and so on.

22256. They include the labour costs of the cultivator and his family?—Yes.

22257. Have you attempted to check your estimates of outturn of paddy by consumption? Have you also estimated the consumption of the people?—I have calculated the consumption on the jail figures.

22258. They are not quite the same; a man in confinement requires more food than a man who is free?—I do not think so; a man in jail is not really confined in that sense.

22259. A man in jail has to have more food to maintain his bodily weight than a man who is free. The consumption of a person outside jails is less than that of a man in jail?—No, I do not think so. In Bengal the cultivators take much more than we allow the convicts. It may not be good for them but they do take much more.

22260. Dr. Hyder: Have you ever found in your experience as a Magistrate whether the people who go to jail gain in weight?—Yes, they always do.

22261. Mr. Calvert: You suggest a kind of system of compulsory thrift of, I think, one anna per bigha?—Yes.

22262. Is that your own idea, or did you base it on the French system?—It is my own idea entirely. It will not find favour with the people in Bengal generally. Everybody wants the Government to finance this and that, but Government's resources are not unlimited, and therefore I suggested there should be this contribution from landlords and tenants and that the money should be kept in the district as a permanent land improvement fund.

22263. You do not know whether a similar compulsory contribution taken in the French colonies has proved a success?—No.

22264. You are not very much in favour of popularising the *taccari* loan?—No. It will not be necessary if there is an improvement fund.

22265. Yet you favour a new type of *taccari* loan for industries?—Yes, that is special; but the source may be from that land improvement fund if there is one, or otherwise from Government.

22266. In the first case you are not in favour of popularising *taccari* and in the second case you say Government can do a great deal to foster and encourage home industries by providing raw material on credit?—That is a special side. It is not possible to make the ordinary *taccari* which is now being given very popular, because the officers who have to make inquiries have responsibilities and they are over cautious. It is not possible to be very liberal with those loans.

22267. Then I come to agricultural indebtedness. Have you read Mr. Darling's book on the Punjab Peasant?—No.

22268. When you talk of average annual income, I presume you refer to money income; you have not calculated the supplementals?—What are the supplementals?

22269. A certain amount of free grazing, free house site, free water?—I have calculated the income from all the subsidiary industries which the ordinary agriculturist engages in.

22270. Have you calculated the income from vegetables grown in the fields?—It is not much in Bengal. I have seen it in Bihar in my early days. In Bengal the subsidiary income is from fish and from poultry.

K. B. M. A. Momen.

L. 13—22a

22271. You say that a large proportion of the peasantry "cannot afford to have even the bare necessities of life." How do they manage to live without the bare necessities of life?—They do not have the many necessary things that people ought to have, but still they live.

22272 On page 320, you say that people are "getting more and more into debt?"—Yes, they are.

22273 Can you let us know why does the moneylender go on lending money?—Because he gets interest.

22274 They do pay interest?—Yes.

22275 You suggest that he cannot pay interest and the debt is getting worse and worse?—They cannot pay the interest in time, but ultimately the principal and interest are realised from them by getting a decree in the courts and selling their lands.

22276 The moneylender invests his money in order to get interest?—Yes, to increase his capital. Although the moneylender does not get the interest in time, eventually he realises the principal and interest.

22277. *The Raja of Parlahimedi*. Does he get the ryot's land as a mortgage before lending the money?—Yes, mortgages are very common.

22278 *Mr. Calvert* On page 323 you say, "The ryot's land not being transferable by law his credit is very small," and yet you say, "Lands are freely transferred"?—It is freely transferred, but the law does not make it valid. Therefore there is now a proposal to alter the law in connection with the amendment of the Tenancy Act.

22279 Has not your economic investigation led you to the conclusion that one of the basic causes of debt is credit?—One of the basic causes of debt is want of credit.

22280 Is credit?—I do not know.

22281. You cannot borrow without any credit?—They do borrow without credit; many people do it.

22282 *Professor Ganguly*. Would you lend me Rs. 1,000 if I had no credit?—No, but if I had more money then I know what to do with, in a moment of weakness I might do it.

22283. *Mr. Calvert*: Do you say the moneylenders of Bengal advance money to bankrupts?—They have a credit. The moneylenders know that in the end they will get the land. But there is always the risk of the landlord not sanctioning the transfer, and it is because of that risk the mortgagor gets much smaller credit than he would otherwise get.

22284. Do your economic investigations suggest that the amount of money advanced on land depends upon the price of that land?—Yes.

22285. And as the land rises in value, the mortgage debt tends to rise too?—The amount that the man can get is certainly more.

22286 Naturally he gets more into debt if the value of the land rises higher?—Yes.

22287. So that, debt does follow credit?—If the value of the land rises, he can get the loan he requires by mortgaging a smaller area of his land. If he wants Rs. 60, he has now to mortgage three bighas. The moneylender pays this now because he knows that eventually by payment of *salami* and so forth he can get the land himself. If the land is freely transferable the cultivator can get Rs. 60 by mortgaging only one bigha instead of three bighas.

22288 Under the head "Crops" you say, "I do not think there is much scope for improving the main crops grown in Bengal." On a previous page you appeal to us to face facts and not follow theories?—That is about education of agriculturists.

22289. What is this statement, theory or fact?—I was speaking only comparatively. You can certainly improve every crop, but the cost of manure and labour will stand in the way. I do not say that there is no possibility of improving the yield of paddy. But we should not give all our attention to the improvement of seed and better manuring. There are other methods which I suggest will appeal to the people more, such as irrigation and drainage.

K. B. M. A. Momen.

22290. If we can give the cultivator an unproved strain of paddy which will give him 30 per cent. more yield than the ordinary paddy, would you not call it a substantial improvement?—What about the cost of cultivation?

22291. The same?—There is not much scope.

22292. You say that the ryot once in debt can never extricate himself and finally becomes a landless labourer?—Yes, as things stand at present.

22293. Do you regard that decline into the state of landless labourer as a desirable thing?—It is undesirable.

22294. And you would not use the sources of relief afforded by the Imperial Legislature such as the Usurious Loans Act or the Insolvency Act?—The intention of those Acts is very good. What I say is that the people can always circumvent those Acts; in actual practice they defeat the purpose of the law.

22295. What is your suggestion to amend the law, or to let things remain as they are?—To reduce the rate of interest by starting co-operative banks, and to gradually free them from debt.

22296. Further down the same page you say that the ryots have now got a higher standard of living and they are gradually getting more and more into debt. Do you mean that they raise their standard by borrowing?—No, in some years they get bumper crops in jute areas chiefly; then they expect that they will get it every year, and they spend freely.

22297. You mention about these people "dragging on a life of perpetual want." Are they so poor that they cannot afford to get married?—Marriage does not cost very much in every society.

22298. The Chairman: Your experience has been fortunate in that respect?—I do not mean the ultimate effect of it, but I mean marriage itself.

22299. Mr. Calvert: Do you know that in England millions of people are too poor to marry? You have not got to that stage?—It depends upon the nature of the society, the sort of wives they get.

22300. In England some people are extremely poor and they cannot afford to get married?—Marriage is sometimes a sort of help here. The wife does as much agricultural work as the man himself.

22301. You regard expenditure on marriage as productive expenditure?—Sometimes it is.

22302. Sir Henry Lawrence: Do women work in the fields here?—Not the Mahomedan cultivator women, but the lower caste women do work.

22303. In a separate paper, you say that the average holding in Jessore is 4·8 acres?—I do not mean holding as defined in the Tenancy Act, but the total land held by the family.

22304. You say the average size of a plot is 36 acres. That gives 14 to 15 plots per holding. Would these separate plots be in separate places?—Yes.

22305. That is, the fragmentation would be 14 or 15 plots per holding?—That is true.

22306. Would you not attempt to remedy this?—I would attempt it, but I am not at all hopeful that we should succeed in doing it.

22307. You are not optimistic about improving the crops of Bengal?—Not optimistic of being able to consolidate holdings by exchange.

22308. You seem to get very pessimistic all round, on the question of crops, fragmentation of holdings, debt?—Perhaps experience makes one pessimistic in this country.

22309. We want ideas from you as to how we can improve the position. Can you give any ideas?—I say it is not practical, but I have given remedies that might be tried in a small way and see what happens. I may be wrong, but they may be tried.

22310. Can you offer for our consideration any suggestions as to how to improve the economic position of the poor people of Bengal?—We might try to increase the produce from land.

22311. But you say you cannot improve the crops of Bengal?—I do not say that. I say along with that other things should be tried, such as proper education, drainage and irrigation and those things will give you improved crops. I have said that in one place. You can improve the crops certainly, but what I mean is

K. B. M. A. Momen.

that the subjects I mention must receive first attention, and that you can improve in other directions later on.

22312. We have been told that the Bengal ryot is too proud to be seen cutting his own paddy in his village; he will go further away and work as a labourer, but he will not employ himself as a labourer in his own village?—That is not true. In Barisal and other places, they work in the fields and grow their crops, but at the time of harvesting other people come in and help them.

22313. *Professor Gangulee*: Why?—Because that is the custom with them.

22314. *Mr. Calvert*: They do not cut themselves; they get other people to cut their own paddy?—That is not the case.

22315. One of your fellow Collectors made that statement?—I do not know who made that statement, but that is not correct.

22316. We were told that the poor people would not be seen hoeing their own fields?—That has not been my own experience.

22317. *Mr. Kamat*: In your statement, you have passed a rather severe indictment, as one of my colleagues suggested, against the Agricultural Department, and I should like to ask you the grounds on which your impressions are based?—If you will let me know which particular portion you refer to, I shall try to reply.

22318. On page 321 you say, "I have known few District Agricultural Officers who take that amount of personal interest in the work that they should." Do they not take any personal interest?—Perhaps, the cases I have in mind may have been the exceptions, but the officers whom I have seen did not appear to take that amount of interest which I think they ought to take.

22319. On page 322 you say, "The Deputy Directors seldom meet the agriculturists and come and go unnoticed. I have known officers coming to districts for inspection work but not travelling beyond the railway station". Is that a general proposition?—That is only for one officer, but in some districts I have found that the visit of these officers is not very well known.

22320. You have observed one instance, and on that you make this general statement?—I do not put it forward as a general statement; I mention it as an example.

22321. Your statement applies to the generality of them?—I have seen one officer to whom it applies.

22322. The Deputy Directors, as a class, are not as bad as I thought them to be, from this remark of yours?—Perhaps, it is a little overstated. What I mean to say is that they do not leave behind them that impression, or make that impression which they ought to.

22323. Then you say, "The agricultural farms I have seen are all run at a loss". Is that so?—That is true.

22324. All of them?—The two or three that I have seen are run at a loss. In my book I have given the actual statistics regarding the agricultural farm at Jessore, which go to show that there is no return from the farm.

22325. In your memorandum you say, "The agricultural farms I have seen are all run at a loss"?—They are.

22326. You have seen two or three of them?—I have seen the one at Jessore and the one at Bogra.

22327. Were they losing concerns?—Yes.

22328. *Professor Gangulee*: Have you examined their accounts?—Yes. I have printed it in the book; they are from their own reports. What I was driving at was that you should have a demonstration farm which would appear to the ordinary people as a paying proposition.

22329. *Mr. Kamat*: When you say that the Agricultural Service is perhaps top-heavy, what was the idea in your mind?—That was with regard to the number of agricultural officers; they have been reduced from the bottom.

22330. And yet you say it is top heavy?—In comparison with the lower agricultural officers, the top is heavy. I say that the number of agricultural officers ought to be increased.

22331. What is wrong at the top?—I refer to such posts as Deputy Directors of Agriculture and similar high posts.

22332. *Professor Gangulee*: How many Deputy Directors have you?—Four or five

K. B. M. A. Momen.

22333. *Mr. Kamat* : Do you take that to be a very large number for your Presidency?—They are not too many, but at present they have reduced the number of District Agricultural Officers. What I mean is that their number has been reduced, whereas the superior officers have not been reduced.

22334. On the contrary, that goes against your statement; you were saying that there was something wrong at the top; the District Agricultural Officers are at the bottom?—That is so.

22335. There must be something wrong for you to justify your statement that the department is top-heavy?

*Rai Bahadur Bunnerji* : The number of Deputy Directors is three.

22336. *Mr. Kamat* : Are three too many for your Province?—Perhaps they are not; perhaps what I have said is not quite correct.

22337. Therefore, your statement that the department is top-heavy is not correct?—I do not think it is so at present.

22338. As regards agricultural economics, I suppose the Settlement Report is of recent date?—It is 1923 or 1923.

22339. It was published in 1925?—It was published later on, but it was written in 1923.

22340. Has it been adopted by Government, or has any Government Resolution been passed on it?—I have stated it in the note.

22341. Have they accepted your conclusion?—They do not accept anything.

22342. They have not given a general acceptance to your conclusion?—No.

22343. You have carried on these economic enquiries only in one district?—Yes, but there are other Settlement Officers who have done so in other districts.

22344. Similar enquiries with reference to other districts have not been done?—They have been done.

22345. Any conclusion about the economic condition of the villagers is based, therefore, not only on one district or three districts, but on mere districts?—It is based on enquiries with reference to 15 districts. In time, we will have that information regarding all districts in Bengal.

22346. In this report you say that more than half a century ago the condition of the cultivator was more affluent. Is that quite correct?—Yes, so far as the actual necessities of life are concerned.

22347. You say that the cultivator was a little better off in the early seventies than he is now. You have given us the figure of the average income of the agriculturist at the present day as Rs. 54, whereas you say that in 1872 it was Rs. 62 8 0. Was that net income?—It was net income from agriculture.

22348. That is to say, deducting all costs of cultivation?—Yes.

22349. His present income, you say, is about Rs. 54?—For Jessore.

22350. His income is calculated on the cost of the produce at the present day, either for jute or for paddy?—Yes.

22351. Will you tell me what was the average price of these staple crops 50 years ago?—I took the figures from the statistics collected at that time by a particular officer; I took them from Mr. Ramshankar Sen's book. The whole thing is based on the value of the produce as given in Mr. Ramshankar Sen's book.

22352. Was Mr. Ramshankar Sen a Government officer?—Yes; he was Sub-divisional Officer of Magura when he wrote that book.

22353. His book and the prices quoted in it were official?—He wrote that book in his official capacity.

22354. Were the bases of prices taken then, and taken by you now, official?—They are official in this sense that the book is written by an official.

22355. Was there any official authority behind the figures quoted by Mr. Ramshankar Sen in 1872?—I could not say whether it was so.

22356. If the prices taken then were only prices which had no official authority, but were prices quoted in the bazar, then the two things are not comparable at all?—What is official authority?

22357. The Agricultural Department has got a publication giving the schedule of prices?—They are giving the prices of staple crops like paddy, not the price of everything.

**K. B. M. A. Momen.**

22358. For purposes of comparison, we take those prices as the ruling prices, not the prices quoted in the bazar?—I do not know from where Mr. Ramshankar Sen took his prices; those are the figures in his book.

22359. In your statement you also give figures of expenditure of the agriculturist, is this based on your enquiries only in one village?—No, many villages. The figures were compiled from the reports of Circle Officers. There were about 40 Circle Officers who made these enquiries; they gave me the figures on those particular heads and I compiled them.

22360. You think there is no reason to believe that the expenditure shown is over stated?—I do not think so.

22361. *Dr. Hyder*. How many villages did you have, 50?—That was an economic enquiry which I conducted separately. This relates to figures of agricultural expenditure, which I gathered from Circle Officers.

22362. *Mr. Kamaṭ*. In this report of yours you also state that the lands used to produce at least 50 per cent. more crops in 1872. Is that again a statement borrowed from Mr. Ramshankar Sen's book?—Yes.

22363. Was there any detailed enquiry or official authority for the statement that the lands need to produce 50 per cent. more than they are doing now?—I could not tell you.

22364. That may vitiate or throw out the whole of your present enquiry?—Quite possibly.

22365. With regard to fragmentation of holdings, you do not pin your faith to legislative measures?—No, except, as I have suggested, in a small way to deal with obstructive people.

22366. Is that impression based upon the fact that you have a permanent settlement here, and 90 per cent. of the land cannot be interfered with by Government?—Yes, Government have got absolutely no power to interfere.

22367. Talking about well irrigation, on page 324 you say, "Well irrigation is perhaps not very suitable for Bengal. It means an amount of manual labour which the Bengal peasants will not be able to endure." In other Provinces there is any amount of well irrigation, and the peasant will cheerfully do it. Do you mean to say that the Bengali peasant is so degenerate as all that?—Our experience is that when the District Boards propose to dig wells on the road side, people say "We will take the water," but when the wells are dug, they will not use them because they are not accustomed to drawing the water.

22368. It is rather an extraordinary phenomenon for us to observe?—It may seem extraordinary, but there is the trouble of raising the water; the people here are accustomed to dip their vessels in the tank and take the water; besides, it is the women who generally carry the water, and they do not like to come out.

22369. On pages 326 and 327, you advocate certain measures which Government should adopt to promote home industries. You also say, "Government can also establish small factories for carpet making, lace making, silk reeling and lac-making." Do you mean to say that this should be done without finding out whether these are paying concerns and business propositions?—They ought to be paying concerns, but to whom, to the Government?

22370. To the man whom Government will finance?—Government ought to find out whether it will pay.

22371. The first step is to find out whether it will pay or not?—Yes.

22372. Unless they do that, it is no use starting a carpet-making industry?—No.

22373. You also say, "In suitable centres Government can afford much relief to the people by starting jute mills and spinning mills." Is that a legitimate policy for Government?—I do not know whether it is legitimate or not. I think that perhaps it might help in attracting the local people.

22374. Is jute milling a cottage industry?—It is not; I have put it in a separate sentence for that reason.

22375. *Rai Bahadur Banerji*: You have been telling us this morning that consolidation of holdings is impracticable in Bengal, and I want to ask you a question about it. In Bengal, the zamindar, or the *patnidar*, or the *darpatnidar*, or whoever he may be, is in actual possession of the land, and from him these tenures are held by the different ryots?—.....

*Sir Ganga Ram*. May I ask you how many "dars" there are in Bengal?

K. B. M. A. Momen.

*Rai Bahadur Bannerji* : Quite a number. You have the zamindar, who holds the land direct from the Government by paying the Government revenue; next comes the *patnidar*; the zamindar gives a sort of permanent lease to the *patnidar*.

22376. *Sir Ganga Ram* : He cannot be turned out?

*Rai Bahadur Bannerji* : No, if he pays rent; next comes the *darpatnidar*.

22377. *Professor Gangulee* : Do you propose to give him the whole series?

*Rai Bahadur Bannerji* : If he wants them; there is also the *shepatnidar*, and generally we have the *izardar*; nothing more.

22378. Whenever there is a transference of land from one tenant to another, the zamindar, or the *patnidar*, or the *darpatnidar* or the *izardar* gets a share of the sale money, the mutation fee as you call it, which is generally 25 per cent?—He does not get a share; he gets an additional *salami* for recognition of the purchase.

22379. *Salami* for recognition?—Yes; it varies from 25 per cent. to anything.

22380. To anything which can be settled between the zamindar and the *ryot*; but there is no dispute that generally it is 25 per cent.?—No. He does not get a share but gets an additional *salami* for recognition of the purchase.

22381. If the tenants once understand the benefits of consolidation, they have merely to exchange their lands and can satisfy the zamindar by payment of the *salami* he wants?—This can be done if there is only one zamindar.

22382. Even if there are three different men, what does it matter?—There will be difficulty if the two plots belong to two people. For instance, the *patnidar* may be the common man but the zamindars may be two different men. In that case it is not possible unless you take the consent of the whole lot in the chain.

22383. Is it not a fact that once the thing is leased out, the zamindar has nothing to do with it?—He does not derive much benefit from it.

22384. He gets only settled revenue and nothing else?—Yes; but by exchanging the land they cannot alter the nature of it so far as different estates are concerned.

22385. I shall give you a concrete example?—I have mentioned that in my note I have referred to your case.

22386. If it has been practicable in my case why should it not be practicable in other cases?—Everybody has not got your influence and money.

22387. It is not a question of money because I have never paid for any land?—Then it is a matter of influence.

22388. That is being done in other villages where people have not got the same amount of influence as I am supposed to have?—I thought it was impossible. It may be possible in one or two cases in Birbhum perhaps; but in Eastern Bengal it is absolutely impossible.

22389. May I inquire if it has been possible in some case or cases or in some villages in some districts? If the Government comes to our help with some necessary legislation, do you not think that we can have hopes of consolidating our holdings?—I have no hopes at all.

22390. In the course of your evidence you have told us that the non-official chairmen of District Boards have not acquitted themselves as creditably as they should have done?—I am talking only of those whom I know. I really meant the system.

22391. You condemn the system of having non-official Chairman?—Not the system itself so much as the personnel.

22392. Even if we take your statement to be true to some extent that some of these Chairmen have to live at times away from their headquarters, have not they got equally competent Vice-Chairman always living on the spot to look to the office and other necessary work of the District Board every day?—The results do not justify us in thinking that that is so. In one district I have known that the Chairman toured only for one day in the whole year.

22393. Perhaps the Vice-Chairman was touring?—The Vice-Chairman's tour does not carry the same weight.

22394. Your experience is restricted to one or two examples only?—Yes, to the examples of the districts in which I have been.

22395. With regard to the deterioration of roads, is it not due to this fact more than to any thing else, that in the old days when the chairman used to be the

K. B. M. A. Momen.

official they had perhaps a greater latitude in spending the money on roads than the present non-official chairmen have?—I do not know about the latitude but probably they had more inclination.

22396 If I tell you that they have now got only a certain percentage of their income, because the whole of the income of the public works cess is to be set apart for sanitation, water supply and similar other objects; that only the income from roads has to be spent on roads; that their income remains the same and the number and the mileage of roads is increasing as also the price of labour, does it not mean that the roads are sure to deteriorate unless you have additional income in spite of the chairman having a very great inclination for improving the roads?—It may be so. But in that case they ought not to increase the number of roads but ought to repair those roads that exist.

22397 Your statement as to the want of attention on the part of the Chairman to roads is not very accurate perhaps?—I think it is very accurate. I am sorry to say so but that has been my experience.

22398 Is it not the custom that all communications from the District Board to the higher Government officers are sent through the District Magistrate and is it not a channel through which the District Magistrate has the means of keeping himself conversant with whatever goes on in the District Board?—Yes.

22399 And the Divisional Commissioner and other officers are always at liberty to go and inspect the District Board and its offices?—That is so, but any attempt to give even advice is sometimes considered as an interference.

22400 In spite of the supposition of some of the people in connection with the District Board that this is an interference, Government never admit this so called interference?—Government do very little interference. They ought to do more for the good of the people.

22401. When you say that these District Board wells are not being used by the people, you restrict your statement to Eastern Bengal only?—Generally.

22402. You do not extend it to Western Bengal?—I have not got much experience of Western Bengal districts although that is my home.

It is very unfortunate for Western Bengal that although your home is there you have not given your attention to it.

22403 Sir Ganga Ram. On page 328 of your note you say, "In comfort, below comfort, above want and in want." Will you define these in rupees? What do you call "in comfort?" I want the income in rupees. Can you give me that figure?—I have mentioned that in my report.

Then I will not trouble you with it.

22404 You have mentioned Rs. 54 as the income. Is it per head of the population or per family?—It is the annual income per head.

22405 Supposing a family consists, according to your figures, of six souls?—The family in my note is a family of five persons, two adults and three children.

22406 And the whole income of that family is 5 times Rs 54?—Yes.

22407. Supposing Government took upon themselves to do the irrigation I understand in Bengal irrigation is not required except when the monsoon fails, is that right?—Yes.

22408 Supposing Government incur a large expenditure on irrigation works and the monsoon does not fail as is often the case, then Government lose the interest on the money?—The monsoon very often fails in Western Bengal. But it is not necessary that Government should undertake large irrigation measures.

22409 Unless you do that, it will never pay?—That is for the experts to say. But my own idea is that we should take advantage of the existing sources first and then try to have large measures.

22410. Sir Thomas Middleton: On page 319 of your note you refer to the fact that the District Agricultural Officers require more freedom of action. From what does want of freedom of action arise?—I do not know but I have not seen them exercising any freedom of action.

22411. Freedom of action may be hampered by want of funds?—Yes.

22412 Do you not think the real reason is the financial one?—That is certainly the most important.

K. B. M. A. Momen.

22413. You say on page 820 you would not care to see teachers drawn from the agricultural classes, because that would encourage them to give up agriculture and become teachers; but is the position not this, that the soil of Bengal is trying to support too many people?—I do not think so, because even in Jessore I found that where the pressure of the population was about 550 to the square mile it was a surplus district so far as food crops were concerned.

22414. You have indicated to us the very poor condition of the *bhadralog* in Jessore many of whom are landowners. Do you not think teachers could be found from the families of these men?—They are not agriculturists.

22415. You do not call landowners agriculturists in this Province?—No, not in Bengal. They are in water-tight compartments.

22416. You are thinking exclusively of the cultivators?—Yes. By landowners we mean rent receivers.

22417. You suggest the service is perhaps too top heavy. Would you not agree that in the initial stages all Agricultural Departments must be top heavy?—I have qualified that statement already in my oral evidence.

22418. You agree it is a temporary condition?—Yes; I have said it is not top-heavy if the subordinate staff is increased in the way it ought to be.

22419. You rightly, I think, attach great importance to the subordinate staff. How would you recruit that subordinate staff?—I do not know how they are recruited at present.

22420. How would you like to do it?—I have suggested having a school or a college here.

22421. Would you try to get them from among the *bhadralog*?—From any body who will come to this school.

22422. You consider suitable candidates might be found among such landowning classes as you have described in your Jessore report?—Yes.

22423. How long a training would you give them?—My idea was that there should be a school or college in the Presidency and all our staff should be recruited from that school or college according to the nature of the appointment and higher appointments should be filled from post-graduate scholars as elsewhere.

22424. What kind of salary do you think would be required for these demonstrators at the beginning of their service?—The salary they get at present.

22425. Rs. 30?—That is enough to start with.

22426. You refer to the losses on the demonstration farms. Is it not the case that the demonstration farms also carry out experiments?—Perhaps they do. They say they do, but I do not know what sort of experiments they carry on.

22427. I happen to have examined the accounts of one farm, and I found the demonstrations were profitable but the experiments had involved a loss?—I have given the accounts of the Jessore farm in my report. My idea was that in order to stimulate agriculture and induce people to take to it we ought to have demonstration farms which should be worked at a profit, so that people might see that a profit could be made out of it.

*Sir Thomas Middleton* : I agree.

22428. *Mr. Gupta* : With regard to the want of sufficient co-operation between the Agricultural Department and the people, I take it your object is to draw attention to the desirability of increasing the present amount of co-operation, and not so much to criticise the actual work of the Agricultural Department?—Exactly.

22429. And with that object you would like to see the subordinate staff of the Agricultural Department increased?—That is exactly my view.

22430. Similarly, as regards the ryots themselves, they are not averse from taking advice from officers of the Agricultural Department and the Collectors when they get it, are they?—No; I have said that.

22431. You say they are rather backward and conservative?—They are conservative.

22432. As agriculturists are all the world over, there is nothing special about our agriculturists?—No.

22433. With regard to your observations on the economic condition of the people, I suppose they apply more or less to Jessore, where you have worked as Settlement Officer, and Midnapore?—I have no notes of Midnapore.

K. B. M. A. Momen.

22434. But you will admit that whereas the condition in districts like Jessore is probably unsatisfactory, on the other hand in progressive districts the position is much more hopeful?—Yes, I have said that in my report.

22435. So you do not want to draw any general conclusion that the condition of the agriculturists as a whole is becoming worse every day? You do not want to make any general observation like that; do you?—In some districts it is. What I have said about Jessore applies to Nadia with equal force.

22436. Not to the whole of Nadia?—Except the Kushtia sub-division.

22437. It only applies to places where the health conditions, want of water and so on are unfavourable to prosperous agriculture?—Yes.

22438. With regard to what you say as to the change in the administration of District Boards since they had official Chairmen, I take it your object is to draw attention to the want of time of the Chairmen and therefore their inability to come as closely in touch with the people as is desirable?—Yes. I have explained that, being otherwise fully occupied, they cannot spare the time for this.

22439. Do you think if we had paid Secretaries who would do inspection work this disadvantage might be overcome to some extent?—To a great extent.

22440. If they were paid?—Yes.

22441. And if they had executive control and could do outdoor inspection work?—Yes.

22442. Would you favour a sort of Local Self-Government Service going up from the Secretary of a circle to the Secretaries of the more flourishing District Boards?—That would be very useful, because if the Circle Officers are appointed Secretaries and so on they will make very suitable officers on account of their experience of local matters.

22443. *The Chairman*: I think you told the Commission that you yourself had some experience of farming?—Very little.

22444. Did you make it pay?—It pays in this way, that the establishment pays for itself and does other work also. Otherwise it does not pay from the monetary point of view.

(The witness withdrew.)

## Rai KUMUD NATH MULLICK Bahadur, Ranaghat, Bengal

### Replies to the Questionnaire

**QUESTION 1.—RESEARCH.**—(a) (1) In my opinion, research work all over India should come under a central institution. More facilities should be given to research officers, and all research works should be backed by sound finance. According to circumstances, there should be one or more research stations in every Province directly linked with the central institution. The result of all research, Imperial or Provincial, should be published in English by the Central Research Institution and in all the provincial vernaculars in respective Provinces.

(b) Not known to me.

(c) The water requirement of various crops.

A survey of the subterranean water-supply with special reference to irrigation.

The study of various indigenous grass and other rank herbage for fodder purposes.

**QUESTION 2.—AGRICULTURAL EDUCATION.**—Generally speaking, the time is not yet ripe in Bengal when a large number of men will come forward to take advantage of education, offered by an agricultural school to whatever type it may belong, high or elementary. It is, however, necessary that there must be some institutions for the training of a type of men who might eventually be appointed either under the Government or under private farms or work as teachers if necessary; or go in for farming on their own account. Having at first created a type of men like that it may be possible to interest the mass in improved agriculture.

(i) Not at present.

(ii) Yes. One institution of the status of existing secondary school in each Deputy Director's circle (*viz.*, East, North and West).

(iii) Preferably yes, but there should not be any hard and fast rule.

(iv) No, because they did not get any backing from the Government. If the passed students of such institutions are given appointments under the Government or helped by the Government by grants of lands and agricultural loans under proper safeguard, a large number of middle-class men will certainly take advantage of such courses.

(v) Service or private farming.

(vi) Not always.

(vii) Not known to me.

(viii) (a) It does not appear to appeal to the mentality of our average boys. To me, it seems that it is partially due to the lack of good teachers.

(b) At present, there is no school plot anywhere in Bengal as far as I know. But the idea of both school farm and school plot seems to be good. Moreover a well managed school farm may possibly help a large number of students in getting education, the cost of which he can probably earn by working in farms in spare time.

(ix) Service.

(x) Agriculture in Bengal will only be attractive to middle-class youths if there is a reasonable chance of getting a livelihood out of it. I am of opinion that the system of establishing fully equipped agricultural colonies, all over the Province and giving facilities to agricultural students to settle there, will help it to a great extent.

(xi) By actual demonstration work on the spot by qualified members of the Agricultural Department and by delivering systematic lectures by fully equipped travelling teachers. Lantern lectures are often appreciated in rural areas.

(xii) The administration must be in the hands of the Agricultural Department but finance be made by the Government and public bodies.

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.**—(a) Field demonstration followed by the supply of good and improved seeds.

(b) The effectiveness of field demonstration can be very much increased if the Government guarantee against any loss that the cultivator may incur by allowing his lands for demonstration purposes.

(c) The cultivators may be induced to adopt and act up to the advice of the experts, if the experts themselves advise and help the cultivators in a more lively way than is being done at present.

(d) No such striking instance can be cited either of success or of failure excepting the success of some of the improved varieties of jute and paddy in Bengal.

**R. B. Kumud Nath Mullick.**

**QUESTION 4—ADMINISTRATION.**—(a) I have already said that there should be a more centralised relation between the India Government and the Provincial Government in so far as the research work is concerned. Administration, propaganda and agricultural education must be kept decentralised and entirely provincialised without any reference whatsoever to the India Government. The Government of India can, however, take up the crop statistics and relieve the Agriculture Department of that work.

(b) Yes. The Provinces will certainly be more benefited if the scientific staff of the Government of India is increased, provided however, they are in constant touch with each other and the public. At present the provincial public, as a whole, is not fully in touch with the activities of India.

(c) (i) Not fully, I expect that they should show more life and less of officialism and red-tapeism.

(ii) As regards railway and steamers, the services are not efficient from the agricultural standpoint. They should give more extended facilities at cheaper rates for the transport of seeds, manures, etc., and for carrying all agricultural commodities including cattle, poultry, etc., from the places of production to the places of consumption. Cold storage arrangements for milk, vegetables, fish, eggs, etc., should also be taken up by them.

(iii) Better roads connecting long distances will help agriculture to a great extent.

(iv) Very little benefit is being reaped by the rural people from this department; but arrangements may be made whereby short summaries of various meteorological observations can be daily published in rural areas, preferably in the post office premises. The significance of these observations must also be explained. Unless some sort of arrangement be made to publish these things in local vernaculars, nothing would be done.

**QUESTION 5.—FINANCE.**—(a) Timely loan to help agricultural operations is of great importance to cultivators.

(b) The Government money that is ordinarily available for this purpose is a very insignificant sum in comparison with the vastness of the country.

**QUESTION 6.—AGRICULTURAL IMPROVEMENT.**—(a) (i) The main sources of borrowing are for cultivation purposes as well as for meeting various social obligations.

(ii) Almost invariably the village *mahajan* (creditor).

(iii) Reasons preventing the repayment are: (a) Excessive interest, (b) failure of crops either actual or on economic grounds, and (c) excessive personal expenditure primarily on luxuries.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—(a) No, because no such arrangement can be made permanent so long as the present system of inheritance and rural conditions prevail. Moreover, very little actual benefit will accrue even if a large number of plots are consolidated together. Any endeavour in this direction will create a tendency in the country for extinguishing the present proprietors and encouraging the conversion of agricultural plots to big farms, thus reducing the present proprietors possibly to a state of servitude.

(c) I do not believe in any such artificial check. So long as the land courts will exist, there will always be a tendency on the part of the people to take recourse to them, if they feel aggrieved. There would be no difficulty on the part of the lawyers to find out numerous ways of avoiding the law even if it is passed.

**QUESTION 8.—IRRIGATION.**—(a) In every district of Western Bengal, there is need for the extension of irrigation schemes. I believe that a great deal more prosperity can be given to the ryot by organising irrigation schemes than by any other means of improved agriculture.

(i), (ii) and (iii) All of them are desirable wherever practicable. The main obstacle is the lack of funds.

**QUESTION 9.—SOILS.**—(a) (i) It is mainly for an individual to decide what to do. No generalised suggestion can be made regarding a Province.

(b) Not known to me.

(c) Reclamation and cultivation on favourable terms.

**QUESTION 10.—FERTILISERS.**—(a) In my opinion, the soil of Bengal requires much more organic matter than is at present existent in it. The amount of cow-dung that is available is not sufficient to meet the demand. In the first instance, the quantity and quality of the cow-dung should be improved by rearing more cattle and conserving the cow-dung better and also by the cultivation of green

R. B. Kumud Nath Mullick,

manuring crops and the utilisation of various waste substances, water weeds, etc. (if possible).

(b) The artificial fertilisers are not used in Bengal to any such extent as to justify the considerations in this respect.

(c) Under the present economic, climatic and soil condition of the country, I would advocate a more extended use of organic manure supplemented only by such concentrated fertilisers as may from time to time be found to be suitable.

(d) Nowhere in Bengal.

(e) No. Experiments conducted by the Government Department of Agriculture do not show any conclusive result. On the whole, however, the application of nitrogen seems to enhance a crop in most cases.

(f) It is very difficult to stop the practice, as the cultivators find it more profitable to use it as fuel.

**QUESTION 11.—CROPS.**—(a) (i) Something has been done in Bengal in this direction mainly by selection. The possibilities of hybridizing different varieties however do not appear to have been tapped.

(ii) This is desirable by all means that varieties of crops that have been found to be successful in other countries should also be given trial in Bengal.

(iii) It has been definitely found in Bengal that improved seeds give better results and it is only a question of organising a better seed supply. Encouragement should be given to reliable private parties to multiply seed from stock received from the Government and the Government should guarantee a minimum price for these seeds or subsidise the industry at initial stages.

(iv) Granting of more gun licences to reliable parties.

(v) No. None of the present crops should be replaced though this suggestion does not apply to different varieties of the same crop.

**QUESTION 12.—CULTIVATION.**—(a) The indigenous methods should be improved on the spot. Bengal tillage will never be improved with foreign implements which are generally too heavy and ordinarily constructed without much reference to local conditions.

(b) The present systems are the products of centuries of local experience and investigation.

**QUESTION 13.—IRRIGATION.**—(a) To me it seems that no machinery imported from foreign countries, will be of much use in Bengal, where the cattle are very weak and the land, very much divided. It has also not been definitely proved in Bengal that deeper cultivation is more profitable than shallow cultivation excepting in the money crops like sugarcane, potato, etc. Irrigation appliances are, however, very necessary and useful.

(b) If there is a demand anywhere, the organisation of co-operative societies is the only possible solution. The granting of loans by the Government to purchase these machineries may also be of help in isolated cases.

(c) Not known to me.

**QUESTION 14.—AGRICULTURAL INDUSTRIES.**—(a) In my opinion, it ranges between 150 to 160 actual days and for another period of 60 to 90 days the cultivator is actually confined to bed on account of malaria and other diseases. The rest of the days he generally devotes himself to his household duties, repairing of houses, looking after cattle, marketing of his produce, fishing and in some cases, working as day labourers.

(b) In these days of keen and strong competition with bigger interest, it appears doubtful whether any of the industries that at one time formed as the backbone of rural India, can ever be revived.

(c) These subsidiary industries are almost found in rural areas; according to their local suitability these things, however, exist as modest home industries. Any endeavour to reorganise them in bigger lines may probably ruin them altogether.

(d) Government have done practically nothing in this direction and the question of doing more does not arise at all.

(e) I am definitely against the industrialism of rural areas because the amount of gain that may be expected by the rural people will be more than counteracted by the introduction of all the vices that are incidental to such industrial concerns. It is also my experience that the majority of these workmen are imported from outside, the local people not always caring for such employment.

(f) Yes. Industrial tools and appliances have been proved to be much better than agricultural implements and as such, my answer to the question is in affirmative.

R. B. Kumud Nath Mukherjee.

## Oral Evidence

22445. *The Chairman* : Rai Bahadur Mullick, you have been good enough to put before the Commission a note of your evidence. Do you wish to make any general statement now, or can we proceed at once to question and answer?—I do not wish to make any general statement.

22446. On page 319 of your note you suggest that passed students of agricultural institutions, if they are not given appointments under Government, might be encouraged by grants of lands and agricultural loans under proper safeguards. What lands have you in mind?—The *khaz* lands that Government have.

22447. Have Government lands at their disposal at this moment?—Yes, in every district.

22448. Cultivable, unoccupied lands?—Yes.

22449. Lands of such quality as in fact to encourage cultivators?—Yes; in many cases they are good.

22450. *Dr. Hyder* : Are there any unoccupied Crown lands except in the Sunderbans?—In every district there are lands now lying fallow.

22451. *The Raja of Parlahimedi* : Cultivable waste?—Yes, a portion of them.

22452. *The Chairman* : On page 350 you say in answer to Question 5 on Finance, 'The Government money that is ordinarily available for this purpose is a very insignificant sum in comparison with the vastness of the country.' Have you any constructive suggestions to remedy that situation?—Yes, to give a proper allotment to agriculture. At present it is very much out of proportion that a vast country producing an income of 17 crores as revenue should devote only about 3 lakhs to agriculture.

22453. You think agriculture ought to get a larger share of the revenue?—Yes.

22454. On the same page you refer to irrigation. Have you noticed any demand on the part of the rural population for an extension of irrigation schemes?—Yes. They cannot do very well in agriculture unless they get good irrigation.

22455. That is your opinion, but is there any local demand for it on the part of the rural population?—Yes, of late there is.

22456. You think the need for further irrigation is appreciated by the cultivators?—Yes.

22457. I am struck by a passage of yours on page 352, where you are dealing with agricultural industries. You say the cultivator is actually confined to bed on account of malaria and other diseases for a period of from 60 to 90 days in the year?—Yes.

22458. On what observations or calculations may that statement be founded?—I myself see it on my own farm and on those all round me. They are actually lying down for between 60 and 90 days a year. There is no escape from malaria and other diseases.

22459. It is a certainty year by year that these recurring attacks appear?—Yes.

22460. Given sufficient quinine, would the situation be improved?—Yes, and in some cases it has been; but there are complicated diseases which do not succumb to quinine.

22461. You think that 60 to 90 days a year is a reliable estimate of the period during which the average cultivator in ordinary health is prevented by diseases from attending to his work?—Yes.

22462. Talking of subsidiary industries (or spare-time occupations, as you prefer to call them) you say that in these days of keen competition with bigger interests it appears doubtful whether any of the industries which at one time formed the backbone of rural India can ever be revived. You would probably wish to limit that statement of your view to such industries as are concerned with producing goods for sale; you do not include, I take it those spare-time occupations which enable the cultivators to provide themselves and their families with certain of their requirements?—They can certainly have those industries amongst themselves, but what I meant by my statement was that things which can be done by machinery could not be undertaken as home industries.

22463. But even though the cultivator may not get full value for his time in terms of industrial wage payment, the fact is that, since the cultivator is necessarily

R. B. Kumud Nath Mullick.

L r 14—23

unemployed during such a long period in the year, it pays him to make as many of the requirements of his home as possible with his own hand?—Certainly.

22464. I take it, as you agree to that, you would not object to any attempt to popularise the use of modest implements by any means that might be at the disposal of Government?—No.

22465. You say, "Any endeavour to reorganise them (home industries) on bigger lines may probably ruin them altogether." What are you thinking of there?—I have seen that wherever any attempt is made to make industries pay by introducing machinery the home industries generally become scarce.

22466. Is it a question of making them too expensive?—Yes; they generally forget how to do it by hand, and they adopt the machines which are less trouble some to them.

22467. On page 352 you say, "there is often a temporary shortage of labour on account of migration." What migration are you thinking of there?—Migration within the district.

22468. On the same page, in answer to Question 22, you express the view which the Commissioners have heard from other witnesses, that rather than compel a minority to conform to any scheme of improvement in the community, Government should intervene and give the members of the community consisting of such a minority compensation?—Yes.

22469. Do you not think that a scheme of that sort might raise the number of objectors?—Not generally. If it is made a paying business, you will find a good many people quite prepared to engage in it.

22470. *Sir Henry Lawrence*: As regards those industries which you wish the ryot to take up, would you include spinning of yarn?—Yes.

22471. Has that taken root at all in your district?—No.

22472. Is there any *khaddar* propaganda there?—Not very much.

22473. Do you attach much value to that propaganda?—We have very little knowledge of that propaganda in our district, because we have already the weaving industry in our district.

22474. All the more reason to find that a fruitful soil; has that been extended?—Not extended, because it is all done with foreign yarn.

22475. Your weaving is done with foreign yarn?—Yes.

22476. Could it not be done with yarn spun locally?—They do not know how to spin fine yarn.

22477. At one time they used to do it?—Yes.

22478. How long ago did it die out?—Long before the British came here.

22479. One hundred and fifty years ago?—Yes.

22480. That is not the view of history; it is popular belief?—It is true; I have myself written a history of our district.

22481. You have written a history and investigated this point?—Yes.

22482. That will be an interesting document; could you let us have a copy?—Yes.

22483. You remark that malaria incapacitates people for 90 days in a year; is that limited to the district of Nadia?—Nadia and Jessore specially, and speaking generally.

22484. It applies to other districts in Bengal?—Yes.

22485. As to migration, to what part of Bengal do your people migrate?—I have stated that they migrate within the district.

22486. Within the limits of the district from one place to another?—Yes.

22487. Is that a point to which you object?—No, because by their doing so everybody gets labour.

22488. It is a beneficial thing; you do not deprecate it?—No; I do not.

22489. Do your labourers emigrate overseas at all?—No; not to my knowledge.

22490. Do they emigrate to Assam?—Not to my knowledge.

22491. This migration is only a seasonal movement within the district for the benefit of agriculture?—Yes.

R. B. Kumud Nath Mullaik.

22492. Can it be encouraged?—There are two sides of the question. Migration from a place where there is not enough labour already is bad; but migration from a place where there is surplus labour is good.

22493. In any case this migration is of some benefit to the labourer who migrates?—Yes.

22494. *Sir Gauga Ram*: Would the poor people of Bengal emigrate to other Provinces if good land were given to them?—Perhaps not.

22495. They are too homo-ridden?—Yes. The labouring class would not, but the middle class would.

22496. For clerical service?—Also for land and other things.

22497. They would not touch the plough?—But they will go in for big farming on scientific lines.

22498. What do they know of farming?—There is a section of the population who know it.

22499. Have they capital or do they expect Government to supply them?—They have a modest amount of capital but they want Government to help them.

22500. Has the introduction of the Reforms in any way ameliorated the condition of the poor people?—It is practically not known to the poor cultivators.

22501. Has it benefited them in any way or not?—I am not competent to say.

22502. Are you a member of the Legislative Council?—No.

22503. *The Raja of Paralimedi*: Does the Bengal Tenancy Act provide enough security for the ryot to induce him to take an interest in his own holding and carry out improvements?—Yes; whatever might be the law, by custom they have a permanent tenure of the land.

22504. The occupancy right of the cultivator is safeguarded?—Yes. As soon as a permanent tenant of a village touches land it becomes his, and the zamindar has no right to take it from him. Practically the tenants are the masters.

22505. The same thing prevails in Madras too. After exchange of *pattas*, if a tenant lives for a period of twelve years in a village, the tenancy law gives him right to any land he touches. So, the zamindar has no inducement to purchase that kind of land, unless it be that he wishes to keep the land under his own private cultivation?—Yes.

22506. As soon as he allows the ryot to enter upon that land and cultivate, the right of occupancy goes to the ryot?—Yes.

22507. So, the zamindar while lending money to the ryot, does not entertain the hope of acquiring the ryot's land?—Certainly not.

22508. *Professor Gangulee*: Are you a member of the Provincial Board of Agriculture?—Yes.

22509. Can you tell us how that Board is working in Bengal?—Its activity is nil.

22510. Could you account for that?—It has been introduced only recently, and it has yet to be organized in a proper way. Perhaps that is the reason why it does not work properly.

22511. *Sir Henry Lawrence*: How many years ago was it formed?—Some six years ago.

22512. Has it been working for six years?—I do not know exactly.

22513. *Professor Gangulee*: Could you account for this state of affairs? Six years may be considered to be quite a long time, is it not?—Recently they have taken in other members, they have resolved to have quarterly meetings, and so on, and they are showing some activity.

22514. What are the activities?—Nothing particular, but they have resolved to meet quarterly; recently, they have framed rules to guide them properly.

22515. Have you, as a member of the Board of Agriculture, submitted any proposal to infuse life into this organisation?—No.

22516. What quantity of jute seed do you grow on behalf of the Department of Agriculture?—I have often supplied seed worth Rs. 3,000 to Rs. 4,000.

22517. What variety do you grow?—*Chinsura green* and *G. Capularis*.

22518. You grow it from year to year?—Yes.

R. B. Kumud Nath Mallek.

11 13—2'14

22519 Do you find any change in the quality of seed, or any deterioration?—No

22520 Have you any practical experience in that direction? Have you tested the seed grown from year to year to see whether there is any deterioration in the quality, and to see whether it is maintaining its strength and purity?—Yes, but on this question I may be permitted to say that the supply which comes from the Agricultural Department is always good, but if it comes through any middle men then there is mixing of other inferior varieties, and many complaints have been received against these seeds

22521 Have you any co-operative organisation?—Yes

22522 Are you in touch with it?—Recently I have not been in touch with it.

22523 Why did you sever your connection with it?—I fell ill and went away from home.

22524 You still retain your interest in the movement?—Yes

22525 Do you closely follow this movement?—Yes, in a general way, not entirely

22526 Do you realise that the co-operative movement may offer very substantial help to the cultivator?—Certainly, if it is conducted properly.

22527 What do you mean by 'conducted properly'?—If officers do their duty faithfully

22528 Do you mean to insinuate that they do not?—No, they do their duty.

22529 And, though you realise the importance of the co-operative movement, you are not yourself taking any interest in it at the present moment?—I was taking interest in it; for six or eight years I was Director of two associations there

22530 Just now are you taking any interest?—No, but I am a member still

22531 Member of what?—Member of the co-operative society.

22532 Is it an urban bank?—Yes.

22533 Are you in touch with any rural co-operative society?—No

22534 Are you in touch with any silk society?—I have heard that there are only a few of these silk societies but practically ordinary societies are now loan societies.

22535 Do you attend any of the Provincial Co-operative Conferences?—Yes.

22536 You are invited there?—Yes.

22537 What experience have you of agricultural education? Have you started any school yourself, or are you in touch with any school in your district?—There are some schools which I know.

22538 Have you been to the Chinsura Agricultural School?—Yes.

22539 What are your views with regard to the success of agricultural education in vernacular schools?—It is quite possible.

22540 Can you tell this Commission your views as regards the failure of the Chinsura experiment?—It is due to the apathy of the general public to take up agricultural education.

22541 That is the main cause of failure?—Yes.

22542 Have you any suggestion as to how the interest of the public could be roused?—As soon as agriculture appears to them profitable, the demand for school will grow.

22543 Not till then?—Not till then.

22544 You attach more importance to demonstration farms?—Yes.

22545 Do you participate in any demonstration work yourself?—Yes.

22546 Who demonstrates in your district?—It is generally done by ourselves.

22547 Does the Department of Agriculture help you?—Yes, they help us.

22548 What sort of help do you derive from the department?—We get the land seeds from them, and sometimes they give us instructions which we follow.

22549 Can you kindly describe a field demonstration to us, that is, how things are done at present?—To my knowledge, it is not done anywhere by the department in the proper sense of the word, but individually somebody does it; of course their staff too is very limited.

R. B. Kumud Nath Mullik.

22550. What is the nearest demonstration farm you have?—We have no demonstration farm anywhere near us; at Dacca, there is one.

22551. There is no demonstration farm nearer to Ranaghat than that?—No.

22552. Is any demonstration on private farms carried on by the Department of Agriculture?—With the help of the Agricultural Department we do it.

22553. I want to get from you your relationship with the Department of Agriculture. What is your relationship with them as a practical farmer?—Whenever I ask for their help they help me with their advice; that much and nothing else.

22554. Do they assist you in your propaganda work, if you do any?—Not much.

22555. *The Raja of Parlakimedi*: Do they spare any demonstrators?—No; except sending me seeds and giving me advice when I ask for it, they do nothing else.

22556. They do not send any trained demonstrators?—No.

22557. *Professor Gangulee*: Are you in touch with the cultivators in your neighbourhood?—Yes.

22558. Do they come to you and do you go to them?—Yes.

22559. What sort of views do you exchange with each other? What do they ask of you and what do you ask of them?—They are benefited by the successful demonstrations that we carry on in our fields, they watch our proceedings keenly and they question us about them; they adopt any methods which are not expensive.

22560. *The Raja of Parlakimedi*: Have you applied to the Agricultural Department for demonstrators?—No; I have my son who is trained in agriculture, and therefore we have some facilities for carrying on our work.

22561. *Professor Gangulee*: You have had some success in the demonstration work in your own private farm?—Yes.

22562. Is it better seed, better manure, or better implements?—It includes everything; I use tractors and up to date machinery.

22563. Is it a Fordson tractor?—No; it is a bigger one of 20 horse power, manufactured by the International Harvester Company.

22564. *Mr. Calvert*: Is that under the advice of the Agricultural Department?—No; we do it ourselves.

22565. *Rai Bahadur Bannerji*: Did not the Agricultural Department advise you to do it?—No; we did it ourselves.

22566. *Professor Gangulee*: In these demonstrations, what commends itself most to the cultivators' point of view; is it better seed, better manure, or better implements?—They are struck by the general results of all combined, but particularly seed.

22567. Do they look about for better seed?—No; of course I give it to the local people and they do it; for miles around my farm they are growing my seeds.

22568. You mostly grow jute and paddy?—Mostly jute and paddy, but now I am taking up sugarcane, and I am going to give up jute and paddy, because it does not pay enough.

22569. Not even jute?—Not even jute.

22570. So, you are proposing to give up jute and paddy and to replace these crops with sugarcane?—Yes, and that is done under the instructions of the Director of Agriculture.

22571. You have already started it?—Yes.

22572. What variety of sugarcane do you cultivate?—Co. 213, the Coimbatore variety; that gives very good results.

22573. Have you already had experience of it?—Yes.

22574. And the yield is satisfactory?—It is very satisfactory.

22575. *The Raja of Parlakimedi*: Have you got any of the Java varieties or the Mauritius varieties?—Yes.

22576. *Sir Henry Lawrence*: What rotation are you going to adopt?—Potatoes and some land with jute.

22577. Your rotation will be sugarcane, potatoes and jute?—Yes.

R. B. Kumud Nath Mullaik.

22578. And that was advised to you by the Director of Agriculture?—I do not remember the particular rotation which he recommended to me, but he recommended me, if jute and paddy did not pay, to grow other crops, and he recommended the growing of sugarcane, potato and jute also.

22579. *Sir Ganga Ram*: Do you grow any cereals?—Cereals are taken as a second crop on the land when paddy and jute are taken out. On my farm, at present it is done in that way, but I am going to change it; I am not going to grow any cereals.

22580. Not even millets?—Not even millets.

22581. How big is your farm?—My experimental farm is about 200 *bighas* and my demonstration farm is something like 600 *bighas*. When I bought the big tractor, I had in mind to go in for big farming, but, as I said, it does not pay to go in for big farming if you grow paddy and jute; I therefore thought that I should take up something else which will pay me more. Then, the question of irrigation has everything to do with the success of these crops. When I went to take this up on a big scale, there was some water on the plot, but I do not know the reason why now the moisture from the soil is disappearing, so to say. Every year it is seen that the moisture goes down and down. The rainfall in that area is 60 inches, but whatever quantity may fall on one day, if it stops for three or four days you will find the moisture gone from the surface of the land.

22582. *The Raja of Parlakimedi*: Is there no scope for having a tank?—The land is so porous that tanks are not very useful.

22583. *Sir Ganga Ram*: Have you ever had a section of the soil taken?—Yes.

22584. What does it consist of?—It is sandy loam.

22585. What is it down below?—Down below it is pure sand.

22586. Up to what depth?—We have just now a tube well, and we found that as far down as we could go it is sand.

22587. Well irrigation does not pay there?—It does not pay, but recently we have had a tube well of 3½ inches diameter, which is working with a power pump; it is doing very well, and we have great hopes of it. We did it purposely shallow to see whether it is possible for us to get water at less expense, and I am glad to say that it has proved very successful.

22588. How far did you go down?—About 60 feet.

22589. Did you put a strainer below?—Yes.

22590. Whose strainer was it?—We made it ourselves.

22591. Did you ask any professional man about it?—My son has learnt something about the sinking of tube wells and he has done the whole thing himself.

22592. *The Raja of Parlakimedi*: How many acres of sugarcane have you got at present?—Twelve acres.

22593. And you are managing with the help of this well to irrigate that crop?—Not all, only a portion of it, because it has been sunk only last year, and it has not yet been properly tried. The supply of water for vegetables and other crops this year has been enough; it gives 3,000 gallons an hour, and I think after a year's use it will be able to give more.

22594. *Sir Ganga Ram*: Do you pump the water with an oil engine?—Yes.

22595. *The Raja of Parlakimedi*: How do you water the rest of your sugarcane crop?—We do not water it; we mulch the land with our tractor, and we preserve the moisture as much as we can, and that helps us.

22596. It has to be irrigated periodically?—We do it without irrigation; irrigation means money which we cannot spend; naturally the return is less; we spend a little and we gain a little.

22597. Is the growth quite all right?—In some cases it is.

22598. *Sir Ganga Ram*: What is the cost of working your tube well?—I shall have to work out the figures.

22599. How much is it per acre?—It gives 3,000 gallons per hour. If I work my pump for eight hours it gives enough water for one *bigha* of potato crop. It costs only 6 annas per hour.

22600. What is the yield of potatoes in this Presidency?—It is 60 to 80 mannds per *bigha*.

R. B. Kumud Nath Mukher.

22601. Do you put any fertilisers on it?—Yes, we put on castor cake and a little manure. The more enlightened class are now using sulphate of ammonia and also Chilean nitrate.

22602. *Professor Gangulee*: You have 200 *bighas* of experimental plots and 600 *bighas* of demonstration farm. What is the difference between the two?—As I have just now told you, I had in my mind the expansion of my agricultural operations. So whatever crop proves successful in my experiment, I shall have it on a bigger scale afterwards.

22603. So you do not carry out experiments of various crops in the proper sense of the word?—At first I used to do that but now I have actually taken up sugarcane as my chief crop.

22604. Do you depend on the profits of these farms or you have other sources of income also?—I have other sources also.

22605. Is any one else in the neighbourhood going in for sugar cultivation?—Not to my knowledge.

22606. You have now got 12 acres of sugarcane. May I know what is the out-turn from these 12 acres?—It must be not less than 20 maunds a *bigha* of *gur*; that is without irrigation.

22607. That is more profitable than jute or paddy?—Certainly.

22608. Do you give this information that sugarcane is more profitable than jute or paddy to the cultivators in the neighbourhood?—Yes.

22609. And what is the effect of the information? Do they take to sugarcane cultivation?—Some persons have taken to it.

22610. What are the handicaps to the extension of sugarcane in your district?—In my district there are large plots where sugarcane cultivation has gone down because the crushing of the sugarcane is a thing which requires animal-power as well as man-power. So, during the months when malaria is raging seriously in the district they cannot take it up in right earnest and the cattle too are very weak. After doing this sugarcane work, they cannot take up the new crop work which is to be taken up at once. There is also the loss of facilities.

22611. *Sir Ganga Ram*: Do you grow cotton?—No. I grow cotton only for my own use.

22612. Is the land not suited for growing cotton?—Not much; we have tried it.

22613. *Professor Gangulee*: Who manages your farm? Do you manage it yourself or is it managed by your son?—It is managed by my brother and by my son.

22614. Do you keep your farm accounts in minute detail?—Yes.

22615. Taking into consideration the labour employed per crop per unit of area?—Yes, everything.

22616. Now, please turn to page 350 on agricultural indebtedness. You are in touch with the agriculturists?—I am.

22617. Do you go to their houses and attend their social functions and so on?—Yes.

22618. You say that various social obligations are one of the causes of borrowings?—Yes.

22619. And you also mention "excessive personal expenditure, primarily on luxuries." Do I understand then that the standard of living is increasing in your district?—Decidedly. But it is increasing at the expense of the money which costs them their blood.

22620. Do you not think that it is a hopeful sign that the standard of living is increasing?—Certainly not, because they do it all by borrowing. They come in contact with gentlefolk and come to know that a wrapper can be had for Rs. 2 and a hurricane lantern for one rupee and they never deny themselves these things. They at once buy them.

22621. Do you mean to suggest that the rise in the standard of living is so artificial that the whole thing depends on borrowing and not on the additional income?—Unfortunately that is so.

22621a. Have you made any definite inquiries as to these facts?—I see it every day.

R. B. Kumud Nath Mullick.

22622. With regard to fragmentation of holdings on page 850 you say that "very little actual benefit will accrue even if a large number of plots are consolidated together." Do I understand that you are against consolidation of holdings?—Yes.

22623. Would you state as briefly as possible your reasons for holding that view?—I have given my reasons in my statement. It says, "Any endeavour in this direction will create a tendency in the country for extinguishing the peasant proprietors and encouraging the conversion of agricultural plots to big farms, thus reducing the peasant proprietors possibly to a state of servitude."

22624. I do not understand what you mean?—The labouring class will have to withdraw themselves from the land and they will have nothing to fall back upon during their bad times. And if this is done, they will be turned into landless labourers.

22625. You are probably confusing the terms subdivision and fragmentation?—You can put it as you like.

22626. I want to know whether you have gone into the question of fragmentation carefully. Do you know the experiments done in the Punjab or in any other part of the country?—I have only given my general opinion.

22627. *The Raja of Pariahmed:* As regards *gur*, may I know what your net cash income will be per acre?—It will be something like Rs 480 per acre.

22628. Is that gross income?—Yes.

22629. *Sir Ganga Ram:* Is that without fertilisers?—We use a little condung manure for top dressing only.

22630. *The Raja of Pariahmed:* What does paddy fetch you per acre?—I have a statement here about the cultivation east of Jole and paddy.

22631. You have not got a comparative statement of sugarcane?—No. I have two crops of paddy, *aus* and *aman*. The *aman* is a very uncertain crop in Bengal as it depends very much on the rains. It generally fails if we do not get any rains when it is ripening. But the *aus* crop, although it is very costly, is a certain crop. We can say definitely that we can get something at least out of it.

22632. You have not got a comparative statement between sugar and paddy?—No, I have not got it here, but I can tell you roughly.

22633. Can you let us have it later on?—I will do that (*vide Appendix*).

22634. *Mr. Calvert:* To come back to Professor Ganguleo's question about fragmentation and your objection to consolidation. I should like to read you the remark made by a certain landlord and should like to ask you how far it reflects your opinion. It reads as follows—

"Every farm swarms with little holders; they are too poor to improve their land, and yet it is impossible to turn them out as they have no other means of subsistence." Was that your point about starvation?—Yes.

22635. That was remarked by Lord Palmerston many years ago with regard to Irish estates. With regard to indebtedness, is any pressure brought to bear for the repayment of the principal so long as the interest is paid?—Yes, when the crop fails for consecutive years.

22636. He does press for repayment?—Yes.

22637. *Mr. Gupta:* You are a practical agriculturist?—Yes.

22638. You have a farm of your own?—Yes.

22639. Is it a financial success? Do you make money out of it?—No, it was not a financial success, but now that I am putting in sugarcane and potatoes the position is changing.

22640. It is beginning to pay now?—Yes.

22641. Do you think agriculture offers a suitable opening for our young men?—Yes, it may. You mean with small capital and small holdings?

22642. Yes?—Unless it is done in an improved way, it does not. It does not as it is done at present.

22643. Do you not think it would be a very good thing if by actual demonstration it could be shown that small farms could be made to pay?—Yes; that is a very important matter.

R. B. Kumud Nath Mukherjee.

22644. Would you be in favour of our having a small commercial farm near Calcutta which young men could go and see?—Nothing could be better.

22645. And would you be in favour of our introducing a little engineering education on that farm?—That is very necessary.

22646. You are in favour of that?—Yes. I could not have been as successful as I have been if I had not given my son a little education in engineering.

22647. *Sir Henry Laurence* Where was he educated?—At Nain College, and he also had some practical education under European engineers. I consider it very important that improved implements should be devised on the spot with the help of agricultural engineers with good qualifications from England. That is a point which I would ask the Commission to bear in mind.

22648. *Sir Thomas Middleton*: You have 800 *bighas* under cultivation?—No, I have only 200 to 300 this year. I bought the land to take up farming on an extensive scale, but I have since, after doing it for a year or two, changed my policy.

22649. What is the actual size of your holding at present?—About 300 *bighas*.

22650. How many pairs of bullocks do you keep for that?—I have now five pairs of bullocks and buffaloes combined, and one tractor.

22651. Can you tell us how many pairs of bullocks you save by using one tractor?—Yes. With 300 *bighas* it would require 25 pairs of bullocks. Unless the land is of that area or larger, the question of employing a tractor never arises.

22652. You refer to the fact that your cattle were very weak after the sugarcane season?—Yes.

22653. What fodder crops do you grow for cattle?—As a general rule fodder crops are not grown. Do you mean I myself?

22654. Yes?—I grew *juar* and Guinea grass. I have many things on which to feed my cattle.

22655. With the help of *juar* and Guinea grass, can you not keep your own cattle in good condition after the sugarcane season?—No. That is the season when these things do not keep well.

22656. You refer to the need for rearing cattle in order to get an abundant supply of manure?—Yes.

22657. Are you attempting to improve cattle yourself? Are you rearing cattle?—Yes.

22658. Do you attempt to improve them?—Yes. I have a Hissar bull, and its services are free to my neighbours.

22659. Is that bull of much larger size than the ordinary run of cattle in Bengal?—Yes.

22660. Do any difficulties arise?—Sometimes the calf is too big.

22661. How many cows do you keep yourself for milk and rearing calves?—I have some dozen milch cows of which some are dry and some in milk.

22662. The common practice is that when fodder is scarce the bullocks get it and the cows get none. Do you feed your cows as carefully as you feed your bullocks?—Yes.

22663. At what age do your calves become fit for work?—When about three years old.

22664. At what age do the young cattle of your neighbours become fit for work, the ordinary cultivators' cattle?—About that time. With regard to the fodder question, the important thing is the education of the public. It is possible to keep the fodder in good condition.

22665. By means of silos?—Yes. Everything depends on good demonstration.

22666. *Sir Ganga Ram*: Do you grow any winter turnips or carrots?—Yes, not for the cattle but for the market, for human consumption.

22667. You sell those?—Yes, and also potatoes; we grow every sort of seed at present, and vegetables especially.

22668. *Sir Thomas Middleton*: You have no difficulty in constructing silos in your soil?—No, but it is not done under the earth, but above ground. We have another principle of storage.

R. B. Kumud Nath Mullick.

22669. And you have not lost much of the fodder?—No; not much.

22670. *The Chairman*: You mean you store it in a tower?—Yes, in a big bamboo shed, with bamboos all round.

22671. *Sir Thomas Middleton*: Do you use much weight for pressing?—Only human pressure; some men are there to trample it.

22672. Do you put earth or stones on the top?—Yes.

(The witness withdrew.)

*The Commission then proceeded to hear Dr. H. Pascoe for whose evidence please see Volume I, Part II.*

*After Dr Pascoe's examination, the Commission adjourned till 10 30 a.m. on Wednesday, the 8th December, 1926*

## APPENDIX

## Comparative statement of the cultivation cost of crops

*Jute for one bigha of land.*

Preparatory tillage in—			
Cold weather	...	...	3 ploughs with ladder
Manning	...	...	16 cartloads of cowdung
March and April	...	...	3 ploughs with ladder
Sowing	...	...	1 plough with ladder
Thinning cost	...	...	1 on the whole.
Weeding	...	...	18 men average.
Reaping and binding	...	...	5 men.
Carrying to water	...	...	3 carts and 2 men
Steeping	...	...	2 men.
Retting	...	...	6 men.
Carrying to house	...	...	1 cart and 1 man.
Drying and poles, etc., for the same	...	...	1 man and 4 annas
Storing	...	...	2 annas
Rent of land (half calculated)	...	...	Rs. 1 per bigha
Cost of seed 1 seer per bigha	...	...	Rs. 1.
<i>N.B.—Yield—6 maunds per bigha.</i>			
Jute stick—8 annas.			
Plough, at 12 annas each.			
Man labour, at 8 annas each.			
One cartload of cowdung—4 annas			
Average Rs. 30 cost.			

} Cost is calculated at these rates.

*1man paddy for one bigha of land.*

Preparatory tillage	...	...	4 ploughs with ladder.
Ploughing in puddle	...	...	1 plough.
Transplanting seedlings	...	...	2 men.
Proportion of cost for seed at nursery	...	...	2 annas.
Cost of 6 seers of seed at Rs. 3 per maund.			
Fertilizer and application of the same—12 cart-			
loads of cowdung 1 annas per cart	...	...	Rs. 3.
Work of shade	...	...	2 men.
Reaping	...	...	3 men.
Binding and carrying	...	...	3 men.
Threshing and winnowing	...	...	3 men.
Storing	...	...	1 man.
Rent	...	...	Rs. 1.50 per bigha.

*Maximum yield.*—Eight maunds per bigha. But it should be remembered that this crop depends much on rain and hence uncertain.

*Straw.*—One and half lakans at Rs. 5 per lakan.

Approximate cost—Rs. 16.

*2ma paddy for one bigha of land.*

Preparatory tillage in—			
Cold weather	...	...	3 ploughs with ladder.
Manning	...	...	12 cartloads of cowdung.
March and April	...	...	4 ploughs.
Sowing	...	...	1 plough.
Thinning cost	...	...	1 man on the whole and 2 bullocks.
Weeding	...	...	18 men.
Harvesting	...	...	3 men.
Carrying	...	...	2 men and 2 carts.
Threshing with bullocks and winnowing and			
preparation of threshing land	...	...	2 men and 4 bullocks.
Storing	...	...	1 man.

R. B. Kumud Nath Mullick.

Rent of land (half calculated against *Aus*  
crop) ... .. Rs. 1 per *bigha*.  
Cost of seed (12 seers) at Rs. 3 per maund ... 14 annas 6 pies  
*N.B.*—Cost of ploughing at 12 annas each.  
Man labour at 8 annas each.  
One cartload of cowdung at 4 annas per cart

*Yield*—Six maunds per *bigha*.

*Straw*.—Rs. 2.

Cost of tractor ploughing—

Ploughing once ... .. Rs. 3 8 0 per *bigha*.

Discing twice ... .. Rs. 3 8 0 per *bigha*.

Approximate cost—Rs. 25.

*Sugarcane per acre.*

	Rs.
Preparatory tillage	20
Cost of setts	45
Cost of manure	21
Cost of labour for planting setts and covering the same	20
Cost for weeding, hoeing and earthing up	12
Cost of irrigation	25
Cost for harvesting cane	7
Cost of dressing and carrying the same to the mill	18
Cost of crushing and gur boiling	36
Rent per acre	6
Miscellaneous expenses such as fencing, tying and watching the crop, etc.	30
Average yield—600 maunds of cane or 60 maunds of gur per acre.	

Wednesday, December 8th, 1926

## CALCUTTA

## PRESENT :

The MARQUESS OF LINTHICHOE, D.L. (Chairman).

Sir HENRY STABLEY LAWRENCE, K.C.S.I., I.C.S.	Mr. H. CALVERT, C.I.E., I.C.S.
Sir THOMAS MIDDLETON, K.B.E., C.B.	Raja Sri KRISHNA CHANDRA GAJAPATI NARAYANA DFO of Parlakumedi.
Raj Bahadur Sir GANGA RAM, Kt., C.I.E., M.V.O.	Professor N. GANGULY.
Sir JAMES MACKENNA, Kt., C.I.E., I.C.S.	Dr. L. K. HYDER. Mr. B. S. KAMAT.

Mr. J. N. GUPTA, I.C.S.	} (Co-opted Members).
Raj A. C. BANERJEE Bahadur	
Mr. J. A. MABAY, I.C.S.	} (Joint Secretaries).
Mr. F. W. H. SMITH	

Sir P. C. RAY, Kt., D.Sc., University College of Science and  
Technology, Calcutta

## Replies to the Questionnaire

**DETERIORATION OF THE CATTLE.**—MILK INSUFFICIENCY.—In England and on the Continent, cattle-breeding and dairy-farming, poultry, etc., form an essential part of agriculture. I shall therefore confine myself only to this aspect. As not only milk insufficiency—but what I may call milk-starvation in the average diet of the Bengalee has led to malnutrition, stunted growth, rickets, etc.

During my tour in Europe, I had ample opportunity of seeing the extensive pasture lands alternating with arable lands in France, England, Ireland and Scotland. Not only in Ireland, called the Emerald Isle, but even in the other lands green verdure always greeted my eyes. I often found stately bulls and cows browsing and chewing the cud leisurely, the long grown grass cut down and exposed to the sun in order to be converted into hay. I was told that in many a plot as many as three crops of hay are yielded during these summer months.

During my six years' residence in Edinburgh (1882-1888) I often used to walk with interest in the extensive fields outside the town various kinds of food crops grown specially for the cattle, e.g., turnip, carrot, mangel-wurzel. Macaulay writing of the state of England in 1685 says:—

"The rotation of crops was very imperfectly understood. It was known indeed that some vegetables lately introduced into our island, particularly the turnips afforded excellent nutriment in winter to sheep and oxen; but it was not yet the practice to feed cattle in this manner. It was therefore by no means easy to keep them alive during the season when the grass is scanty. They were killed and salted in great numbers at the beginning of the cold weather." Again, "the sheep and ox of that time were diminutive when compared with the sheep and oxen which are now driven into our markets."

In my days of childhood, now close upon 60 years ago, almost every household in Bengal had its *goekala* (cow-shed) where milch cows were tended and taken care of. Straw was piled up for at least six to eight months' consumption. There was in every village a number of commons. According to the Hindu notion, the cow is an embodiment of the Goddess Bhagwati and every householder considered it a point of religion to feed the cow and look after her. The diet and regimen of the cow consisted of well chopped straw, soaked in water with an admixture of bran and oil-cake. Tender shoots of various plants, chopped plantain or banana plants, gruel of the cooked rice also were given at intervals.

Now, alas, all this is changed. Very few householders even in the villages can boast of milch cows. The pressure on the land during the last half a century has been enormous and this is due to a variety of causes some of which may be enumerated here. Every village was in a manner a self-contained republic. It

Sir P. C. Ray.

had its community of weavers, blacksmiths, and carpenters specially for the construction of country boats for inland navigation. Manchester piecegoods have deprived the weavers, *jolas* and *tantis*, of their means of livelihood. Imported cutlery has also played havoc with the village smith. Sixty years ago again every navigable river in the lower Bengal was studded with country boats of 500 to 1,500 maunds "tonnage," and these used to give employment to thousands of crews. Nowadays they however are now plod with the steamships of the B. I. S. N. Co. Of course a few *lisears* are employed in these but they do not come up to even 5 per cent. of the boatmen who used to find occupation in the days gone by. The result has been simply disastrous. All the artisans and the boatmen have had their morsels of bread thus snatched away from their mouths and they have been driven to land as the only source of their sustenance. It might be urged that there are some 82 jute mills on the banks of the Hooghly, but they give employment to, at best, 4 or 5 lakhs of people of which again barely 5 per cent are Bengalis.

Owing to the extension of jute cultivation again, there has been encroachment on the village commons or pastures. There were also in many districts in Bengal extensive grants of land, by Raja Krishnachandra of Nadia, and Rani Bhowani of Nator, of pious memory, to *gourals*. Unscrupulous zamindars or land-grabbers have taken possession of them after harassing litigation. Not far from Poradah is a railway station called *Gowal Bathan* or pasturage for cowherds. Such names only remind us of the state of things which once existed.

During the last five years in connection with the relief operations of the Khulna famine and the North Bengal flood, I have had to make extensive tours into the villages of these regions and study their economic condition. The cattle in some parts of Rajshahi, in the recent flood area, are diminutive in size, shrivelled in limbs, and reduced to skeletons. Mr. C. F. Andrews who visited the area wrote to the papers saying that to use such bullocks for ploughing purposes is cruelty to animals. The milch cows, lean and shrunken, barely yield on an average 23 lbs. of milk. On the contrary, London with a population of 7 millions, is provided with rich milk in abundant profusion before 7 o'clock in the morning. There are also throughout London, scattered at intervals, any number of dairies, containing rich supply of milk, cream, butter, eggs, etc. Throughout Bengal with the exception of one or two districts milk is procurable at only 6 annas per seer and that only in limited quantity. Those who are fairly well off have to depend upon condensed Swiss milk, Horlick's and so on, but very few can afford such luxury. For infants during their period of growth milk is the most ideal food—in fact it contains all the constituents necessary for the growth of the bones and muscles; in a word, it is a perfect food. It is not too much to say that 95 per cent. of our infants suffer from malnutrition on this account. The mothers also for want of milk-dot and proper nutrition can afford to give very little milk to their suckling babes.

Throughout Bengal specially in North and West Bengal a couple of months after cessation of rains the grass begins to dry up and as there is no arrangement for irrigation the fodder scarcity is keenly felt. It might be urged that as in the jute growing districts the agriculturists get cash money in their hands, they ought to be in a position to lay by or store up fodder for the cattle. Unfortunately this is by no means the case. When they have money in their hands they are eager to purchase all manner of showy and shoddy imported articles, and they are found to be improvident in this respect.

If a reference is made to the imports from the Port of Calcutta it will be found that extensive quantities of oil-cakes are shipped off to Japan and other countries. Moreover owing to the scarcity of fuel dried cowdung cakes are used instead. This represents so much valuable manurial loss.

**Agricultural education.**—My considered opinion is that unless we have compulsory primary education introduced there is no use having research institutes of the types we have in Pusa and elsewhere. The researches carried on in these institutions on the comparative values of phosphatic, nitrogenous and potash fertilisers and the improved strains of rice, wheat, sugarcane, etc., by means of imported varieties or of cross fertilisation are good in their own way, but, I am afraid very little benefit is derived by the illiterate peasantry, who are conservative to the back bone.

**Agricultural industries.**—I referred above to my experiences in Khulna and in North Bengal. In both these regions there is practically one principal crop and main-stay of the people, I mean the paddy. This gives occupation to the people

Sir P. C. Ray.

for barely three or four months. The remaining eight months or so they sit absolutely idle. If they would utilise a fraction of their time in some subsidiary occupations not only would their condition be improved but during failure of crops due to drought or flood, they would have a second string to their bow. These people as a rule are hopelessly in debt both to the landholder as also to the *mahajan*. On mature consideration I have come to the conclusion that the *charaka* (spinning wheel) is the only machinery which can be brought home to the door of every peasant in the hamlet. In short, the spinning wheel and its accessory the handloom can *par excellence* be called the home industry of Bengal or for the matter of that of the whole of India. During the last five years I have travelled throughout the length and breadth of India and of Bengal more than fifty thousand miles preaching the gospel of *charaka*.

Sir P. C. Ray.

## Oral Evidence

22673 *The Chairman*: Sir P. C. Ray, you are a Professor in the University College of Science and Technology, Calcutta?—Yes.

22674 You have provided us with a note of the evidence which you desire to give the Commission. Do you desire to say anything at this stage apart from what you have written in your note?—As it was drawn up in a very great hurry yesterday immediately after my return journey from Madras, I forgot to add, with reference to the deterioration of cattle, that in the days of my childhood there was a Hindu custom of setting at liberty a number of bulls.

22675 You refer to the custom of dedicating Brahmin bulls?—Yes. Within recent years these bulls are not allowed to roam at large; they are caught hold of because they eat up all the grains in the fields, and they are sent to the cattle pound and sold by auction. So, that system has practically ceased to exist, with the result that we have no breeding bulls except the few kept by the District Boards which are not available to most of the people.

22676 We have had evidence before the Commission to suggest that the quality of the animals dedicated was not so good as it was in old days. Do you agree with that?—Yes.

22677 Your note touches two points, the importance of cattle in relation to agriculture and to the welfare of the population?—Yes, in relation to milk supply.

22678 And your belief in the extent to which the home industries of this country might be revived to the great advantage of the rural population?—Yes.

22679 On the first point, in the improvement of cattle, one of the principal difficulties in this Presidency is the provision of fodder and food supply for these animals?—Yes.

22680 How used that to be provided in those old days to which you have made reference?—There was not so much pressure on the land then. During the last half century, of which I can speak from my personal knowledge, owing to the extensive cultivation of jute and also owing to the fact that many people who used to derive their livelihood from a variety of other occupations which I have enumerated, village weavers, boatmen, smiths, have had morsels of their bread snatched away from them, there is undue pressure on the land. That means no more commons and pasture lands are available in the villages. In my childhood days, more than half a century ago, every village had from time immemorial, commons or pasture lands set apart. All those have now been fenced round, and it has become very difficult for people to maintain cows or cattle.

22681 Was there any method of preserving fodder in the old days?—The only thing was that dried straw used to be piled up. It is done to a certain extent now, but not to the same extent. It is strange that milk is more plentiful and comparatively cheaper and richer in London, Edinburgh and other cities of England, not to speak of France, than in Bengal; and condensed milk, Swiss milk, Nestle's milk, go to maintain our babies chiefly, even in remote villages.

22682 *Mr. Kamat*: Even in villages?—Even in villages. The price of milk in villages is  $2\frac{1}{2}$  seers per rupee.

22683 Condensed milk in villages?—Yes. You will find it in the groceries.

22684 *The Chairman*: Would you agree that the diet of the cultivator in Bengal is peculiarly deficient in just those qualities which milk would supply?—Yes, especially for the infants and babies, because as a chemist I can say that milk is the only food which contains all the bone and muscle building elements.

22685 And in the days that you first remember, was more milk consumed by the cultivator?—Yes. Milk was priced at 32 seers per rupee in the district of Khulna, my place.

22686 How long ago?—Fifty-five years ago.

22687 What is the price in that district now?—Even in the best season, when for some two or three months milk ought to be cheap, the price is 8 seers per rupee, but during the rest of the year, only 2 to  $2\frac{1}{2}$  seers per rupee, i.e., 8 annas or 6 annas per seer.

22688 When you first remember the countryside with which you are familiar, was jute grown there?—Very little jute was grown.

Sir P. C. Ray.

22689. What food crops were grown?—Chiefly paddy in the *kharij* and mustard and some pulses in the *rabi* season. Paddy was the chief crop there.

22690. What do you say about the standard of living of to day as compared with the standard of living which you first remember?—Of course, owing to the increased prices of jute and of paddy there has been certainly a larger circulation of money, but I find the largest proportion of that money is sent away for the purchase of foreign imported goods, for which our ignorant rustics have a kind of fancy, showy, shoddy imported goods.

22691. Would you agree that the substitution of a money crop for a food crop is an advantage, provided the extra wealth is well spent?—Yes; I have alluded to it. If they were intelligent, they could lay it by in the savings bank or they could utilise it in purchasing fodder, oil-cake, brinn and other such things, but they do not do it. They are so improvident that if they find any money in their hands they are in a hurry to get rid of it in the minimum of time.

22692. Most of us know the feeling ourselves very well?—Last year, when I was in Dacca and Narayanganj, jute rose to such fabulous prices that it was selling at Rs. 25 or Rs. 30 per maund, and there has been such a rush for the cultivation of jute this year that the price of jute has fallen down below the price at which it can be economically cultivated. I know in many fields jute has been allowed to rot; the peasant says that it does not pay to employ labour to cut it down and sleep it.

22693. Professor Ganguly: That is bad speculation?—You cannot help it; every one wants to be rich beyond the dreams of avarice, and every available plot of land was cultivated with jute.

22694. The Chairman: In your recollection has the problem of rural debt altered?—Not at all. I think the peasantry are still hopelessly in debt. All that they do in good years is to pay off interest to the moneylender and to clear off interest and part of the rent due to the zamindar or landholder, and they carry on the burden of debt not only from year to year, but I should say from generation to generation.

22695. When you first remember the district, there was very little jute grown?—Yes.

22696. Was there much debt in those days?—There was debt no doubt, but not to the extent to which there is to day.

22697. What was the effect in the earlier years of jute being grown as a crop? Was the original debt paid off to some extent?—I do not think so. As I have said, there have been other causes at work driving the people to the land. There were subsidiary industries which went to maintain a large percentage of the population. I read only recently that 70 or 75 years ago in the district of Rajshahi 50 per cent. of the people used to be employed as boatmen in river navigation. That is the report of the Collector of that district, but all those people, thanks to the rapid means of communication by steamships, have been driven to the land.

22698. Dr. Hyder: Was that an occupation from the beginning of the year to the end of the year?—Throughout the year, because all the rivers in my days of childhood used to be navigated with country boats; they were laden with export and import articles. Then, again, Manchester cloth and Japanese textiles had not entered so largely into the economic life of Bengal, and the cloth industry used to give occupation to a large number of weavers and spinners.

22699. Were they engaged in the transport of goods from upcountry in the absence of railways?—Yes; especially in Lower Bengal, which is intersected with rivers, there was a large number of men employed in navigation by means of country boats with a tonnage of 1,000 to 1,500 maunds.

22700. The Chairman: What about the health of the population compared with old days?—The health has deteriorated comparatively.

22701. Are you quite sure of that?—Yes, especially, the ravages of malaria were almost unknown 50 or 60 years ago. I am myself very fond of spending at least a month in my own native village. I once made bold to stay there when the rains commenced, but I had to pay a heavy penalty, because I caught malaria, and it took me fully a year to shake it off. Now, excepting in the months of April, May and June, it is not safe to reside in any of the villages in Bengal.

22702. That may be due to less efficient drainage of the land?—Yes. My friend Rai Bahadur Bannerji hails from a place called Snri; ten or fifteen years ago, it was

Sir P. C. Ray.

L r 18—24

regarded as a sanatorium of Bengal, but now it is very malarious. It is difficult to say to what it is due; some say it is due to railway embankments, but I know many villages where there are no railway embankments, and the ravages of malaria there are as great as in any other place.

22703. That may be due to the congregation at the sanatorium of as many infected people as it could hold, and the consequent spread of malaria into the district now, and it may also be due to poorer nourishment?—That is what Dr. Bentley says; he says it is due to malnutrition, that the resisting power of the people has disappeared.

22704. Have you yourself formed any view on that problem?—I have read and studied a good deal about it; I think it is one of the causes.

22705. Can you suggest any other causes?—The absenteeism of the intelligentsia and of the zamindars and landlords. They are all now absentee landlords, and they care very little about the sanitary conditions of the villages in which they once resided. The result is that the tanks and the roads have been allowed to get into a very miserable condition; there are water pools everywhere, there is no sufficient arrangement for drainage, and these are prolific breeding grounds for mosquitoes and so forth. I say that the absenteeism of the landlords is a curse. In fact, on the occasion of the opening of an exhibition, I said in the presence of the Magistrate of Khulna and some of the biggest landlords of the district that there ought to be a Bill introduced into the Legislative Council, compelling every landlord to spend at least four or five months of the year in his own zamindari; otherwise, he should be disqualified.

22706. In your recollection, is this problem of absentee landlords more acute than it used to be?—I should say it is ten times more acute. Any landlord who has got sufficient means now makes a point of deserting his own village and living in Calcutta in luxurious style; he gets into debt, and leaves the tenantry entirely at the mercy of the *sowcars* and his agents.

22707. *The Raja of Partakumed*: Is not malaria also responsible to some extent?—Yes; I have said that before. But the absenteeism of the landlords is also responsible. It is a terrible sight to see palatial residences of landlords crumbling to pieces; they do not care to live there but must have a separate establishment with all the paraphernalia of their position; they spend all their money in cities and all the money is drained out of the land.

22708. *The Chairman*: That movement, I take it, in your view, deprives the countryside of those who should be its natural leaders?—Yes, quite so; a resident landlord is always a blessing, even if he be extortionate, because the money flows back into the pockets of the people, and he would take care to have a good supply of drinking water at any rate.

22709. Next time any of my tenants complain, I shall remember that dictum?—I have some knowledge of Scotland, I have lived there more than six years, and I know something about the Sutherland clearances, when Professor Blackie was the champion of the people.

22710. Now, a word or two on this question of spare-time occupations. You are concerned, I understand from your note, to advocate in the main an attempt to spread by means of propaganda, the practice of making those things in the home which are required in the home?—Yes.

22711. You are not so much concerned to attempt home industries producing goods for markets outside the district?—In my part of the district, during successive failures of crops the people were supported, and even now they are supported, by making mats out of a kind of reed growing in the water logged areas. These reeds are woven into mats, and there is an extensive export trade in these mats. If you go to Assasuni in the district of Khulna, you will find that the inland steamers there are maintained mainly by the carriage of mats, and the people during the bad years manage to live pretty well. I should have recourse to local conditions; I would not have only the *charka*; I would have as many local subsidiary industries as possible.

22712. Is mat-making, which you mention, one of those industries where the home craftsman can compete with more highly organised labour?—Yes; these mats have an extensive sale throughout Upper Bengal and even in Upper India; in the Midnapore district also another kind of mat called *shital pati* is made.

22713. Do you think that there would be any future before the mat-weaving industry in attempting to dispose of its goods in the open market?—No; these

Sir P. O. Ray.

are dependent upon local conditions; these mats can only be manufactured in those areas where you have that kind of weed growing; it does not grow everywhere. In peculiarly favoured areas you can have some such local industry.

22714. Remembering that the cultivator is handicapped for many months in the year, it would be of course a great saving on his budget if he could make the cloth which he requires for his own use?—Yes, and use the spinning wheel of which I am a great propagandist.

22715. A great deal of effort and, I suppose, of money has been put into this propaganda?—Yes.

22716. What has been the result?—The result has not been as satisfactory as it ought to be. The reason is that the modern accessories of so-called civilisation have compelled the people to be lazy. I shall explain it in a word. You have motor buses constantly plying in the streets of Calcutta and also from Calcutta to the mofussil. Formerly, I noticed that the peasantry class used to walk on foot ten to twelve miles very rapidly. Now that the motor buses are plying, they get into them and pay, say, 2 annas. In that way idleness is being encouraged; we are putting a premium upon idleness. I read the other day that Carlyle used to walk a hundred miles on foot to Edinburgh, and it was the custom then that scholars were supported on the way. We have now got any number of motor buses and railway communication, and that has made the people lazy. It does not matter with Scotland, where the people are wide awake and where there is an immense accession of wealth. I know my friend Prof. Ganguly has personal experience of that part of Bengal which was the scene of the late floods. I find that formerly for the distance of 5 or 6 miles between one station and another, the peasants used to walk on foot. These rustics have no idea of time. Now they sit at the railway station for a couple of hours waiting for the train to come, they pay an anna or two and then go to the next station. In a country where for nine months in the year the people are absolutely idle, what does it matter if they do not save time in that way? It may be an important matter to an American, or to an Englishman, or to a business man in Europe to save time in that way, but here the question, as I have often said, is not how to utilize time but how to kill time, and with such people these accessories of modern civilisation have proved to be a curse; it has encouraged idleness and indolence.

22717. Would you suggest doing away with these buses?—I would not, but I am giving an example of how these incorrigible habits of idleness are being encouraged; we put a premium upon idleness.

22718. In your experience, is drink a growing evil in the mofussil?—Not in the mofussil; it is a growing evil in those centres where you have modern industries, centres where you have jute mills, where you have cotton mills and in the tea gardens; it is not a growing evil so much in the villages as yet; the population as a rule is yet sober, but I know in Khulna amongst certain classes drink is spreading very rapidly and working havoc with them.

22719. You do not find that drink is an acute problem amongst the truly rural population?—Not yet; but in certain parts where the peasants are very prosperous drink is penetrating quite rapidly; it is not a case of peaceful penetration, but it is a case of rapid entry.

22720. How about the use of tobacco; do you think the habit of smoking cigarettes is spreading?—Yes, and that is one of my subjects of discussion wherever I go. In Rangpur, Cooch Bihar and Bezwada, you have the centres of tobacco cultivation, and it so happens that even in places which are the very fountain-heads of tobacco cultivation, you have the "Hawa Gari", the "Three Castles", the "Elephant" and a number of other brands of cigarettes commanding a rapid and extensive sale. There I tell them that it is a case of carrying coals to Newcastle. People will not buy the locally produced coal, but they will import coal at ten times the price and allow their own coal to lie and rot. Formerly, they used to smoke what is called the *hooka*, and for a satthing it would last half an hour. Now they have beautiful cigarettes and along with them the sale of matches has also gone up by leaps and bounds.

22721. Sir Ganga Ram: Why do you not teach them to make cheap cigarettes?—They are making bricks.

22722. They are no good; I have smoked them. Why do you not ask them to make good cigarettes?—It is for men like you who are the educated people to start industries and not to sit idle. My indictment against my educated countrymen, especially men returned from England, is that they have adopted all the

Sir P. C. Ray.

L. r 13—24a

vinces of the West minus the good qualities. They sit idle and smoke cigars and cigarettes and drive in motor cars and do not create anything; they are the worst enemies of *swadeshi* articles.

22723. *Mr. Kamal* : Are women taking to cigarettes?—In certain "civilised and fashionable" centres they do smoke. But this is not the case with all the women.

22724. *The Chairman* : Do you notice amongst the rural population any growing demand for the services of the Agricultural Department?—Not much. I have noticed in Faridpur and in some other districts that there is a very great run on the improved varieties of jute seeds. That is certainly to the credit of the Department because they know that weight for weight the standardised seeds supplied by the Agricultural Department yield a far better crop.

22725. That is widely recognised?—Yes; and I believe some strains of paddy also are recognised. In some cases, I believe, sugarcane has also improved.

22726. *Sir James Macpherson* : Just a question about Scotland. Do you not think that Thomas Carlyle would have taken a motor car from Leith to Edinburgh if one had been available?—I have read in Froude's biography of Carlyle that people have lost that old habit of self-reliance.

22727. You think Thomas Carlyle would have?—Even when I was at Edinburgh I could have my breakfast for one penny. I returned from Edinburgh only a few months ago, I was again there with my old friend Sir James Walker who is now Professor of Chemistry, and Lady Walker told me that oatmeal porridge had migrated more to England and Scotch people were fond of ham, mutton chop and things of that kind. On board the steamer also I found that oatmeal porridge was very much in vogue.

22728. I think I had better leave my native country alone. Just a question about chemistry. You are a very experienced research worker and teacher of chemistry. The Commission would like to have your frank opinion about the capacity of Indian students for research in chemistry and physics?—I think the Indians have been able to give as good an account of themselves as any one else. We have our Journal of the Indian Chemical Society. Three years ago there were so many papers communicated to the London Chemical Society that they could barely make room for them. Even in London they have only one journal for the whole English-speaking world. They had to appeal to the authors of papers to cut down the size of their papers as much as they could. Now, we are running a journal of our own and I find we are getting as many original papers as one could fairly wish to have.

22729. Is the standard of research good?—It is a very delicate question for me to answer. In fact, we have got unsolicited testimonials and they all say that our output both in quality and in quantity would compare favourably with any such papers published in Europe or America. I think our chemists can hold their own. My pupils are now holding almost all the chairs throughout India.

22730. What are your views about the milk supply?—I only wanted to say that if the cows are well fed you could get more milk from them. I was in England about six years ago and I heard that a single cow gave as much as 82 pounds of milk, equivalent to one mound. Of course, that was a record case. She was milked four or five times during the day; that shows the immense capability of the cow as a source of milk.

22731. Was that a Scotch cow or an English cow?—It was an English cow. The average yield in England, I suppose, is half a mound. I visited purposely a dairy farm this time in England and I found that great care is taken of them especially by the Health Department.

22732. *Professor Ganguly* : They take great care of the cow, although they do not worship her?—Yes.

22733. I should like to ask you a few questions about your experience with central co-operative anti-malarial societies. Are you familiar with these societies?—I am one of the Honorary Vice-Presidents of the society of which Dr. Gopal Chandra Chatterjee is the head. I have not had much experience of it. I had been once or twice to his place, Shubchar.

22734. You have had no occasion to study the details of this movement?—I am afraid not.

22735. Could you tell us whether these anti-malarial societies are assisted by Local Self Government bodies?—They are assisted by Local Self Government.

**Sir P. C. Ray.**

bodies. If they are properly worked, they are capable of doing immense work for the country. It all depends upon the working and upon the local co-operation which you can secure.

22736. That is precisely the point I wanted to get from you. Do you think that these anti-malarial societies have interested the Local Self Government bodies sufficiently to take up the work themselves?—Only in certain cases.

22737. I think your Bengal Chemical Works took some interest in deep tube wells?—Yes, they did.

22738. Are you familiar with the rural conditions with regard to the position of the drinking water-supply?—All I can say is that we are having extensive orders and the department is flooded with them. In fact, in the Bengal Chemical Works we have had to open a separate department for tube wells and in many districts we are full of work. That goes to show that these tube wells are very popular. They must have been a blessing to the persons, otherwise our department would not have been so popular.

22739. So you find that there is a great deal of demand for tube wells?—Yes.

22740. How long did it take you to create this demand? When did you start these tube well sinking operations?—We started these operations on our own account; that was about five or six years ago.

22741. Within these five or six years there has been a great deal of demand for these tube wells from different parts of the Province?—Yes.

22742. And you are able to supply the demand?—Barely.

22743. You have manufactured these tube wells yourself?—The pipes are not made by us. But all the other things, such as borings and fittings are of course made by us.

22744. You must have a number of engineers to inspect the works?—Yes.

22745. What is the cost per tube well?—It all depends upon the description of the tube wells. We have supplied five or six tube wells to the Calcutta Municipality in the suburbs of Calcutta and the average depth of the boring was 220 feet. Their cost was between five and six thousand rupees. It all depends upon the depth of the boring.

22746. *Sir Ganga Ram*: And also on the size of the tube?—Yes on the diameter of the tube.

22747. Were they all for drinking purposes or also for irrigation purposes?—They were all for drinking purposes.

22748. *Professor Gangulee*: Could you give us an idea of the cost of a tube well dug in the rural areas?—Unless you have deep boring the quality of water cannot be depended upon. In many places boring up to 220 feet is quite enough, but I know in one case in Norkhah the boring went five to six hundred feet deeper and yet we had salt water. The geological formation of lower Bengal is so very peculiar that no two districts would agree in that respect.

22749. Do I then understand from you that there is scope for sinking such wells?—There is ample scope, especially for irrigation purposes. If grass and fodder can be kept alive by means of irrigation with the help of these tube wells, they will have a grand future. In fact, I had an opportunity about a year and a half ago of paying a surprise visit to the village of Mr. A. C. Bannerji and I was struck by what an intelligent and patriotic person who has some sort of love for his own native village can do to improve it. He has made improved arrangements for water storage and I found his agricultural produce and the pasture in a thriving condition, whereas the surrounding places gave me the impression of something like a desert.

22750. Do these demands come from the local bodies or the District Boards or Village Unions?—So far they have been coming from the District Boards.

22751. Have you received any demands from individual farmers?—Some private individuals have also sent orders for them.

22752. With regard to your Chemical Works, do you manufacture any artificial manure?—Our biggest expansion at Famlitti was due to a very large improved plant for sulphuric acid. Six years ago I purposely paid a visit to the works near Edinburgh where they are making immense quantities of manure from superphosphate of lime as it is called, and we have also started manufacturing manure from superphosphate.

**Sir P. C. Ray.**

22753. But you cannot get fossil phosphate in this country?—That is the chief stumbling block. We cannot get coprolite as it is called. At present we have not been able to work it because there is little demand for that kind of manure.

22754. Do you consider one can make superphosphate out of bones?—Yes; but it will not pay.

22755. Are you familiar with some of the chemical works in the Bombay Presidency which are carrying on superphosphate works?—Yes, but they are not doing well.

22756. Why? Is there no demand?—It was overcapitalised. It was started during the days of the boom immediately after the War and they went on spending money right and left.

22757. I want to know whether one could manufacture superphosphate in this country with bones?—I think you will get the best possible information if you refer to Messrs Parry & Co., Madras. They will be able to give you better information. On the Bengal side there is absolutely no demand for phosphatic manures.

22758. On page 365 you want to see each village a self-contained republic and an autonomous unit?—Yes, I have also used that very expression.

22759. Do you think the tendencies are favourable?—No.

22760. How would you proceed to achieve this dream?—It is very difficult to say. It is a dream of old. Everything is now upside down.

22761. So we have to adjust ourselves?—We must.

22762. And we need not waste our time on dreams?—I am a *charla* upholder and I am supposed to be as good an up-to-date industrialist as you could wish to find.

22763. With regard to Manchester goods being responsible for throwing a large number of weavers out of employment would you not include the Indian mills as being equally guilty?—Indian mills barely touch the fringe of the whole question, because you know the products of the Bombay looms used to have a market in China and the Persian Gulf littoral. Of course, they have now to depend more on the Indian market, but hitherto they could only spin up to below 30 counts for which there was not much demand in India, especially in Bengal because we go in for finer stuffs.

22764. Would you call the spinning and weaving industry a subsidiary industry to agriculture?—Yes, certainly.

22765. Are weavers also cultivators?—Some of them are.

22766. Has that been the case in the past? Was not there a caste of weavers by themselves who did not cultivate?—Yes, the *Jola* and *Tanti*, you know.

22767. They are cultivators?—No; they were not cultivators in the past but now practically they are, as their bread has been snatched away from their mouths.

22768. So they are now cultivators?—Yes, mainly.

22769. I want to get from you whether you would call spinning and weaving a subsidiary industry to agriculture?—Yes, certainly. It will not maintain you by itself, as I said. Nine months in the year and in some places six months in the year they sit absolutely idle. But in these days of keen competition, when India has been thrown into the vortex of world competition, is it possible for any people to live idly for six or nine months in the year and complain of their lot?

22770. No; the point is this. In your propaganda work you have been trying to introduce the spinning wheel. But who are the people who have taken to it? Have the cultivators taken to it or the weavers?—No, the cultivators. It is especially successful in the Chittagong district even where the tradition survived to a large extent and there also the cultivators say "Why should we not utilise the off-time if we can earn extra two pice?"

22771. So your experience is this, that this propaganda of yours has resulted in introducing the *charla* as a spare-time occupation?—As a spare time occupation, yes, as a subsidiary one.

22772. In answer to the Chairman you said that your success in the propaganda was not what you would like to see?—Yes; it will take time.

22773. Would you be prepared to tell the Commission some of the inherent weaknesses of that propaganda?—The inveterate conservatism of the people. We  
Sir P. C. Ray.

have lost the tradition for nearly a century. Very few people had even seen a *charka*, whereas a century ago, take the case of Bengal; after supplying the whole wants of Bengal, Dacca, Santipur and other places used to export to the extent of 2 crores worth of muslins; and 2 crores in those days, it is in Mr. R. C. Dutt's *Economic History of India* and I think Mr. Gupta will be able to tell you better, would be equal to 10 crores at the present day, because at that time the price of paddy was Re. 1 per maund. If that was possible a century ago, why should it not be possible now to revive it?

22774. Regarding your propaganda, would you say that your *charka* or the spinning wheel might have a better chance of success if this movement were not associated with politics?—That is gone; that was only during the first year of non-co operation. Now it is entirely divorced from politics.

22775. Is it so?—It is practically, it is absolutely carried on on economical grounds.

22776. That is precisely what I wanted to get from you?—Yes; that used to be. The *charka* was something like a red rag to a bull.

22777. Can you tell us something about the economics of the *charka*? Can you tell the Commission how much one might earn per day from hand spinning?—That depends upon various factors. If you refer to the Tamil Nadu, Mr. Rajagopala Chariar has sent an unofficial memorandum which I saw in the *Hindu*. I suppose a copy of it must have been forwarded to you. It will give you an account of the Tamil Nadu.

22778. His experience is confined to the Madras Presidency. As you are connected with the Bengal Presidency, I should like to get from you how much a cultivator or a weaver might earn by hand-spinning per day?—It is not the weaver who takes to it; it is the women folk who spin really, you see. Even the word "spinster" is derived from spinning. The men seldom have taken to spinning; they help indirectly. They fetch the cotton, card it and so on.

22779. Would you tell us how much he could earn per day?—I have seen in a famine year a man earning at least 2 annas a day. He generally can earn one anna a day.

22780. One anna a day?—Yes.

22781. How much could one earn by hand-weaving if the yarn is brought from the mills?—I have seen them earning as much as a rupee or Rs. 1.40 if they use mill yarn.

22782. Would you then recommend hand-weaving in preference to hand spinning or would you connect the two?—The two must go side by side.

22783. Must they?—Yes; one cannot exist without the other.

22784. Why can you not weave with mill yarn?—If you spin yarn, the yarn must be utilised in weaving, so the two industries are inter-dependent.

22785. Hand-spinning and hand-weaving?—Yes.

22786. Are not mill-spinning and hand-weaving possible?—There are now a great many, your Agricultural Department will give you statistics, there are a few lakhs in India who earn their livelihood by using mill yarn; there is no doubt about that.

22787. That is precisely my point, because economically it is a more prying proposition. Now, is it true to say that spinning was at one time, as you have mentioned here, the universal subsidiary industry of India?—It is true; otherwise how could the demand of the whole of India have been met and how could India have exported so much? I read that Phury, the Roman Historian, complained that the Roman Patricians were so fond of the Dacca muslins that the wealth of Rome was drained away to India.

22788. That does not explain my point.

22789. Dr. Hyder: That was not due to the love of the Romans for the muslins alone?—There may be others.

22790. That is one of the items?—Yes.

22791. Professor Gangulee: That does not prove the universality of the *charka* as a subsidiary industry throughout the country, does it?—Otherwise how could the entire population have been clothed?

22792. The population was far less than it is now?—I only wanted to draw the attention of the Commission to one fact. How is it that a tiny little country like

Sir C. P. Ray.

Denmark after supplying her own needs as far as the dairy produce is concerned, supplies even England? Danish butter I find in many parts in England.

22793. Better organisation?—I have not much experience about that. I only wanted to say that.

22794. Mr. Kamat : You said a woman working the *charka* about, say, eight hours a day can make about one anna to two annas?—Yes.

22795. I want to know whether in competition with this there are not other spare time occupations to which women might take in the villages?—I do not find any. As I said, the *charka* is the only thing ready at hand. It costs barely Rs. 280; it will last for two or three generations and you can take it up any time you like and give it up any time you like. It does not require much capital; it does not require any organisation. Supposing you introduce a Singer sewing machine, that would mean so much cloth to be kept in stock; then again, there would have to be an agency for the sale of the production and so on. But if you have a *charka* it is so very simple.

22796. I know the value of the *charka*. In fact, I am looking at it purely from the agricultural point of view and the spare-time occupation point of view?—I have just returned from Mysore and Bangalore. There the Maharaja, through the Department of Agriculture, through the Minister of Industries, has encouraged the use of the *charka* amongst the village folk and I was taken to some of these villages.

22797. The point I was coming to is this; with every desire to see the possibility of the *charka*, recently in the Bombay Agricultural Exhibition, we went into the question of the economics of it and invited the All-India Spinners' Association at Ahmedabad, which Mr. Gandhi has started, to give us a demonstration of it. But the whole point is this. If it can only earn one pice per hour, can it stand competition with other spare time occupations, knowing human nature as we do?—But there are none others that I know of.

22798. Not, say mat-making?—As I said, it is only suitable to those areas where that kind of reed grows.

22799. Rope making?—No, because it will not give occupation to the entire people. Next to food, clothing is the greatest necessity of life. If every one were to take to mat-making, there would be such a surfeit of mats that you would have to burn them.

22800. You have been unable to show us why the *charka* has not been taken up during the last four years in greater proportion, if really as you say, it is a good spare-time occupation?—As I said, we have to go against the inveterate habits of the people.

22801. Is it the habits or is it the economically low value?—Nothing of the kind. What is the average income of an agriculturist? That you know better. Following Naoroji's or Romesh Chandra Dutt's statistics, it may not be one anna a day. Suppose it is two annas a day. If the average income is over two annas a day, then if they could earn two pice that would mean 25 per cent. increase on their income. So it should not be judged from your and my point of view.

22802. We shall leave that subject. I want to ask you about chemical matters. In Calcutta, to start a small chemical industry there is no dearth or want of capital, I suppose?—Well, we Bengalis have been always lacking in business instincts. I have been crying myself hoarse ever that for the last 30 years and my public writings and speeches would amount to a big volume, I am afraid.

22803. That is exactly the whole thing. With your great knowledge of chemistry, I want to know why, in this Province, chemistry has not been applied to commercial purposes, to produce articles which, you said, people are importing and spending money on?—Because of the backwardness of the Bengali in matters of trade, commerce and industry. We have the hereditary love of books only. We can produce research scholars who can hold their own; but when it comes to application of chemical knowledge to industries, the Bengalis are absolutely nowhere.

Thank you for your frankness.

22804. Rao Bahadur Bannerji : Is there not a variety of *charka* called *shoral charka* invented by Priyanath Datta which they say will give as much yarn a day by spinning as will give you a daily profit of at least Re. 1?—Nothing of the kind; it is all moonshine. The *charka* we are using has been introduced by the Manager and the Factory Superintendent of the Bengal Chemical Works, both of whom are thoroughly up to date and conversant with mechanical matters, and I think it

Sir P. C. Ray.

has been accepted throughout India as giving the best outturn; it is also very easy to work.

22805. How much can a man earn with that per day?—It all depends on the number of hours he can devote to it.

22806. In your notes on agricultural education you have been pleased to say, "My considered opinion is that unless we have compulsory education introduced there is no use having research institutes" etc. That compulsory education will be free?—Free.

22807. It will require a very large amount of funds?—Yes.

22808. So that unless the Government of Bengal can come forward with the necessary funds or unless the people agree to pay an educational cess, there is no hope for it?—No.

22809. Will the people of Bengal agree to pay a small educational cess?—Well, you know the people of Bengal better than I do. Even if the Government is not willing, I think it lies with us to find the ways and means. I remember when the late Mr. Gokhale, who was the great apostle of compulsory primary education, first came to Bengal years ago, he did not find much support for compulsory primary education among the local Calcutta leaders. Then he went to East Bengal to Nawab Ali Chaudhuri, now of the Executive Council, who said that even if the Hindus would stand aloof, he as a Mussulman leader would recommend the levying of a special cess from among his own co-religionists so that the people might have the advantage of compulsory primary education, because in East Bengal 80 per cent. of the people are of the Mussulman faith, and it is the Mussulmans who would be really benefited by compulsory primary education. Personally I recommend that the Government should pay half and we should pay half.

22810. Sir Henry Lawrence: You have mentioned that men will not spin; they leave it to the women?—Generally that has been the case everywhere; "When Adam delved and Eve spun."

22811. Does that refer to every community?—I think in the history of the world you will find spinning generally confined to women; I suppose it is because they have more patience.

22812. Then your advocacy of the *charka* is being addressed to the women of India and not to the men?—I do not say that. I should welcome the help of men because they also sit idle during six or nine months of the year; but you must take things as they are, and generally I find spinning is confined to women.

22813. Is that the experience of the movement in every Province in India?—Yes, I think so.

22814. Then I must be mistaken, because I understood Mahatma Gandhi was appealing to the men?—Yes, he is, but in Bengal I find that in spite of the appeal it is the women who are left to do the work. The men help them in other ways, bringing cotton, ginning, carding and so on.

22815. The Chairman: They give moral support possibly?—No, not only that; they carry the material to market for sale.

22816. Sir Henry Lawrence: In those golden days when India supplied these muslins outside India, you say she had an export trade of 2 crores?—It was 2 crores only about a century ago; you will find it in Mr. R. C. Dutt's *Economic History of British India*.

22817. I do not understand?—I think Mr. Gupta will be able to tell you. I have read that book carefully.

22818. Professor Ganguly: You pin your faith to the economic principles of R. C. Dutt?—Well, not entirely; but you must move with the times, and I remember that particular passage which he quotes from Wilson that the foreign rulers of India used the arm of political injustice to keep down and ultimately strangle a competitor with which it could not compete on fair and equal terms.

22819. Sir Henry Lawrence: My question was with reference to the statement you made that a century ago the export trade was 2 crores?—Yes.

22820. Did I understand you to say it was more than 2 crores?—It is a question of statistics. In Taylor's "*Dacca*," written years ago there is a vivid account of the hand loom industry of Dacca.

22821. What I want to get from you is whether at that time this spinning was done by men or by women?—I have put in a printed copy of my "Message of

Sir P. C. Ray.

Khaddar;" it is a big document, but I have marked passages. If you refer to them you will find a reference to Dr. Francis Buchanan's tour throughout India; he gives the figures district by district. I am quoting from memory; it is engraved on my memory; he says in Rangpur he found ladies of even respectable classes in the afternoon sitting up certain hours and taking to spinning; and Rangpur over and above supplying her own needs, used to export yarn. If you will kindly refer to the copy which I have sent to the Commission you will find all the figures given there.

22822. I want to get some idea of the economic possibilities of this policy that you are proposing. I want to know whether there is any prejudice on the part of ordinary castes and higher castes against allowing their women to spin?—No prejudice whatever; even respectable classes, Brahmin ladies, used to spin. There is no caste prejudice as far as spinning is concerned.

22823. Does that apply to Bengal or to other parts of India?—My knowledge is confined more to Bengal.

22824. And in regard to the Mahomedan community?—It is the Mahomedan community which is really foremost in spinning.

22825. There is no prejudice amongst the higher or any grade of that community against allowing their women to spin?—No; in fact in Bengal it is the Moslem community which is the backbone of the spinning industry.

22826. You have had considerable success?—In some communities, yes, where the tradition survived and where people only required a little stimulus.

22827. Where the tradition survived?—Yes.

22828. Where is that: East Bengal?—No, in the Chittagong Division.

22829. Where there is some cotton grown?—There is hull cotton, yes; Chittagong cotton is well known. It is only of short staple.

22830. Do you find any difficulty in supplying the raw cotton in other parts of Bengal where cotton is not grown?—Yes, there is difficulty because we are supplying them with imported cotton.

22831. From the Central Provinces?—Yes.

22832. You convey that cotton from the Central Provinces to the homes of these people in North Bengal?—Yes.

22833. And when it has been conveyed there then they work on this cotton and earn 1 anna a day; does that pay for the railway transport?—Well, at present it is not so convenient certainly.

22834. I do not want to know about convenience; I want to know about economic possibilities. Does it pay for the railway transport?—It does not pay; that is the reason that the cotton is highly priced; but we are trying also to have cultivation of the cotton. There are several places in which cotton used to be grown, and where it is grown on a small scale now. There is a place not far from Calcutta which is called Kapasdunga, that is a place where cotton used to be grown; we are trying to introduce the cultivation of cotton side by side with spinning.

22835. Then do I understand the possibilities of this economic development are limited to those areas in which you can get cotton growing in the fields of the ryots?—Yes, especially so.

22836. That is your view?—Yes.

22837. You spoke of the difficulty of getting business occupations taken up by the Bengalis?—Yes.

22838. You say the Bengali is especially good at research as opposed to business?—Yes.

22839. Is he equally good at applying his research?—I am afraid not, not for practical purposes. In applied chemistry also the Bengali has hitherto proved to be a failure. You see there are 82 or more jute mills on the banks of the Hooghly; not a single one of them is owned by a Bengali.

22840. *Professor Gangulee*: Why not?—Because the Bengali is backward in industries and business capacity.

22841. *Sir Henry Lawrence*: Is it not possible to train him to it?—Well, there are one or two exceptions; for instance there is Sir R. N. Mukerjee who is perhaps *par excellence* the captain of industry in Bengal. That shows the capability of the Bengali intellect, and shows that given the proper push and encouragement,

Sir P. C. Ray.

there is no reason why the Bengalis should not succeed in industry. In my humble way I began the Bengal chemical industry with only Rs. 800 in my pocket, and now it has grown to fairly big dimensions. It has been entirely managed from the very beginning by Bengalis. So that there is nothing lacking *ab initio*, but the tradition of the Bengali has been for book learning and logical quibbling.

22842. So that he will not apply his research work to business. Will he apply it to administrative science?—Yes. There is an example (pointing to Mr. Gupta).

22843. Administrative science not as a part of practical business?—I am afraid not; otherwise the Bengalis would not be in their present miserable plight. There are 22 lakhs of Indians in Bengal who are non-Bengalis. They are Parsis, Armenians, Jews, Marwaris, Bhatias, etc., and I have calculated that if you take the average earnings at Rs. 50 a month, 11 crores of the wealth of Bengal is earned and largely drained away by non-Bengalis.

22844. Do they give no service in return?—Very little. The only service is in so far as they consume rice, but unfortunately most of them consume wheat, which is also imported from upper India. I have made that calculation.

22845. Mr. Kamat: Do you regard consuming rice as a service?—No, but that portion is left in Bengal.

22846. Sir Ganga Ram: With regard to the provision of pasturage, how can you provide land for it, when there is no vacant land?—Action of the kind under the Land Acquisition Act should be taken.

22847. Somebody will have to pay for the land acquired?—You will have to indemnify out of the Village Union fund or the funds of any such corporate body.

22848. Where is the money to come from?—That is the point. Anyhow arrangements must be made for acquiring the land.

22849. The land should be acquired and left for pasturage?—Yes.

22850. We gathered from one witness that 15 per cent. of the population was in comfort, 32 per cent. below comfort, 33 per cent. above want and 20 per cent. were in want?—In East Bengal I should say they are fairly well off, if there is a good jute and paddy crop, e.g., in Barisal and Mymensingh.

22851. It does not apply to the whole of Bengal?—It does not.

22852. If it does not, why should not the starving population move into the better districts?—The land is over-crowded. I know one of the fertile districts, Mymensingh; there is a constant stream of emigration from there to Assam.

22853. Then, why do they not migrate from unprosperous tracts to prosperous tracts?—In the prosperous tracts there is no land available.

22854. They say that in the prosperous tracts there is want of labour?—They come during the harvesting of crops and go away again.

22855. The Conservator of Forests tells us that he cannot get sufficient labour to develop his forests?—There is a reluctance to leave the homesteads. As I have stated, even though the jute mills give occupation to four or five lakhs of people, not even 5 per cent. of them are Bengalis, I might even say not more than 3 per cent.

22856. That ought to be remedied. I appeal to you to take that as a mission instead of what you have now taken, the *charka*?—But, they are very homeloving.

22857. I am only asking questions on agriculture. For these 20 per cent. you must find occupation. The *charka* will not give them enough food?—It is only to utilise the off-time when they sit absolutely idle.

22858. I know you are a great chemist. Can you not invent some fertilisers which will be cheap enough for the cultivator?—We have already some fertilisers. There is cowdung; but .....

22859. The use of cowdung as a fertiliser is vanishing on account of the cost of fuel to replace it. It is all an economic question. In our colonies cowdung is only used for warming milk; for fuel they use cotton stalks. Can you not make nitrate of soda, for example?—Yes; some European firms import it, but very little of it is used.

22860. I ask you as a chemist to give your attention to fertilisers. That is a great problem?—They are just learning to use them. I know bonemeal is used even by the Hindu population in Burdwan; they have overcome the caste prejudice.

Sir P. C. Ray.

22861. You talk of absentee landlords. Do you not think that the absentee landlord is the direct outcome of the Permanent Settlement? They will get the same rent wherever they stay?—Yes, to a certain extent; but they have no business to absent themselves from their land.

22862. Everything has to be considered from the economic point of view. When they have nothing to gain by living there, why should they live there?—Yes; the failure of the Bengalis on the industrial side is also due to the Permanent Settlement.

22863. You mentioned tube wells. What is the size of the tubes?—I do not remember the exact diameter; the manager of our farm will give you the details.

22864. *Sir Thomas Middleton*: In the first paragraph of your note you draw attention to the great need for improving the mill supply and the cattle of Bengal?—Yes.

22865. Do you regard that as one of the primary objects we ought to aim at?—Yes.

22866. You quote Macaulay to show the position of livestock farming in England in 1685, and you yourself describe what you have seen as a student in Edinburgh. Have you studied how the change from the poverty-stricken animals described by Macaulay to the stately bulls and cows which you describe was brought about in a period of 250 years?—By improved knowledge of agricultural science and of breeding. In England scientific principles penetrate among the general people much more rapidly, whereas here all the theoretical knowledge is confined to a microscopic minority, and our zamindars, especially in Bengal, though some of them are fairly well educated, have been very remiss in their duties; they are expected to take the lead in this matter, but they have hopelessly failed in this respect.

22867. Are you not aware that much of the improvement took place before the landowners of England and Scotland knew anything of scientific principles? It took place between about 1750 and 1825. What was the change that brought that improvement about? Have you studied the question?—England is a land of progress in everything. The history of England, as Macaulay says, is a history of the triumph of progress all along the line.

22868. I was going to ask you if you had studied in detail the history of the improvement of our livestock as given, for example, in Lord Erskine's book "English Farming: Past and Present." There you will find that the improvement began when we enclosed our commons?—I see.

22869. Reading your evidence, I have come to the conclusion that you are a strong advocate of common pastures?—Yes.

22870. But it will not help Bengal; it will make matters worse?—Somewhat or other fodder and foodstuffs for the cattle must be found.

22871. How was the foodstuff provided round Edinburgh when you were studying there?—When I was there first I was travelling by the East Coast; but this time I travelled by the Midland Railway, and on every side I found green grass and cattle browsing.

22872. Green grass for the summer?—Yes, for the summer.

22873. And turnips and other food grown for the winter?—Yes.

22874. In Bengal for what length of period do your common pastures provide grass?—Only during the rainy season.

22875. How are you going to improve your cattle if you have not got food for all periods of the year?—Special foodstuffs must be raised during the rainy season.

22876. Then you must turn your attention to fodder crops?—Yes. I may be permitted to say that in England educated and scientific people take a prominent interest as in the Rothamsted farm; these enlightened and well-to-do people do their utmost for agriculture, like Sir Ganga Ram for instance. If we had men like Sir Ganga Ram scattered throughout India, I think the problem might have been solved.

22877. I am only concerned to try and correct your view that the right way of improving the cattle of Bengal is to restore the village commons?—Yes.

22878. That is the wrong way, I think. You must provide food for the cattle all the year round?—Yes.

**Sir P. C. Ray.**

22879. The next point I ask your opinion on is this; you no doubt know that the dietary of Bengal was studied by Captain McCay some fifteen years ago; do you agree with his conclusions that, generally speaking, the diet is not well balanced?—I am afraid he lays undue stress on the nitrogenous element; his views have been criticised by some Dutch or Danish physiologist.

22880. I know to whom you refer?—They say that even in Irish potatoes there is enough of nutriment, nitrogenous and other. I agree in the main with some of his conclusions, that the average Bengali diet is rather poor in nitrogenous elements.

22881. As a chemist, have you yourself studied the subject of nutrition?—I have done so in a general manner; I have seen, for instance, the analyses of the pulses which are widely used in the dietary.

22882. When you referred to the criticism of Dr. McCay, you quoted the views of the Danish scientist Hemerhede. Have you got any figures of your own on which you can criticise?—No. I have read the book by the American author Chittenden; he also does not lay so much stress upon the richness in nitrogenous element.

22883. That is so, but neither of these experts were dealing with the quality of the foodstuffs that are consumed in Bengal?—There is too much of farinaceous food in Bengal and Madras.

22884. When such criticisms are made about the foodstuffs of Bengal, do you not think it is desirable that chemists should turn their attention to the study of that and verify the point whether Dr. McCay was right or not?—After all, what I mean is that those who have got a good supply of fish, wherein the Bengal rivers abound, got on fairly well even without milk. I am speaking particularly of those persons staying in places where even fish is not available, and our people have a horror of beef or any other meat; if they took to beef, the question would be solved very readily.

22885. I was not thinking of beef but of pulses, crops of which you know the composition very well?—That is the only nitrogenous foodstuff.

22886. Can you explain why they are so much less used in Bengal than in other Provinces? Is it a question of poverty, or custom, or what?—The *dals* are in fairly common use; I have found that where fish is abundant, people do not use pulses. In the districts of Bankura, Birbhum and Burdwan, where fish is scarce, they depend a good deal upon pulses, *dals* as you call them.

22887. Dr. Hyder: I want to ask you a few preliminary questions before I take up your note. You stated in your evidence that the Danish cows yielded much more milk than the English cows; do you know why that is so?—They are very well-fed.

22888. Do you know what the character of English or Danish agriculture is?—No; I have seen a little of English agriculture.

22889. Do they go in for stock raising or arable farming?—During the summer months I find it is all arable.

22890. You have your vast plains of Bengal; are they not all covered with paddy?—Yes.

22891. You have to make a choice here, either paddy or cattle?—Either paddy or cattle, or jute.

22892. Provided your methods do not improve, you must devote the land either to the feeding of the population or to the increase of milk; if you increase the milk-supply, there must be a shortage of paddy somewhere?—Yes.

22893. You say that the cultivators of Bengal are idle for 6 to 9 months?—Yes; in many parts of the district of Khulna, paddy land is prevented by means of embankments from being spoiled by the rush of salt-water; and there you have only one crop.

22894. Turning to your note of evidence, you say: "Imported cutlery has also played havoc with the village smith." Are you referring thereto to the things made by the village blacksmith, ploughshares, for example?—Not ploughshares; I refer to knives, scissors, spades, etc. Even now, these are supplied by German and Japanese manufacturers; they are not so much of British manufacture.

22895. With what do your people cut mangoes when they eat them?—With imported knives.

Sir P. C. Ray.

22896 That is not so in the United Provinces. In the different centres in the United Provinces mangoes are still cut with a country knife?—The blacksmiths in Bengal are losing their bread.

22897. With regard to the question of occupation, you say there were a number of boatmen, but do you not think that the people have changed their occupations? The number of boatmen might have diminished, but the number of cartmen, muncars, smiths, porters, permanent-way staff on the railway, may have absorbed them; there is also 5 per cent of them in the jute mills. These new occupations have been found for these people; do you not think that there has been a change of occupation?—In Bengal, I have made a careful study of the question. I have been to Santalpur and Ghalunda. There you will find not even 1 per cent. of the coolies are Bengalis, they are Oorissas, or Biharis, or United Provinces men. The Bengali agriculturist even during the time of famine would prefer to starve at home and die of hunger rather than move on to do that kind of work; he says it is below his dignity or *izzat*.

22898 I would refer you to the Census statement of occupations. If you look at the occupations, you will find that in Northern Bengal, 13 per cent. of the population is engaged in non agricultural occupations; the proportion rises to 18½ per cent in Dacca Division and just over 19 per cent. in the Chittagong Division; in Western Bengal it is as much as 23 per cent., and Central Bengal 32 per cent. Surely, those people are not all foreigners?—I know in Dinajpur and in Bardwan they are all what are called Santals, Mundas, etc., they are from the aboriginal stock. A good part of the land of Bengal would remain uncultivated but for the annual immigration of these people to do the work.

22899 You say that the landlords of Bengal stay away from their estates; is that the general practice here?—Those who are well to do stay away.

22900. Are there any notable exceptions?—There are a few; I have travelled extensively throughout Bengal.

22901. Take the Maharaja of Bardwan, for instance, does he stay away?—He of course sometimes stays in Bardwan. I know a good many zamindars in Mymensingh, of Muktiyeha, Nator, Dubalhat and Balihar, who are living in their own villages. There are notable exceptions even in spite of malaria and *kala-azar*. For instance, the zamindars of Balihar and Dubalhat, I am glad to say, have still clung tenaciously to those places.

22902 Now with regard to the gospel of the spinning wheel. You have already been sufficiently questioned on this subject and I have only one or two points to raise. Is it not a serious matter for any man to direct the attention of 47 million people to one occupation in Bengal? Do you not think that if a man does so, he takes a very heavy responsibility upon himself?—Yes.

22903 You know spinning was an occupation carried on by the women?—Yes.

22904 And the cloth was woven not by the cultivators but by the *Solas*?—Yes.

22905. If you do not buy foreign or locally-made cloth but have everybody to weave and spin in their own homes, then there is no trouble about the matter, but do you not think trouble will surely arise as soon as you bring the yarn to the weaver? I ask you, has anything happened in the last six years or ten years which has increased the competitive efficiency of the village weaver?—I should say it is increased because when we began some four years ago the yarn was of eight to ten counts and very rough and the weavers refused to have anything to do with it. But, as the yarn improved in quality due to practice, they have now taken kindly to it.

22906 That may be so, but I ask you to consider this matter in the light of what I am going to say. If the Indian weaver is going to compete with the mill made cloth produced either locally or imported, then he will have to pay particular attention to a number of things such as the value of the raw material. You know what the system is of buying cotton on a large scale by the mills?—I do.

22907. Do they not buy more cheaply than your cultivator?—They buy cheaply because they buy in large quantities.

22908. So that there is an element of weakness there, is there not?—It must go hand in hand with the growing of cotton in those parts of Bengal where the soil is favourable.

22909. I agree with you wholeheartedly there. But my point is this, whether you can give material point to this gospel which you are preaching to the people of Bengal as long as the mill continues to buy at a cheaper rate in large quantities.

• Sir P. C. Ray.

than the village cultivator? If not, then that is one element in which the mill is always going to beat the cultivator?—Yes.

22910. Take another item, namely, the cost of preparation. As preparation is done on a large scale in a factory, the cost per unit is going to be cheaper there; so, there also your weaver is going to be beaten by the cloth made either locally or imported from abroad?—If that is so, then how is it that there are lakhs of weavers in India who make a living by weaving? This shows that they are able to compete with the mills.

22911. We have not seen the end of the struggle yet. Some countries, I submit to you, have seen the end of this struggle but that struggle is still going on here and we have not yet come to the final stage?—I have read the report of the Director of Industries in Bihar and it says that in spite of the competition with the mills, a good percentage of the weavers manage to eke out a living successfully by means of weaving.

22912. Has that area not been constantly invaded?—Since the days of the "Partition of Bengal" agitation when we all took a *saradeshi* vow, although at that time we could not even make yarn, in Tangail and in many other places the weaving industry, received a filip or direct stimulus and the weavers there are doing very well. I have heard that in some of the markets near Kushtia, I think Kumarkhali, as much as half a lakh of rupees worth of handloom-woven cloth has been sold every week. Take over Howrah Hat, and in this I think Mr. Gupta would be able to bear me out, several lakhs worth of woven cloth is sold every week.

22913. We can only make a guess, but I understand that a good deal of the cloth still comes from the village weavers. But in order that the position may be stabilised and in order that your gospel may spread and be laid on sound economic foundations, I was wondering whether attention was directed to cost matters to which the attention of a mill Director or a mill Manager is always directed. I ask you with regard to the cost of manufacture, is that higher or lower?—I think that shirting cloth is almost competing with the mill-made article but this is not the case with the cloth for *dhotis*. If you have time to pay a visit to our Khadi Exhibition which is going on just now, you will see the whole thing in a quarter of an hour.

22914. Would you agree with me that your gospel of the *charla* can spread only if the women folk of the cultivators spin and the cultivators weave themselves, but the moment the weaver comes in, he is at once exposed to the attacks of the mill industry?—If the yarn is of a uniform texture, the weaver has no objection to using it. It is only when it is very rough and unslovely that the weaver objects to it because it does not pay him.

22915. But if there is any difference between the cost of producing a yarn in a mill on a large scale and the cost of producing a yarn in the handloom, then the side which produces cheaply will win?—My contention is that any extra penny earned during the time which you would have wasted by gossiping or idling would go to compete with imported yarn.

22916. In so far as the extra hour devoted to gossiping was devoted to the spinning of the yarn, there would not be much difficulty, but the difficulty would arise if the yarn were made over to the weaver because then he would be attacked by the mills and other people, and so far nothing has been done to increase the fighting efficiency of the weaver?—Yes.

22917. Mr. Gupta: Besides the desirability of finding pasture land for the cattle, are there any other concrete suggestions which you wish to make regarding the improvement of Bengal cattle?—I had thought about the Brahmani bulls in which the Chairman anticipated me.

22918. How are these bulls to be procured? Do you suggest that at Government dairy farms we should have a certain number of bulls which should be distributed?—Yes, that is a very good idea. They may be distributed to the District Boards for the time being.

22919. But the District Board is only one unit. Are there no other agencies through whom these bulls can be distributed profitably? Do you not think Union Boards will be very useful?—Yes; but there is another great drawback. The breeding bulls nowadays are of very stunted growth.

22920. Have you any other concrete suggestions? For instance, if co-operative dairy farms were started, could you recommend that Government should either give them long period loans or give them subsidies?—Yes, I would recommend that; it would be a good thing.

Sir P. C. Ray.

22921. Regarding the provision of subsidiary industries and the revival of the cottage industries, have you any definite suggestions to make by which the district officers can help?—What I have found is that anything done through Government agency turns out in the long run to be rather expensive.

22922 And it is not so popular?—No.

22923 Can you say if Government in any way help you?—My belief is that the initiative must come from the people.

22924. But after the initiative has come, are there any definite ways in which Government can come to your assistance?—Yes, they can help co-operative organisation, advance loans and so forth.

22925. Would you recommend that there should be a Department of Industries in each district to examine the industrial capabilities of the district?—I am afraid the expense of such a department would be almost prohibitive.

22926. You are not in favour of additional expense. How would you like the idea if Government, for instance, desired that the district officer should pay special attention towards developing the industrial resources of the district?—As you know, I am on the Advisory Body of the Department of Industries.

22927. But they have nothing to do with the districts?—It would be a good thing if the district officers could help; but if you have a separate machinery, then the remedy would be worse than the disease.

22928 If it were not too expensive, then some such machinery would be useful?—Yes.

22929 Coming to this question of reviving spinning and weaving; I suppose your main contention is that people should be encouraged to do spinning so far as their own requirements are concerned primarily?—Yes.

22930 As regards competition with manufactured articles, of course, there are some counts in which they can hold their own, both in the lower counts and in the higher counts?—Yes. In higher counts there is no difficulty in competing with mill-made articles. We have now got handspun yarns of 60 and 80 counts and we have some saris with fine borders which are purchased at any price by the well-to-do people.

22931. Do you not think it would be desirable if weaving and spinning progressed simultaneously?—Yes.

22932 Professor Gangullee: Are you familiar with the agricultural research that is carried on in this country?—I have studied a good deal of what has been done at Pusa in Bihar, and other places.

22933 Having cited some of the experiments made and the value of phosphatic manures and so on, you say on page 356: "I am afraid very little benefit is derived by the illiterate peasantry." What do you precisely suggest there?—What I mean is that the knowledge must filter through to the masses.

22934. You mean to say that that knowledge is not filtering through at the present moment?—Unless you have got a more advanced system of elementary education, it is not possible. The people are very conservative and are wedded to backward notions. It is by the spread of education alone that they can be rendered intelligent and able to understand their own interests.

22935. Could you tell us the acreage which is under improved jute varieties, or under improved rice varieties in this Presidency?—I am not aware of it. Mr. Finlow can let you have the figure.

22936. You will admit that a great deal of work has been done in that direction through propaganda?—Yes.

22937. You make a reference to the extension of jute cultivation. Could you tell us what the exact area now is in proportion to the total cultivable area in this Presidency?—I do not know. All that I know is that in East Bengal, Mymensingh, Dacca, and Serajgunj (Fabna) jute has almost supplanted paddy, but not in Barisal and a good part of Faridpur and Khulna.

22938. About 21 million acres are under paddy and about 3 million acres under jute?—Of course, it is a matter of statistics only.

22939. You mention here your experience of Northern Bengal floods and you say you have studied the economic conditions of the villages. Have you published any book?—No; I have been simply watching.

Sir P. C. Ray.

22940. *The Chairman* : What do you say about the standard of the science courses of Indian Universities?—It is pretty high. Our M.Sc. in the Calcutta University would compare favourably with any M.Sc. in England. I have ascertained that copies of our *Journal of the Indian Chemical Society* have been circulated to the Members and if you will kindly have a look at the table of contents, you will find that they are of a fair degree of excellence. In fact they are having abstracts of all these papers regularly appearing in the European Journals of Chemical Societies; there is a constant reference to this and you will find that almost all these are by students of our own colleges, M.Sc.'s and Research Scholars in the College of Science. Thanks to the munificent endowments of the late Sir Taraknath Palit and Sir Rash Behari Ghose, we have got not only endowed Chairs but we have all the special endowments earmarked for research scholarships; these research scholars carry on their researches after taking the M.Sc. degree and go up for Doctorates and their researches are regularly published. Some contribute to the London and Continental Journals but most of them contribute to the *Journal of the Indian Chemical Society*.

(The witness withdrew.)

Sir P. C. Ray.

L r 13—25

## THE INDIAN TEA ASSOCIATION, CALCUTTA

## Replies to the Questionnaire

*Introductory.*—The tea industry is an important branch of Indian Agriculture, with a capital of over £32,000,000 and supporting an agricultural population of over one and a quarter million, but owing to its capitalistic character and to the organised uniformity of its agricultural processes, the majority of the questions propounded by the Royal Commission do not directly apply to those engaged in the production of tea. It must, however, be borne in mind that a steady increase in the investment of Indian capital in tea is going on, and that Indians in increasing numbers are being employed in this agricultural industry.

The capitalist owners of tea gardens and their managers are not contemplated by the Questionnaire, but as employers of agricultural labour, and as exporters of an agricultural product, they are deeply interested in certain aspects of the Royal Commission's Enquiry. Disabilities which affect a large industry like tea must have a serious effect on the village cultivator too; there are therefore some questions which bring the tea garden owner and the village cultivator together on common ground.

The tea garden employee, as such, does not come within the scope of the Questionnaire, but if he is regarded as a labourer driven by seasonal unemployment to seek temporary service on a tea garden, or as a permanent emigrant who acquires land to cultivate in addition to, or as a sequel to, his employment on a tea estate, he does appear to come within the scope of several of the questions.

**QUESTION 1.—RESEARCH.**—(a) (i) The Indian Tea Association have a well staffed and well equipped Scientific Department for investigating the various problems connected with tea culture and manufacture (*vide* the accompanying note). It is however realised that there are many fundamental problems connected with agricultural research that hardly come within the province of a specialised department to investigate. Such problems should be investigated by an Institute set apart for such work and not definitely connected with any specific crop or industry. Pusa might be cited as an Institute of this nature but as an Institute for the whole of India it is at present wholly inadequate. It needs very considerable enlarging.

Owing no doubt to financial considerations, some of the Provincial Agricultural Departments are not developing, and indeed are not so well able to deal with their local problems as formerly. This is a very serious matter.

Scientific work in agriculture, which involves many of the natural sciences, needs to be co-ordinated if the greatest progress is to be made. This is not done to any great extent at present. Formerly occasional meetings of various branches were held at Pusa such as the Chemists' and Entomologists' conferences, etc. These enabled the workers in those departments to meet and discuss technical topics, but more than this is wanted, for the workers in all the various branches of science connected with agriculture should be afforded opportunities of meeting together to discuss the various problems and the progress that is being made in their solution by all the branches concerned.

Many workers in agriculture meet together, it is true, at the biennial meeting of the Board of Agriculture, but this does not provide a suitable occasion for the discussion of purely scientific problems.

There is another point that should be stressed in regard to agricultural science. The organisation of the Scientific Department of the Indian Tea Association provides for one controlling head in the Chief Scientific Officer. It is for him to decide what are the problems that are of primary importance, and it rests with him to see that the various branches carry out investigations along such lines and are not allowed to embark on problems that may appear of particular interest to the workers in any one department. Such control, whilst it indicates the problems to be investigated, does not in any way stultify the initiative of those in charge of the various branches.

The work of the various branches is then submitted in the form of reports to the Chief Scientific Officer, who is able to correlate the results and in consultation with the heads of the branches to decide how further progress is to be sought. Some such form of unified control should be enforced in all research institutions. In other words, the encouragement of team work is sought rather than the contribution of any one individual.

(b) Many problems can be suggested as requiring investigation, but perhaps those of greatest urgency are:—

1. The correlation of soil analytical data with soil fertility.

The Indian Tea Association.

2. Investigation into the available plant food in the soil, which subject incorporates the problems connected with soil solution and soil colloids.

3. Biological problems connected with the plant itself, such as, in what form do nitrogen, potash and phosphoric acid exist in the plant and how does any alteration in these ratios affect the growth and health of the plant and how can alterations be effected.

4. *Soil bacteriology*.—This subject requires a greatly increased amount of work in all its problems, even in one that has received considerable attention, namely, the nitrogen problem.

**QUESTION 2.—AGRICULTURAL EDUCATION (vii).**—The science courses at the Indian Universities call for much improvement. The standard appears to be too low and the knowledge of men who have obtained honour degrees in Science is so poor that they are not fitted to do more than undertake the simplest forms of routine work.

The laboratory skill of the men is lacking. This is to be attributed more to the system of teaching than to the character of the men themselves.

**QUESTION 4 (c).—(i) The Agricultural Services.**—The demonstration farms conducted by the Agricultural Department are so few, and so far apart, that it is impossible for the small cultivator to visit them to an extent which would make their influence widely felt. There is a very great need for demonstrators to carry out field experiments on the cultivators' own plots. This would bring home to the cultivators the benefits accruing from improved methods.

(ii) *Railways and Steamers.*—The tea industry has not been satisfied in the past with the services afforded by the railways, as there has been no progressive policy linking up new districts or providing communications to districts already under tea. The inconvenience thus occasioned has been aggravated by the fact that Government has failed to provide adequate feeder roads. There have, recently, been signs of some improvement as regards railway communications, and a number of branch lines are under construction, but there are still many districts where the requirements of the industry demand fuller railway facilities, as, for example, the north bank of the Brahmaputra in Assam, and the Dooars in Bengal.

(iii) *Roads.*—The tea industry is not satisfied with the roads in the tea districts. In fact, road communications in many parts, more especially in the Province of Assam, are in a deplorable condition. The urgent need for the construction of new roads, and the better maintenance of the existing roads, is being continually urged by the Indian Tea Association and its Branch and District Associations. So far their efforts have not met with much success. The Government of Assam has voted a grant for the improvement of communications during the current year, but the amount thus made available can do but little, while some years ago a scheme of road communications was inaugurated by the Government of Bengal in the Dooars, but the work was stopped before it was completed.

The improvement of railway and road communications is also of vital importance to the ordinary cultivator, as it enables him to dispose of his produce to better advantage; he is not then limited to markets in his immediate neighbourhood as he is almost invariably at present.

(iv) *The Meteorological Department.*—As recruiters of labour from practically the whole of India, the tea industry, when arranging for its recruiting operations each season, makes great use of the Meteorological Department's statistics and of the District Crop Reports published by Local Governments. The information derived from these sources is sometimes found to be misleading and unreliable, involving the industry in considerable waste of money. In the case of the Meteorological Department's figures, the fault seems to lie in the fact that the observation station for a district is almost always the headquarters town, whether the weather conditions of that town be typical of the whole district or not. The following examples will illustrate what is meant:—

In Bellary and Sambalpur the rainfall at headquarters is less than the average throughout the district whereas at Waltair and Berhampore it is greater.

The District Crop Reports are not always compiled with the care which such important records merit, and are frequently found to be entirely misleading.

As regards the tea districts, the industry is not satisfied with the present meteorological service in the tea districts as it does not record all the data required, e.g., sunshine, and certain stations do not record humidity. From the point of view of the industry these are most important observations.

**QUESTIONS 5 AND 6.—FINANCE AND AGRICULTURAL INDENTEDNESS.**—The questions under these headings have no direct application to the tea industry, as garden labour obtains bonuses and is able, where necessary, to get loans from the employer without interest in order to keep them free from debt. The position is

The Indian Tea Association.

of course different in the case of the ordinary agricultural labourer, and until there is a marked extension of the system of agricultural banks, co-operative credit societies, and similar organisations to replace the moneylender, the development of agriculture will be retarded by the burden of debt which hangs over the petty cultivator.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—The only remedy for the evil results of the fragmentation of holdings is the encouragement of the emigration of those who are in excess of what the land can maintain in reasonable comfort.

**QUESTION 10.—FERTILISERS**—The tea industry is using larger quantities of artificial fertilisers annually, and it is understood that the cultivator is gradually recognising the benefits to be derived from careful manuring. The extension of the use of fertilisers among the cultivators is likely to be slow; for it is difficult to convince him that the methods handed down for centuries can be improved on, while the lack of funds to meet the cost of fertilisers is a further handicap. The industry can only suggest that Government officials should co-operate with recognised suppliers of fertilisers in bringing home to the cultivator the benefits to be derived from the manuring of impoverished soils. See reply to Question 4 (c) (i).

(b) The tea industry of North India, in conjunction with the fertiliser suppliers, have drawn up a tentative set of rules to control the supply of fertilisers in that they shall conform to the sale standard. Such rules would not be suitable to govern sales to the cultivator and, whereas the tea industry does not press for any legislation at present, it might be necessary in the future to introduce legislation in the interests both of the seller and of the cultivator.

(c) and (d) In the case of the tea industry, the Scientific Department of the Indian Tea Association can advise as to the most suitable fertilisers for tea gardens, while certain firms which specialise in artificial fertilisers place the advice of their experts at the disposal of purchasers.

The experience of the tea industry in the use of fertilisers shows that there is still room for much useful work to be done amongst ordinary cultivators in encouraging them to adopt systematic manuring. The cultivator in the neighbourhood of tea gardens shows a tendency to profit by the experience of the industry. See reply to Question 4 (c) (i).

(e) Investigations have been and are being made by the Scientific Department of the Indian Tea Association on the effects of manuring with different manures, and the results of the investigations are placed at the disposal of the industry as these are determined from time to time.

(f) The labourers employed by the tea industry use very little cowdung as fuel. The discouragement of the practice of so using it by the ordinary cultivator is a matter of education, and it must be expected that progress in this direction will be exceedingly slow. One of the most important methods of convincing the cultivator on this point is by demonstrating its value on his own fields as a means of increasing his crop.

**QUESTION 11.—CROPS.**—(iv) Damage by wild animals is as serious a question to tea gardens which adjoin large forests as it is to the village cultivator. The principal source of such damage in the case of a tea garden is the wild elephant. His depredations take the form of uprooting of tea bushes, destruction of fencing, knocking down coolie huts and eating the rice stored therein, and sometimes the taking of human life. The efforts made by the Forest Department to keep down the numbers of wild elephants are entirely inadequate.

**QUESTION 13.—CROP PROTECTION, INTERNAL AND EXTERNAL.**—(i) As will be noted from the reply to Question 1, the Scientific Department of the Indian Tea Association is investigating and recommending the adoption of various forms of treatment for the control of pests and diseases common to the tea industry.

**QUESTION 14.—IMPLEMENTS.**—There is a strong demand from the tea industry for the introduction of new and improved agricultural implements, particularly those operated mechanically, but so far no satisfactory mechanical cultivator suitable for work on a tea garden has been devised. Different types of such cultivators are, however, under examination.

**QUESTION 15.—AGRICULTURAL LABOUR.**—The cultivation of tea, like all other forms of agriculture, employs labour of two kinds:—

- (a) Temporary labour rendered available by seasonal unemployment; and
- (b) Permanent settlers.

The tea industry has a recruiting organisation; but Government has none from which the ordinary landlord or cultivator can obtain temporary labourers or

The Indian Tea Association,

permanent tenants. Even Government itself, in its Public Works, Forest and other Departments, often finds it difficult to get labour.

In India there is, in the more remote areas in particular, great difficulty in would-be employers and would-be employees getting in touch with each other. When they do succeed in getting in touch there are still difficulties to be contended with, such as :—

- (1) Legislation of the kind which hampers the operations of tea garden recruiters;
  - (2) debt which keeps the would-be emigrant in the grasp of the moneylender in his home districts;
  - (3) agricultural agreements which prevent the labourer from getting away when he wants to.
- Government could and should assist the free movement of labour from surplus to deficit localities in the following ways :—
- (1) By propaganda and disseminating reliable information; Government need not take up this work itself, but should assist those who desire to do so, so long as they establish their *bona fides*.
  - (2) By facilitating the operations of approved organisations or individuals for recruiting labour for remunerative employment under conditions favourable to the labourer.
  - (3) By setting up, where necessary, a Government organisation to arrange for the permanent migration of population to specific localities in cases where private enterprise is not at work.

**QUESTION 19.—FORESTS.**—(a) Certain tracts of land, eminently suitable for tea or other cultivation are reserved as forest,—a much less profitable use of those particular areas.

(b) It is unduly difficult and expensive even for those whose land adjoins a forest to obtain any sort of forest produce. The Forest Department should grant permits at nominal rates for the cutting of undergrowth suitable for firewood but not required for timber trees.

In Northern Bengal, much damage has been caused by floods whose violence can in some measure be traced to unregulated cutting of trees in the hills to the north. In sub-montane tracts, like the Doons, it would be a great boon to all cultivators, whether of rice or the tea bush, if a strip of forest ran along each bank of every stream of any size.

**QUESTION 20.—MARKETING.**—(a) and (b) The only factor in this connection on which it is necessary for the tea industry to comment is the question of transport. Where transport is adequate, the industry is satisfied with the marketing facilities, but where transport facilities are not sufficient the industry is not satisfied. This matter has been dealt with already in the answers to Question 4 (c), (ii) and (iii).

(c) The tea industry has, through the Indian Tea Cess Committee (see note attached) pressed for the prescription of a standard of quality for tea sold for human consumption in India. As a result of such representations action has already been taken by Local Governments as follows :—

- (i) The Government of Bengal have prescribed a standard of quality.
  - (ii) The Punjab Government have the subject still under consideration.
  - (iii) In Madras a bill has been introduced in which provisions have been incorporated to prevent the sale of tea of inferior quality.
  - (iv) In Bombay draft rules have been framed and are under consideration.
- In Burma and the Central Provinces, the Prevention of Food Adulteration Act has not yet been introduced.

It may be explained that imported foreign teas of inferior quality compete with the lower grades of the Indian product. The industry has pressed for the prescription of a standard of quality for imported tea but the Government of India is of opinion that this is a matter which can be suitably dealt with by Local Governments. With this view the industry disagrees as Local Governments have not the necessary authority and in any case the matter can be dealt with much more easily and economically by the Customs Department. It is not, of course, suggested that any restriction should be placed on the importation of foreign tea beyond requiring that it should comply with the standard prescribed by the Local Government.

**QUESTION 21.—TARIFFS AND SEA FREIGHTS.**—The tea industry has consistently opposed the export duty on tea, amounting to Rs. 1-8-0 per 100 lbs. Apart from all other considerations, it is contended that this duty is detrimental to the interests of the agricultural classes in India. For it is obvious that every circumstance which

**The Indian Tea Association.**

increases the cost price of tea, other than increased wages of labour, reduces the amount which the industry can afford to spend on its labour.

The interests of tea producers are also, of course, affected. Tea is not a monopoly of India and in some of the large consuming countries the export duty places the Indian producer at a disadvantage as compared with his competitor in other countries. In the Australasian market, for example, Java has already a considerable geographical advantage over India and the figures of the imports of tea into Australia and New Zealand are instructive. The figures are given in millions of lbs. :—

		Pre-war average	War average	1920	1922	1923	1924	1925
India	.	9.4	9.8	9.4	6.2	5.8	5.4	7.4
Java	...	8.7	8.1	19.8	23.9	27.1	27.6	24.8

It is not suggested that the export duty on Indian tea is solely responsible for this development, but it is certainly a factor.

QUESTION 23—GENERAL EDUCATION.—The only comment which the tea industry desires to make under this head is that so far as has been seen the text books supplied in the schools do not seem to touch sufficiently on agricultural matters. These books might be made more use of to spread a certain amount of elementary knowledge of agricultural subjects.

QUESTION 25—WELFARE OF RURAL POPULATION.—The activities of the department controlled by the Sanitary Commissioner might with advantage be extended and brought into closer touch with the rural population, particularly in regard to such matters as the disposal of corpses, disposal of refuse, draining, elementary hygiene, and so on.

QUESTION 26—STATISTICS (a), (i) and (ii).—The existing method for obtaining Government's statistics of the production of tea does not always give results which agree with the Indian Tea Association's own figures, and the Indian Tea Association considers that its own figures are the more accurate. The Government's figures are for the most part those reported by planters, estimates being made by the local officers in the case of gardens for which figures are not reported. If there is a discrepancy between the figures returned by the Statistical Department and those compiled by the Indian Tea Association an endeavour is made to find where the discrepancy lies but this is not always possible; definite proof cannot be obtained because the details from which the Statistical Department's figures are compiled cannot be disclosed for the scrutiny of the Association's representatives.

A few years ago the suggestion was made that legislation should be introduced to provide for compulsory returns regarding planting statistics being submitted by planters. The Indian Tea Association's view of the proposal was that, while there did not appear to be any necessity for the suggested legislation so far as the Northern India industry was concerned, it was not disposed to take exception to the suggestion. The proposal for legislation was not, however, proceeded with.

The tea industry would like to see the statistical tables in the "Note on the Production of Tea in India" made available at an earlier date than is now the practice. The publication is not issued until from seven to ten months after the end of the year to which it relates, and a considerable amount of its value, except as a book of reference, is thus discounted.

**The Indian Tea Association.**

## APPENDIX I

**Memorandum on the activities of the Indian Tea Association  
with particular reference to the work of its  
Scientific Department**

*History.*—At the annual general meeting of the Indian Tea Association on the 29th May 1899, a resolution was passed authorising the General Committee to make use of the surplus funds of the Association to such extent as they might think fit for the purpose of employing an expert to study scientifically and report upon the cultivation and manufacture of tea. Immediately after that meeting the opinion of the Branches of the Association and the different Planters' Associations in the tea districts were sought regarding the special branches of scientific knowledge in which it was considered that the scientist engaged should be an expert. The preponderance of opinion was distinctly in favour of the appointment of an Agricultural Chemist; and on the recommendation of the then sole chemist to the Royal Agricultural Society in England, Mr. Harold H. Mann, B.Sc., F.I.C., was selected in London and engaged on a three years' agreement. The initial estimated expenditure of this appointment was reckoned at Rs. 1,500 monthly which had to be met from the surplus funds of the Association, augmented by grants from the Government of Bengal and the then Administration of Assam, and from additional contributions from the different Branches of the Association. The initial sanction for laboratory equipment was £200 and this laboratory work was inaugurated in conjunction with the laboratory accommodation in the Economic Court of the Indian Museum, Calcutta, where laboratory accommodation is still enjoyed by this Association. From these small beginnings this Association's Scientific Department has developed into an Institution employing a European qualified staff recruited from home consisting of a chief scientific officer, three chemists, an entomologist, a mycologist and a bacteriologist, together with Indian qualified assistants and others, full particulars of which are contained in the statement referred to in Question 8 below.

*Laboratory accommodation.*—There are well-fitted chemical, entomological, mycological and bacteriological laboratories, each fitted with petrol gas, water and electricity. The entomological building includes an insectarium and cages in which fully developed tea bushes can be grown.

Laboratory accommodation for the present is sufficient for the staff at present employed.

One chemist with an unqualified assistant is working in a temporary laboratory in a bungalow in the Dooars.

A chemical laboratory is also maintained at the Indian Museum, Calcutta.

*Field Experiments.*—At Tocklai there are about ten acres of land used for experiments on tea and green crops used in tea.

At Borbhetta, a grant of land situated about 1½ miles from Tocklai, there are over 100 acres of which about 50 have been planted since 1916 with tea for experiment. Over 20 acres of the earlier planted tea are now under experiment.

In addition experiments devised by officers of the department are conducted by managers on their own tea gardens and results reported to and collated at Tocklai.

*The present system of recruiting staff.*—Recruits for the European staff at this Association's Tocklai Experimental Station, Cinnamara, P. O., Assam, are now engaged by the Indian Tea Association, London, for and on behalf of the Indian Tea Association here in consultation with the Professors of the different Technical Colleges where recruits have been trained. The initial engagement is for a three years' term, with renewals for further periods of three years, in terms of the scale of pay and conditions of service set out in the accompanying print. Formerly it was the practice to engage these officers in the first instance on a five years' agreement but within the past five years initial agreements and renewals have been for terms of three years and these three yearly agreements are found by this Association to be satisfactory.

*Lines of research and experimental work undertaken.*—*Chemical Branch.*—Research and experimental work have dealt with—

(a) *The soil.*—A systematic soil-survey of the tea districts based on an enormous number of soil analyses is in preparation and is nearing completion, surveys of many districts having already been published. Field trials are made on the various soils and results correlated.

In addition to the effect of manures the question of soil acidity and its effect on tea and such green crops as are used in tea has been very carefully studied.

The Indian Tea Association.

It has been found that tea, unlike most green crops, favours a high degree of soil acidity. The lower limits of acidity are now very fairly understood, but the upper limit requires much further study, as it is complicated by questions affecting disease control.

The use of manures for the tea plant has been investigated with the object of devising systematic schemes of manuring. A great deal of very valuable information has been obtained.

Systematic manuring such as will give best results for expenditure on the particular soil is now very generally practised; but much more information is still required particularly with regard to the quantity of nitrogen which it would pay to apply, and the ratios of potash and phosphoric acid which should accompany larger doses of nitrogen than are now generally employed.

Improved soil treatment accompanied by a greater degree of control of most pests and blights have undoubtedly greatly contributed to the large increase in the tea crop per acre generally obtained throughout the tea districts of North East India since the Department started.

Methods are being elaborated for the rapid estimation of water soluble phosphoric acid and potash in the soil which it is hoped may prove useful in investigating these soil conditions that are favourable or unfavourable for the development of pests and blights on the tea bush.

A large number of experiments in connection with the theory of cultivation are being conducted. Already results have led to economy in the application of deep cultivation. With regard to light cultivation it has been found that the factor of chief importance is that weeds shall be suppressed. This knowledge is of importance in the economical use of labour. Methods of suppressing weeds not involving hoeing have been suggested and tried and are coming into practical use.

(b) Questions affecting the pruning, plucking and general field management of tea are also investigated by the Chemical Branch by means of practical experiments. The Entomological and Mycological Branches collaborate in this work as it affects their special interests.

There has undoubtedly been a great improvement in such garden work of late years, and this improvement has undoubtedly been largely fostered by this department.

(c) Investigations connected with the production of good quality tea, and with the control of manufacture are also conducted by this branch.

The substances present in tea have been investigated in the laboratory. The nature of the tannin present has received special attention, since this substance and its derivatives formed during manufacture have a great influence on the colour, strength and pungency of the extracted liquors.

Results have emphasised the necessity for a correct wither, and the importance of this is being more widely understood, although its importance has always been appreciated in districts producing good teas. At times climatic conditions are against the production of a good natural wither and methods of artificial withering are now being investigated with great hopes of success.

Results of practical importance have also been obtained by the fixing of optimum temperatures for rolling, fermentation, and firing and the demonstration of the necessity for high humidity conditions during the fermentation have now become very largely a part of the general routine of manufacture.

The fact that the essential oil of tea can be distilled off in steam has made it clear that drying must be done not by heating in moist air, but under a definite forced draught of dry air at low temperature. This fact to some extent is taken into consideration in the construction and use of firing machinery.

**Entomological Branch.**—The life histories of all the more common and destructive insect pests have been worked out.

For many pests hand collection is still advised as the best method of control, and the time for collection when this method can be most effectively employed has been indicated. A pest calendar has been published.

Cultural methods of control have been indicated in many instances, for example the practice of better pruning for bark-eating borers and cultivation at the right time for pests which pupate in the soil have led to a great diminution in the damage done by these pests.

The application of spray fluids has been shown to be generally of small efficiency in practice. An exception is the very serious pest, red spider, which can be effectively controlled by application of lime sulphur at intervals varying with the known times required for the hatching of the eggs at different seasons.

**The Indian Tea Association.**

This Branch has occupied itself mainly with the tea mosquito bug (*helopeltis theivora*).

The aspects of this subject which have been investigated are indicated by the conclusions below :—

(1) While spraying is of distinct value early in the season in checking the development of the insects when confined to isolated bushes here and there, spraying on a large scale is not a practical proposition.

(2) With regard to parasites and predators no specific enemy of the mosquito bug has yet been found which appears to have any effect in causing an appreciable reduction in the numbers of the pest.

(3) With regard to weather it has been shown that conditions which result in continuous wetting of the soil which has received a preliminary soaking conduce to a greater liability to insect attack. It is suggested that this increased liability is associated with a change in soil conditions consequent upon the wetting.

(4) It has been shown that the "jat" (variety) of the bush is of small importance compared with environmental conditions.

(5) The varying effects of shade trees in different places can be explained only by the resulting changes in the soil particularly as regards aeration.

(6) Attention to sub-soil drainage is a prime necessity.

(7) The effect of cultivation on soil aeration is an important factor and the danger of continual cultivation throughout the year under the conditions prevailing in North-East India is great.

(8) With regard to manuring, lime and potash afford evidence of being of benefit, while bushes will respond with an increased crop to well-balanced manuring in spite of being affected by the pest.

(9) There is little justification, so far as increased control by collection of the eggs is concerned, for extra hard plucking on mosquito blighted gardens and no justification for "clean plucking".

(10) While the operation of pruning affects the insects by removing a great part of the food supply and by destruction of a certain number of eggs, even cutting to the ground does not prevent the insect from carrying on during the cold weather, nor the invasion of the cut-down area next season.

(11) It has been observed by the Entomologist that there is a correlation of liability to attack by mosquito bug with the ratio of available potash to available phosphoric acid in the soil, and with soil acidity.

Manuring experiments have shown a transient degree of reduction of attack following the application of potash manures.

Leaf analysis has shown that comparative immunity from attack accompanies an increase in the proportion of potash to phosphoric acid in the leaf.

When a constant supply of potash salt in solution is applied directly to the roots of a bush, the potash is taken up by the bush, and bushes which are entirely shut up by the pest can be caused to throw it off entirely.

Experiment with the insect shows that its vitality is directly controlled by the suitability or otherwise of its food-supply. Under field conditions it is observed that apparent immunity does, sometimes, occur naturally.

It is suggested by the Entomologist that high hopes of effective control of the mosquito bug lie in the improvement of soil conditions, and that a chemical enquiry into the behaviour of phosphoric acid and potash in the soil under different conditions might be useful in this direction. It is suggested that the older methods of analysis which show the amounts of substances present in the soil may be described as investigations into soil "Statics", but that investigation is required into temporary changes in the soil solution which may be described as "Dynamics".

No effective method for the control of mosquito blight in practice has yet been found, but it is becoming appreciated that losses due to the mosquito bug may be greatly reduced by the maintenance of the bushes in healthy condition, and that increased crops may be obtained, in spite of the presence of mosquito by well-balanced manuring and general good cultural treatment.

**Mycological Branch.**—Shortly after the opening of this Branch of the department at the end of 1911, it was found that root diseases were causing very serious losses in all districts. In the case of the Doars it was estimated that the loss was sufficiently to justify an expenditure of Rs. 60 per acre on new clearances in preventing root disease. The losses due to these diseases have now been very much reduced throughout North-East India. Many gardens formerly badly infected are now comparatively free.

**The Indian Tea Association.**

In regard to blister blight (*Exobasidium vexans*, *Masseo*) as a result of our investigations it has been found possible to eradicate or greatly reduce the incidence of this disease on isolated gardens, but in Darjeeling where gardens are adjoining it has not been found possible. Even in the case of Darjeeling prompt treatment of small outbreaks and the protection of tea which experience has shown to be specially susceptible to the disease has considerably reduced the losses due to this disease.

Other leaf diseases such as Brown blight (*Glomerella cingulata*), Grey blight (*Pestalotzia theae*) and Copper blight (*Laestadia camelliae*) have been investigated. It has been found that soil conditions are largely responsible for outbreaks of these diseases. Red rust (*Cephaleuros virescens*) has also been found to be controllable by soil treatment. Severe outbreaks of these diseases are now no longer feared.

Stem disease producing fungi have also been investigated and it has been found that most of these diseases are associated with unsatisfactory system of pruning. Improvement in pruning methods is reducing the amount of these diseases.

The general line of investigation has been to ascertain the influence of health and vigour of the tea bushes on their susceptibility to disease. Specific fungicidal measures have been confined to the treatment of small outbreaks of disease with a view to eradicating the fungi concerned before they attack large areas. When large areas have become infected, the first consideration has been the improvement of the health and vigour of the bushes concerned. In most cases this leads to such a reduction in disease that specific fungicidal treatment becomes unnecessary. The investigations on fungus diseases have done much to improve the general condition of the tea.

In the course of our investigations on the treatment of fungus diseases it was found that lime-sulphur solution applied in the cold weather after pruning not only reduced the amount of fungus disease directly but also indirectly caused an improvement in the health of the tea. This solution is now being used on a large scale with very beneficial results.

In addition to the work on fungus diseases, the Mycologist has devoted much attention to the physiological aspects involved in the manufacture of tea. He has succeeded in isolating many varieties of yeast from both fermenting tea leaf and from the surfaces of fresh leaves. He has also demonstrated that some of these yeasts influence the flavour of manufactured tea. The influence of temperature on the changes in colour of tea leaves was also investigated by this Branch and useful results obtained.

In the absence of a Botanist, most questions involving special botanical knowledge are referred to this Branch. In this connection a herbarium has been gradually built up. It now contains some 3,000 species. The Branch has paid attention to the improvement of tea seed gardens and it has been possible to make some useful practical suggestions as a result. In former years this section also devoted a great deal of attention to green manures and shade trees and most of the experiments carried out with new varieties of green manures were initiated and supervised by the Mycologist.

The microscopic examination of tea seeds for export certificates is also carried out by the Entomological and Mycological Branches and in the past year more than 60,000 tea seeds were examined in this connection.

**Bacteriological Branch**—This Branch has only been in existence for seven months. Research is at present directed towards the problems connected with nitrification in acid tea soils, and up to the present time work has been confined to the study of the chief factors which influence this process. In the case of ammonium sulphate, initial acidity of the soil plays an important part and it has been found difficult to start nitrification of this salt in a soil of high hydrogen ion concentration; In the case of oil-cake the hydrogen ion concentration of the soil in the immediate neighbourhood of any particle is raised by the liberation of ammonia, and nitrification proceeds rapidly.

The results of the experimental work of the department as outlined above are given practical application generally throughout the tea districts of North-East India. The appreciation of the work of the department is evident in the increasing demands received from those interested in the tea estates for advice and assistance from the department.

**Advisory work done for provincial departments, local bodies, etc**—Advisory work with regard to tea is not asked for by provincial departments or local bodies.

Information acquired is communicated in the *Indian Tea Association Quarterly Journal* in a practical form as free from scientific technicalities as possible.

Planters and managing agents ask and receive advice by post.

**The Indian Tea Association.**

In addition, the officers of the department tour all the tea districts regularly and visit the gardens which ask for visits for the purpose of discussing problems. Lectures are given at the local clubs or other meeting places. These are very well attended by the planters.

*Provision for training men for the highest posts.*—No special provision is made for training men for the highest posts, since candidates for these posts are selected from British-trained men. The qualified and unqualified assistants receive a very useful training in agricultural science, and sometimes leave to take up superior posts. The training given meets our requirements. It is found that even the Honours Science degree conferred by an Indian University denotes but a very indifferent knowledge.

*Short courses in special branches of study.*—In the cold weather months of every year arrangements are made at the Association's Tocklai Experimental Station for three courses of instruction for Superintendents, Managers and Assistants attached to tea estates in the membership of this Association. Each course accommodates twenty visitors and lasts for one week, thereby allowing for instruction to be imparted to sixty visitors every cold weather. The subjects dealt with in these courses of instruction will be seen in the accompanying syllabus prepared by the Chief Scientific Officer.

*Co-operation in work.*—(a) With the Imperial and Provincial Departments of Agriculture,

(b) with other departments;

(c) with the Imperial Bureau of Mycology and Imperial Bureau of Entomology; and

(d) with other institutions such as the International Institute of Agriculture at Rome.

In the work of the Scientific Department, Indian Tea Association, all branches co-operate under the direction of the Chief Scientific Officer of the department.

As instance the Chemical Branch endeavours to find the information regarding soils required by the Entomological and Mycological Branches in relation to attacks by pests and blights. The Chemical Branch has collaborated with the Bacteriological Branch in connection with the investigation connected with the determination of soil acidity.

The Entomological and Mycological Branches have worked together on the examination of tea seed for export.

(b) This department has always received able and willing help from the Imperial and Provincial Departments of Agriculture when required; and has been willing to render any service possible in return.

Opportunities for meeting and discussion at conferences at Pusa have been taken but it is regretted that these conferences are not held sufficiently regularly and frequently.

(c) The Imperial Bureaux of Mycology and Entomology have been useful.

(d) The publications of the International Institute of Agriculture and of other research institutions in other countries are helpful, but these institutions are not consulted directly, except during visits whilst officers are on long leave.

*Obstacles in the work.*—The chief obstacle in the way of developing the work of the department is the difficulty of applying results obtained at Tocklai to districts different in soil, climate, etc. In the neighbourhood of Tocklai also certain pests such as helopeltis and thrips are practically absent. At present this difficulty is only partially solved by observation and experiment during tours and by experiments on gardens run by managers themselves. Such experiments are always very difficult to interpret because owing to the demand on labour and on supervision it is never possible to run experiments on more than single plots, the results of which are liable to a large and indeterminate probable error. This obstacle can only be overcome by the establishment of small branch experiment stations in the various districts. As a start to this end there is now an officer of the department stationed in the Bengal Dooars, with a temporary laboratory, who is also to give personal supervision to experiments on the gardens in the neighbourhood.

The Dooars, however, and also the Terai and South Sylhet, have expressed wishes for permanent Branch Stations to be established within their districts, and it is hoped that these will eventually materialise, and that when the benefit is seen, other districts will follow the example.

*Total budget provision.*—The expenditure of the Association's Scientific Department on revenue account in 1926 is estimated at Rs. 2,58,726-1-0 which is reduced by the estimated income to Rs. 1,93,937-1-0 which is met from the money collected in subscriptions at the rate of 8 annas per acre from all tea companies in the membership of this Association. The estimated capital expenditure in 1926 is Rs. 45,511-1-0.

**The Indian Tea Association.**

## APPENDIX II

## Memorandum on the Indian Tea Cess Committee

The Indian Tea Cess Committee was constituted under the provisions of Act IX of 1903 which was passed by the Governor General of India in Council on the 20th March 1903. The object of the Act was to provide for the creation of a fund to be expended for the promotion of the interests of the Indian tea industry. From the year 1898 the Indian Tea Association had been collecting a voluntary assessment for expenditure on the development of foreign markets for Indian tea. There are, however, objections to this system of raising funds, and, these becoming increasingly obvious as time went on, the Association resolved to obtain if possible the levy of a compulsory cess. And in 1902 after much correspondence and discussion the General Committee of the Association presented to the Viceroy a memorial, praying for the imposition of a cess at the rate of one-fourth of a pie per pound on all tea exported. The memorial was signed by, or on behalf of, 366 tea proprietors and companies, representing 416,140 acres of tea land, or rather more than 80 per cent of the total area then under tea cultivation in India. It was favourably received by Lord Curzon, and a Bill, providing for the levy of the cess at the rate suggested, was introduced into the Imperial Legislative Council by Sir Montague Turner, the then Mercantile Member, on the 30th January 1903.

2. Before the passing of the Act the General Committee of the Indian Tea Association had framed, at the instance of the Government, a scheme for the administration of the funds which would be raised. Subject to certain modifications this scheme was adopted by the Government. In its final shape it provided for the formation of an Administrative Committee consisting of twenty members representing (a) tea growers; and (b) the general commercial community. The representatives of the latter were to be four in number, three of them were to be nominated by the Bengal Chamber of Commerce, and one by the Madras Chamber of Commerce. The representatives of tea growers were to be nominated by the following associations:—Indian Tea Association, Calcutta (seven); Arsam Branch, Indian Tea Association (two); Surma Valley Branch, Indian Tea Association (two); Darjeeling Planters Association and Terai Planters Association, jointly (one); Doonra Planters Association (one); Dehra Dun Planters Association (one); Kangra Valley Planters Association (one); United Planters Association of Southern India (one).

3. As is intimated above, the cess was levied at the rate of  $\frac{1}{4}$  pie per lb of tea exported. It remained at this rate until 1921-22 when, at the instance of the tea industry, the rate was raised to 4 as per 100 lbs. In 1923-24 the Act was amended, also at the instance of the tea industry, so as to enable the cess to be levied at a maximum rate of 8 as per 100 lbs of tea exported. The maximum rate has not been put into operation so far. But, with effect from the year 1923-24, the levy has been made at the rate of 6 as. per 100 lbs. of tea exported.

4. The cess is collected by the Customs Department and the proceeds are made over by the department to the Committee. The collections from 1903-04 to 1925-26 are shown in the following table:—

				Rs.
1903-04	at $\frac{1}{4}$ pie per lb.	...	...	2,66,891

5. At the time when the cess was instituted the Committee determined to concentrate their efforts largely on the United States of America. With this end in view they spent Rs. 23,61,831 in promoting the sale of Indian tea in that country from the year 1903-04 to the year 1916-17. By that time the War had made it difficult to proceed. Freight troubles grew more and more serious, and the reduced imports of tea into the United States made advertising unnecessary. The work was accordingly restricted, so much so that in the years 1917-18 to 1923-24 a sum of only Rs. 83,303 was spent. The Committee began again in the United States in 1923-24 after making full enquiries into the trade conditions prevailing there. They decided to embark on a scheme of intensive newspaper advertising, and this scheme they placed in the hands of Messrs. C. F. Higham, Ltd., advertising agents of London and New York, by whom it is now being carried out. During the years 1923-24, 1924-25 and 1925-26 the Committee have spent Rs. 18,87,008 in the United States.

6. In continental Europe, the Committee began work in a small way in 1905-06. They selected Belgium and Germany as two countries in which to start their propaganda in favour of China tea. The operations came to an end in 1916-17 the distributing trade. The scheme went steadily forward until it was stopped by the outbreak of War in 1914. Apart from gifts of tea to the French and American troops nothing further was done on the Continent until 1922-23 when work was begun in France and from that time to the end of 1925-26 a sum of rather more than Rs. 9½ lakhs has been spent in France. The total amount expended on the Continent of Europe since 1905-06 is slightly in excess of Rs. 10½ lakhs.

7. In the United Kingdom, the Committee carried on an advertising scheme for a number of years before the War, the object at the beginning being to counter a propaganda in favour of China tea. The operations came to an end in 1916-17 by reason of the War. In the early years of the cess, 1903-04 to 1906-07, the Committee contributed to a League which was formed with the object of bringing about a reduction in the import duty on tea in the United Kingdom. They have also been represented at exhibitions such as, for example, the British Empire Exhibition of 1924. In all they have expended about Rs. 7½ lakhs in the United Kingdom since the institution of the cess in 1903.

8. During the years 1903-04 to 1914-15, the Committee spent small sums in India on experimental operations, the total amount being less than Rs. 75,000. But during the War they decided to begin work in India on a large scale, and in the eleven years 1915-16 to 1925-26 they have expended upwards of Rs. 41 lakhs in this country. No trading in tea has been undertaken by the Committee. The funds have been spent in encouraging the sale of tea entirely by private enterprise. More than 40,000 bazar shopkeepers have been influenced to take up the sale of tea, and have been assisted with free supplies of suitable advertising matter, containers, measures, and packets for tea. Various attractions have also been periodically lent in order to bring customers to the shops. Arrangements for the sale of tea to Indian passengers have been organised on several inland steamers, and at important junctions and large stations on the Eastern Bengal, East Indian, Oudh and Rohilkhand, North Western, and Bombay, Baroda and Central India, and South Indian Railways. At the instance of the Committee, tea rooms have been started at most large industrial establishments in India where such did not previously exist. Tea and Recreation Rooms have been organised for about 300 military units.

9. According to the statistics available, the sale of tea in India and Burma averages approximately 18 million lbs. annually for the quinquennium before the start of the propaganda work in India. During the year ended 31st March 1926, the estimated quantity of tea available for consumption in India and Burma was over 50 million lbs.

Mr. T. C. CRAWFORD (Chairman), Mr. P. H. CARPENTER and Mr. J. A. MILLIGAN, Representatives of the Indian Tea Association

### Oral Evidence

22941. *The Chairman*: Mr Crawford, Mr. Carpenter and Mr. Milligan, do any of you gentlemen desire to make a statement of a general character before we proceed to question and answer?—(Mr. Crawford) No, I think we have made our statement clear; we would rather just answer questions.

22942 I propose to address myself in the main to you, Mr. Crawford, but of course if your colleagues desire to interpolate any remarks, we shall be glad to hear them, if they do not, we shall assume that in the main they agree with your expressions of opinion. Will you turn to the memorandum which your Association has been good enough to prepare for the Commission and for which we are greatly obliged. There is a covering sheet giving us the history and the particulars of organisation of the Indian Tea Cess Committee; I should like you to tell us at the outset what exactly is the relation between the Indian Tea Cess Committee and the Indian Tea Association?—The Tea Cess Committee was started through the Indian Tea Association to propagate and assist in advertising the sale of tea. We have no real connection now with the Indian Tea Association except that the Indian Tea Association nominates certain representatives to the Tea Cess Committee.

22943. Let me understand the position aright; your Tea Cess Committee is concerned purely with advertisement?—Purely with advertisement, yes.

22944 How is your Indian Tea Association financed?—It is financed by a levy from members of eight annas per acre per member.

22945. The Indian Tea Association is financed on an acreage basis, while the Indian Tea Cess Committee is financed on a poundage cess?—Yes.

22946 Could you provide the Commission with some indication as to the extent to which demand has responded to advertisement?—In India, where we have been mainly concerned about ten years ago the consumption of tea was approximately 16 million lbs., while we now place the consumption of tea in India at 50 million lbs.

22947. And overseas?—In America it is really too early to say what results have been obtained. We are spending in the neighbourhood of £50,000 in America; we consider it will be a matter of three or four years before we can clearly state what results will be obtained.

22948 How long after the launching of an effort, do you find the reaction usually takes place?—We could not say from experience. In India, the position is rather different because we have concerned ourselves mainly with work in the larger towns and on railways; certainly the response has been slow but it has been quite marked; annually the increase has been quite marked. In regard to America we have noticed a slight response and there has been a demand for Indian tea; it is difficult to say to what extent that has been due to our advertising campaign which only started two years ago.

22949 Now will you turn to the principal memorandum of the Indian Tea Association? In the first paragraph on page 388 you point to the fact that there is a steady increase in the investment of Indian capital in tea. Is it the practice for Indians to take the whole risk and to manage themselves?—Yes, particularly in the Doors there is a marked increase in the acreage taken up by Indians both for the cultivation and manufacture of tea.

22950. What do you say about the standard of cultivation in plantations managed by Indians as compared with plantations managed by Europeans?—I think the majority of advanced Indians follow European methods of cultivation; they profit by European methods of cultivation.

22951. *Professor Gangulee*: What about the quality of tea?—That is rather a difficult question to answer. Possibly on the whole, with many more years of experience, our manufacture is a bit better than the Indian. At the same time, a great deal depends on the district in which it is grown and various other factors. There are some Indian gardens producing excellent tea.

22952 *The Chairman*: And no doubt the market which they are seeking to serve has to be taken into consideration?—Yes.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

22953 Will you turn to page 386? To what extent are you on the research side of your organisation in touch with the Government of India organisation at Pusa?—(Mr. Carpenter) We have no organised link; it is purely as we feel we need it.

22954. Let me make myself clear; the first problem which you suggest as requiring investigation is "The correlation of soil analytical data with soil fertility." Now that is a fundamental problem of general application?—Yes, it is.

22955. Is not that a problem to which Pusa might well direct its attention?—Yes, I think it is; that is why I mention it here.

22956. Have you asked them to do so?—No, never definitely. I have never been consulted as to what programme Pusa should adopt.

22957. You feel disinclined to take the initiative?—Yes, in that respect officially.

22958. Would you like to have closer touch with Pusa if it can be arranged?—I certainly should in things like that.

22959. Then on page 387 under the heading Agricultural Education, in answer to our Question 2, you say, "The science courses at the Indian Universities call for much improvement." On what do you base that view?—On my experience of the graduates turned out from Universities; we employ them.

22960. Do you think they are weak in pure science?—Yes, and in technique particularly.

22961. In what branch of technique; research technique?—No, ordinary laboratory technique, in chemistry, bacteriology and mycological work.

22962. What is your own training?—I am a chemist.

22963. Have you ever held a post under the Government of India or any Provincial Government?—No.

22964. What do you say about the natural capacity of Indian youths under adequate systems of training? Do you think their lack of scientific attainment which you think you see might be removed?—I am only speaking directly from my own experience; judging from my own experience, I should say that some of the men that I have had could certainly have been trained.

22965. They are first class men?—I consider that one or two of them have been capable of becoming first class men. I do not think that of all of them.

22966. You are concerned with an organisation which looks at these matters from the commercial angle and your views are very important. I do not know whether you could give the Commission any more substance upon which we might form a judgment on the views that you have expressed as to the inadequacy of scientific training in the Universities?—It struck me that one of the great needs of the students was lack of technique which means that they had not had sufficient laboratory training during their College course. I have not gone into the detail of what that course is, that is for the University authorities, but in my opinion they ought to have more practical training.

22967. Have you ever made any representations to any person or body responsible for the University courses?—No, I have not.

22968. You recognise the importance of keeping the authorities who are responsible for controlling these matters at the Universities in touch with commercial opinion, because after all the main objective in the minds of most of the young men when they take these degrees is remunerative employment?—I quite agree; I am quite willing to give my views to the Universities whenever they want them.

22969. *Professor Ganquhar*. Have you visited any research laboratories run by the Universities?—No, I am speaking purely from my own experience gained in my own laboratory.

22970. *The Chairman*: I do not want to put words into your mouth but has there been too much work on the text-books and too little work at the bench?—Yes, some of the men have obviously got text-book knowledge.

22971. Good general text-book knowledge?—Yes, without having had sufficient practice.

22972. Not sufficient practice in the laboratory?—Nor have they had sufficient training in initiative, that is to say, I think they have had very little training in the problems; they have not been given a problem that has required anything more than text-book knowledge and asked to solve it.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan,

22973 I will leave that subject. Under the heading *Railways and Steamers* on page 337 you say "The tea industry has not been satisfied in the past with the services afforded by the railways, as there has been no progressive policy linking up new districts or providing communications to districts already under tea." Now is it your view that there are openings for branch and feeder lines which would be remunerative and which are not being taken up?—(Mr. Crawford.) At the present time so far as the tea districts of Assam are concerned, we have three feeder lines under construction; at the present moment we are agitating for another feeder line to deal with a very large area of tea and cultivators' land. In addition to that we are agitating for a link with the Bengal Doon Railway and the Eastern Bengal Railway; but generally we feel that in the past the possibilities have not been sufficiently exploited. There is certainly now every indication that the Government are alive to the need for opening up and undertaking new areas; and with that, if the present programme is continued, we have no complaint to make.

22974. What gauge are you on?—It is a question of fitting in with the gauge available. As the Assam-Bengal Railway is on a metre gauge, it would not serve any good purpose to put in other gauge in Assam.

22975 There is no difficulty in connection with the gauge?—No.

22976. On the same page you say you are not satisfied with the services rendered by the Meteorological Department because, as you say, the information they give is sometimes found to be misleading and unreliable, involving the industry in considerable waste of money. I read between the lines there that you are referring to attempts on your part to direct your recruiting agencies in accordance with unemployment in other rural areas in India?—Yes.

22977 You want to know where crops are going to fail so that you may keep your recruiting staff at work and get the necessary labour for your own plantation; is that right?—Yes.

22978 Then on the same page again you say you are not satisfied with the present Meteorological Service in the tea districts. There you are concerned with forecasts of weather, records of sunshine and other natural facts as a guide to the current season or future weather?—Yes.

22979. Then on page 338, in answer to our Question 10, paragraphs (c) and (d) you say, "The cultivator in the neighbourhood of tea gardens shows a tendency to profit by the experience of the industry." Do you mean other cultivators of tea?—No, I mean the actual land cultivator.

22980. Do you think the presence of the tea gardens and the consequent large local demand for fertilisers cheapen the fertilisers and make them more easily available for the other cultivators?—It is not that; for instance, we make a point of collecting as much cattle manure as we can and we now find other cultivators realising its manurial properties are anxious to acquire it for application on their own paddy fields. There is also, I think, a slight tendency to use chemical manures.

22981. On the same page you speak of the damage to tea gardens by wild elephants?—That has been very serious of late.

22982. Is it only a question of having a sufficiently well organised hunt?—We are not allowed to kill them unless they are proscribed.

22983 Are only rogues proscribed?—If they do a fair amount of damage, Government may proscribe them.

22984. Is it not the case that a *kheddah* is being organised there at the moment?—Only in certain districts.

22985. Is it a serious source of loss?—It has been particularly so in the last month or so, but it has always been a serious matter.

22986 You deal with the general question of agricultural labour and your views are set out perfectly plainly. Amongst the difficulties that you encounter in recruiting sufficient labour from distant districts, does not the cultivator's love of his own native village play an important part?—There is no doubt that it does.

22987. Are you experiencing a growing difficulty in getting sufficient labour?—Yes.

22988. Is that because you want more labour or because less labour is available?—There is less labour available because there are many other forms of industry developing in India which absorb labour. Railway construction in particular and

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan,

docks and wharves have absorbed a certain amount of labour which previously went to the tea plantations; moreover there has been an extension of tea cultivation which absorbs more labour.

22989. Do you want labour to come and settle in the neighbourhood?—We prefer permanently-settled labour; we prefer families to come. Afterwards they either take land on the estate or take up Government land.

22990. Do you provide houses for them?—Yes and medical attendance.

22991. You have a very complete system of hygiene, have you not?—We are doing our best, but we are kept back very much by the peculiarities of the labourer.

22992. You mean his disinclination to adopt modern views of hygiene?—Yes.

22993. Is it not true that you are conducting an anti-hook-worm campaign?—I could not call it a campaign but the treatment of hook-worm is receiving special attention. We have also conducted a malaria survey of Assam and have just finished a survey in the Doorgas.

22994. All at your own expense?—Yes.

22995. Have you seen definite indications of improved vitality and capacity for work as the result of the hook-worm campaign?—Certainly. As the result of the hook-worm campaign we find there is increased efficiency which is a great factor.

22996. Is there a greater degree of mental alertness?—Yes.

22997. Is that very definite?—In Darjeeling in particular we carried out a very extensive and elaborate campaign and we found as a result of that that the efficiency was increased by, I think, about 15 per cent.

22998. Was the central point of that campaign the provision of sanitary latrines?—We have managed to do that in Darjeeling; in other districts it is very difficult to get sanitary latrines used when installed.

22999. Is there any hope of permanently eradicating hook-worm until you can control sanitation in that respect?—I do not think so; I think we are certainly keeping it down.

23000. But until you can get the latrine system installed throughout, there will always be infection?—Yes. We are quite prepared to instal latrines if there are any signs of their being used.

23001. It is a great deal easier for your Association to control these matters amongst labourers in your employ than it would be for the Government to control these matters in villages where the cultivators are independent. Have you instances where you have been successful in persuading the community itself to administer and keep these facilities reasonably clean?—Our efforts have been mainly in the direction of improving our own house.

23002. I am speaking of your own house?—In our own house, yes; it is very slow but we are gradually effecting improvement in matters of hygiene and in regard to sanitation particularly. The lines are being kept in better order and we are looking forward to improving matters further. We find that they are more inclined to benefit by medical advice than they were a few years ago.

23003. Do you have overseers or foremen in charge of the sanitary side of the work?—No; we work on the principle of having an European Medical Officer in charge of a group of Indian doctors each of whom is in charge of an estate hospital or dispensary. The Indian doctor is usually made responsible with his hospital staff for keeping the lines clean and with regard to sanitation.

23004. As a rule how many families would be in charge of each Indian doctor?—An estate varies from about 400 to 800 acres.

23005. Employing how many people?—About 1,200 in the case of the latter.

23006. Is that male workers?—Families all told.

23007. Does that 1,200 include the children?—Yes.

23008. Even in the conditions where one trained doctor, with I suppose adequate assistance, is in charge of that small number of people, do you find the greatest difficulty in controlling these insanitary practices?—Yes.

23009. *Professor Gangulac*: What is the qualification of the Indian doctor?—As a rule we prefer to have graduates from one of the recognised Colleges or Medical Schools.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

23010. *The Chairman*: They are fully qualified men, are they not?—In some cases they are not as well qualified as we should like them to be; but we are very much limited by what is available.

23011. Do you mean by what you are prepared to pay or by what is available?—I do not think we ever questioned any payment in regard to medical services.

23012. Are they disinclined to come?—They seem to be disinclined to go to Assam.

23013. What do you think that is due to?—Possibly it is due to the malaria.

23014. *Professor Gangulee*: What pay do they get now?—I could not say; it varies; I know some of the Indian doctors get Rs. 800, others Rs. 100 to Rs. 150.

23015. *Rai Bahadur Bannerji*: In that case are not they graduates from the Calcutta Medical College?—They are mostly obtained up country; we leave it to the European doctor to recruit the Indian doctors himself.

23016. *The Chairman*: In answer to Question 19 with regard to forests you say, "Certain tracts of land, eminently suitable for tea or other cultivation, are reserved as forest,—a much less profitable use of those particular areas." Do you mean less profitable to your constituents or less profitable to the Government?—Less profitable to the Government.

23017. Are those tracts which are being held for commercial reasons or for protective reasons?—Forest reserves entirely.

23018. It is not a question of preserving them as areas which ought not to be cut out because of the dangers by erosion of flood?—No.

23019. Have you ever made representations to Government on that score?—Continuous representation is being made for releasing these areas, but it is always refused.

23020. With an argument or without?—(*Mr. Milligan*.) Argument has been sometimes attempted without much success. The only possible argument of course is that the land would be more profitable if put under tea than under forest; that does not appeal much to the Forestry Department.

23021. *Mr. Calvert*: Do you mean more profitable to the Government?—Yes.

23022. *The Chairman*: Do you mean that the Forest Department have water-tight minds in that respect?—Entirely.

23023. They are thinking of their own budget?—It is a very difficult thing to get the Forest Department to part with a single acre of land; it always has been. They are only too ready to grab any land they can get, for increasing the reserves.

23024. But do you as an organisation deal with Government in these matters or do you allow the individual to make his own application?—(*Mr. Crawford*.) As a rule, with regard to land application the individual appeals to Government.

23025. Could you not as an organisation bring your weight to bear in a matter of this sort?—I do not remember it having been taken up by the Association at any time.

23026. Do you not think it might well be?—Possibly.

23027. On page 389 you deal with the question of marketing; you say, "The industry has pressed for the prescription of a standard of quality for imported tea, but the Government of India are of opinion that this is a matter which can be suitably dealt with by Local Governments". Is that with the idea of keeping out teas which are cheaper than the lowest priced Indian tea?—No, because there is a duty on imported tea; it is entirely with a view to setting up and maintaining a suitable standard of tea for India. We find it extremely difficult to prevent unsuitable tea from coming into the market. We have been agitating it through the various Governments to have a standard of tea prescribed, as is prescribed in most other countries in the world. The Government of India think that is entirely a matter for the Provincial Governments, but on the other hand it is easier to deal with imported tea through the Customs which is a Central Department than through the Provincial Governments. That is the reason why we mention that aspect particularly there.

23028. Who do you think is the best judge of good tea; your Association or the person who is going to drink the tea?—I think the Association.

23029. But you are quite definitely of opinion that these imported teas are not being sold more cheaply to the public than tea which could be provided from Indian gardens?—That really does not trouble us. Recently there has been some particularly undesirable stuff coming in from China; we want to keep that off the

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

market, and we also want to keep off the market certain low grade stuff sold by Indian producers, in other words, tea waste which we export and which should be used for the manufacture of caffeine.

23030. On the same page you say, "The tea industry has consistently opposed the export duty on tea, amounting to Rs. 1-8-0 per 100 pounds." I suppose the effect of that duty is certainly not to raise the price of tea to the Indian consumer, is it?—No.

23031. Has it any effect in lowering the price to the Indian consumer?—I do not think the consumption of tea in India is sufficiently high to have a marked effect one way or the other.

23032. If it did have an effect, that is the effect it would have, would it not?—I should not like to say; I do not think it has any effect on Indian prices.

23033. Does your Association still hold the view set out on page 390 of your memorandum that legislation might be introduced to provide for compulsory returns regarding planting statistics being submitted by planters?—Yes. We did not hold any very pronounced views about it; certainly the figures were unreliable and we were quite prepared at that time to entertain any proposal as to legislation.

23034. Is there a large area outside your membership?—Our membership represents 83.46 per cent. of North India and 71.8 per cent. of all India. In addition to that, of course our branch associations frequently have members who are not members of the parent association, so that I think possibly you may take it we really represent about 90 per cent. of North India.

23035. Do you know what particular importance was attached by its advocates to this particular scheme?—That is in regard to collection of facts about acreage?

23036. Yes?—It is useful from our point of view; we are very anxious indeed to know what is available for consumption in India particularly; that is what we were getting at.

23037. Would these facts about the acreage planted be essential for the provision of the information which you require? I was trying to get from you what was in the minds of the persons who advocated the collection of facts about acreage?—The reason was that we were out in our estimate; our estimate differed considerably from the Government's estimate. After going into the matter further we found that the Government had left out two or three gardens in one district. This agitation followed on that. We considered if there was an exchange of figures between our Association and Government, we could possibly trace where these differences arose. On the other hand, Government considered their statistics confidential.

23038. Is the whole of your membership in one Province?—No, Assam, Bengal, etc. We do not touch South India.

23039. In your research work do you find any difficulty springing from the fact that your constituent's gardens are situated in more than one Province?—Mr. Carpenter does; he is very anxious to have branch research stations throughout the various districts.

23040. I think we should like to hear about that?—(Mr. Carpenter.) The climatic and other conditions, in the tea districts vary very considerably, from conditions such as one gets in Ranchi and Dohra Dun to conditions such as one gets in Northern Bengal. There are also very great differences of soil. It is impossible to translate the results of experiments carried out in one district to other districts; they have to be confirmed in the particular districts for which one wants results. The experimental station at present is situated on a sandy soil in Assam. It represents a very large area of Assam proper. It is entirely different from a very common type of soil that occurs in Northern Bengal where there is a heavy clay. The result is that one finds that results from manuring in one place will not hold good in the other. Owing to different weather conditions one also experiences different incidence of blight which require to be studied on the spot.

23041. Would you advocate one central institution and then smaller institutions in typical areas?—Yes. You are speaking of tea?

23042. Yes, tea only?—Yes. I do. I consider we ought to have one central institution where we could deal with general matters, and that the results so obtained should be interpreted for other districts by small district stations. I do

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

not suggest having big staffs in the districts, but small staffs which would be in continual touch with the planters of that particular district.

23013 Have you any touch with the Government; is any representative of Government in touch with your Research Committee?—(Mr. Crawford.) We have a Scientific Branch Committee.

23014 Have you any Government representative on that Committee?—No.

23015 Are you familiar with the organisation of the Indian Central Cotton Committee?—No.

23016 Are you familiar with it, Mr. Carpenter?—No, I am not.

23017 If Government research stations were willing to undertake work on subjects of general application, would you welcome some representation of Government on your organisation? Have you considered that at all?—For what purpose?

23018 To keep touch with you on questions of research, and possibly to be there to interpret the needs of your particular industry in terms of administrative action. You told the Commission a short while ago that representations had never been made to Government on this question of giving over certain forest areas to tea growing; it might be well worth your while to be in close touch with Government so that when it is of that sort could be dealt with by representatives of the Government and taken to higher authority?—(Mr. Crawford.) We, of course, exchange publications, and Mr. Carpenter attends all the conferences at Poona, so that we keep in touch with Government to a certain extent. (Mr. Carpenter.)—Personally I am in touch with such institutions as Poona, but there is no official touch except that I am a member of the Board of Agriculture, which meets once in two years, as being Chief Scientific Officer of the Indian Tea Association.

23019 Of course, your problems are not parallel to the problems of the cotton industry because in the latter yours is a planter's crop, whereas cotton is a grower's crop?—I should rather like to take exception to that.

23020 Well, please to say?—I think there are many problems which are fundamental and which have not been investigated in India; it is the lack of fundamental research in which India is suffering.

23021 I am not sure you understood my question, but that is not I. There are problems which I take it in your view might well be undertaken by Poona?—Yes, some central research station that is set apart for research questions connected with fundamental research.

23022 Sir Henry Lawrence: Have you raised any of these particular problems at the meetings of the Board of Agriculture?—On one occasion I told the Board of Agriculture that I thought we needed an opportunity of discussing when all scientific officers were present, some of these problems. But the Board of Agriculture meeting is hardly a suitable time to do it; it met for another purpose.

23023 They appoint sub-committees occasionally to go into further detail, do they not?—Yes.

23024 Is that problem suitable for sub-committee discussion?—No, I think we want something entirely different from the Board. The Board is then for the purpose of advising the Government of India in regard to agricultural matters.

23025 But the Board also undertakes special investigations and arranges for them. It seems to me you could get what you want done by your presence at the Board, if you put it to them, could you not?—I think it would be difficult, it might be possible; I should like to see it possible.

23026 Have you any suggestion to make as to the way in which your problems could be investigated?—I think there should be some central reference committee where one could raise problems which one considered of fundamental importance; these problems should be collected from all India; those that were of greatest necessity, as judged by the answers received from the various districts, should receive attention at the central research station.

23027 The Chairman: Mr. Crawford, you will have an indication of the direction in which some of our minds are working when you come to look through the verbatim report, and if your Association care to forward us any views on these subjects, we should be very glad to receive them?—(Mr. Crawford.) You intend visiting Toolai later; when you have seen Toolai you might desire some further information, in which case we are at your service.

23028 Sir Henry Lawrence: You mention that your area under tea is growing; can you tell us what your present acreage under tea is?—The total acreage is

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

728,000 acres; total production for India is 363½ million lbs., 61·93 per cent. of that is in the Assam Province proper.

23059. On that acreage you employ on the average about 3 persons per acre, do you?—No, as a rule about 1½ is a very full allowance.

23060. You gave the figure as 3; was that including women and children?—Yes, that was everyone on the estate. As a rule we consider we are well laboured if we have 1½ working coolies per acre.

23061. So that your labour force is a little over a million: 1,100,000, and the total population is between 2 and 2½ millions?—The total tea garden population of Assam is about 1½ millions, in Assam and Bengal the workers number about 862,000.

23062. I should like to have rough figures for the whole of India rather than for Assam only, with a view to seeing what is the value of the industry to the employment problem of India?—Assam's report which is just out gives 991,000 as the total strength of the labour force in Assam.

23063. And you say that is 60 per cent.—That is about 61 per cent. I should think there are fully 1½ millions.

23064. That is your labour force?—Yes.

23065. And the total population, with women and children, would be about double that?—(Mr. Milligan) That figure includes women and children.

23066. You refer to the competition of Java in the Australian market; is that competition increasing generally?—(Mr. Crawford) Yes; I have some figures here which will give you the outline you require (*document handed in*).

23067. That is contained in your statement which we have?—Yes.

23068. The total outturn of Java has increased four-fold within the last twenty years?—Yes.

23069. It now exceeds the output of China?—I have not the figures of the production in Java available.

23070. There are some here in this statement Is the Java tea industry receiving any special assistance from the Java Government?—(Mr. Carpenter) Yes, the Scientific Department is supported by Government.

23071. You are suggesting that some steps should be taken to assist your industry because of the competition of Java in Australia. Is that competition also world wide?—It is. Of course, at Home we have a preferential duty in our favour, but in Australia we have against us this export duty. We are not suggesting Government assistance in regard to our Scientific Department; we are more concerned with the removal of what we consider a war duty, the export duty.

23072. But the Australian market represents only about 1 per cent. of your export?—It is a very small percentage, but still we do not want to lose it if possible.

23073. I only want to get the whole thing in perspective. You speak of the advantage given by preference in the Home market; the Home market represents 80 per cent. of your total production?—Yes.

23074. I notice from your statement here that your expenditure on propaganda in the United Kingdom is very much less than in other areas?—We have really no expenditure on propaganda in the United Kingdom. You refer to the tea cess?

23075. Yes?—We have an expenditure of £10,000 in France. The American expenditure of course last year was exceptionally heavy owing to the Exhibition; we spent £10,000 on propaganda at the Philadelphia Exhibition.

23076. From what area in India do you get most of your labour?—In Assam and the Doars from Chota Nagpur, Central Provinces, United Provinces, Madras.

23077. Have you got much of your labour from Madras?—A fair amount. (Mr. Milligan) It varies. From Northern Madras there has always been a steady influx of labour to Assam; but from the middle of Madras sometimes we have a considerable number and at other times not; at present we are getting very little.

23078. Do you employ the depressed classes; have you any prejudice against them?—(Mr. Crawford) No. (Mr. Milligan) There is an objection on the part of the Government of Assam to criminal tribes. We have tried several times to

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

import criminal tribes on a large scale, but the Government of Assam are always objecting

23079 Criminal tribes and depressed classes are not synonymous terms?—No, the ordinary impoverished classes are the people we usually do import.

23080 Have you got the percentage from Madras?—Very approximately 15 per cent last year

23081 But your largest number of recruits come from the tribes of Chota Nagpur?—Yes, until recently; during the last five years they have had a series of very good harvests in Chota Nagpur and recruiting there has dropped down practically to nothing, but it is showing signs of revival this year.

23082 Are there any restrictions imposed by Government which interfere with your recruitment, say, in Madras?—As a matter of fact, we get more assistance from the Madras Government than from any other Government; they have always been very well disposed towards recruitment for Assam; but there is a body of restrictions contained in Act VI of 1901, as subsequently amended, which makes it extremely difficult for Assam to make a start in a new place. Once you have got a good connection with a certain place, it is fairly simple, but it is practically impossible to tap new sources of labour.

23083 Why?—Because the only person you can employ for the purpose is a *sardar* sent down from the gardens; he is a labouring man; if he does not belong to that district, he goes there as a perfect stranger and his chances of success, except in times of famine or something of that sort, are practically nil.

23084 Have you represented that difficulty to any Local Government?—Yes, repeatedly, and at the present moment it is being represented in rather a more comprehensive manner than previously. (Mr. Crawford) The resolution on immigrant labour in Assam of the Assam Government has just become available; it says, "It has long been recognised that the provisions of Act VI of 1901 are out of date and that with the amendments which have since been made in it the Act constitutes a patchwork which it is difficult to interpret or to administer. The question of the replacement of the Act by legislation better suited to the conditions of the present day has been the subject of anxious consideration both by the Tea Industry and by the Local Government."

23085. We know that phrase very well, but what does it mean? What is going to be done?—We have given the matter our anxious consideration and we have put up a note to the Government of India which is presently having the consideration of the Member-in charge. Beyond that I cannot go at present because we have had no expression of opinion from the Member-in charge

23086. But do you wish to get some relaxation of these restrictions?—Yes, while preventing any abuses being introduced. That refers to Assam. Doors is under no restriction except such restrictions as are applied by ourselves. (Mr. Milligan) May I give an example of the way it operates. Some years ago there was a famine in the Chhattisgarh Division of the Central Provinces; the Commissioner of the division said to me, "Can you possibly take away large numbers of these people to Assam, they are starving?" I said, "I am sorry, it cannot be done; this Act makes it impossible." He had to open famine relief camps and feed the people as best he could, because this Act made it impossible for us to take these people in a mass like that and divide them up in Assam. It would have been necessary to send down individual recruiters from particular gardens who might or might not have succeeded in getting in touch with these people and taken them away.

23087. Your point is that these restrictions refer to a condition of affairs which existed before your Association improved the conditions of labour on the tea gardens?—As a matter of fact, up till eleven years ago things were not nearly so bad; before that you could recruit through contractors; but the contractors' system fell into such disrepute owing to the abuses that occurred and that facility was taken away from the industry and we were confined entirely to the *sardari* form of recruiting. It has not really to do with conditions in the gardens; these restrictions are the direct result of abuses. They took place in the course of recruiting itself. In the Commission of 1906, the Government of India in their Resolution record their satisfaction that the Commission found the conditions of coolies in tea gardens satisfactory.

23088. On the point as to your obtaining certain areas of forests for the development of tea gardens, what is the revenue that your tea gardens pay per acre to the Government?—It varies; there is fee-simple land and there is land which has been taken up more recently on a much higher rent. Fee simple land pays something

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

very small indeed; but, of course, there would be no question of that in this forest area; Government could put the land up to auction and get very big prices for it. In fact the offers which have been made to Government, so far as money is concerned, have been very attractive one would have thought.

23089. Can you give me any figure?—I cannot personally; I can only give hearsay evidence.

23090. Well; hearsay evidence is good enough?—I remember one offer being made to the Government of Rs. 100 an acre.

23091. That is occupancy right, and there would be a rental of about Rs. 2 per acre I suppose?—This was in the Doonra where it is laid down by law that the rent shall not exceed the rent of the highest rented paddy land in the portion of the district where the garden is situated; in that case it would have been Rs. 2 8 0 an acre.

23092. How many thousands of acres are in view as to possible additions to the tea area?—As no definite survey has been made, it is difficult to say.

23093. Is it two or three thousand acres or ten thousand acres?—I doubt if it is as much as 10,000 acres; but the point is that it is absolutely first class tea land, whereas a lot of the new gardens which have been opened out in recent years and are still being opened out are on inferior fourth class land.

23094. The Forest Department are making 1 annas an acre revenue?—Some of it I think actually makes a loss; not every district in the Forest Department pays.

23095. I want to know the relation between the public revenue that is being foregone by the Government, whether it is of Bengal or Assam?—It is very difficult to arrive at that because we are talking of particular sections of a place and the whole place is not uniform; by dividing the revenue of Government by the acreage of the forest you will not get a fair result. Some of these lands that are particularly suitable for tea are also very suitable for timber; in the Doonra particularly some of the best pieces of land for tea land also grow very fine timber so that in that case the profit to Government at the present time is higher than that of the average forest land.

23096. Would it pay better as tea land?—It would not pay better if it was let out for tea on the same terms as the present land is, but if the Government put up these pieces of land to auction or accepted the best offer made, they would get very much more for it than they are getting at present.

23097. Do you say that as a revenue proposition it is in the interests of the Government to accept the offer?—I think so.

23098. Sir Ganga Ram: These figures that you have just now quoted do not represent the price for the absolute sale of the land. Supposing Government sold the land absolutely, subject to land revenue of course, how much would they get?—(Mr. Milligan) What title are you suggesting?

23099. Absolute proprietary rights?—But the Government in Bengal and Assam never give absolute proprietary right nowadays.

23100. Supposing a new policy were adopted, I suppose they do not do it because it is subject to Permanent Settlement?—No, land in the forest area is not permanently settled.

23101. In the Punjab enormous quantities of land are sold and new canals and irrigation works are constructed with the revenues thus produced?—They sell, and in addition to that they take land revenue.

23102. The proprietary rights are not absolute?—No, what I suggested is tantamount to a sale except that there would be no permanent tenure.

23103. In the Punjab, we have to pay a very heavy figure to purchase proprietary rights; supposing the Government of Bengal adopted the same policy, would not they get three or four times the price?—Yes, I should think it is very likely they would, but it is very unlikely that they would do it, because if they did they would be pressed on all sides to go on with that policy; all the tea gardens would immediately want to buy up their land.

23104. What percentage of your labour comes from Bengal?—Practically none; of course, there are recruiting centres in Bengal at Midnapore and Bankura, but the labour recruited from Bankura is not Bankura labour.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

23105. Is that due to the home ridden tendency of the people or is it, if you will pardon my saying so, that there is a general rumour that you people sometimes treat the coolies very unkindly?—It is due to the nature of the Bengal cultivator; he goes in for subinfeudation to an extraordinary extent, far more than any other part of India. Rather than become a labourer and go abroad, he will manage somehow or other to get a small interest in a bit of land.

23106. We learnt from the Collector's evidence that 20 per cent of the people are starving?—They are certainly in great poverty in Bengal but the people who are starving most are people of the *bhadralog* class who are impoverished by the subinfeudation system.

23107. What wages do you give the labourers?—(Mr. Crawford) I think it is better to pass over the Government statistics (*document handed in*)

23108. You are manufacturing tea only for the English market?—We are manufacturing for the world market, but the main export is to England.

23109. You have not exported to the markets of Kurdistan?—Kurdistan takes very little tea; to a great extent it is green tea.

23110. You do not make green tea?—A little, not much.

23111. Is there any extra cost involved in making green tea?—You lose in weight by making green tea; you do not get the same amount of green tea from the same amount of leaf as you get when you are making black tea.

23112. I understand from the Punjab people that green tea can be made from inferior leaves?—It is made from inferior leaves there.

23113. I mean from the economic point of view does it pay you better to make black tea or green tea?—It pays better to make black tea but there is no market for black tea in Kurdistan.

23114. Now it all comes from Russia?—Yes, I think from Russia. A certain amount filters through; we sell it ourselves.

23115. The bulk of the imports into Kurdistan come from Russia?—Yes, not only do they grow green tea but there is also demand for a very superior kind of China tea which the higher class people drink.

23116. You do not make China tea?—No; we have China trees but we do not make China tea. (Mr. Milligan) China tea is made round Almorah.

23117. There is also a demand for China tea in England?—Yes. If you are interested in the matter, if you try Almorah tea, you will not know it from China tea.

23118. In the Indian market, the price of the China tea is double that of Darjeeling tea. I know high class people in the Punjab prefer China tea?—Yes. (Mr. Crawford) Of course, the best Darjeeling tea as a rule goes to the Home market; there is a demand for it there.

23119. You think that in the Government so-called waste lands there is a large area which could be brought under tea cultivation?—In the forest land there.

23120. What fertilisers do you use?—(Mr. Carpenter) We use practically every kind of fertiliser that there is on the commercial market.

23121. I am thinking of fertilisers containing nitrogen, phosphate and potash?—Yes, we use them.

23122. I understand the tea trees bear for two years; every two years you have to plant new trees?—(Mr. Crawford) No, it bears at all times.

23123. How often do you renew the tree?—We have tea which has been growing for sixty or seventy years.

23124. Do you adopt any inter-culture of potatoes?—No; we tried indigo some years ago but it was a failure.

23125. Indigo will give you a very good fertiliser?—We used it as a green crop; that was only an isolated experiment, it was not general.

23126. What kind of wild animals are you harassed by?—Mainly elephants.

23127. In Darjeeling?—Not in Darjeeling; in Assam.

23128. Have you improved the means of transport for tea to the railway stations?—Our communications in Assam are very bad.

23129. Do you not construct feeder tramways?—There are some tramway systems.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

23130. That is a very cheap way of doing it in view of the fact that the land is all on the slope, is it not?—(Mr. Milligan) The land is not on the slope in Assam; tea is planted on the flat there. In Bengal, in the Dooars it is also mostly on the flat; in Darjeeling, of course, it is on the hills. The bulk of the Assam tea land is almost as flat as paddy land.

23131. I understand you do not admit that the scarcity of labour is due in any way to unkind treatment of the coolies?—(Mr. Crawford) No, we repudiate that suggestion entirely. Of course, in dealing with a million of people there are isolated cases. (Mr. Milligan) What you say is true in the case of particular gardens but it is not true of the industry as a whole.

23132. Is it not one of the functions of the Association to prevent that sort of thing?—(Mr. Crawford) No, the Association has no disciplinary powers over individual managers.

23133. Have you any difficulty with regard to drinking water?—No, in all our gardens the question of water-supply has been receiving increasing attention; we have provided deep wells. Where we find it a practical proposition we put in artesian wells.

23134. Do you give the same water to your labour force?—We make a special point of water supply; our medical officers are expected to report monthly as to the condition of the water-supply.

23135. Does your European population suffer from malaria?—Yes.

23136. Sir Thomas Middleton: With regard to agricultural education, you state that the men are lacking in laboratory skill and you attribute that to the system of teaching; may it not be that it is the examination system rather than the teaching system that is at fault?—(Mr. Carpenter) Yes, I am quite willing to include that.

23137. The primary fault is with the examination syllabus?—What I meant to convey was that some of those men can be taught.

23138. But they do not have a sufficient number of hours in the laboratory during their training period?—Yes.

23139. That is your complaint?—Yes.

23140. Who takes the meteorological observations in the tea districts?—The Meteorological Department have certain stations but they are insufficient in number.

23141. Are there no stations on any of the tea estate?—Yes, most tea gardens keep their own temperature and rainfall records.

23142. Is any sunshine record kept?—No. These records are not taken under standard conditions and consequently are not comparable; we can only use the meteorological survey statistics.

23143. There is no system by which the instruments are furnished by the Meteorological Department, you taking the observations in the tea gardens and the work being inspected?—The Meteorological Department are not at all willing to provide the instruments.

23144. Did you state that there are no sunshine observations in the tea districts?—Only those that we ourselves take in our department.

23145. Dr. Hyder: I direct your attention to Question 21, Tariffs and Sea Freights. Is Ceylon one of your competitors in the world market?—(Mr. Crawford) Yes.

23146. Do you know what the export duty in Ceylon is? Is it not double what it is in India?—I think it is more than the Indian duty.

23147. Is this competition that you are meeting in the Australian market entirely at your expense? Is it not a fact that Java has been displacing China tea, not Indian tea?—Certainly, Java has been making headway in Australia at the expense of China but I should say also at the expense of Ceylon and ourselves.

23148. Is it not a fact that your share of the world market has increased from 39 to 49 per cent while the share of Java has increased from 8 to 12 per cent?—I cannot give the figures; I did not come prepared.

23149. Do you give the labourers any allowances in kind and if so what?—Of course, we enter into agreements in Assam; they are not legal since Act XIII was abolished. A bonus is granted every year; that is Rs. 12 per man and Rs. 10 per

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

woman. We give three months' full pay, or more if the medical officer requires it, to pregnant women who are paid Rs. 5 at the birth and another Rs. 5 afterwards; we provide free medical attendance; all our estates are fully equipped with medicines and hospitals or dispensaries; there may be a few here and there which are not as fully equipped as we would wish for. We have, as I have already said, an Indian doctor in charge of each estate. We give quinine free; we make no charge whatever for drugs. In addition to treating people on our own gardens, we frequently give drugs to people from outside who get employment on our gardens.

23150 Apart from these money allowances, do you give them land?—We give them land as far as possible.

23151 Do you still give land?—We still give land as far as we have it.

23152 Is there any difference between your system of marketing and the marketing of jute; have you a smaller number of middlemen through whose hands tea passes than in the case of jute?—I am afraid I cannot say; I am not an authority on the subject of jute. We consign our tea either to London, to the Agents of the Companies concerned, or we consign it to be sold by public auction in Calcutta.

23153 Am I to understand that there are only one or two hands through which tea passes, either your managing agent here or some managing agent elsewhere who makes over the tea to a broker?—Yes, between the managing agent or the control of the company and the actual buyer it only passes through one hand, that is the broker, who gets his commission.

23154 That is not so in the case of jute?—I cannot speak for jute.

23155 We have been told that nitrate of soda is liable to deterioration through being washed away, is that so?—(Mr. Carpenter) Assam is a country of heavy rainfall and the demand for nitrate of soda is limited on account of its liability to be washed away as compared to sulphate of ammonia. It was washed away fairly rapidly and from one of the experiments I have been able to carry out it does seem to wash out quicker than sulphate of ammonia.

23156 Mr. Calvert Is your Association taking any steps to prevent the export of adulterated or inferior tea?—(Mr. Crawford) We do not trouble about that; the people we deal with have their own system for stopping the sale of inferior tea. At home they have a certain standard, as they have in America. We are more concerned with preventing the sale of undesirable tea in India.

23157 But your reputation would go up if your general standard of quality were high?—Each producer sells his tea on a particular garden mark; if any garden ships an undesirable quality of tea or one which is unsuitable, it does not receive attention from buyers so that it comes home to them in time. You do not think it is necessary to take such steps?—If you ship home stinky tea at the present moment you do not get the same price as you do if you ship good tea.

23158 Has any economic use yet been found for the tea seed?—There were certain experiments but I do not think they were proceeded with. Of course, seed is only obtained in any quantity from seed bushes which are allowed to grow. There is at present an inquiry for tea seed from Kenya, Java and other places.

23159 Is it a grievance with you that potassium nitrate has to pay an import duty?—(Mr. Carpenter) If it means that potassium nitrate would supply nitrogen and potash at a lower rate than that at which we are now supplied, it is a grievance. In tea gardens we practically never use potassium nitrate now because the price is too high.

23160 Is that because of the import duty?—Possibly.

23161 It is 15 per cent.?—We simply do not use it because the price is prohibitive.

23162 Mr. Kamat The export duty on tea is Rs. 1-8-0 per 100 lbs. which gives a revenue to the Government of about 50 lakhs a year?—(Mr. Crawford) Yes, round about 50 lakhs.

23163 So far as the cost price is concerned it works out at less than a quarter of an anna per lb.?—Yes.

23164 Your argument is that if this duty is abolished the amount spent on labour would be increased, is that right?—Well, we should have more money available to spend on labour.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

23165. That is to say, it is a question of improving wages or looking to the interests of the general taxpayer, one of those two alternatives; is that right?—Yes, you can put it in that way.

23166. Can you suggest any other method of raising this money from the general taxpayer?—I can understand that the Government do not want to part with this source of revenue. I cannot suggest any other tax.

23167. Is there any guarantee that, supposing this export duty were abolished, the money would be spent on labour?—I could not commit myself to that statement.

23168. In what way do you suggest labour would be benefited if this tax were abolished?—It makes more money available between the cost of production and the selling price.

23169. The difference would go into the pockets of the planter?—No.

23170. I want to know what guarantee there is that the money would be spent on the improvement of labour? Why do you assume that? What is the general level of cash wages paid to your labour?—It is very difficult to say because it varies so much in the different districts. In the Dooars district at the present moment the men are earning up to 12 annas a day; in Assam they are earning from 8 annas up to 12 annas. In the plucking season women make very good wages, up to a rupee a day.

23171. This export tax amounts to a quarter of an anna. Supposing that amount of money went to the industry, do you mean to say that instead of paying 12 annas a day for labour you would pay 12½ annas?—That, of course, does not apply because you are dealing in one case with a daily wage and in the other with production.

23172. I am trying to see if there is any guarantee?—There is no guarantee.

23173. In that case, if you admit that, the whole of your argument falls to the ground?—(Mr. Milligan) In a great many cases it is bound to go to the labourer because at the present moment, while there are great many gardens which are making handsome profits, there are a lot of gardens that are just paying and no more; those gardens are always lagging behind in the matter of raising the wages of their labourers. They are very anxious to raise wages in order to get more labour; and they would undoubtedly spend this money on labour.

23174. That means that you will not be increasing the wages of the whole of the labour; it would only benefit a section of the labour?—In the case of the gardens which are making good profits, there is no need to increase wages because the labourers are getting as much as they care to earn now.

23175. Mr. Gupta: Am I correct in saying that most tea gardens have a fair amount of spare land for future expansion?—Certain gardens have but not most gardens.

23176. Most of the larger gardens have?—I should not say so.

23177. What percentage would you say?—I could not answer a question like that.

23178. I have visited some gardens and they seemed to have land kept for future extension?—In Dooars at the present time.

23179. I am referring to the most of the older gardens?—They have not much room for extension.

23180. Were not the rules in regard to the cultivation of Government waste lands circulated to the Secretary of your society when they were framed for consultation and further opinion?—When was that?

23181. The last was about three years ago as far as I remember, and your Association, I suppose, concurred with the rules that were framed on behalf of Government?—I do not recollect that.

23182. But that is a fact; I was only trying to point out that the Government in framing these rules did consult the industry?—That is so far as the Dooars are concerned. Of course, I am referring more particularly to Assam.

23183. Sir Ganga Ram: Have you ever considered the question of bringing down rock silt in the streams; would not that be of great value in your tea plantations?—(Mr. Carpenter) In places that is made use of when it is rich inorganic matter; that is to say, in temporary streams; but silt from rivers has often proved very dangerous.

23184. Silt from rivers is rather injurious?—Yes.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan. :

23185. But silt from rocks is a matter which is under the consideration of the scientists, is it not?—Yes.

23186. Might not you set up some works which would throw the silt into the streams so that it could be utilised by the agriculturists below?—Yes, it goes on to the lower flats.

23187. Have you taken any steps to collect dung from the forest grazing grounds?—I think not. (*Mr. Crawford*) No, not from the forests. (*Mr. Milligan*) The nearest grazing grounds are always a long way from tea gardens; there are no roads to the grazing grounds and the cart hire would be prohibitive.

23188. Have you considered the question?—(*Mr. Milligan*) I am not a practical planter.

23189. And the leaves that fall from the trees?—That has often been done

(The witnesses withdrew.)

## APPENDIX

**Statement showing the position of the Indian Tea Industry  
in the world market by Mr. John Harpur, Commissioner  
for India, Indian Tea Cess Committee**

Separate Government statistics, relating to tea produced by members of the Indian Tea Association are not kept; furthermore no statistics are available either to show the destination of tea exported from any particular district in India or even the percentage of the total production which is exported from the different tea producing districts, so it is not possible to state by what percentage the Indian Tea Association's share of the world's market has increased (before the War as compared with the present date).

The following items may be of some interest and use :—

(a) During the year ending 31st March 1926, the total area under tea in India (Northern India and Southern India) was 728,812 acres, the total acreage belonging to the members of the Indian Tea Association was 513,231 (or approximately 70 per cent.). The association's sphere is in North India—the corresponding Association in South India is the United Planters' Association of Southern India—and the Association represents about 88 per cent. of the acreage in North India.

(b) The following is a comparison of the total exports of tea from the principal tea producing countries for the years 1913-14 and 1925-26 :—

	Exports		Percentage of increase or decrease	Percentage of total share		Percentage of increase or decrease
	1913-14	1925-26		1913-14	1925-26	
	lbs.	lbs.				
India*	201,716,041	337,314,760	+16·6	37·0	43·3	+5·7
Ceylon*	107,410,430	200,701,384	+0·2	25·4	20·0	+1·5
China*	101,634,183	111,007,738	-42·01	21·7	14·2	-10·5
Java*	61,938,007	64,774,200	+40·0	8·8	12·1	+3·8
Japan†	29,640,945	25,131,125	-14·0	3·8	3·2	-·6
	775,148,466	778,070,202				

(c) The principal tea consuming countries in the world : (the following are the Home consumption figures compiled by Tea Brokers' Association of London, 1926) :—

	Libs.
Great Britain and Northern Ireland	... 401,996,203
United States of America	... 100,159,110
India	... 50,000,000 (estimated).
Australia	... 49,256,000
Canada	... 36,255,140
Irish Free State	... 23,305,856
Holland	... 16,152,400
New Zealand	... 10,821,616
Russia‡	... 28,302,858
British South Africa	... 10,000,000 (estimated).
Persia	... 11,932,560
Morocco	... 12,000,000 (estimated).

\*Figures are taken from Indian Tea Statistics, 1925 (Supplement to the *Indian Trade Journal* dated November 11th, 1926).

†Figures are taken from the Shidzokota-Ken Tea Refiners' Guild.

‡According to the *Tea and Coffee Trade Journal's* correspondent in China, Russia's pre-war consumption was 189,680,000 lbs.

Messrs. T. C. Crawford, P. H. Carpenter and J. A. Milligan.

## THE INDIAN JUTE MILLS ASSOCIATION, CALCUTTA

### Replies to the Questionnaire

**QUESTION 2.—AGRICULTURAL EDUCATION.**—Replying generally to the questions on the subject of agricultural education, the jute interests represented by the Bengal Chamber of Commerce would say that there is practically no such education in Bengal. They understand that a beginning has been made in the Punjab, and they believe also in Bombay, towards giving elementary instruction in agricultural matters. They are not sufficiently in touch with developments in this direction in these Provinces to feel assured that instruction on similar lines in the jute districts could be adopted with advantage; but they would like to see the experiment made.

The demonstration farms conducted by the Agricultural Department are excellent as far as they go, but only the ryots who live in the immediate neighbourhood of them derive any advantage from the demonstrations. The ordinary cultivator is of course very conservative, and he is not readily convinced of the advantages that may follow on a change in his methods; a greatly extended system of demonstration farms, aided by a large staff of efficient demonstrators, would help in this direction, but the cost would be very heavy. On the other hand, the existing schools might, with considerably less expenditure, be made use of on the lines we have suggested above by giving some elementary instruction in simple agricultural processes; and although jute interests are a little doubtful whether this would do very much good without being supplemented by expert demonstration, the experiment is worth trying. It might be attempted in one of the important jute districts, and the results there carefully watched. The Dacca district suggests itself, as the Agricultural Department would be able to keep closely in touch with the progress of the work. It is only by demonstrating that improved methods of cultivation mean more money that adult education in rural districts can be popularised [sub question (xii)].

The Chamber does not feel qualified to offer any strong opinion as to how a scheme for better educational facilities in rural areas should be administered [sub-question xiii (a)]. They understand that administration might either be central, from Pusa, or provincial; they would be inclined to think that, with a crop such as jute, 90 per cent. of which is obtained from the Province of Bengal, administration by the Bengal Department of Agriculture would be preferable. With regard to sub-question xiii (b), Finance, this must be provided, in the first instance at any rate, by Government. Possibly the co-operative credit societies might be made use of in some way, but the responsibility must rest with Government.

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.**—(a) The existing demonstration farms have to a small extent sometimes improved the methods of the cultivators but, as has been indicated in replying to Question 2, the area in which a farm can do good in the way of demonstration is necessarily restricted to its own vicinity.

(c) As stated above on Question 2 (xi), the inducement to a cultivator is a matter of money. If he can be convinced that it is to his financial advantage in the near future to adopt new methods, he will listen to expert advice. Recommendations, unless they can be put in such a way as to carry conviction, will not in themselves be sufficient. And the cultivator will not be interested if the financial benefit is likely to be more or less remote.

**QUESTION 4.—ADMINISTRATION.**—(a) and (b).—Speaking generally, the Chamber considers it advantageous that research work, particularly with crops grown in different parts of the country, should be centralised at, or at any rate directed from, Pusa. But as they have indicated above, in the case of a crop like jute which is confined to one part of the country, and 90 per cent. of which is grown in one Province, the position is different, and it seems to them that the administration of this work can be more effectively carried on by the Local Government. But they regard this matter as being one for expert opinion and commercial interests would not be disposed to criticise the means as long as the end is attained.

(c) (i) *Agricultural Service*.—Funds have never been available to allow of the Agricultural Department being sufficiently staffed or carrying out an adequate programme.

(ii) *Railways and Steamers*.—Jute interests are, speaking generally, satisfied with the services afforded by railways and steamers. They feel, however, that railway  
The Indian Jute Mills Association.

rates have recently been enhanced to a greater degree than is reasonable, especially in proportion to the increases on other goods. There is also a tendency on the part of the railways to starve stations where they are not in competition with the steamers, and the steamers are sometimes considered to take similar advantage of the absence of competition.

(iii) *Roads*.—In the jute districts of Eastern Bengal, waterways are of more importance than roads, and in recent years sufficient attention has not been given to the maintenance of these. Serious silting up has taken place in certain of the main Sunderbunds channels and elsewhere. A case in point is the English nullah, a waterway which forms the only channel for the despatch of jute from an important area. The Chamber has had occasion, during the current season, to draw the urgent attention of the Government of Bengal to the serious position which has arisen through failure to keep the channel clear. The Chamber has been informed that the amount of dredging required is very small.

Again, in some districts the encroachment of the water-hyacinth threatens to block up the small waterways altogether. At the annual meeting of the Associated Chambers of Commerce of India and Ceylon in 1925, a resolution was unanimously adopted urging the necessity of legislation to enforce the destruction of the weed. It is understood that legislation of this nature has already been introduced in Madras, with beneficial results. The Bengal Chamber is again bringing the matter forward at the Annual Meeting of the Associated Chambers, which takes place at Cawnpore on 6th and 7th December.

(iv) *The Meteorological Department*.—Jute interests are quite satisfied with the work of the Meteorological Department.

**QUESTIONS 5 AND 6.—FINANCE AND AGRICULTURAL INDEBTEDNESS.**—Government should take every opportunity of extending the scope of the co-operative credit system. It is by means of credit societies and similar organisations that the Chamber thinks agricultural operations can best be financed, and the cultivator freed from the necessity he is now under of borrowing from moneylenders—his only source of credit in the absence of a credit society. He has to pay the moneylender such high rates of interest that he has little chance of getting free, for apart from ordinary living expenses he has to make large payments for marriages and other ceremonies. Generally speaking, the ryot seems unable to save money even when he has the opportunity of doing so. In 1925, for instance, when jute prices were high and he had a chance of freeing himself from his debts, he did not take advantage of his opportunity but spent all the money he received.

**QUESTION 10.—FERTILISERS.**—(a) In the greater portion of the area on which jute is grown, the use of manures is unnecessary because the land is subject to inundation every monsoon, and needs no manure beyond the silt which is then deposited, and which is in itself a sufficient fertiliser. The position is of course different in the case of high land jute, and the greater use of fertilisers in these areas would be advantageous. This can only come in time (a) with the education of the cultivator and his appreciation of the money value of careful manuring, and (b) with cheaper prices for artificial fertilisers, the high cost of which certainly militates against an expansion in their use.

(f) The cultivator in the jute districts, speaking generally, has no option but to use cowdung as fuel, for the simple reason that he cannot get wood or any other substitute. Theoretically of course it would be excellent if he could do without cowdung and keep it for manure but practically, for the reason stated, this is impossible. It does not seem likely that any substitute will ever be available at a price that would make it possible for the ryot to use it instead of cowdung.

**QUESTION 11.—CROPS.** (a) (i) **THE IMPROVEMENT OF EXISTING CROPS AND (ii) THE DISTRIBUTION OF SEEDS.**—Jute interests have always endeavoured to co-operate with the Department of Agriculture in questions connected with the jute crop, and for some years conferences have been held periodically for the interchange of opinions on these questions and on the work of the department. A Board of Assessors assists on questions in connection with the different types of jute, the Board representing the different branches of the trade. The types are examined and reported on by the Board, and it is understood that their reports are found to be of assistance to the department. In the jute growing areas a number of the jute firms have placed land at the disposal of the department for the conduct of their experiments. A difficulty in connection with the seed question is that the cultivator prefers to grow his crop for fibre rather than to keep some of it for seed;

**The Indian Jute Mills Association.**

and it should be explained that, when kept for seed, the plant gives a very poor quality of fibre which can be used for only the coarsest manufacture.

The seed supply has been a subject of particular study by the Department of Agriculture, the contention being that Government seed, where it is used, has considerably increased the output per acre. In this work jute interests have co-operated. Some years ago consideration was given by the Indian Jute Mills Association to a proposal that the Association should start and maintain a series of seed farms, but this suggestion was found to be outside the region of practical politics. During the past year, however, another proposition has been carried through. The indications were that, with high prices for raw jute in 1925, the supply of seed for the 1926 crop was likely to be far short of what was required, and the situation was the subject of discussion between jute interests, particularly the Indian Jute Mills Association, and the Department of Agriculture. As a result a scheme was drawn up under which the Association would give a guarantee to the department up to a total of Rs. 2½ lakhs in the event of Government sustaining any loss by arranging for planters in Bihar to grow jute from seed supplied to them, such jute to be grown for seed. Government would undertake to purchase 10,000 tons of seed so grown at Rs. 25 per maund, the idea being that the seed should be sold to the cultivators for their 1927 crop. It transpired that Government could not accept the Association's offer of a guarantee as the distribution of departmental seed had been handed over to an agent, so that Government no longer dealt directly with the cultivators in the matter of the supply of seed; it was explained therefore that any guarantee that might be offered by the Association would be a matter for Government's agent. As matters have turned out, it will probably not be necessary to make the guarantee operative; at any rate, it is understood that Government anticipate no difficulty in disposing of all the seed obtained by them from the Bihar planters, but the information given in this reply will perhaps be of interest to the Royal Commission as indicating the willingness of the jute trade to co-operate with the Department of Agriculture in the efforts of the latter to improve the crop. Jute interests have always to keep before them the fact that the main attraction to the user of jute manufactures is their cheapness. A succession of years of high prices such as this which prevailed in 1925 would be dangerous in the long interests of both the grower and the manufacturer.

**QUESTION 12.—CULTIVATION.**—This is not a subject in which jute interests can offer evidence as it is a matter for experts, but they might say that as far as their knowledge goes they believe the existing systems of tillage to be suitable for the land. For example, deep ploughing would, if resorted to on a small land, do it a great deal of harm by destroying much of the beneficial effect of the silt.

**QUESTION 13.—MARKETING.**—The existing marketing facilities are suitable so far as the jute trade is concerned.

**QUESTION 14.—CO-OPERATION.**—It has been stated above that, in the opinion of jute interests, the co-operative movement should be developed as a means of financing the jute crop. It is not proposed to go into this matter in detail as it is one for experts, but the opinion is offered that, although the methods of the co-operative societies may in some cases be unworkable, these can be adequately controlled by Government audit; and it is considered to be of the utmost importance that Government audit should be a *sine qua non*. As has already been indicated, it is felt that the co-operative credit system has helped only to a very limited extent what is one of its main objects, namely, to get into closer touch with the cultivator; and the Chamber is of opinion that there is room for, and the need for, great expansion in this direction.

**QUESTION 15.—STATISTICS.**—(a) (i) and (ii).—Jute interests would like to see more money made available for staff work on the jute industry. They consider that it should be possible to obtain a greater degree of accuracy in these, and they have for a long time past closely examined the question. In 1927, the Jute Forecasts Joint Committee of the Chamber was in correspondence with the Government of Bengal on the subject of the staff of jute clerks engaged to check the estimates of the village purchasers as to carry out crop cutting experiments. The annual cost of the staff of clerks referred to was Rs. 22,000. Government decided that they could not afford the sum and that unless the trade would pay it the staff would be discontinued; they were, it should be explained, acting on a recommendation of the Bengal Retrenchment Committee. The trade took strong exception to this suggestion. The amount involved, as is, of course, regarded as trifling and the fact

**The Indian Jute Mills Association.**

that it was so made it all the more surprising that the question should be raised. They pointed out that in export duty alone the jute trade had brought in as revenue to Government during the three preceding years some nine crores of rupees. Notwithstanding the protest of the trade the staff was not restored. Jute interests have all along regarded this incident as unfortunate.

It is unnecessary to refer at length in this answer to the discussion which the Jute Forecasts Joint Committee have had in the past with Government on the subject of the forecast figures. That discussion is still going on, the principal point being that the forecasts of crop are regarded as inaccurate and unreliable. A suggestion has indeed been put forward quite recently by the Jute Forecasts Joint Committee to the Government of Bengal that a Committee of Enquiry should be appointed, on which the jute trade would be represented, to investigate the methods employed in arriving at the forecast figures.

**Mr. J. SIME (Chairman), Mr. J. T. FINLAYSON, Mr. J. W. A. SIMPSON and Mr. W. J. SOUTAR, of the Indian Jute Mills Association**

**Oral Evidence**

23190 *The Chairman.* Mr. Sime, you are Chairman of the Indian Jute Mills Association and I understand you wish these other gentlemen's names to appear along with yours as witnesses representing the jute interests of the Bengal Chamber of Commerce?—Yes.

23191. I propose to address myself to you in the main, Mr. Sime; if your associates desire to say anything, they may do so at any time; if they say nothing we shall assume that they agree with what you tell us?—There are some matters with which I shall want my colleagues to deal.

23192 Perhaps you will ask the appropriate witness to do so?—Yes.

23193 Is the Indian Jute Mills Association the only organisation that has any being at the moment in connection with the jute trade?—In connection with the jute trade there are other Associations; there are the Calcutta Jute Shippers' Association, the Calcutta Jute Dealers' Association and the Calcutta Jute Balers' Association.

23194. All representing various interests or stages in the trade?—Yes.

23195. But there is no Association with regard to jute in the position occupied with regard to cotton by the Indian Central Cotton Committee?—No.

23196. Are you, broadly speaking, familiar with the functions and work of the body to which I refer, the Indian Central Cotton Committee?—No.

23197. Have you ever considered the wisdom of forming an Association representative of all the interests in the trade, including the grower, with a view to attending to the agricultural problems, the research, the marketing, and the processing of jute, and also, if necessary, the interests of the trade abroad?—We have not considered that. Our latest suggestion to the Government was that an Advisory Committee should be appointed to assist in the preparation of the forecast; that is the extent to which we have considered the matter although we think that an Association similar to the Indian Central Cotton Committee would be advantageous to the trade.

23198. Do you think jute could bear a small cess to be spent entirely on the work of such an Association?—The virtue of jute is its cheapness; the continual addition of a little here and a little there to the cost of production, by increasing the cost of material is of course going to affect jute adversely in competition with a substitute.

23199. If that is your view, do you think it would be advisable, if possible, to make an arrangement whereby a small part of the money already collected in the shape of an export tax could be made available to such an Association?—Yes, we think that would be advisable; we think something should be done on those lines for the purpose you suggest.

23200. You know that Government takes a share in the work of the Central India Cotton Committee; they assist with advice and the research side of the Indian Central Cotton Committee's work is supported in every possible way by the organisation as a whole and by the Governmental element in the organisation. Speaking of course without having had full time for consideration, would you consider the advisability of Government having some representative on the Jute Association that we are thinking of?—On the Association you describe the Government would have to be represented.

23201. If taxation for general revenues is used for the purpose of financing an organisation of the whole trade, under these conditions do you think some representation by the Government would be reasonable?—Yes.

23202. On page 416 of your memorandum in answer to Question 10 (a) you say, "In the greater portion of the area on which jute is grown the use of manures is unnecessary because the land is subject to inundation every monsoon, and needs no manure beyond the silt which is then deposited." Are you satisfied that this silt provides a complete diet for plants?—(Mr. Finlayson). Yes, but if they could use fertilisers as well, it would be an advantage especially in the higher lands.

Messrs. J. Sime, J. T. Finlayson, J. W. A. Simpson and W. J. Soutar,

23203. On the last page of your memorandum, speaking of the Jute Forecasts Joint Committee, you say that you have had discussions with the Government on the subject of the forecast figures, that that discussion is still going on, the principal point being that the forecasts of crops are regarded as inaccurate and unreliable. Do you wish to expand that statement at this stage or would you rather not say anything about it now?—(Mr. Sime) The Government are to adopt another method in compiling the next year's forecast and they have assured us that they expect much more reliable results from it; that is where the matter rests now.

23204. The usefulness of these returns consists in the main in the assistance which they give to the trade in estimating as early as possible in the season what the crop is going to be?—Yes.

23205. That does not help the cultivator to decide how much of his land he had to put under jute, does it?—It should influence him with regard to the next year's crop.

23206. What he really wants to know is how much jute is in store at the moment when he is considering planting his crop?—Yes.

23207. How would you consider a proposal to make available for the cultivator that information?—That is available from the statistics in the Chamber of Commerce; these statistics are prepared regularly.

23208. The total jute in storage?—Yes, the approximate amount.

23209. Do you think that might well be made available for the cultivator?—Yes; there is no reason why it should not.

23210. There is no question of secrecy?—Not at all.

23211. It is public information to-day for anybody who cares to come and ask for it; is that the position?—Yes, the mills are storing about 16 lakhs which is in the neighbourhood of 3½ months' consumption.

23212. Is that information published in the newspapers?—That I could not tell you; but all the trade knows it, it is public.

23213. The trade is not the cultivator, is it?—No.

23214. But those figures would be available to Government tomorrow if they choose to publish them; is that the position?—Yes, that is the position.

23215. In answer to Question 20 with regard to marketing you say, "The existing marketing facilities are suitable so far as the jute trade is concerned." Do you consider they are suitable so far as the producers of jute are concerned?—I am not prepared to speak on that matter.

23216. I do not wish to take you into this field unless you are familiar with it; but we are anxious to discover whether the cultivator is getting a reasonable share of the total price?—(Mr. Finlayson) At the present time most of the holdings are small; there is no other way in which the cultivator can market his crop. There is no big concern which could deal direct with the cultivator; it would be too big an undertaking. The average cultivator probably takes a maund to a maund and a half into the market at a time; he sells it to a middleman who collects anything from 200 to 2,000 maunds and that middleman takes it to the big buyer. With the holdings as they are and considering the fact that the cultivator sells off his crop gradually, not selling his whole crop at one time, it would be impossible for a dealer to handle it.

23217. Probably the cultivator is in debt and therefore within certain limits has to accept what price his creditor may choose to give him; who comes off worse?—(Mr. Finlayson). Do you mean in the case of his being forced to sell?

23218. Would you agree that the whole system of marketing, the position of the intermediaries who work that system and the margins upon which those intermediaries operate, might be a very proper subject of enquiry, shall we say, by the Central Indian Jute Association, if that were the title of this suggested Association? Might that be a useful thing to do with a view to discover whether it would be possible to improve the system?—I think it would; but the only way we can think of to improve it at the moment is through co-operative societies. The theory that the middleman always takes a profit is a mistake; he takes his risk as every one else does.

23219. Do you wish to supplement at all what has been written here?—(Mr. Sime) No.

Messrs. J. Sime, J. T. Finlayson, J. W. A. Simpson and W. J. Soutar,

23220 Mr Kamat. In the jute companies in this Presidency what percentage of the total capital is held by Indians?—You mean jute mills; I should say 3/8ths

23221 Have the Indians any representation on the Boards of Directors?—Yes; in the firm I am connected with there are two Indians on every Board.

23222 Has any serious attempt been made to form an Association to protect the interests of the jute growers?—(Mr Sime) Not that I am aware of.

23223 No attempt has been made?—No.

23224. Supposing such an attempt were made, do you think it would receive support from you?—Every man must mind his own business.

23225. Sir Henry Lawrence. Could you tell me what is the revenue that the jute cess brings in to the Government of India?—The amount which it has brought in is in the neighbourhood of Rs. 8,60,00,000.

23226 Is that the average rate?—That is the average for the last three years. These are the figures—

	Rs.
1923 24—	
On the export of raw jute ... ..	1,53,09,000
On the export of jute manufactures ... ..	1,99,10,000
1924 25—	
On the export of raw jute ... ..	1,66,29,000
On the export of jute manufactures ... ..	2,09,34,000
1925 26—	
On the export of raw jute ... ..	1,53,50,000
On the export of jute manufactures ... ..	2,09,54,000

So that the total for the year 1925 26 is in the neighbourhood of Rs. 3,60,00,000.

23227. Is it levied at the rate of Rs 4 8 0 a bale on raw jute?—Yes.

23228. And Rs. 20 a ton on sacking manufactured?—Yes.

23229. No portion of that is used for the benefit of the industry?—None of that is used for the industry; it all goes into the Central Government.

23230. And the Government of Bengal?—Not the Government of Bengal. There is a two anna cess on jute; the amount of the cess paid to the Government of Bengal during the same three years was, in 1923 24, Rs. 9,73,000; in 1924-25, Rs. 10,92,000 and in 1925 26, Rs. 11,16,000 That was for the Calcutta Improvement Trust.

23231. Sir Ganga Ram : That was for the improvement of Calcutta?—Yes.

23232. Sir Henry Lawrence : You do not wish to have those duties or cesses increased?—No; anything that adds to the cost of jute is bad for the trade.

23233. Bad for the producers?—Bad for the producers; it encourages substitutes; if the price had been lowered during recent years, I am sure there would not have been such a large amount of substitution of other things.

23234. The result of such substitution is that there is less demand for the produce grown in the fields?—Yes.

23235. Of course we are more concerned with the interests of the producer than with your interests?—It seems to me that the interests of the producer and our interests are the same, I am sure ultimately they are.

23236 If the producer can produce jute at a lower rate by any improvements in cultivation, that would benefit both the trade and the producer?—Certainly.

23237. If you can get a heavier crop on the same amount of land, it sets free other land for the cultivation of paddy or other crops. That is a matter to which you have no objection but in which you have no particular interest?—We have an interest in that because we think it will reduce the price of jute.

23238 If, at the present time, a man grows three bales to the acre, and if by using a better yielding plant he can produce six bales to the acre, of course his cost will be less, so that anything that is done for the improvement of jute helps both you and the producer?—Certainly.

23239 Sir Ganga Ram : Supposing there was a Growers' Association in the interest of the growers, in what way would your Association help that Association?—I do not know that we could help it very much.

Messrs. J. Sime, J. T. Finlayson, J. W. A. Simpson and W. J. Soutar.

23240. Supposing out of the huge reserves which you have now got you supply money to agricultural co-operative societies at the Government Paper rate, and those societies lend the money to the grower at about 1 per cent above the Government Paper rate, would not that help?—That would not do at all.

23241. Why?—Because the money is not ours; the money is the money of the shareholders of the Company.

23242. But of course you control the shareholders?—No, we do not control the shareholders; it is getting more and more difficult every day.

23243. Is it a fact that 70 per cent of the shareholders are Indians?—Yes, approximately.

23244. Are they adequately represented on the Directorate?—Yes. At any rate in our companies they are.

23245. Do you take them into the Dealers' Association; are there Indian representatives on the Dealers' Association?—Yes.

23246. We were told yesterday that an Indian is barred from becoming a Member of the Dealers' Association?—No; the Indians do not require to join the Association. Are you speaking of selling jute to the mills?

23247. Yes?—They do not require to join the Association.

23248. Supposing they apply for membership, are they barred?—They are not barred; but any Indian can call at a jute mill and sell jute; there is no restriction on him.

23249. Can the Indian become a broker as well?—Yes, certainly.

23250. There is no restriction to buying only through the European Brokers' Association?—Certainly not.

I hope you will consider my humble proposal that you should lend some of your money at Government Paper rates to the Co-operative Societies so that they may lend the money at 1 per cent more to the cultivator.

23251. *Sir Thomas Middleton*: Does the quality of jute vary much with the retting as in the case of linen?—(*Mr. Finlayson*) Yes, very considerably.

23252. Has any work been done by the Association on the subject of jute retting?—(*Mr. Sime*). No, nothing has been done.

23253. Has your attention been drawn to the Linen Industry Research Association which has been established in the North of Ireland recently to study retting problems?—(*Mr. Finlayson*) No; that is a matter which the agricultural farm at Dacca have in hand; they are continually working at that sort of research work.

23254. The Linen Industry Research Association of Northern Ireland is not a Government Association. It is an Association of those interested in the linen industry. You have not heard of their work?—(*Mr. Sime*) No; we have not heard of it.

23255. In the last three or four years, a great deal of time and attention has been given by this Association to studying retting questions in connection with linen; it might be useful for you to get into touch with that Association because it is possible that the discoveries they have made in connection with their studies of the linen plant might have some application to jute retting?—(*Mr. Finlayson*) Retting is done entirely by the natives.

23256. Retting in the North of Ireland is done by small farmers; the object of the industry is to devise a better system of retting?—(*Mr. Sime*). Yes; if the jute could be retted quicker and cheaper, it would certainly decrease the cost and would make jute considerably cheaper.

23257. In the case of linen quality, is the chief matter that enters into consideration; in the case of jute I take it that quality is not nearly so important as in the case of linen?—It is very important; for instance, this year although the crop is a big crop, there is a much larger proportion of inferior quality than in last year's crop due to bad retting.

23258. So that it would obviously be in the interests of the Association if by some action improved methods of retting could be introduced?—Yes.

23259. *Dr. Hyder*: In reply to the Chairman you said you would not favour any addition to the cost of production of jute; is that the position?—Yes.

23260. So that you are opposed to a tax or any increase in tax?—Yes.

Messrs. J. Sime, J. T. Finlayson, J. W. A. Simpson and W. J. Soutar.

23261. Do not the middleman's profits and commission have the same effect as the imposition of a tax by the State; they both add to the cost price at which jute is sold; is not that so?—That is so.

23262. So that, that being so, would you be in favour of a reduction in the number of persons through whose hands jute passes?—Yes, certainly.

23263. Do you know that the English farmer has been dissatisfied and has always grumbled since the year 1860 when wheat was made unprofitable? Do you know that the wheat of the Canadian farmer had to pass through a number of hands but he has been able to reduce the number of hands? Would you not, therefore, favour the formation of some kind of Jute Growers' Association with a view to creating harmony of interest between the jute trade and jute growers?—No; I am afraid the jute trade would not favour that.

23264. Are you aware of any agrarian movement? You may not like that?—Yes; we are feeling it now.

23265. You say the cost of transport has increased; has the classification of goods been changed with regard to the rates on railways and steamers?—I can give you the figures.

23266. If you do not mind, I want you to answer general questions. Is your jute carried at class rates, station to station rates, or special rates?—It is carried at class rates.

23267. Do you know the class rates are rigidly confined between a minimum and a maximum?—Yes.

23268. That being so, has there in fact been a heavy increase?—During the years 1914-15, 1923-24 and 1924-25 the same number of tons was carried but the cost increased by 126 per cent; that is the increase we paid to the Railway.

23269. How much did you pay?—We paid 54 lakhs in 1914-15, 112 lakhs in 1923-24 and 125 lakhs in 1924-25.

23270. That is the total cost of transport on railways and steamers?—Yes, that is the total, the tonnage was the same, 969,000 tons.

23271. Is it railways and steamers put together?—That is only railways, the Eastern Bengal Railway. You get those figures from the Railway Board's Administration Report, Volume II.

23272. Mr Gupta: Your Association is not opposed to any scheme by which the growers could be informed from day to day of the ruling prices in Calcutta?—No, we are not opposed to it; I think they know it already.

23273. But if they do not and Government favour such a scheme, your Association would not be opposed to it?—No.

23274. Sir Ganga Ram: Supposing some invention was brought in or discovery was made which led cultivators to grow something more profitable instead of jute, would that not affect your interest?—Yes, it would affect our interests.

23275. Is it not, therefore, in your interests to attract the growers to your side I mean, would it not be in your interests to give them some facilities for growing jute because the profits of the growers are now becoming less and less?—I do not think that is correct. The profits last year were three times what they had ever been before.

23276. Last year was an exceptional year?—It may happen again.

23277. But supposing some discovery were made which showed them that they could grow better and more profitable crops than jute, that would affect your interests in which you have invested a huge sum of money?—Yes; we should have to turn the key of the door and get out.

23278. Do you not think, therefore, it would be wise to anchorate the conditions of the growers to a certain extent?—No, I am afraid the jute mills will not consider that. Mills think that is a question for the consideration of Government.

Then you are following a suicidal policy.

(The witnesses withdrew.)

Messrs. J. Sims, J. T. Finlayson, J. W. A. Simpson and W. J. Soutar.

**Mr. JAMES PEDDIE, I.C.S., Magistrate-Collector,  
Malda, Bengal**

**Replies to the Questionnaire**

**QUESTION 1.—RESEARCH.**—I have nothing to say on this subject except that it is clear that there should be much more research if it can be financed.

The research still is at present very inadequate and the results of research in other Provinces are not readily available. I want for example to know the result of the experiments on wheat at Pusa for introduction of improved seeds into the Malda wheat area. This is not readily available. More co-ordination seems to be required.

**QUESTION 2.—AGRICULTURAL EDUCATION.**—(i) There are practically no teachers of agriculture or institutions where agriculture is taught.

(ii) There is an urgent need for extension of teaching facilities in all the districts of Bengal. I know personally Dacca, Midnapore, Bankura and Malda.

(iii) Teachers in rural areas should wherever possible be drawn from the agricultural classes. Teachers belonging to the non-agricultural classes are too often afraid of soiling their hands or handling a plough.

(iv) I have no personal knowledge of attendance at agricultural institutions.

(v) As far as I have been able to gather the main inducement leading men to study agriculture has been the hope of Government service.

(vi) I am of opinion that (a) nature study and (b) school plots help towards the end we are striving to attain and should be encouraged. I think however that (c) school farms if they can be developed would be a much more practical way of securing the general spread of improved methods of agriculture. In the school plot a few cabbages and brinjals are grown and neither teachers nor pupils take much interest in it as a rule.

If, however, we could give teachers training at Dacca Farm or elsewhere and start small farms attached in selected schools where cultivation would be on a field scale, useful lessons would be taught. I believe that the Bengal Government has approved of some such scheme but I am doubtful from what I have heard, if it will result in the spread of the school farms sufficiently rapidly.

(x) Agriculture can only be made attractive to middle-class youth by clear demonstration that it can be made to pay. We must demonstrate by running farms on a commercial basis that improved methods are paying and that labour and energy expended are well rewarded. This may of course be done by inducing keen agriculturists to run these farms on approved lines. I do not think that Government can without non-official help do this.

(xi) Adult education in rural tracts cannot be popularised by Government alone. It can be made part of the Education Department's policy that in each aided Middle English School night or evening classes should be held as well as perhaps day classes in the seasons when at a particular area there are no agricultural operations going on. This policy if adopted will, where the enlightened people in the villages lend it their support, be of great help in spreading agricultural knowledge. We require the non-official help, however, if it is to be a success. It will also be necessary to devise some system of giving to teachers in these Middle English Schools or High Schools some training. This scheme should in any estimation proceed *pari passu* with the establishment of school farms. The adult people will then be able to see the result in the school farm of the methods recommended and taught to the boys in the school.

(xii) The Government of Bengal have drafted a Bill for the introduction of free and compulsory primary education. This scheme is to be financed by an education cess to be collected like the road and public works cess through the Collector. The schools will be under a district educational authority or under the education committee of the District Board. I do not know definitely, but I presume that Middle English Schools will fall within this scheme. Financing of school farms may therefore be met partly from the educational cess and partly from grants from the Agricultural Department of Government.

**QUESTION 3.—AGNOSTICATION AND PROPAGANDA.**—(a) The most successful measures taken to improve and influence the cultivators' practice have been :—

(1) Field demonstration.—Persuading an influential cultivator to adopt a new crop or an improved variety of seed or to use a fertilizer recommended by the department.

(2) Distribution of improved seeds to a large number of individuals in one area, e.g., jute seeds.

Mr. James Peddie.

These methods, however, are successful only when village propaganda accompanies it, when officials or non officials take the trouble to find out and explain to the cultivator the value of the seed, etc., recommended.

Method No 1 has resulted in a large increase of the area under improved sugarcane.

Method No 2 has resulted over bad areas in the adoption of improved races of jute seed.

Both methods, however, would have been much more successful if there had been a proper organisation in the mofussil through which the results could have been watched.

(b) I am of opinion that by properly organised demonstration and propaganda we can do a very great deal to improve the outturn immediately. The whole of the work of the Agriculture Department is being held up for lack of proper facilities for demonstration and propaganda. To take the example of Malda district. After the Retrenchment Committee's report was submitted there were two years when there was no agricultural officer in the district at all.

We have now had one District Agricultural Officer and one demonstrator for a year and the number of demonstrators is being increased to five. This staff is however absolutely incapable of tackling the question of demonstration and propaganda. There is the farm to look after. The District Agricultural Officer is responsible for that and he has little time to spare for village work.

We need some organisation through which the District Agricultural Officer can keep in touch with the actual cultivator. The mofussil has in many places now been organised for village self government. Union Boards have been established and in Dacca, Tippera and other places are working very well. I do not see why we should not use this mofussil organisation. Why should not Government say "Our Policy is to have an Agricultural Association in every Union". These associations may be very loose associations to start with but they will have an executive through whom the District Agricultural Officer can keep in touch with actual conditions of all crops in every part of the district. These Unions are grouped into circles under a Circle Officer who works under the Collector. The Circle Officer visits the Union at least once every quarter. When he visits the quarter he has to look into the accounts of the Union Board, to enquire into the condition of the people and the state of the crops. The leaders of the Union Board will in nine cases out of ten be the leaders of the Union Agricultural Association. Why should not the Circle Officer take an interest in the Agricultural Association and help them by reporting to the Collector and the District Agricultural Officer their needs and their difficulties? The Circle Officer also comes to headquarters every month for a conference. At that Conference, the District Agricultural Officer is present. Circle Officers can then receive instructions about the Unions they are to visit during the next month and report what they saw and heard in the Unions they visited last month. If this is to be done, it must be made part of the Collector's duty to foster these associations and it must be made part of the Circle Officer's duty. One finds everywhere that, when the District Officer takes an interest in the work of one of the "notion building" departments, the officers of that department are able to accomplish more than in other places. District Officers have had District Boards taken away from them. The routine work left is often dull. I am strongly of opinion that the District Officer should be in charge of the agricultural propaganda as well as the propaganda of the Co-operative and Industries Departments. He alone can properly co-ordinate the work of these departments. There is a good deal of overlapping and the Collector is on the spot to see that subordinates are doing their duty. In mofussil subdivisions the work will be done of course through the Sub divisional Officer. I feel most strongly that if progress is to be made we must organise the mofussil. To do this Government must take the lead and if this is done non-official agencies will soon spring up to relieve Government of the task. At present, however, Government must undertake the work and the best means I can suggest is that detailed above.

District Agricultural Associations are usually run by busy pleaders who meet once a year to discuss the budget and the policy but who do no real work. Once however we can get the actual cultivators to take over the associations, I am sure that Government will soon be able to hand over the work to non-official agencies, and, as the Circle Officer has come to stay, Government will always be able to take a friendly interest in the well being of these associations.

8 (c) The only method by which cultivators may be induced to adopt expert advice is by intensive propaganda and by demonstrating to them that the expert

Mr. James Peddie.

advice is sound and profitable. When once the cultivator has confidence in a particular variety of seed or a particular method or even in a particular officer, results always follow. We must win their confidence. That can only be done by getting into close touch with them.

**QUESTION 4.—ADMINISTRATION.**—(c) (ii) *Railways and Inland steamers.*—These on the whole, I think, meet the present demand for facilities for removal of agricultural produce. A very great deal of the inland transport is of course by country boat which is cheaper than rail and steamship transport.

(iii) *Roads.*—The roads in many parts of rural Bengal are hopelessly insufficient. The roads in Malda district are particularly bad, and the District Board does not have the money to tackle the problem. With the new developments in public health and sanitation the District Board finds that it cannot even repair its roads once in four years and now construction is almost out of the question. There is now also a growing public demand for motorable roads, but at present I see no hope of satisfying that demand without a very large increase in the income of the District Board. There should, I think, be a Road Board of some kind to govern the road policy of the Province. Extra taxation must also be imposed, e.g., a cart tax—the whole of the proceeds of which should go to the roads. Road repair is very necessary.

(v) and (vi) *Post and Telegraphs.*—As far as my experience goes, I find that the Postal Department is willing to consider favourably any application for extension of facilities when there is a case at all for the granting of these facilities.

**QUESTION 5.—FINANCE.**—With regard to loans to cultivators I think that the only sound method of financing them is by the extension of co-operative societies of various kinds but I think that for propaganda purposes a much fuller use of the system of *taccari* might be made.

(b) The Agriculturists' Loans Act is practically a dead letter. In many districts it is very seldom indeed that applications are received. Most of the cultivators know nothing about it at all, and many of those who do know about it do not apply because, they say, Government always demands the money at the time fixed for repayment. An extension of the time allowed for repayment is, they say, difficult to obtain. Very much more use could be made of these agriculturists' loans and very much more good work could be done with their aid provided the grants were made to subserve the Director of Agriculture's programme of propaganda.

If we are to have an Agriculturists' Loans Act it seems to me that part of the money at least should be at the disposal of the Director of Agriculture for the financing of his scheme for the propagation of new crops in areas where they are not grown, for the spreading of improved varieties of seeds, and for the supplying of manure.

One finds that many cultivators are quite willing to set apart land for trying a new crop or a new manure but they are unwilling to pay cash for the seed. They will agree to repay at the time of harvest.

If the Director of Agriculture had part of the money available for distribution as agricultural loans at his disposal, he could do six times the amount of work that is done at present to increase the yield of jute, paddy, sugarcane and the other crops of which improved varieties have been produced in the Government farms.

If Government so desires, the money may be distributed through the Collector to persons whom the Collector considers to be fit to receive it and it may be collected through the loan collection department of the Collectorate.

If the money necessary for properly financing the schemes of propaganda is not readily available, I do not see any reason why Government should not raise a loan for the purpose. At present as far as I know (I may be wrong) money lent under the Agriculturists' Loans Act comes from current revenues. I do not think that this is necessary or desirable. Cultivators will take these loans far more frequently if they know of the possibility of getting them and if the law is not too strictly administered. There is provision in the existing law for granting time for repayment in the event of failure of crops, inundation, etc.

**QUESTION 6.—AGRICULTURAL IMPROVEMENTS.**—In my opinion (i) the main causes of borrowing are:—

(1) The frequent failure of the crops especially in one crop areas like the barind of Malda and Dinajpur and over considerable tracts of districts like Bankura, Burdham and Midnapore.

(2) Bad social customs—especially the dowry.

The sums that are paid by all classes of ryots and middle-class *bhadralogs* are far beyond their means. The poorest cultivator in this district now pays 40, 50, 60

Mr. James Peddle,

60 rupees as *pon* and I am informed that the same is the case elsewhere. In the Government *khas mahal* area of Malda district a landless cultivator often pays 100 or 150 rupees and a cultivator with 15 *bighas* 250—300 rupees to marry a daughter. This has often to be repaid by binding himself or his sons to serve the moneylender for his or their food for a period of years. Fifteen or twenty years ago, this was not so and the rate is increasing year by year out of all proportion to the increased price of commodities. Among certain classes, e.g., the Pundras or Purni Kshatriyas who are silk-worm rears in this district and the Gondshes who are pure cultivators, money has to be paid for the girls, to get rid of them by marriage. A silk-worm rears will often pay Rs. 2,000 for a wife. The rate is Rs. 100 per year of the girl's age.

(3) *The habit of borrowing.*—There is little saving among the cultivators. When they get a good harvest they spend all the surplus on luxuries or on additional plough oxen with the result that when they get a poor crop they have to go to the moneylender.

(4) *Ignorance and lack of education.*—I find that lack of education has been one of the main causes of indebtedness of many cultivators, particularly among aboriginal tribes. They are a prey to any one who has a little money to lend. There are a number of men I know who now rank as *zamindars* who twenty or thirty years ago were nobodies. Their wealth has been made by lending money at exorbitant rates to illiterate cultivators, who did not know what sort of a document they were signing. The area occupied mainly by aboriginal tribes is in the district of Malda in the neighbourhood of 800 square miles and this land is fast passing out of the real cultivator's hands.

(5) *The ridiculously high rates of interest charged.*—37½ per cent is the usual rate and even if compound interest is not always realised it is usually entered in the mortgage that interest will be compound.

When seed is taken and repaid in kind the interest is very excessive. In the *barind* the cultivator takes paddy for seed and for food on the *dheria* system, i.e., at the next crop he returns 1½ times the amount received.

In the Government *khas mahal* area the state of affairs is worse. There the *duna* system prevails. If I take 10 maunds of paddy in July, in December, repay 20 maunds. If it is not paid, then I am liable to pay 30 maunds in March, and if not paid then 37½ maunds in July. If I still fail to pay a mortgage is executed, the consideration money being 37½ maunds converted into cash at the market rate and interest will be charged at 37½ per cent. on that. The result of this iniquitous system has meant that whole villages of people have lost all their lands even their homestead lands.

(6) Documents such as the *Suddhondhak* by which the cultivator gives up his land to the lender till he can repay the capital. I presume that this is the kind of document referred to in Questionnaire as an interminable mortgage.

(ii) Practically the only sources of credit of the cultivator are the village *mahajans*. The co-operative societies, although in certain areas they have succeeded in reducing the prevailing rate of interest, have so far only touched the fringe of the problem.

(iii) The reasons preventing repayment seem to me to be mainly—

(1) Failure of crops especially in one crop areas.

(2) The habit of postponing payment which is a very common habit and results in many cases in the failure to pay interest and the increase of debt till the cultivators' lands are sold by order of the Court.

(3) The fact that moneylenders often take advantage of the cultivators' disinclination to pay, give them an extension of time for payment, till, with the accumulated interest at high rates, the cultivator is doomed and he loses his land.

(4) *Borrowing beyond means.*—This often happens among cultivators and the readiness with which money is obtained helps to encourage this.

(b) *Measures for lightening agricultural burden of debt.*—(1) First and foremost of all we need universal primary education.

(2) Second, we need social reforms. For that a social reformer who will grip the people and carry them with him is required. Many educated Indians profess disagreement with hind social customs, but few seem to break away from these.

(8) The Civil Courts are very often rich men's courts. In many cases I have advised cultivators to take real grievances to Court to have them righted and in the majority of cases I have been told, I have not the money to go to Court. I must do without justice. In many cases summons are not served on the person or the person on whom it is served is so poor that he cannot appear to defend himself. The result is an *ex-parte* decree which is in money suits tried by the Small Causes Court Procedure usually decided by the Munsiff according to the plaint. Munsiffs are as a rule busy. They may have 30 *ex-parte* decrees to make

Mr. James Peddie,

in a day. They say they have not time to go into uncontested cases. The fact remains, however, that in these cases not nearly enough use is made of the Usurious Loans Act.

Many holdings are sold in execution of *ex-parte* decrees which might have been saved had justice not been so difficult to obtain in our Courts of law. The really poor man has little or no chance of gaining the day. It is difficult to see what can be done except to insist on a much more strict interpretation of the Usurious Loans Act. I shall refer to this again in paragraph (b) of this section.

(4) Non-terminable mortgages should be prohibited by law. Among ignorant tenantry in certain areas they have worked in credible damage. I know of many cases personally especially in the Gomaathapur thana of Malda district.

(5) I have already suggested that the Usurious Loans Act should be much more strictly enforced. Munsiffs complain that the provisions are too vague and if they enforce them rigorously the only result is an appeal which is allowed, and, that Munsiffs naturally wish to avoid. I know of Munsiffs also who hold that 37½ per cent is a low rate of interest. This rate is the average minimum charged in the Malda district—usually compound interest. I have found documents where the interest was between 50 and 60 per cent, compounded every three months. When paddy is taken in kind for food or for seed the cultivator borrows the paddy in July and returns the same amount *plus* 50 per cent in kind in January. If he fails to pay, the number of maunds is converted into its cash equivalent and a mortgage is taken for the amount. This is the custom in the barind high land area.

(6) I think that there should be much more control of the village *mahajan*. Some means should undoubtedly be devised for limiting the int. of interest charged. The illustrations I have given already are sufficient to show how impossible it is for a cultivator to save himself if he once gets into debt. Registration of money-lenders with a system of licenses might be introduced. If this were done and if Government could do something to limit the exorbitant rates now charged, much good would result. If licenses had to be taken and if *mahajan* accounts were open to inspection moneylenders in villages would be more careful.

(7) The only really final methods of lightening agriculture burden of debt are (a) the hastening of the extension of compulsory primary education, (b) intensive propaganda in the villages both agricultural and co-operative and endeavour to cover the country with co-operative societies as early as possible.

(c) It seems to me to be dangerous to try to limit the right of the cultivator to mortgage or sell his land.

This has, it is true, been done in the case of certain aboriginal tribes like the Santals and the results are satisfactory as far as one judges after a two years' trial. In practice, however, this law is found somewhat difficult to administer properly. There is also the danger that if we limit that right to mortgage and sell we may make it far too difficult for the cultivator to get money which is essential for his cultivating of the soil.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—(a) *Remedy for excessive subdivision.*—The remedy seems to be to amalgamate and the only satisfactory method is the co-operative method.

(b) Obstacles in the way are both sentimental and practical: (1) the sentimental obstacle is the love a cultivator has for his own piece of land. He knows what it can do and he hesitates to exchange it for another even though the exchange will help him.

(2) The chief practical obstacle is the fact that in so many areas non-cultivators and non-residents are the ryots and the old original family of cultivators have sunk to the level of the "korja" or under ryot paying "adhi" or "borga" at harvest time to the non-resident non-cultivating ryot.

(3) Dissentients in the village. To deal with these and with the non-resident ryot powers should be taken to compel them to join when the majority of the villagers desire to amalgamate their holdings through co-operative societies.

**QUESTION 8.—IRRIGATION.**—There is much irrigation to be done in Malda district and in Dinajpur district as well as in other districts of the Province. We can accomplish far more for agriculture by irrigation than by any other means. I have already suggested to the Irrigation Department two comparatively large schemes and eight or nine smaller schemes in Malda district. The Irrigation Department started last year and are engaged now in the task of collecting hydraulic statistics.

There should be an irrigation sub-divisional headquarters in Malda. There is enough work in Malda district alone to justify the opening of an irrigation sub-division there.

Mr. James Peddie.

There are two main areas where irrigation or flood control or both are required—one area is the *barind* the high land in the East and the other is the *tal* which lies in the West and the North West.

The *barind* of Malda covers about 800 square miles. It also extends a long way into Dmajpur. It gives one crop per annum—winter paddy. The rain comes either too late or too early or both. For the last five years the crops in the *barind* were roughly —

1926	...	4 annas (probably)—not yet reaped
1925	...	4 to 5 annas.
1924	...	16 annas
1923	...	4 annas.
1922	...	about 8 annas.

This area when the rain comes at the right time bears a heavy crop of paddy and large quantities are exported to Bihar and East Bengal. At one time during the Mahommedan period the *barind* was highly cultivated. There are hundreds of old tanks which must have been used for irrigation. These are now nearly all silted up. We might start the work of re-excavating these old tanks through co-operative societies if the Santal inhabitants were not so ignorant. One may go twenty miles without meeting a person who can read or write. The correct manner of dealing with the area would be as a whole and to do this the rivers Taugan and Purnabhaha might be utilised by damming the water in the upper reaches of the valleys and by bringing it down by high level canals along the main ridges. The country is undulating and the undulations would probably lend themselves to such a scheme.

Apart from the *barind*, there is a large *tal* area twenty miles from north to south by 10 to 12 miles broad. This area floods deeply so that in most years paddy and jute are drowned out. When the rains stop the water drains off at once and the land dries very quickly, the result being that though the soil is excellent soil for wheat, in four years out of five the rabi crops fail for want of water. This area is essentially a wheat and oil-seed growing tract and it is at present a vast waste of jungle with a few patches of cultivation here and there. If we could supply water in the cold weather and the hot weather, it would bear excellent crops. For this it would probably be necessary to use the water of the Mahananda which would be admitted through sluice and brought down by canals. Enquiries in the area are now going on and should be hastened as far as possible.

Apart from the *barind* and the *tal* there remain large *bhil* areas where much good arable land might be reclaimed by flood control and drainage. These questions which are also intimately bound up with the health of the people (Malda is very malarious in certain years) cannot be properly tackled unless an officer is posted here.

I think that by irrigation we can do more at least in West and North Bengal than by any other form of activity for the benefit of the cultivator.

(b) The obstacles in the way of extension of irrigation are:—

(a) *Lack of knowledge.*—The Irrigation Department has only just begun its general enquiries in North Bengal and it is not in a position to advise the local authorities. More general hydraulic statistics are necessary.

(b) *Lack of staff.*—There are many calls on the Irrigation staff which is insufficient.

(c) Large rivers are undoubtedly very important but I think that the Irrigation Department should devote more time to purely agricultural irrigation schemes.

(d) *Finance.*—Government is not the owner of the soil and the results of irrigation schemes do not react on Government revenues as they do in certain other Provinces.

(e) Zamindars are indifferent or conservative. They are mostly too busy collecting rents to worry about permanent improvement of the land by irrigation. Were Government the zamindar money invested in the land would be a very profitable investment. It is difficult to get private zamindars to see this.

(f) The Agricultural and Sanitary Improvement Act has not yet been properly tested. Most of the officers of the Irrigation Department object to it on the ground that the assessment of benefit derived especially in schemes of flood regulation and control, is very difficult—I mean schemes where flood water is kept off a certain area till certain crops are reaped, then gradually let on to the land as the young crops rise and at the end of the rains, gradually let off so as to retain moisture in the soil for the longest possible period.

(g) I think that the present legislation is not quite sufficient for our needs.

Mr. James Peddle.

QUESTION 9.—SOILS.—I cannot say much about this except that where as a few years ago the tops of the ridges in the *barind* tract of Malda used to be covered with scrub jungle and *sal* forest these have now been cleared. The result is that from the top of the ridges there is much washing away of surface soil during the rains.

These should either be planted regularly with crops like *arhar* or in my opinion better still replanted with *Sal*.

The trouble is that all these lands have either been let out by the zamindar to tenants or have been occupied by tenants without the landlords' permission.

The same state of affairs exists in parts of the highland of Banlura and of Midnapore.

QUESTION 11.—CROPS.—(a) (i) *Improvement of existing crops*.—Much is possible by persuading the cultivators to introduce new varieties produced on Government farms whose yield is higher. More research will enable us to deal with a larger number of crops. At present, we have mainly jute, sugarcane, tobacco and several paddies. The work on paddies is not nearly finished but before long we shall have completed the introduction of jute as recommended by the Department. Much remains to be done on *rabi* crops and the results of the work on these in other Provinces should be made more readily available.

Much more also could be done to improve existing crops by (a) irrigation (separately dealt with) and (b) better manuring. For the latter more propaganda is required. Unless we get the staff and create the organisation, work will be very slow and much effort will be wasted.

(2) *New crops including fodder crops*.—Here also much is possible in certain areas. Tobacco and sugarcane can be grown over large tracts in Malda district where none is grown now. To effect this improvement, supply of seeds, village propaganda, and motesul organisation are required. At present we could sell much more tobacco and sugarcane of recommended varieties than can be supplied to us. There is every chance that these new crops will soon establish themselves.

*Fodder crops*.—The need for fodder crops is beginning to be recognised in this district and with staff for village work the cultivation of fodder crops could be rapidly extended. Many of these problems could be solved if we had the money to tackle them.

*Distribution of seeds*.—(ii) The Agriculture Department cannot tackle this question alone. It must have help. It can produce new varieties and say how they should be grown. It can give the new varieties a start; but multiplication and distribution should after the initial stages be done by non-official agencies.

These, I suggest, should be non-official seed farms registered by the department and to a certain extent supervised in order to avoid mixing of good and bad seed. If the seed is good, it will soon spread and when once it has covered an area the seed supply problem will solve itself as local agents will undertake the supply. As has been done in the case of jute responsible agents may be appointed for the collection and sale of seed guaranteed by the Department. If the local Agriculture societies I mentioned in paragraph 3 are formed they may form a link in the chain which ends in the cultivator. One difficulty must be faced, viz., the fact that most cultivators dislike paying cash and if they can get the poorer seed on credit they will probably take these in preference to the better seed. We must therefore try to enlist the support of certain recognised local seed suppliers. Co-operative seed supply societies may in time be formed but it will be a number of years before these can be of much real assistance.

(c) *Successful efforts in improving crops*.—Fifty per cent. of the jute now grown in Kharba *thana* of this district is *kakia bombai* jute which yields a much better crop than the local varieties.

Government jute is also spreading in other *thanas* and the demand is increasing in these areas also. Work on jute will soon be finished in this district except for occasional renewal of the supply of pure seed.

*Dudsar* paddy is now established in Gajole *thana* and would now be fairly widespread in other *barind* *thanas* were it not for the fact that for the last two years there has been a failure of the *barind* crops for want of late rains. This year about twenty *dudsar* paddy seed farms were started in the *barind*.

Potatoes have been established in Kharba and Hariachandrapur *thanas*, and in Kharba the cottage garden habit is now almost universal.

QUESTION 16.—ANIMAL HUSBANDRY.—I do not know much about animal husbandry but there are one or two facts which I would like to mention.

Land is let out as arable land to tenants irrespective altogether of the necessity for retaining pasture lands. The result is that over very wide areas there is no

Mr. James Peddie.

pasture land and no land for exercising the cattle. In the *barind*, the habit is to allow cattle to graze over all the holds from December to July. During this period there is practically no grass even on the *ahls* or ridges between the fields. It is all brown and dry. The cattle get little grazing, and, as there are no fences, it is impossible to grow a second crop, e.g., maize. In the rains most of the land is under paddy and there is not even exercising ground for the cattle. Near the river valleys there are large *bhils* or marshes where villagers often take their herds for the dry season. These however are fast coming under the plough and with the extension of irrigation and flood control the available pasturage will shrink still further. The villagers all complain that the supply of milk is getting worse and worse from year to year and the price is continually going up.

Over large areas there is much overstocking of available pasture land. No attempt is made to control breeding or to improve the stock. The village bull is of a very poor type and the cows are on the average so small that the bulls from the Rangpur Government Farm herd are too heavy for them.

There are no enclosed pastures. Without village propaganda and education we shall be unable to influence villagers in this direction.

There are periods all over the district, which vary with the type of land, when dry fodder is scarce.

I have noted above that there is great scarcity of green fodders at certain seasons. In *bhil* areas it is when the *bhils* are under water, and on the high land area chiefly when the sun has dried up all the grass, i.e., from February to June. I have had requests from villagers in different parts of the district that arrangements should be made to ensure protection of pasture land. It is difficult to do anything, however, for most of the landlords take no interest in the question and are far too anxious to get the *salami* and the rent to worry about grazing.

The question is a very important one especially in its bearing on the milk problem which seriously affects the whole population.

The only solution of the fodder question seems to be in the cultivation of fodder crops and the development of the system of storing in silos. Here again education and propaganda are essential.

QUESTION 17.—AGRICULTURAL INDUSTRIES.—(a) The average cultivator in the *barind* one crop area of Malda district does about four months' work altogether during the year, in some cases less than that. In *diara* or riverside areas where a variety of crops are grown the cultivator works for from six months to nine months every year. The cultivator in his slack time does nothing at all.

(b) I can suggest no means for encouraging the adoption of subsidiary industries except the continual preaching of the necessity of adopting these industries and the persuasion of as many individuals as possible to adopt them. Government alone cannot do it. Non official help is essential and in these matters in the average district one gets very little non official help. Among the Sonthals, Rajbanshis, and Drooms of the *barind* Government might establish weaving as a cottage industry and efforts in that direction are being made. The cultivators there, however, especially the Sonthals have become very lazy and if they can get enough to eat they will not take the trouble to work. More education is required. There are only between twenty and thirty primary schools in an area containing over a lakh of people and these schools have from ten to twenty pupils each.

Demonstration parties are a useful means in areas when the cultivators are a little more enlightened and Government should maintain as many of these as possible. The work of these parties is hampered if the district authorities do not co operate and fail to do what they can to bring the cultivators to the demonstration.

The necessity of subsidiary industries should be taught in all schools. We need not hope for a sudden change but by using all the means at our disposal we may in time teach the cultivators as a whole that they can do much to help themselves by being a little more industrious.

(c) The obstacles in the way of expansion of the industries mentioned in the Questionnaire are—(1) indifference of the cultivators themselves, (2) lack of effort on the part of the educated people to interest themselves in propaganda towards this object, and (3) caste prejudices and old customs in such industries as poultry-rearing which the Hindus will not adopt, and basket making which is done almost entirely by Doms who belong to the lowest grade of society.

I append notes on the industries which have fallen within my own experience (*vide* Appendix).

(d) Government should, if possible, do more towards the establishing of small industrial concerns in rural areas. Apart from the fact that they will bring the market nearer to the door of the cultivator and will assist in the elimination of the middleman who absorbs so much of the profit,

Mr, James Peddle,

(e) Communications are in many places so bad that it would, I think, be difficult to persuade the large concerns to migrate to rural areas.

(f) More extensive study of each rural industry is very desirable. By the starting of Industrial Unions and sale and purchase societies as well as by the introduction of improved tools and implements much good work is possible. The difficulty lies in arranging for proper management and supervision.

I asked the Industries Department for a simple cottage machine for finishing and burnishing brass and bell-metal articles eighteen months ago. I have not yet got it.

(g) I can suggest no other methods of increasing rural employments than those already mentioned.

(h) The only way to induce the people to improve the health conditions of their environment is by education and by introducing co-operation. In a village of 300 people where 100 died in four months of malaria and where the children were still dying almost daily it was with the very greatest difficulty that they could be persuaded to allow the health authorities to cut down the few bamboos that were keeping the sun off the insanitary ditches where the mosquito was breeding. If that is the case in such circumstances, the difficulty where epidemics do not prevail can easily be imagined.

**QUESTION 22.—CO-OPERATION.**—It is with some hesitation that I write about co-operation. Without the extension of the co-operative movement among agriculturists it would seem to be impossible to make progress in the practice of agriculture; but on the other hand there is not an urgent demand from the people for co-operative societies and without the support of the general public the Co-operative Department cannot extend. Up to the present co-operative work except for a few societies here and there, e.g., the Industrial Union in Dacca, Jute Purchase and Sale Societies in Serajganj and others, has been mainly concerned with credit societies financed through Central Banks. These associations have to a certain extent fulfilled their object inasmuch as they have succeeded in many places in reducing *mahajani* rates of interest and in freeing their members from debt. I feel, however, that if full use is to be made of the Co-operative Department for the improvement of agriculture we must go much farther than credit societies and start societies with limited but definite agricultural objects.

I have talked about this with Directors of Central Banks who are usually busy Pleaders. The answer I invariably get is "We know all about lending money, banking *mahajans* but we do not know about buying and selling crops, looking after seed stores, etc. If you want to do that it will have to be done by a separate organisation." In this district a year ago two new Central Banks were started. They are the "Chanchal Raj Central Bank" and the "Harischandrapur Central Bank." These two banks are to all intents and purposes, Zamindari Central Banks run on co-operative lines. The zamindars of Chanchal and Harischandrapur have between them undertaken the co-operative development of three *thanas*. They are adopting a definitely agricultural policy and instead of the ordinary Credit Societies they propose to start tobacco societies where we want to introduce tobacco and sugarcane societies where we want to introduce sugarcane, etc. They will combine the work of the ordinary credit societies with seed-supply. Where one can get zamindars who are really interested in the tenants this is undoubtedly a good type of bank, but there is of course the danger that with a change of management such banks might not be run entirely for the benefit of the ryot. More Central Banks of this type might be started. Far too many of our Central Banks have developed into dividend making machines. If the existing Central Banks cannot undertake the work how is it to be done? I believe that if we start Agricultural Unions financing rural societies of various kinds such as those enumerated in the Questionnaire the benefit to the agriculturist would be greater. The problem is how to start these Unions and how to look after them. Is Government to do it or are non-official agencies to do it? The answer is that, if Government does not show the way, nothing will be done at least for some time to come. However much people may object to interference by Government Officers, I do not think that we have at present any non-official agency which will take this up.

Non-official agencies will be found to help and I think that the money will be forthcoming, but if the work is to be done Government must show the way.

(b) *Credit Societies.*—Many of these have been very successful. Many others have failed. The failures are very often the result of slackness and lack of supervision. One readers' society in Malda has fallen into a bad condition because the Central Bank though it lent large sums of money did not properly supervise the society and much of the money was spent on other kinds of trade and not for

Mr. James Peddle.

the reeling business for which the loans were given. I hear the same tale regarding other societies from co-operative officers.

(ii) to (ix) *Purchase and other societies.*—I have no experience of these. There is however a large field for purchase and sale societies provided we can get the agriculturists themselves and the landlords to take up this form of co-operative activity. We require those interested in the land and the land worker at the head and not the busy pleader who cannot devote enough time to the work. The same remarks apply to the other types of societies mentioned. It will not, I fear, be possible to start societies for joint farming at present. The cultivators have not enough education to see the value of it, but it is only by forming such societies after amalgamation of holdings that proper use can be made of scientific implements and tools.

(c) I am of opinion that when co-operative schemes for joint improvement cannot be given effect to because of the unwillingness of a small majority to join that legislation should be introduced in order to compel such persons to join for the common benefit of all.

(d) On the whole, the societies of which I have experience have achieved their object. In a village, however, where there is a co-operative society one finds that it is only the more well-to-do cultivators who are members. They have not been able to help these most in need of help.

Seed societies where the return can be taken in kind will benefit a far larger number of people than the ordinary credit society and such societies will be introducing nothing new, for the mahajan takes his paddy back plus interest at the time of harvest.

*Note.*—The Co-operative movement is at present financed by the Provincial Bank. It is proposed to start a separate Industrial Federation in Calcutta to finance Industrial Unions. It seems to me that if there were a Provincial Agricultural Federation, co-operation in agriculture would spread more rapidly. In the same way in the Department there are ordinary Inspectors who deal mainly with credit societies. These officers have little or no interest in agriculture. Recently the number of Industrial Inspectors has been increased. We should have Agricultural Co-operative Inspectors also working in very close touch with the Agricultural Department whose duty it would be to form and look after purely agricultural co-operative societies. The Co-operative Department would then have three main branches—ordinary credit, industrial and agricultural.

There is so much overlapping of agricultural, co-operative and industrial activities that one head for the direction of work among the people seems to me to be desirable. In other words I think we should have a Development Department in which activities of agricultural, co-operative and industrial officers might be co-ordinated.

QUESTION 23.—GENERAL EDUCATION.—(i) and (ii) At present the training given in high schools and middle schools is of no assistance whatever in the raising of the standard of agricultural efficiency. If a boy who is a cultivator's son has read up to the standard of the middle English school, he becomes dissatisfied with his hereditary profession and wants to become a clerk. It is pitiful to meet a very large number of youths who have read up to the Matriculation standard who admit that they have been sitting at home idle doing nothing for one year, two years or three years, waiting for some job to turn up. These, too, are very often cultivators' sons who might be helping their fathers. We want to educate our cultivators' sons up to the middle school standard; but unless something is done to alter the course of study, the education is largely wasted as far as agriculture is concerned.

(iii) *Elementary Education.*—The Primary Education Bill has already been referred to. There is a considerable demand from the people for primary education and the sooner we can get compulsory primary education the better. There are far too few schools now. Elementary education, good elementary education, is absolutely essential if any of our agricultural problems are to be solved.

(b) (i) It has already been noted that middle schools should all have school farms attached to them as early as possible and that agricultural education should form an important part of the curriculum. I have also suggested that the institution of adult classes should proceed *pari passu* with the establishment of school farms.

(ii) I have no experience of compulsory education in rural areas.

(iii) The explanation usually given for the small proportion of boys in rural areas who pass the fourth class is that their parents are too poor to keep them at school. This I do not believe to be true in many of the cases where this explanation is given. What often happens is that the boy plays truant, the parent is fined and at once withdraws his son from the school. If the boy does not play truant he is

Mr. James Peddie.

kept at home to herd the cattle in which case the parent is fined, with the same result. Most often, however, the boy is kept away because his father wants his help in the fields or as a herd. The fees are such that with a less expenditure than the expenditure on pan and tobacco the children can get primary education. I have put the pan and tobacco proposition to many cultivators and they have usually admitted that what I said was true, viz., that the fees were less than the cost of their pan and tobacco.

QUESTION 24.—ATTRACTING CAPITAL.—(a) Profits from moneylending are so great and the return is so sure that as soon as a man is in a position to invest money he at once lends it out at interest and thereafter keeps it out at interest. If he has to foreclose, he often buys up the land but here again profit is so easily made without his taking the trouble to farm that he adopts the easy course of admitting the late ryot as his *adhidar* or of putting in another *adhidar*. He supplies seed and at harvest time gets half of the crop. I know one man who has acquired 4,000 *bighas* in this way. Practically all his cultivation is through *adhidars*. This applies also to most of the *zamindari kamats* or farms in the *zamindars* own possession and to a very large numbers of the *talukdars* and *jotedars*. In the district of Malda, there are a very large number of persons holding 100 acres and upwards. Few of these farm the whole of their lands although there are many of them expert cultivators and are willing to adopt new methods.

As long as money is so easily made by moneylending it will be difficult to get men of capital to take to farming. The successful cultivator who makes money also very soon becomes a moneylender.

The only way to induce men of enterprise and capital to take to farming is (1) to make it less easy to make money by moneylending. (2) to demonstrate the possibilities of scientific agriculture and (3) improve the land by irrigation, etc.

(b) I cannot understand why owners of land do not carry out improvements. The only reasons I can give are:—

(i) That most owners of land are, like their tenants, not sure of the results of a proposed improvement. I have consulted a number of *zamindars* with regard to irrigation schemes. They say "if you can do that it will be good for us and also good for the tenants and we are prepared to pay our share." They have not however the initiative, knowledge and enterprise to carry out these schemes.

(ii) Many of them, the majority, take no interest in the land at all as long as their officers collect enough money from the tenants. The conscience of the landlords—not of all but of many of them—must be awakened to the duties of the landlord to his tenants and to the State. He must be made to realise that it is not enough to pay his revenue regularly before sundown on the last day of the list. If he does not awaken soon, I think that the awakening he will get at the hands of his tenants will be a rude one. There are still many *zamindars* whose *zamindari* papers and maps are in hopeless confusion who are, along with their tenants, a prey to their officers. *zamindars* who even now give the *mahals* to the *gomostha* who can advance beforehand the largest sum of money. Education of the small *zamindar* is as necessary as education of the ryot.

QUESTION 25.—WELFARE OF RURAL POPULATION.—In districts like Malda, the rural population suffer much from malaria. This is caused by insanitary conditions. Every District Board should have and enforce bye-laws for the removal of the insanitary conditions so that, if a villager or villagers refused on notice being served to make their village sanitary, the District Board through the Health staff might carry out the work and realise the cost from the inhabitants. Such bye-laws exist in all Municipalities and should form part of all District Board books of bye-laws.

(h) District Boards should be encouraged to take loans for the improvement of rural water-supply instead of carrying on the work at the present rate of progress out of current revenues. Powers should if possible be taken for recovery of part of the cost of supplying water from the villages which benefit.

(c) I think that economic surveys in typical villages are very necessary. One hears so many opinions about the economic conditions of the cultivators that it is extremely difficult to say what steps are required in a particular area without such enquiries. The enquiries may be carried out through the staff of the District Officers as and when the District Officer is able to spare an officer for the work. Much useful information may be collected at the time of settlement operation.

(d) In the agriculture department such enquiries are going on and I append the results of these enquiries in one or two villages as well as certain broad deductions from more extended enquiries over one third to one-half of the total silk producing area in Malda.

Mr. James Peddle.

I did not expect that I would have to reply so early to the Questionnaire so the enquiries I am having made in one or two villages inhabited by ordinary cultivators have not yet been concluded

QUESTION 26 —STATISTICS —As long as the education is in its present state I do not see how we can improve the method of collecting agricultural statistics. We must rely to a large extent on the village *dafadar* and *chowkidar* and these statistics are bound to be very uncertain for some time to come.

(b) Under the heading, I would like to suggest that market prices of agricultural produce in the various markets if it could be circulated in print regularly for posting in police stations, sub registry offices and on the notice boards of other offices would help in the education of the cultivator. If we do not begin to supply such information, the cultivator will continue to be robbed by the middlemen.

Mr. James Peddie,

## APPENDIX

## Note A

1. *Sericulture*.—I write separately about sericulture as it is one of the most important subsidiary occupations of cultivators in certain parts of Bengal and over large tracts in the districts of Mudda, Murshidabad and Birbhumi, is the main occupation of many people of the cultivator class.

Up to the present the industry has not been properly organised. Government have certain nurseries producing disease free seeds. Over most of the area where Government seed is purchased, the seed is put into disease infected houses and ruined. If, therefore, the maximum effect is to be gained from Government scientific culture of seeds the cultivators must be taught improved and hygienic methods of rearing silk worms. Government have sanctioned a number of officers for this financial year for village work. It will take several years before this staff can be safely dispensed with and the industry left to itself. The industry is said to produce in Mudda district alone 1,50,00,000 (one and a half crores) of rupees worth of thread each year. Most of this is consumed in India.

2. *Research*.—This is necessary to improve indigenous races and also for the production of new races which will be more resistant to disease and which will yield a larger percentage of silk.

3. *Sericultural Education*.—At present there is a Sericultural School in Rajshahi. The Collector of Rajshahi and the Director of Agriculture both agree with me that that school should be removed to the Mudda district and attached to the Plasbari nursery and proposals will probably be put before Government asking that this should be done. This school produces selected rearers. These selected rearers are some of them *bhadralay*, and some of them professional rearers' sons. When they have passed the examination they are at present given a reward by Government of Rs. 250 and are required to build a rearing shed of the approved type and to produce seeds for a period of years, failing which the reward may be demanded back. I have proposed that instead of granting a reward of Rs. 250 that a loan of Rs. 600 should be given. Rs. 250 is far too little and the result is that the young rearing rearer has often to saddle himself with debt to a *mahajan* at the start of his career. If he had a Government loan it might be given interest free for three years and if not paid within that time interest at 6½ per cent might be charged on the sum still to be paid. If lists were regularly unpaid the money might be realised either from the ex-student himself, if he has land of his own, or from his surety who would be responsible for his carrying out his contract.

The output of trained seed rearers should be increased with the object of relieving Government as soon as possible of the burden of production of seed on a commercial scale. As early as possible the Sericultural Department should be producing only the seed necessary for "selected rearers" who should produce all the seed required by all-village rearers in the Province. The students of the Sericultural School, Rajshahi, know theory but fail in practice. For that reason the school should be attached to a large nursery where the students can do the actual work.

Apart from the sericulture schools a certain number of rearers' sons are taken on to the farms as labourers. They get accommodation and labourer's pay and they do the work of the nurseries, both rearing and cultivation, learn the improved method and go home trained. Some of these become selected rearers and the others return home to introduce to their own village the methods they have learnt.

*Demonstration and propaganda*.—This is very necessary if the industry is to be put on the right lines. I have noted above that until a short time ago disease free seeds were being put into disease infected houses and Government were blamed for producing bad seed. In addition to this the cultivator frequently gets only a sick and crop because he has had the first destroyed by flood. This can be avoided by showing that his rearing shed has all the holes filled up with mud and doors and windows fitted with wire gauge. Without village to village propaganda it is impossible to get this done. With such propaganda it has been found in Mudda that it can be done and the results show that it is very profitable for the cultivator who is persuaded to do the advice of the departmental officers. I append a statement regarding certain villages where propaganda has been carried out.

Another cause of loss to the cultivators is disease. The cultivator does not know what to do when disease appears and often before it is reported the disease will go right through every rearing shed in the village whereas had the cultivator

Mr. James Pridle.

L. v 12—28a

reported the epidemic of, say pebrine, it might have been checked by disinfection at the outset. If this is not taught to the cultivator, the heavy losses which are quite unnecessary will still go on. For this purpose also the staff for propaganda is required.

At the present moment these officers are engaged on the compilation of certain statistics as well as in the assistance of the cultivators in the fight against silk-worm diseases. These enquiries show that in the last ten years there has been little change in the amount of land under mulberry. The decrease is under 5 per cent and is mainly due to the substitution of jute for mulberry in the diara or river side lands. They also show that though there is a great deal of debt the cocoon rearing class as a whole is not very badly in debt. In other words, in spite of the drawbacks under which he is working, he is making a living though it is a poor one. Statistics relating to one or two villages are given below.

I also append a statement showing increase and decrease in mulberry cultivation over one third of the silk area.

**Marketing.**—The complaint one hears on all sides is that the market is poor. The rearer sells cocoons to the reeler who prepares the thread. The rearer cannot afford to wait for the market. He must sell or the cocoons will be spoiled. He must therefore take what the reeler is prepared to give and that is largely dictated by the Marwari middlemen who advance money to the reelers and take and export to various parts of India the thread they prepare. This brings us to the marketing side of the industry which can I think be very much improved by the establishment of a co-operative silk union to finance societies whose members will rear cocoons and spin them into thread. It is expected that the silk union will start work soon. The industry at present therefore requires—

- (a) Research.
- (b) Continuation of the staff now doing propaganda in the villages.
- (c) Increasing the output of selected rearers and elimination of the bad village seed.
- (d) Improvement of the rearing houses and the introduction of the use of disinfectants and more hygienic methods. This is to be done by village propaganda and by the formation of co-operative societies.
- (e) Disposal of the finished products through a co-operative union.

There are other ways in which the condition of these cultivators can be improved. At present the pierced cocoons are spun into thread called *matka* by the women of the household. By using a spinning wheel which costs 10 rupees the waste silk now sold at Rs 150 per seer can be spun into thread for which there is a ready market at Calcutta at Rs 8 to Rs. 10 per seer. Two seers can be spun in two days and the yield is about one seer of thread. What is rejected is probably still marketable as waste silk. The profit is obvious and this profit can be gained by the introduction of the spinning wheel. The Industries Department have three parties at work in Malda now demonstrating this method of the spinning which the cultivators do not know.

This state of sericulture is at present so bad that I do not recommend its extension as a subsidiary industry. The Agricultural Department will have quite enough work to do in the next few years trying to get it properly organised.

The industry can be made to yield a livelihood to the cultivator but the cultivation charges per seer must be reduced by teaching them how to fight disease and flies, where to get the best seed, and how to dispose of their produce to the best advantage. Introduction of tree mulberry also is desirable.

Mr. James Peddie,

## (ENCLOSURES TO NOTE 'A')

Statement showing the economic condition of the silk-worm rearsers of village Serampur in the district of Malda

Serial No.	Name of rearers	Quantity of mulberry lands	Rearing accommodation	Annual Income		Annual Expenditure		Value of mulberry land	Debts	Remarks
				From sericulture	From other sources	For sericulture	Family expenses			
		Bighas	Chakras	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	
1	Uswari Mondal	2	1	200	120	112	160	400	..	Other sources are mainly ordinary arable land, mango garden or dry labour. Silk worm rearing is the main occupation of the family. Most of the work, however, is done by the women. The general conclusion I draw is that this industry is well worthy of attention and that there is no justification for the statement made on several sides that the silk industry in Bengal is doomed

### Note B

*Lac.*—Lac is an important subsidiary industry to agriculture and in Malda district there are some of the best lac jungles in India. After the War, prices of crude lac fell so much that many persons gave up cultivating it. This year the refiners in Murshidabad and the neighbouring Bihar districts are closing down their factories because there is no supply of crude lac and the crude lac producer is not growing the lac because he says the price of crude lac is too low. If however the cultivator takes up refining of lac—a very simple process—he makes a profit at once. It will necessitate the bringing of experts here and the training of the local cultivators but it can undoubtedly be done. Six men working in two shifts can refine one maund of crude lac a day. The cost of crude lac last week was Rs. 20 a maund, of superfine refined lac Rs. 90 and ordinary refined lac Rs. 75. From two maunds of crude lac one maund and ten seers at least can be obtained of which one maund will be superfine lac. The remainder usually thrown away can be made into toys and other things. This needs propaganda and co-operation. The cultivators are conservative and do not like new things. Meanwhile the trees have no lac on them and all the money which used to come to this district from the sale of lac is now going elsewhere.

Lac cultivation is well known here as a subsidiary occupation. What is required is the teaching of the process of refining lac and arranging for the disposal of the finished products.

---

### Note C

#### OTHER INDUSTRIES

*Basket making*—This is confined almost entirely to *Doms*. Other castes object to the work.

*Poultry keeping*—This would be developed among Mahommedans and aborigines. Hindus object to it for caste reasons. People keep hens mainly for their own use. There is nothing resembling poultry farming though in certain tracts Mahommedan cultivators keep poultry for sale in the markets. In most rural markets poultry can be bought on the market day.

*Bee keeping*—No one has any idea of how it should be done. I do not think it is very suitable as an industry subsidiary to agriculture in India.

*Rope-making*—This is done mainly by widows. The ordinary cultivator makes ropes only for his own use. This might be encouraged. The main difficulty is the laziness of the cultivator who prefers to sit and do nothing when he has some spare time.

Mr. James Peddle.

### Oral Evidence

23279. *The Chairman:* Mr. Peddie, you have put in a very valuable note for which the Commission is greatly obliged to you. Do you want to say anything in general at this stage?—No.

23280. May I ask you to turn to the printed note of your evidence? You have attached to it a very remarkable body of statistical information?—I should like to say that those figures were sent off unchecked; there are probably some inaccuracies, but the general conclusions which are to be drawn from those figures are probably the same as they would be after correction.

23281. When were they collected?—They have only just been collected.

23282. They were collected fresh for this Commission?—Yes.

23283. In your own Collectorate?—Yes.

23284. Had you made surveys of this nature before you collected these statistics?—In collaboration with the Sericultural Department we had begun a survey of the sericulture area on the same lines. Part of the results of that survey is embodied in this.

23285. Will you turn to page 423? You are talking about agricultural education, and you say, "school farms if they can be developed would be a much more practical way of securing the general spread of improved methods of agriculture." Do you see any difficulties in connection with the management of those farms?—There will be considerable difficulty unless we get in people who have been properly trained.

23286. Is it not much easier to train people to handle a small garden intelligently and to teach what can be seen in the garden than to train the same people to manage a farm on a commercial basis?—I agree.

23287. And, of course, any failure on the commercial side of a farm of that sort would make it the laughing stock of the district, would it not?—It would.

23288. With regard to your remarks on the same page on adult education, have you any indication of what a campaign in adult education might achieve? Can you cite any experiments which have been made?—I have no experience of it at all; I have heard that in Madras a certain amount has been done, but I do not know enough about it to say.

23289. On the same page again on the question of demonstration, would you agree that demonstration on the cultivator's own holding is probably the most efficacious method?—The question is how it is to be done; how you are to get the cultivator to allow you to do it.

23290. You do not think it is possible to persuade him to make an experiment?—I think, in the case of jute, it is possible with the larger cultivator, I think that is the only possible way in which it can be done.

23291. A demonstration farm under the control of Government is always suspected to some extent by the cultivator?—I think it would be very much better to have it under unofficial control with Government supervision.

23292. You point to the insufficiency of the staff of the Agricultural Department for dealing with the task in the way in which you would like to see it dealt with; is not that shortage due to financial difficulty to some extent?—It is entirely due to that.

23293. You are talking about developing the Unions as Agricultural Associations, and a little later on in your note you affirm your faith in the co-operative movement. Do you think that encouraging the Unions to take on these functions would to some extent limit the future of co-operative organisation?—I do not think that we ought to let the Union Boards determine for themselves what is to be done. I think these Unions should have Agricultural Associations within them and the object ought to be for the executive of the Union Agricultural Association to keep in touch with the District Agricultural Officer.

23294. You mean to have the Union as the territorial unit and within that to have an Agricultural Association?—Yes; if the people will not accept any close association at all, to begin with we might have a very loose association with an executive.

23295. You assume that they will ultimately develop into a co-operative organisation?—The main thing about that which I would like to say is that I do not think anything will be done unless Government lead the way.

Mr. James Peddie.

23296. You seem to be quite clear on the point and also that the organisation should begin from the bottom?—Yes.

23297. Through organising village communities?—Yes; I have tried District Agricultural Associations, but the District Agricultural Association is of very little use unless it has got something with which you can keep in touch at the bottom.

23298. On page 425, talking about roads, you say that the District Boards have no money. Do you think they have the will?—They have got the will, and there is a growing demand for improved roads. I am speaking mainly about my own district, which is a very poor one comparatively with some of the others. There is now a growing demand for motorable roads, which will inevitably force them to do it. I am told unofficially that Government have turned down the proposal for a cart tax, on the ground of the difficulty of collection.

23299. You say there is a growing public demand, and you discuss the possibilities of improving the roads, and you come to the conclusion that a tax on carts is the best way. Would not a tax on motors meet the point?—Where you have got only about ten motors it would be of little use, but you have got a lakh of carts.

23300. I think that is a good answer. Would you like to see the motors pay their share?—I would most certainly like to see them pay their share.

23301. On page 426, you are talking about the tendency of the land to pass from the hands of the cultivating tribes into the hands of the non-cultivating classes; that is what it comes to, is it not?—Yes.

23302. Can you observe any deterioration in the quality of cultivation, as a result of this movement?—No.

23303. You think the fields have been just as well cultivated?—Only a few days ago, I suggested to some cultivators that they should put a *bund* over a valley in order to store the water, and they said "Why should we put a *bund* over it?" I said "You are going to get more crops". They replied "We are only the *adhikars*, why should we do it? The *mahajans* should do it."

23304. Are most of the people who own land cultivating it as labourers or as sub-tenants?—A very large number of them cultivate on the *adhi* system and get half of the crop; the *mahajan* allows the man to live on the holding and takes half of the crop.

23305. Has he any rights at all?—No rights whatever.

23306. Liable to be ejected at any moment?—Within a year.

23307. On page 427, you deplore the fact that the Usurious Loans Act is not more frequently made use of. Do you think the Act itself is satisfactory?—Except for the fact that it is a little vague, I think it is. *Munsiffs* have complained to me, when I have been talking to them about it, that they do not know quite what to do; it is too vague.

23308. And then there is the other trouble to which you have referred, namely, the extreme poverty of most of the injured parties?—Yes.

23309. Have you noticed any tendency on the part of credit societies to which you have referred on page 426 to reduce the rate of interest extorted by *sowcars* in the district?—Co-operative credit societies?

23310. Yes; do you think they are having the effect of reducing the general level of the rate of interest?—That is the case, when you can get a sufficient number of them together in a block.

23311. The general impression I got from the reading of your note and of the statistics that you have provided is that the situation is, in your view, deteriorating progressively in these rural areas?—That is so.

23312. How do you account for this progressive deterioration?—As far as Malda district is concerned, ten years ago it was nearly all jungle land; it is now all under cultivation and there is no more ground to break, and naturally that is the result. Formerly when a man lost land he could go into the jungle and cultivate another bit; he can no longer do that now, and the result is that those who stay are becoming more and more impoverished, whereas the wandering tribes like the Santals are very largely clearing to the hills.

23313. Are they going to Assam?—Yes.

23314. To the tea plantations?—They go to the tea plantations from Midnapore, but there is no recruitment of Santals from Malda. Many of these people go off  
Mr. James Peddie.

on their own and take up cultivation in the jungles in the Terai, both in Bengal and in Assam.

23315. What is the density of the population for this district that you are talking about?—There is a population of 10 lakhs in an area of 1,800 square miles; it varies very much; in the *diara*, on the river side, it is high, but in the high land which is a one crop area, it is very very thin.

23316. Do you see any change in the standard and quality of cultivation, as a result of this deposition of the owners?—No, I have not seen any difference in the standard of cultivation.

23317. With reference to husbandry, what type of farming in the district do you know best?—I do not know any of them very well, because I am not an expert.

23318. Is your present Collectorate, broadly speaking, a low lying area?—It is high land on one side, *tal* land in the middle and *diara* land on the other side.

23319. It is the high land here where you suggest the cultivation might well be remedied?—There are two kinds of lands which require attention. One is the tract of black soil; it is an old river formation on the top left hand corner of the map; that is the wheat growing area. At present they grow jute; they tried to grow aman paddy, but there is such an extensive amount of water when the area is flooded that jute and paddy are drowned out. Whereas, if they could get water in the cold weather they would be able to get *rabi* crops of wheat and oil seeds.

23320. Do you mean that is *tal* land?—Yes.

23321. Is that the rib running through the country?—Yes, that goes through Dinajpur into Bogra and down into Rajshahi.

23322. What approximately is the scale of this map?—Five miles to the inch.

23323. You suggest that the higher ridge might be irrigated and produce wheat amongst other things?—It is partly paddy growing, but if you can supply the water they can take a second crop off the land.

23324. You suggest that this might be irrigated by gravity?—If they can harness a sufficient number of these hill rivers, then it may be possible to bring it down by canals along the tops of ridges; whether that is possible will depend entirely on an enquiry extending over all these districts.

23325. No practical survey has been carried out?—No; they have put in one or two gauges in these rivers to see how much water they carry.

23326. Are there any wells in this district?—Not many; I think there are three wells in one of the *barind* *thanas*.

23327. At what depth below the surface is the water?—The wells are sixty feet deep; I do not think that you would get a sufficient supply of water for well irrigation in that area.

23328. When did you put up these schemes?—About a year ago.

23329. You had no answer?—The Irrigation Department have been working in the district ever since that time; they have put in a certain number of gauges, and they are collecting the statistics with as many people as they can spare for the work. I think that, if finances permit, there is large scope for work in irrigation, and there is also a growing demand for it. One talks to the zamindars and other people, and they are now beginning to ask that something should be done.

23330. Do you find the zamindars take an interest in these improvements?—Not generally, but there are one or two who are keen. One of these schemes was put up by a big zamindar; he takes a keen interest in it, and that scheme will probably be put through, as he is the owner of the *tal* land.

23331. Do you connect the irrigation of these areas with the problem of providing fodder crops?—It would have a very marked bearing on the question of the supply of fodder crops. You cannot grow fodder crops at present, simply because you have no water; in the *diara*, there is a possibility of growing fodder crops.

23332. Is it a malarious area?—It is.

23333. About how many days in the year does the average healthy male, during the working years of his life, spend on his back?—In the one crop area, about two months.

23334. On his back?—On his land.

Mr. James Peddie.

23335. How much time does he spend on his back as a result of malaria?—I am afraid I cannot give you the figures.

23336. We have heard some remarkable figures suggested, I think from 60 to 90 days in the year?—In a village which is badly affected, the whole village will be laid up for probably three months, and practically no work will be done. In one village last year, out of 300 people there were 100 deaths, and all the rest of the people were absolutely incapable of doing any work whatever owing to malaria; but it varies from year to year and from locality to locality within the district.

23337. Have you any indication as to whether malaria is growing in intensity or declining?—The local people say that it is growing in intensity, but I am not so sure that that is the case.

23338. Have you any natural leaders amongst the people, any better-to-do people who concern themselves with trying to improve conditions or trying to lead the people?—That is one of my great difficulties, to get honorary workers who would really put their backs into it and do a bit of spade work. There are one or two, but most of them have got other business to attend to, and cannot put in a sufficient amount of work in this direction.

23339. We have had some interesting evidence about sericulture from other witnesses. Would you agree that, broadly speaking, the average income from land under mulberry would be about Rs. 200 an acre?—I do not know enough about it to speak to figures.

23340. You have given us some figures here; you have been quoting figures?—Most of these I have got through officers of the Sericulture Department.

23341. Have you studied them yourself?—I have not studied them myself at all; I cannot say how much they get from mulberry.

23342. Are the people in your own Collectorate engaged in sericulture?—A very large number of them are.

23343. Whole time or part time?—Both.

23344. Would you wish to see sericulture extended as a whole time occupation, or would you rather see it extended as a part time occupation?—Our main object should be to try and make it a better whole time occupation for those people who are whole time sericulturists and stick to that at present. I think we will have quite enough to do if we try to accomplish that just now, but its extension as a subsidiary occupation is a question which I think is of doubtful value, on account of artificial silk.

23345. I should have thought that the case against extending it as a whole time occupation on account of artificial silk was stronger than the case against extending it as a part time occupation?—I do not mean to extend it to a larger number of people. I mean to improve it as far as the people who are at present occupied are concerned. I do not know how far artificial silk will affect sericulture, but I am told that a large number of centres up country are now using artificial yarns instead of Maida yarns.

23346. Have these facts and data about marketing that you have provided us with been collected by yourself?—They were collected from zamindars and from various officers in various departments in the district.

23347. Have you ever gone into cases where money has been lent on the security of the crop to see whether the moneylender writes off a fair proportion of the debt on account of the crop when he takes it?—I have not gone into it.

23348. Would you agree that that is a sort of coercion upon which unfair dealing might take place?—I think that it very often does, from what I have heard.

23349. I think in your note you say something about the possibility of registering moneylenders?—Yes.

23350. Do you think that public opinion in that respect has reached a point where that would be expedient?—I do not mean by moneylenders the more or less respectable kind in the big towns; I mean village moneylenders; the small man in the village is at present, I consider, a danger.

23351. But in the definition of moneylender there would be difficulty?—Yes.

23352. Do not most cultivators lend money, if they have it, at some time or another in their life?—The cultivator, when he does get money, becomes a money lender, that is perfectly true; he will then fall within the definition and ought to be registered.

Mr. James Peddie.\*

23353. Have you attempted to measure at all the staff that would be required to administer a system of that sort?—No. But even if there was not very much inspection, the very fact that the man had to take out a license and had to keep accounts which were available for inspection might be of some use.

23354. You have pondered over the matter, and it is your view that the experiment might be made?—I think something should be done, and I cannot think of anything else.

23355. What is the extent of the average holding in your Collectorate?—It is very small. In some villages, I think it is as low as 2 *bighas*, that is, less than an acre.

23356. Is fragmentation a burning problem?—There is a great deal of fragmentation, but I think it is very difficult to do anything with that in Bengal.

23357. Do you think there is any real appreciation on the part of the cultivators themselves of what a burden fragmentation is upon them?—I do not think they realise it at all, but when it is explained to them they understand it. When you ask them, they say "Yes", but not until it is explained to them.

23358. That sort of thing does not occur to them unless you are there to tell them?—That is so.

23359. Have you ever known cases where two or three persons have come together to attempt some measure of consolidation of their holdings?—I have never come across such a case.

23360. Take appendix G\* for instance, "Statistics of economic condition in rural areas collected in typical areas". Are these the facts that you have been good enough to have collected for us within the last few weeks?—Yes.

23361. Have you had any time to examine them in detail?—No.

23362. You agree with the figures giving the family budget?—I think those are rather ideal, but I did look at them before they were sent off and made some enquiries, and as far as I can find out they are reasonable.

23363. You have given figures for a family with no crops of its own and purchasing articles in cash; is that just an ideal?—It is bound to be an ideal budget.

23364. Is it assumed that wages are being earned?—Yes. That man may be labouring for another man, or he may be cultivating a certain amount in *adhi*, that is, cultivating and getting half of the crop.

23365. *Sir Henry Lawrence*: Is any part of the district permanently settled?—It is all permanently settled.

23366. How long have you been there?—Two years.

23367. Is the Usurious Loans Act ever used?—Yes; it is used by the Munsiffs occasionally on their own initiative.

23368. Is it used in a large percentage of cases?—A very large percentage of cases are *ex-parte*, and in practically no *ex-parte* suits do they use the Usurious Loans Act.

23369. It is used only in a very small percentage of cases?—Yes.

23370. Do the debtors know enough about it to claim its application?—No. The ignorance of the debtors is one of the reasons why there are so many *ex-parte* suits; they have not got the money even to pay for a pleader to support their cause.

23371. If a man employs a pleader, does he not ordinarily ask for the application of the Usurious Loans Act?—I do not know.

23372. Your opinion is that it is generally a dead letter?—That is my opinion.

23373. Is there any means of stimulating the Munsiffs to make use of it more frequently?—I think it should be possible to get the Act so altered that the Munsiff will have some guide as to what should be considered reasonable.

23374. He cannot do anything in the absence of a guide?—That is so.

23375. Is not that a weak point—the absence of a stimulus to the Munsiff to take the trouble?—There again the difficulty is the fact that the Munsiff is over-worked, and when he comes to *ex-parte* suits he has hardly the time to look at them. "If I look at every one of those cases, my file will become still more in arrears than it is at present." That is the answer which I have got when I have put that question to Munsiffs.

\*Not printed.

23376. Then, is it any part of any other portion of the judicial machinery to see that the Munsiffs employ this Act?—They are under the District Judge.

23377. It is partly his duty to see that the Usurious Loans Act is utilised?—As far as I know, when he inspects the Munsiffs he will probably see whether they were using it properly or not.

23378. Did you ever see any comments or notes made by a Judge on Munsiffs' work?—I do not know.

23379. You do not know how far the District and Sessions Judges have taken cognisance of the Act?—No.

23380. Is that Act brought in review by the High Court?—I think so.

23381. Have you ever seen any comments by a Judge of the High Court on the subject?—No.

23382. Is it brought under review by the Government of Bengal?—I do not know whether it has been or not.

23383. There are various points at which some stimulus might be applied; you do not know whether they have been?—No.

23384. You say there are only three wells in the *thana* of Habipur. Where do the people get water from?—Some of them go 2½ miles, mainly to tanks and some non-perennial streams which they dam up to keep a little water until April; in certain places they dig holes in the ground where a little water remains until March. The only wells I know of are three big wells dug by the District Board.

23385. How is the water in these tanks?—It is very bad indeed.

23386. Is the population increasing very rapidly?—The population in the *diara* has increased but not very much. As a whole the population is increasing.

23387. Is it due to immigration or natural increase?—Mainly natural increase. Now, the immigration has practically ceased. There was a very large amount of immigration from Bihar when the jungles began to be cleared up.

23388. As a whole the people are in a poor condition, and the condition is deteriorating?—I think so.

23389. Is emigration open to them?—Yes; large numbers of them go to the hills. They are more or less wandering tribes like the Santals.

23390. Is it seasonal emigration?—Some of them go away and never come back.

23391. Is the population Santal?—The population in the high land is Santal. The emigration is from that class.

23392. The rest of the people?—Mainly Mahomedans and a certain number low caste Hindus.

23393. Do they emigrate?—No.

23394. Do they go to the tea gardens of Assam and Ceylon?—No.

23395. There are no restrictions to their movement?—No.

23396. How far is your district from Pusa?—I do not know how far.

23397. There are schemes under consideration for irrigation. Do these schemes require co-operation with the adjoining Province of Bihar and Orissa?—The *tal* scheme is the only scheme where we require co-operation with Bihar and Orissa. That has evidently been done, because I know the Irrigation Officer of Bengal has been working in the district of Purnea.

23398. Is the Irrigation of the *tal* to be by means of a reservoir tank or a canal?—Probably from a river by means of sluices and canals.

23399. There has been joint action between the two Governments. Has your district been contour surveyed?—No.

23400. Has there been any difficulty with measurements?—I do not think there has been. All that they have done is to measure the depth of the rivers at selected points and the flow in the rivers.

23401. What evidence do you see of the deterioration in the condition of the people?—The deterioration in the condition of the people I infer from the fact that they are losing the land and becoming landless labourers.

23402. It is not the physical condition?—I do not mean their physical condition.

23403. They are not starved?—I have seen no signs of starving. But last July when I went out on tour in the one crop area, I made enquiries and I was told

Mr. James Fiddle.

that the people had eaten all the paddy from the last crop and that the majority of them were living on one meal a day.

23104. If you got irrigation, would it convert a *kharif* crop area into a *rabi* crop area?—In the *tal*, it will be the case. If you give water in the high land, it will mean five full crops and five catch crops, instead of two full crops and two catch crops.

23105. No water is required in the *kharif* season?—In the high land, water will be required at the time of planting paddy in July and before reaping in October and November, and water will be required throughout the cold weather and the hot weather for the second crop. It also grows good vegetables. If you give them water they can grow very good vegetables.

23106. In permanently-settled areas is there any difficulty about charging water rates?—I do not see why there should be.

23107. That must have been considered?—Under the Irrigation Act it can be done.

23108. In another Province, we were told that irrigation could not proceed unless legislation was carried, because of the rights of zamindars in permanently-settled areas. That does not apply here?—I do not think so; it has never struck me before. I discussed it with the Chief Engineer, Irrigation Department last year, and he intended to put this through under the Irrigation Act.

23109. The Chairman: Is the water rate charged on the land or is it charged for water supplied?—There are two ways. The charge is for water supplied where you benefit a particular land by giving it water. Where you are benefiting the land by holding up the water and then allowing the water to come down gradually so as to benefit the whole of an area, the charge is attached to the land.

23110. Mr. Gupta: What are the Acts governing the charge?—The Irrigation Act and the Agricultural and Sanitary Improvements Act.

23111. Are you thinking of canals or other irrigation schemes?—Irrigation schemes.

23112. They would not be under Act VI (Agricultural and Sanitary Improvement Act)?—There is an Irrigation Act.

23113. That is only for canals?—Under the Irrigation Act, you can have canal irrigation. Other types will be done under Act VI of 1920.

23114. That Act does not provide for charge for water?—That will be for the land where the water is used.

23115. Sir Thomas Middleton: How many Circle Officers are employed in each Collector's district?—It depends upon the area which has not already been formed into Union Boards. The Circle Officers often go according to the number of circles. In Malda they have five circles. I have got three Circle Officers. The people are so ignorant in the other two circles that it is impossible to start Union Boards.

23116. What is the pay of these Circle Officers?—I do not remember the actual figures. They are sub-deputy magistrates.

Mr. Gupta: It is Rs. 150—400. They are sub-collectors.

23117. Sir Thomas Middleton: You suggest that they should be used for improving agricultural conditions?—The Circle Officer has got to go to the Union every quarter to inspect the accounts and talk to the President. If he has got to go there I do not see why he should not talk to the cultivators and why he should not get some training in order to be able to talk to the cultivators.

23118. If he gets so much salary. I do not see why he should not?—I do not see why one or two months' training in the Dacca farm should not materially assist him in carrying on propaganda. It would involve the creation of a few more Circle Officers, because you will have a certain number more under training. But that is all it would mean.

23119. Then, you suggest that part of the money provided under the Agricultural Loans Act should be at the disposal of the Director of Agriculture?—Yes.

23120. At present at whose disposal is it in a district?—The Commissioner is in charge of the grant for the Division, and he allots a certain amount to the Collectors according to their requirements.

23121. At present if the Director of Agriculture wants a certain amount, does he ask the Collector?—He never does.

Mr. James Peddie.

23122 The money is there, and he never applies for it?—I have never known of a case where the Director of Agriculture has gone to the Collector. I have used the agricultural loans for purposes of propaganda in the Sericultural Department, but I did that in consultation with the office of the Director of Agriculture and the Sericultural Department, so that it is not really correct to say that the Director of Agriculture has never gone to the Collector. The sericultural officers get money through me.

23123 Your suggestion is that when the Director of Agriculture wants to give money for seed, he might apply to the Collector and money would be there for the purpose?—Yes. I think that if this is done probably more would be required because the estimates at present are based on the demand from the ryots, and there is practically no demand for it.

23124. Mr. Gupta: Will you kindly refer to page 424 of your note where you make some remarks about the way in which the District Officer and the Circle Officer could help in the improvement of the agricultural conditions of the district? You say, "If this is to be done, it must be made part of the Collector's duty to foster these associations and it must be made part of the Circle Officer's duty. One finds everywhere that, when the District Officer takes an interest in the work of one of the 'nation building' departments, the officers of that department are able to accomplish more than in other places. District Officers have had District Boards taken away from them. The routine work left is often dull. I am strongly of opinion that the District Officer should be in charge of the agricultural propaganda as well as the propaganda of the Co-operative and Industries Departments." I entirely agree with those views. Do you not think that a comprehensive resolution by Government drawing the attention of Collectors and the departments concerned, might be useful? A resolution on the report of the Agricultural Department probably might escape attention. Are you aware, for instance, that in the last resolution Government said that Collectors should co-operate as far as possible?—I know Government had done that. My point is that District Officers should be impressed with the importance of this work.

23125 I quite agree. Could not that be done by a resolution drawing the attention of Collectors to the changed conditions of the country and the need for Collectors to give more time to what are called nation building departments?—It might be.

23126. You have quoted some figures and made some observations regarding the deterioration of the condition of the people in your district. I have not had time to study them, but I presume they do not apply to the whole of your district for instance, the diara areas of Manilchal and Kalinchal?—Many of these *thanas* are in the diara.

23127. Is it your opinion that the condition of the people in the Kalinchal is deteriorating?—I do not think they are deteriorating.

23128 It is more in the barand and jungle tracts?—Yes.

23129 When you put in a plea for the improvement of the district roads, will you justify the need for the improvement of roads without referring to the necessity of providing good roads for motor cars?—Yes. Besides the improvement of roads, people want motorable roads.

23130 When there are only eight or ten motor cars, a general law on motor cars would not be justified?—Undoubtedly.

23131. Mr. Coleridge: You suggest that part of the allotment under the Agricultural Loans Act might be placed at the disposal of the Director of Agriculture for certain purposes. But does any obstacle at present come in the way of your doing that?—There is not enough money in the allotment.

23132. You can lend money to the people for those purposes?—I do.

23133. There is no objection at all to carrying out the policy?—None at all.

23134. Would you be prepared to say whether the number of moneylenders in your district is increasing or not?—I think it has increased considerably in the last ten or twenty years.

23135. Do you think the amount of capital involved in moneylending is also increasing?—I think that is undoubtedly so.

23136. Have you had complaints in your district about dishonest account keeping?—I have heard many complaints. The receipt is written on the back of the document, and in many cases no receipt is made out at all.

Mr. James Peddle,

23437. Have you heard of the Moneylenders' Bill in the Punjab designed to make moneylenders keep accounts in a prescribed form?—I have not heard of it.

23438. Do you think it would be sensible?—I do not see why it should not be. It is all a question of supervision. The provision of supervision will act as a deterrent even if the supervision is going to be only after ten years.

23439. It will be inspected in civil courts?—Yes.

23440. *Sir Henry Lawrence*: Was that Bill passed?

*Mr. Calvert*: It did not receive the sanction of the Governor, Government propose to bring in a Bill along the same lines.

23441. Your proposal to register moneylenders would have been acted upon in the Punjab but for the fact that the members of the Council thought that some of them would come under the description of "moneylender" and the Bill had to be dropped. Would that apply to this Province also?—I spoke about this to one or two people, and they have raised that point. The whole thing is the Legislative Department has never been able to provide a definition which will be acceptable.

23442. In your district, beyond the professional moneylenders and moneylenders by caste, are there amateur moneylenders?—There is a very large number of them. There are agriculturists who carry on moneylending at times.

(The witness withdrew.)

*The Commission then adjourned till Monday, the 13th December, 1926, at Shillong (Assam). For Assam Evidence see Volume V. The Commission dispersed for the Christmas holidays after taking evidence in Assam and resumed its sittings at Dacca on the 6th January, 1927.*

Wednesday, January 5th, 1927

**DACCA**

**PRESENT :**

The MARQUESS OF LINLITHGOW, D.I. (*Chairman*).

Sir HENRY STAFFORD LAWRENCE, K.C.S.I., I.C.S.	Mr. H. CALVERT, C.I.E., I.C.S.
Sir THOMAS MIDDLETON, K.B.E., C.I.	Professor N. GANGULEE.
Sir JAMES MACKENNA, Kt., C.I.E., I.C.S.	Dr. L. K. HYDER.
Mr. J. N. GUPTA, I.C.S.	} ( <i>Co-opted Members</i> ).
Raj A. C. BANERJEE Bahadur	
Mr. J. A. MADAN, I.C.S.	} ( <i>Joint Secretaries</i> ).
Mr. F. W. H. SMITH	

**Mr. E. F. OATEN, M.A., I.E.S., M.L.C., Director  
of Public Instruction, Bengal**

**Replies to the Questionnaire**

QUESTION 23. (a) As regards elementary education, it is not so much the system of education that is in question as the lack of system. It is not a matter of curriculum. In Bengal we have in the Revised Curriculum for Primary Schools, 1920, adhered to the policy laid down in the Government of India Resolution of 11th March 1904 that "the aim of rural schools should be not to impart definite agricultural teaching but to give the children a preliminary training which would make them intelligent as cultivators, would train them to be observers, thinking and experimenting in however humble a manner, and would protect them in their business transactions with the landlords to whom they pay rent and the grain dealer to whom they dispose of their crops." But as things are to-day, it is not possible to do much by mere manipulation of curriculum, though if and when a real step forward can be made in rural primary education the question of the curricula will be of first rate importance. But to-day a preliminary requisite of any improvement in rural education is adequate finance, on the basis of which a reasonable system of rural primary education, both on the administrative and pedagogic side, might be built up. The existing voluntary one teacher village school of thirty to forty children, with the expenditure as each higher class is reached, can have no future. Neither school nor village nor anything else can be adequately taught in present conditions.

A very careful examination of a very large number of primary schools has led me to the deliberate opinion that we cannot hope to improve these schools very much in present circumstances. So wrote Mr. Bux in his first report. My answer to the question as to whether primary education is concerned is therefore that the inadequacy of the rural primary education system—or rather lack of system—has been detrimental to agriculture as it has been detrimental to every other rural activity—no more and no less—simply because it is inadequate, and that it is not so much a change in the system as the creation of a system which is needed. If Bengal cannot economically afford the taxation necessary for the creation of a system there is no hope for anything except inadequate palliatives; if it can and will, it will be repaid a hundredfold, through the revivifying of rural life which will follow, and the consequential increase in the efficiency of the main source of its economic life—agriculture. The Government of Bengal Resolution\* on Primary Education, dated September 25, 1926, is in accordance with the views expressed in this note, and aims at a comprehensive tackling of the problem of rural education.

Next comes secondary education. The secondary school system of Bengal came into existence largely in response to a demand for what was really vocational education for those vocations which obviously existed mainly in towns—Government service, the law, clerkships, medical, journalistic. Within the limits of its aim it did its work well—its products obtained posts or work of some sort. Now that the products of the system

\* No. 3222-Edn.—Not printed.

Mr. E. F. Oaten,

exceed the number of posts open to them owing to the increase in the number of schools and colleges, and the fact that the cultivator's son is taking advantage of the system of higher education, the system no longer satisfies, and its defects which really existed before are realised in some degree. There comes a demand for "vocational" training, often for vocations which scarcely exist, and the demand so far as rural areas are concerned naturally translates itself into a demand for vocational training in agriculture, the main occupation of the country side, a demand which is really a belated recognition of the fact that all men cannot escape through education from the course of Adam.

The secondary educational system, as it has extended itself to the rural areas, certainly needs modification to bring it into some relationship with the life of the country. If in its present form it has done little harm to agriculture, it has certainly done little good to it, since it has little relationship with it. It tends to draw the pick of the rural areas away from the country instead of equipping them for life in it. This is doubtless largely the result of economic conditions—openings are few in the country—but a secondary education which cannot influence the main activity of Bengal certainly needs overhauling. It has however grown up in response to a need, to a large degree unaided by Government, and it obviously meets a demand. As to possible changes, I see every advantage in experiments on the lines of the vocational agricultural middle school recommended by the Missionary Commission on Village Education, 1920, where adequate funds, competent guidance, and suitable conditions exist. But any general vocationalising of the rural school system is a dream. For the generality of the schools I think the main change that can be attempted is to introduce some form of "practical training" into as many middle and high schools as possible. In rural districts, the practical training would often naturally be one or more of the agricultural or allied processes suitable to the locality, whereby the divorce of school education from all relationship with the life of the boy in it be modified. But any general vocationalising of the rural schools in the near future seems to me so impracticable that it is hardly worth while discussing whether it would be educationally justifiable or economically profitable. We have to deal with things as they are. Finance, the educational demand and social facts combine to forbid any general change, even if we considered it right. On the second point—the demand—Mayhew: "Education of India" is worth quoting:—

"Distinction of courses, if it is to be real, must involve the exclusion from Universities of those who have taken the non-academic course. No Indian parent will take the risk of such exclusion."

Even to introduce one practical subject, whether industrial or agricultural, even simple manual training, in all the middle and high schools of Bengal will be beyond our resources for some years. We are in Bengal trying to make a real beginning of linking the middle school system with rural realities by starting in a small number of schools a scheme for agricultural work in middle schools borrowed from the Punjab. It is hoped that funds will be allotted for the purpose early. The object is to give to the boys such an outlook on rural life that they will return to the land with minds better prepared to receive agricultural training, and with interest aroused in agriculture and its possibilities. Further than this except experimentally, I would not go, as far as general schools are concerned, though I would watch and develop to their utmost any successful experiments.

In general, I feel that the first need in secondary education which must be met is that of ensuring the existing teacher a living wage with a view to making the teaching of the rudiments of knowledge efficient, and any diversion of the available funds from this object except to a limited extent would be a disaster. For the raising of the economic efficiency of the country side, so far as general education can affect the problem, I would concentrate on a really efficient primary educational system. The other desiderata will follow or will become easily attainable. Any revised secondary school curriculum based on an inadequate primary school system can accomplish little or nothing. If combined with the introduction of an efficient primary education system in rural schools, we could (a) raise examination standards in secondary schools, (b) pay middle and high school teachers better, (c) create an adequate secondary education authority in which rural interests are represented, and (d) give a practical bias to the work of the middle and high school of a kind suited to rural conditions, we should accomplish much. The curriculum can doubtless be improved; but our main task in secondary education is to do more efficiently the work we are already attempting.

Collegiate education like secondary education has little relation to the rural economy. The higher educational system came into existence to prepare students for professions followed in towns, and it has received no essential modifications in this respect. The Calcutta University Commission advocated a Faculty of Agriculture and a University course in Calcutta as a beginning, and added emphatically "We are bound to regard it as an experiment." I am doubtful of the capacity of the rural economy to absorb many

Mr. E. F. Oaten.

highly trained agricultural experts. The Commission also advocated the inauguration of agricultural courses in the proposed intermediate colleges, and an improvement in the facilities for the study of the sciences which underlie agriculture.

These proposals have not yet been carried out though the University has not dropped the question of agricultural training under its auspices. The higher educational system of Bengal therefore still remains almost unrelated to the rural economy. I think one may say that the system has affected agriculture only negatively in that it has drawn talent from the country districts without sending any of it back into them; that, as things are in Bengal, it is difficult to see how any very close relationship can be created between the higher educational system and the agricultural life of rural areas, until the primary and secondary systems have really begun to affect it; but that a beginning might be made on the lines recommended by the Sadler Commission, as soon as funds can be made available, it being clearly recognised that the work is not one for immediate control, and that above all things we must, by limiting numbers, and by ensuring that agricultural experts really control the Faculty, avoid creating anything in the nature of agriculturally trained unemployed.

This answer refers solely to institutions for general education.

(b) (i) It is very difficult to make suggestions, on the assumption that primary and secondary education remain in their present condition, and while finances in Bengal are so straitened. If the Bengal Bill for the expansion and improvement of primary education in the rural area is materialised into an Act, and the curriculum is kept related to the lives of the boys, there will be a rise in the ability and culture of the agriculturists without detriment to their practical life afterwards. In other words, the real solution is compulsory or at least widely extended primary education in the rural areas.

There are, of course, numerous alternatives. We could give the primary school teacher an increased agricultural bias by laying greater emphasis on school gardening, and nature study at the training school. In rural middle and high schools we could introduce a certain amount of school gardening or agricultural training as a "practical arts subject" (subject to the limitations of finance). (There is a good example of what can be done already at the Nawab Bahadur's Institution, Murshidabad). We could aim at ensuring that so far as possible the inspecting staff know something of and was interested in nature study and agriculture in general. Whenever possible, schools should have school gardens and inspecting authorities should be instructed to commend instances of good work in this respect.

(b) (ii) In Bengal we have no experience of compulsory education in rural areas.

(b) (iii) The figures in Bengal of 1925-26 are—

Class I	..	..	..	..	..	917,850
Class II	..	..	..	..	..	276,289
Class III	..	..	..	..	..	160,100
Class IV	..	..	..	..	..	87,116
Class V	..	..	..	..	..	62,001

#### Middle

Class VI	..	..	..	..	..	19,966
Class VII	..	..	..	..	..	41,259

There is a heavy fall between Class I and Class II, Class III and Class IV, Class IV and Class V. The fact is that the primary school is more or less used as a sort of *crèche* during the early infancy of a child. Such children spend a year or two in the school and then go away without learning anything, i.e., as soon the boy becomes servicable or domestically useful, he is kept at home. During the mischief-making period he is put in school under the care and protection of the *guru*. This accounts for the fall between classes I and II.

Class III marks the end of the Lower Primary Course. Poor people cannot afford to keep the child longer in school, as he has by that time attained an age when he is expected to help the father in the fields or to earn something for the family. This accounts for the fall between Classes III and IV and IV and V. It will be noticed that Class V marks the end of the Primary Course but the fall between V and VI is not great. It is difficult to say why. The reason may be that from Class V *Madrasah* class boys predominate and they continue. In the lower classes, the backward classes (including socially inferior and economically poorer classes) predominate. As soon as the boy becomes servicable he is taken away, as the family cannot afford to keep him in school. In the case of higher castes and *Madrasah* classes, social pre-*judice* helps to keep the boy much longer in the school.

To prevent this sudden fall, this waste and lapsing into illiteracy, there is a real demand in Bengal for the revival of a public examination at the end of primary course in the belief that the boys will tend to stay on for this.

Mr. E. F. Oaten.

## Oral Evidence

23413. *The Chairman* : Mr. Oaten, you are Director of Public Instruction in the Presidency of Bengal ?—Yes.

23414. You have been good enough to provide the Commission with a note of the evidence that you wish to give. Do you desire at this stage to make any statement of a general character, or shall I proceed to ask you a few questions ?—I have said all that I have to say of a general character.

23415. Would you agree that the advancement of education bears very closely upon the improvement of agricultural practice in this country ?—I would go further and say that, in my opinion, it is indispensable.

23416. I see that you attach great importance to literacy as the main objective in the primary system of education. Do you think it is possible to infuse any agricultural bias, as it is called, into the system of primary education, without in some degree jeopardising literacy as the aim and object ? In other words, do you think the two are incompatible ?—No, I think the two can go together.

23417. As long as the idea of agricultural bias is not overdone ?—Yes.

23418. Do you attach importance to school gardens or school farms being attached to institutions ?—I attach very great importance to it. I think it is one of the regrettable features of the way things are working now, that there are so few of them, and what few there are have, on the whole, done badly ; it is of very great importance indeed.

23419. Is nature study an easy or a very difficult thing to teach ?—I think it depends on the teacher's previous education. If he has had education in nature study with a certain amount of elementary science in it, it would be easy for him ; but for the type of teacher we have it is impossible. Most of them cannot teach it properly at all.

23420. Is not teaching nature study to small children a very special art ?—Yes ; it is better undertaken by ladies as in the West ; it is difficult.

23421. Do you think it possible, within the financial conditions of the moment, to set up institutions in which school teachers could be instructed in the art of teaching nature study ?—It would be possible to teach a few how to teach nature study, but of course we are up at once against the fact that we are not teaching even a small proportion of the total number of teachers how to teach ordinary subjects. We cannot, under the existing financial conditions, train them even for ordinary subjects, let alone for special subjects of this kind.

23422. So that you regard the instruction of school teachers in this matter of nature study as an ideal which you do not see much hope of attaining in the near future ?—Not until the Legislative Council can be persuaded to impose taxation for educational purposes, and of course, I would add, if the local bodies tax themselves also. If both local taxation and provincial taxation could be imposed, then we could tackle the problem, but under the present financial conditions we cannot begin to tackle the problem at all.

23423. How about the calibre of the persons who are coming forward for posts as school teachers ?—We can judge it from the standard of those who enter the *guru* training schools, which is very low indeed. In fact, one does not really instruct them how to teach but rather merely gives them the rudiments of education ; that takes the whole time available, and they are very little more advanced than the pupils.

23424. Are the salaries that you are able to offer at the moment such as to attract the right type of men ?—No ; the salaries are miserable. We aim at supplementing them ; out of such sum as is available we give Rs. 2 to help District Boards to pay untrained teachers, and we give Rs. 6 to help the District Boards to pay trained teachers. There are additional sources from which they get something, but the total emoluments are not such as to attract anybody into the profession. It is only those who cannot get anything else that take it up, and even some of those who are trained in the *guru* training schools drift away from the profession ; we lose even those whom we have trained.

23425. We have been talking about school gardens. Coming to school farms, is that a still more difficult problem ?—There you come up at once against the problem of finance. If the land is available, well and good, but in most cases it would have to be acquired and the expense would be prohibitive. It is difficult enough to get a site for a school, let alone for a farm.

23426. And the moment you undertake to conduct a farm, do you not come up against the difficulty of management ?—Yes ; there is nobody to manage it under the present system.

Mr. E. F. Oaten.

23457. As regards secondary schools, you are familiar with the Punjab experiment. How long, do you think, it would take to provide in this Presidency persons capable of conducting secondary schools of a definitely agricultural nature designed on that line?—Under our scheme, we take 2 years to train an agricultural teacher, and we can only train very few, 15 to 20. It will take a very long time indeed to train many.

23458. But has not the proposal to institute middle vocational schools after the pattern of the Punjab experiment been accepted?—It has been accepted in principle by Government, but the funds have not yet been provided.

23459. Have you any idea as to how soon funds are likely to be provided?—I have heard that there is not likely to be much new money in the Bengal budget this year, but the popular interest in the scheme is considerable, and I think Government will find the money for it, especially as the amount required for the first year will be very small. I think we shall make a start in training teachers in January 1928.

23460. Would you tell the Commission whether you attach importance to female education?—I attach great importance to it, realising, at the same time, the enormous difficulties of making any great advance. In secondary education I do not believe that there is much chance of attracting a large number of girls to the present type of secondary girls' schools, because people seem to have very little faith in them. I have suggested that a special type of girls' school very different from the present is necessary, if ever we are going to attract many girls into our schools. I was rather thinking of a type which does not train for the Matriculation or any University examination, but which aims at general culture and some knowledge of useful domestic arts. The examination should not be the main aim. I advocated these ideas a year ago in a speech at the Bethune Ladies' College, and, as a result of that, the question has been taken up all over India. A conference is being held in Poona to discuss women's education this month or next month, with representatives from different Provinces. So much for secondary education. In regard to primary education, while realising the enormous importance of educating girls, one realises that at present much of the money spent on educating girls is wasted, more or less in the same way as in the case of the boys' schools; they suffer in the same way; they go away early, and so on. I would answer your question by saying that I attach great importance to female education, but the difficulties are almost insuperable.

23461. Are there difficulties in recruiting and maintaining women teachers?—Yes, there is not a very large supply; it is very difficult to get them to go into rural areas and live there.

23462. *Professor Gangulee*. You have women teachers in Missionary schools?—Yes.

*Rai Bahadur Bannerji*: In other schools as well.

23463. *The Chairman*. You think that female education is not likely to increase to an important extent until you do have women teachers?—With the present social system, I do not see much hope of many women teachers coming forward.

23464. You attach importance to adult education?—Yes; so far as it can be done it is desirable to have it as much as possible.

23465. Have any attempts been made to advance the cause of adult education in the Presidency?—I do not think there has been any strong movement or any special effort, mainly owing to the lack of money. The District Boards help, of course.

23466. If such an effort has been made, it would be very valuable to the Commission to have the particulars,\* even although the experiment may have failed. You attach importance to adult education, if it could be achieved, as a means of impressing upon parents the value of education for their children and as a means of avoiding the tragedy of a child who goes to a primary school for a short time and then returns to an illiterate home?—I quite see the point of educating the father; you probably educate the son by educating the father; you create double effect by making the father literate.

23467. In the present state of the educational budget, I understand you do not feel disposed to spend money in the direction of adult education?—It is only a question of their relative importance, the best way of spending the money. I quite see the point that it might be better to educate the adult than the child. That is rather a new point I think that if the Primary Education Bill comes forward, it will certainly have to take up the question of the education of adults as well, if there is money for it.

23468. As the proportion of literates in the population rises, the demand for adult education, even if the public demand were at its highest potential, would of course be reduced year by year, would it not?—Yes.

\* *Vide Appendix.*

Mr. E. F. Oaten.

23460. So that if it is true that an attempt at adult education would assist the cause of literacy amongst the children, the expenditure on adult education would be on a decreasing scale?—Yes.

23470. Do you think there is a place for the educated youth in agriculture in this Presidency?—Generally speaking, my impression is that there is not.

23471. Why?—Because of the lack of any custom of employing such men. Even if such men were available, I think there are not many openings.

23472. I was wondering whether you attached any importance to the smallness of the holdings available?—I was thinking of that point, that there is no room for the highly educated expert.

23473. Because of the small size of the holdings?—Yes.

23474. On page 453 of the note which you have been good enough to give us, you suggest the raising of examination standards in secondary schools. How have these examination standards moved since you have been familiar with the system?—I was thinking of the Matriculation and my opinion is that the standard has certainly gone down in Bengal. Now, for instance, the standard of the Bengal Matriculation is much lower than, say, that in Madras.

23475. Has that downward movement been effected in deference to public opinion?—It is difficult to say what it is due to; but public opinion certainly likes to make the passing of examinations easy and certainly during the last seven or eight years I think there was a policy, whether, deliberate or not, of making it easy to pass the Matriculation.

23476. Public opinion now supports the movement for the raising of the standards?—Standards were raised last year and as a result admissions into colleges were less.

23477. Have there been complaints about that?—No. Such teachers as I have met have deplored the easiness of the Matriculation. One reason they gave was that it was impossible to make boys work at all. Certainly the teachers are against the lowness of standards.

23478. Are you in favour of compulsory education in this Presidency?—Definitely yes, subject to the proviso that it is practicable and whether it is practicable we can only tell by experiments. Our Primary Education Bill of course does not propose to bring in compulsory education immediately, but the Unions can make it compulsory in their areas.

23479. It is permissive at the discretion of each Union?—Yes.

23480. Now, under a system of compulsory education this tendency to withdraw children from the primary schools before they have passed through the various standards would entail waste of public money. I suppose?—Under a permissive system?

23481. It is to be permissive at the discretion of the Union, is it not?—Yes.

23482. In districts where the Unions have decided to adopt the compulsory principle, every child sent to school involves the expenditure of a certain amount of public money, and if it is withdrawn by its parents at too early a stage that money is wasted?—Yes.

23483. Has it ever occurred to you that it might be worth considering some scheme by which parents would be invited to contract in to a compulsory scheme? By "contracting in" I mean that the parents who have decided that their children ought not to be educated would be allowed to keep their children away from the school but those who decided to educate their children would have to contract in to the scheme. The encouragement to keep their children in school might consist of a fine to be levied in the event of the child being withdrawn before the proper time, and that fine might be on a descending scale, so that the longer the child is left at the school the smaller would grow the penalty?—Yes; that is interesting; but what is the primary inducement to him to make the original contract?

23484. To have his child educated. It would cost him nothing if he kept his contract, would it?—No; the idea is this that in this way you would find out roughly how many you have got to put through the system.

23485. Has any scheme of that sort ever occurred to you?—No; that is a new idea to me altogether.

23486. One might put the case for it in another way and ask whether you would agree that it would be on the whole to the advantage of the public if a smaller number of children went to school, if that smaller number were properly educated?—Yes; I agree thoroughly there.

Mr. E. F. Oaten.

21157. What are your Normal schools situated?—We have six, five of them being Government and one private Government. They are in Calcutta, Chittagong, Kishoreganj, Dacca, Rajshahi and Hooghly.

21158. Do you attach importance to the locality in which these Normal schools are situated in relation to the training of teachers for work amongst the rural population?—Yes I do this point of view. We use the term "Normal Schools" in a reference to kind of course, you are perhaps referring to the primary training schools?

21159. I am, if I understand the question aright. Our first grade Normal schools are only six, but we have 100 the primary training schools and there are about 1000 of them in the primary training schools.

21160. If so, is the selection of the pupils in these primary training schools based on a special merit or standard?—They are selected to be selected on the basis of general merit.

21161. Is there a separate school for the primary training schools in each district?—No, they are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21162. Is there a separate school for the primary training schools in each district?—No, they are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21163. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21164. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21165. How many schools are there in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21166. Is there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21167. How many schools are there in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21168. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21169. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21170. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21171. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21172. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21173. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21174. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

21175. Are there any other schools in the primary training schools?—Yes, there are other schools in the primary training schools. They are not separate schools and normal high schools. The primary training schools are not separate schools in each district but the other schools are in the district.

Mr. E. F. Oster.

decide what his primary education policy will be. When a previous Minister took office, I remember on the very first day he said "I must do something for primary education," and asked our opinion. We had not then a Bill ready. We have now a Bill ready, and the Minister will have to decide what he thinks best and suggest modifications. I presume any Minister must, with some modifications if he thinks fit, put the Bill before the Council, where, in my opinion, it will be cut up mercilessly and probably have to be withdrawn as being cut up too much. That is my prognostication of the probable course of events. But I think, the Bill being there, the Minister will have to take some action on the Bill, either in its present form or with such modifications as suggest themselves to him.

23506. At present, in Bengal the expenditure on University education is somewhat higher than that on primary education?—It is relatively very high indeed, yes.

23507. And expenditure on secondary education is nearly as much as on primary?—Yes, that is a point we have realised a good deal during the last two years, and, on the whole, our policy in the Department now is that any new money available should be spent as much as possible on primary education. I do not say that that opinion has been recorded in any formal Government Resolution, but that is the general trend of opinion in the department.

23508. I have some figures here with which no doubt you are acquainted. Ten years ago the expenditure in Bengal on primary education was 50 lakhs, while in Bombay it was just under 70 lakhs. In these ten years Bombay has added 1 crore to the expenditure on primary education while Bengal has added 10 lakhs; so that what you now propose to do in your Primary Education Bill is somewhat similar to what has been gradually done in these ten years in Bombay?—Yes.

23509. But would you agree that at present the expenditure on University and secondary education is out of all proportion to the amount spent on primary education?—I agree thoroughly and it is of course due to the fact that such public opinion as there is is that of the middle class which naturally wants money spent on secondary schools and Universities which benefit themselves. There is a vague public opinion, of course, in favour of primary education, but when it comes to a choice as to whether money shall be spent on a new school or a new college or on primary education, the whole of public opinion is in favour of spending the money on secondary and University education.

23510. That is public opinion as represented by the present franchise?—I was not thinking so much of actual votes as of the pressure of public opinion, though doubtless it does express itself to some extent through the franchise. But the lowering of the franchise qualification, as it has been lowered, has not really had a chance to affect the situation much yet; the franchise certainly has gone very low, but I do not think that translates itself into a demand in the Council yet; it may in time. I may mention that when the principles of this Bill were discussed, there were some Swarajist Members who said they were extremely pleased with it and meant to push it as representing the wishes of their constituents, many of whom are down at the very limit of the lowest franchise; but whether that will translate itself into action in Council I do not know. I remember that certainly a good deal of Swarajist support was expressed for the general principles of the Bill, involving, as it did, heavy taxation of zamindars. That provision has, however, been modified in the Resolution. The zamindars are not going to be heavily taxed while the ryots are. The original idea was half and half, it is now 4 pice to 1 pice, the ryot paying the 4 pice. The original idea of half and half was modified in the Executive Council before the Resolution was issued.

23511. *Dr. Hyder*: In the Executive Council, not in the Legislative Council?—No, it has not been before the Legislative Council yet. The Resolution was drafted in the Executive Council and the original idea of half and half was modified to 1 and 1.

23512. All the cesses levied so far have been on the basis of half and half?—We have not levied any yet.

23513. I am referring to cesses for public works?—I am afraid I do not know; Mr. Gupta can probably tell you better than I.

23514. *Sir Thomas Middleton*: I want you to tell me something about the position of the village schoolmaster in Bengal. What is his ordinary pay? You have, I think, indicated that it is very small, but at what rate does he start and at what rate may he expect to finish?—There is no incremental rate. Mr. West probably will tell you more about details of that kind, but I imagine he does not get much more than Rs. 11 a month to live on.

23515. Is that the average?—It is too high for an average.

23516. There is no system of graded payment for long service?—No. As I said in my note there is no system really.

Mr. E. F. Oaten.

23517. Is he a member of the village community, or does he live more or less a life apart?—I believe he lives rather a life apart, I believe he does not form part and parcel of the village life.

23518. Then his position is not very enviable?—No.

23519. You remark on the first page of your prices that if Bengal can afford the taxation necessary for the system which you have in view, it will be repaid a hundredfold. You are thinking in this case entirely of a system of primary education?—Yes.

23520. And you are thinking of securing literacy in a large percentage of the pupils who enter primary schools?—Yes.

23521. At present I understand the position is that a relatively small percentage of those who enter over attain literacy?—I imagine that out of the number who enter one twentieth to one thirtieth attain literacy.

23522. Your conception of a satisfactory system would result in what percentage becoming literate. I want to know your aim?—My aim is cent. per cent. of course.

23523. You hope to get cent. per cent.?—Possibly in a hundred years; I do not know when, but ultimately.

23524. They will be able to read and write and figure when they leave school; five years after they leave school what percentage will be literate?—It depends entirely on whether other ameliorative agencies go forward at the same time; you need village libraries and all sorts of activities of that kind.

23525. I think one of the witnesses has pointed out that at present a boy who leaves school has really no chance of remaining literate, because he has got nothing to read?—That is the point; but that need not be the case in the not very distant future if other agencies are utilised for providing such reading matter.

23526. Do you not think that, even if there were a library, there is a danger that a large percentage may not use that library?—I was not thinking of a library so much; I imagine if he becomes literate, like the Westerner the villager will read a newspaper in time.

23527. That brings me to a point on which I wanted to question you. I think all are likely to admit the great value of literacy to agriculture, but how will it work? How in your opinion will literacy affect the improvement of agriculture?—Bringing it down to the concrete, I suppose if he could read he could read seed catalogues, for instance.

23528. That is what you were thinking of?—That is one thing; I imagine he could read elementary treatises or pamphlets which would be distributed by the Agricultural Department, and so on, which at present he cannot do. In that way he will get new ideas, just as the Australian farmer reads an agricultural journal every week.

23529. The Australian farmer may, but there are other countries in which the farmer can read but does not read such journals?—Yes.

23530. Do you think that in Bengal the desire for agricultural knowledge is such that if they could read they would read such publications as, for instance, are issued by Mr. Finlow's department?—I hope so; I admit I am a bit vague on the point.

23531. What other sources of information would be open to them? You mention the newspaper; do the newspapers in fact attempt to give much agricultural information?—I was not thinking of that side of it. I was merely thinking that they would read newspapers in time, with the growth of political life in this country, and that that would keep them literate. I was not thinking of agricultural information being conveyed through the newspapers, though in time I imagine it would be, and, as in other countries, the newspapers would contain a certain number of articles on subjects of interest to farmers.

23532. Then it has been pointed out to us that one of the difficulties in Bengal, and in adjacent Provinces, is that once a boy has become literate he no longer wishes to have any connection with the land?—That is a stage we have got to go through, it has been gone through in other countries, and it has got to be gone through in this, I think. The ordinary boy in England does not leave the land because he can read. I admit that literacy does tend to take people away from the country; that is naturally so, because they can get more enjoyment in the towns.

23533. But that is not an aspect of the subject to which you think we need attach much importance in Bengal?—I do not want importance attached to it if it is going to be used as an argument against literacy, I think it is a stage we have got to go through and risk it.

23534. For instance, in connection with secondary schools, you talk of the pie, of the rural areas being taken by the towns and I am asking myself whether there might not

Mr. E. F. Oaten.

be some danger of the same kind arising out of improved primary education?—I fully admit the danger, but I am not prepared to admit as a conclusion that we must stop education to avoid it.

23535. It occurred to me as an answer to my question that if secondary schools do, in fact, take the pick of the population away from the rural areas, you have plenty of people to pick from and plenty to live in rural Bengal, so that there is really no serious danger?—That is so.

23536. You favour compulsory education if practicable?—Yes that is my standpoint.

23537. In your answer to Question 23, you point out one of the practical difficulties which confronts us; boys at present leave at class III stage largely because parents cannot afford to keep them at school any longer?—Yes.

23538. What is going to happen to such parents when compulsion is adopted?—Whether that difficulty can be overcome will have to be considered; I think the only way to get over it is to have schools in the morning or evening, or at such times and seasons as he can be spared.

23539. Under a compulsory system you would be prepared to favour and aid such morning and evening schools?—Yes, every local authority, every district committee, every union, would have to make varying rules to meet the needs of the locality.

23540. You are prepared to permit a greater degree of elasticity than we are accustomed to, for instance, in England?—Yes, that is inevitable.

23541. With regard to the demand for agricultural education in Bengal, do you think that any real demand for agricultural education does exist among the villagers?—On the whole, I should say not, but I am not really well qualified to answer that question.

23542. So the famous answer given in connection with female education applies also to agriculture?—What is that?

23543. Female education is carried on in response to a demand that does not exist?—Yes, I think there is a lot in that, but still I would leave others to answer that question.

23544. You obviously have no very great hope for the development of female education in Bengal in the immediate future. At any rate that is what I gathered from your answer?—No.

23545. Have you attempted anything in adult female education?—Not very much.

23546. The experience in other countries is that until they get educated women on their side they do not make much progress. And I understand that especially in a Bengal household elderly ladies have a great say in disposing of the affairs of the household?—Yes, that is so. The fact that our secondary system is so essentially a foreign system has tended, I think, to keep alive the idea that education is a thing for men and not for women. If we could once get the ladies on our side we should win the battle.

23547. But at the present time although you have lady Inspectresses you are not getting much done in the way of getting at the women themselves, I mean the adult women?—No.

23548. *Dr. Hyder*: As the question of finance bulks largely in your answer I am going to question you about it. I find from this Resolution which has been appended to your written reply that your Government spend about 92 lakhs on education generally and one-third of that is devoted to primary education. May I know whether the bulk of that money is or is not raised from the agriculturists?—Yes, I should say that the bulk of the money raised in Bengal must be from them because Bengal is primarily an agricultural country and money must naturally come from that source mainly.

23549. Government raise their money from the agriculturists and spend only one-third of that revenue directly on the agriculturists, whereas two-thirds are used for the benefit of other classes?—The middle and upper classes.

23550. Now with regard to this policy of spending two-thirds of the revenue on one set of people and one-third on another, I want to ask you whether there is any return made to the industry from which the money is raised?—I made it clear in my note, I think, that there is practically no connection between the two. We have already revolted against it.

23551. Since when?—I think about two years ago and Sir Abdur Rahim had something to do with the revolt. It has not shown itself in practice as yet because we have had no money since then.

23552. Supposing you did not levy a cess but wanted to divert the funds from University and secondary education mainly to primary education, do you think your Minister could carry through such a policy?—Translated into concrete fact, it means taking away

Mr. E. F. Oaten.

the living of many middle-class teachers in schools, and I think that the pressure both in and out of the Council against that policy would be irresistible. I am well aware of the general idea; theoretically such transference of funds would be a good thing. It was proposed, I remember, by the Phillipino Commission. They proposed, if I remember aright, that the fees in academic high schools should be raised so high that the cost of academic education would fall almost entirely on the parent. I fear that Bengal as a whole would be in favour of keeping the money for the University and the secondary schools, and I do not see any chance of carrying a policy like that through.

23553. With regard to the question of agricultural improvement, I suppose the views of Mr. Burley as given in the Calcutta University Commission Report are familiar to you?—With regard to what?

23554. With regard to agricultural improvements and this question of education?—I remember the note, but I am afraid I do not remember the details.

23555. I shall put them before you. It is said that the landlords of Bengal are interested only in a few minor improvements; they are not interested in the improvement of crops because the benefit of raising additional crops would go to the cultivators to the extent that there rents are fixed in money. So that you have here in Bengal a curious state of affairs: firstly you raise money from one set of people and spend it ultimately for the benefit of another set. Then you are faced with a cross-current of opposition which is of the opinion that whatever little money is being spent on primary education should be diverted to other sources because it is much better that these people should remain ignorant and in the state in which they are?—I have heard that theory put forward, and I think that there is something in it. One does know that there is a certain fear among the upper classes in this country of the lower classes being educated.

23556. With regard to the question of finding employment for graduates in agriculture, for instance, in an institution which the Director of Agriculture might establish, it is of course a fact that the size of the holding is small, but do you not think that there would be some room for these graduates as estate managers? The size of an estate and the size of a holding are two different things, are they not? Could you not find room for these people if they looked after a large number of such small holdings?—I am afraid there are many people in a better position than myself to answer this question as they would be more closely familiar with the details of land tenure. But theoretically I agree that might be the case.

23557. You say that this question of raising 1 piece from the tenant was modified in the Executive Council?—Yes. The original draft Bill contained 2 piece and 2 piece and then it was modified.

23558. I wonder if you could tell us whether all these cesses levied in Bengal have been levied hitherto on the basis of half and half?—Yes, I think that is so.

23559. Can you tell us the reason for the change?—I am afraid that in my official position I must leave you to guess, it is not very difficult.

23560. *Mr. Gupta*: Before I ask you any questions, I would like to have one or two points cleared up arising out of your replies to the questions put to you first by Sir Henry Lawrence and then by Dr. Hyder. Now in connection with the comparatively small amount which Bengal is spending on female education as compared with Bombay, are you aware whether in Bombay there is any special tax for primary education, or whether the money is found from the general revenues?—I cannot say.

23561. There is no tax in Bombay as far as I know, and I speak subject to correction by Sir Henry Lawrence. Is this proportion entirely due to the fact that more money is spent on higher education, or is it due to the fact that much more money is being spent on education as a whole in Madras and Bombay than is the case in Bengal?—I will give you the figures. Madras is spending two crores on education; Bombay also is spending two crores, whereas Bengal is only spending a crore and 38 lakhs, so that the total expenditure on education in Bengal is only about half of what is being spent in either Bombay or Madras. It is therefore not because we are spending more on University and secondary education that we are able to spend so little on primary education, but because the total expenditure in Bengal is much less than it is either in Bombay or Madras. From these figures which I have before me I see that we are spending more money on University education in Bengal as compared with either Bombay or Madras, but at the same time the fact remains that much more money is being spent on education in Bombay and Madras than in Bengal. And I suppose you also know that our total revenue per head is very much less, nearly one-third of what it is either in Madras or Bombay, and one easily sees that that is probably one of the reasons why there is this great disproportion on the whole.

*Mr. E. F. Oaten.*

23562. The second point which I wish to put to you is in connection with the answer you gave to Dr. Hyder when you spoke of revenue from agricultural classes. You are not familiar with the income derived from Excise, Stamps and other sources, are you?—No.

23563. You simply spoke from your general knowledge?—Yes.

23564. Then about this Primary Bill. You have said that, if the Bill comes forward, the apprehension is not so much as to whether the Bill is going to be accepted by the Government as it is but whether it is going to be put through at all?—I may be wrong, but I do not think that the Council would go so far as to throw it out altogether. My point was that it might be modified in such a way as to be unacceptable to the Minister in its final form when it is brought up before the Council. But I am not afraid of the Bill being dropped altogether in the first instance.

23565. Does the Primary Bill exclude compulsory female education altogether?—I think it includes girls' education, but it does not include the compulsory education of girls.

23566. Now with regard to adult education. Are you not familiar with any of the night schools where grown up people are taught?—I am tied to the office a good deal and I have not actually visited any.

23567. With our resources as they are at present, are there any ways in which you might improve the system? If you are a pessimist, I can understand that. Our financial position is not at all satisfactory; but if we had a system of concentration to which reference has been made by another witness, and fewer schools of a better type, could that improve matters?—You mean fewer schools of a better type for males?

23568. I am talking of primary education for boys. Instead of fixing our grants, for instance, for about ten schools in a Union, do you not think it would be better to give Rs. 25 to two good schools rather than give Rs. 4 or Rs. 5 to ten schools?—Certainly the system of having a school in every village is hopeless. If anything is to be done, you must do away with this system.

23569. Sir James MacKenzie: Have you any acquaintance with the scientific side of the University of Dacca?—No, I have not seen much of Dacca University. I have been up here very little.

23570. You are not on the Senate?—I am on their Court which holds only an annual meeting and I have not found time to attend.

23571. I was going to follow up the scientific side of the Dacca University with reference to the proposed Agricultural Institute, but as you have no acquaintance with it I will not do so?—I cannot say I am familiar with it.

23572. Professor Ganguly:—I want to ask you one or two questions about primary education. Do you agree that the demand for compulsory primary education has come to stay in Bengal?—The demand has come to stay but the question is whether the people are willing to pay for it. The demand is there. I think it is national self-respect that brings about that demand now as much as anything.

23573. If you had adequate financial assistance, would you have more schools or would you remodel your existing schools on a sound basis?—At the moment, if you have any scheme for compulsory education you must have more schools; but if you have anything less than a compulsory education scheme, then it is a matter of remodelling; in any case some schools must become central schools in order to serve several villages.

23574. The point is that the mere expansion of schools does not ensure the success of the educational movement?—I agree.

23575. In this note of yours, you lay emphasis on the importance of having adequate finance and you also mention that the primary defect in your education system is the lack of a system. You say in your note, "it is not so much a change in the system as the creation of a system which is needed." I should like to ask you to tell the Commission very briefly how you would propose to create a system? What would be your first step?—The first step would obviously be a survey of places where schools were to be. Secondly, you would have to find out how many pupils would go to them. If you had a compulsory system it would be fairly easy to find out the number of pupils. The survey would also enable you to withhold grants from such schools as were not needed.

23576. Has any such survey been made at all in Bengal?—No, Mr. Biss made a sort of survey and he came to the conclusion that Rs. 2,00,00,000 was required for a complete scheme. But I imagine that in the case of the survey which I propose each district would make its own arrangements; it would not be an all-Bengal survey.

23577. What would be the nature of the information that you would like to seek in these surveys that you contemplate? What would you actually like to find out?—You will have to find out how each village lies and where the schools serving those villages are. Mr. E. F. Oaten,

should be established. Mr. Bis put out a scheme but he did it with circles and half mile areas and so on. You will have to survey the villages and find out where the schools should be.

23578. First you say there ought to be an educational survey and then second stop you mention is to raise the funds ?—Yes.

23579. Then, given the necessary funds, you would evolve a type of administration. That, I suppose, would be the third step ?—I think each District Committee would have to appoint its Educational Adviser to start with.

23580. In your note I find that you propose to have a District School Board ?—The Bill contemplates each district managing its own affairs by means of a special *ad hoc* District Committee and the first thing that this committee would do, would be to appoint an Educational Officer or Director or whatever you may call him.

23581. He would be the controlling authority of all the Boards ?—He would be the servant of the District Committee.

23582. So, you would have an educational officer in each district ?—Yes, because it would be a big problem. Just as the Corporation of Calcutta has its own educational officer, so each district would have an educational officer of its own.

23583. Would all these officers be under the Minister or under the Director of Public Instruction of Bengal ?—I should like to see them under the District Committees. They would be the servants of the District Committees.

23584. They would have nothing to do with the Local Government ?—Certain aspects of the District Committee's work would be subject to the sanction of the Local Government but I see no difficulty in the educational officers being the servants of the District Committees.

23585. You would have the educational officer under this *ad hoc* Committee ?—Yes.

23586. Do you think the District and Local Boards have, as they exist now, shown the necessary ability for administration and supervision of rural schools ?—They have not but the *ad hoc* Committee is quite different from the District Board.

23587. In the case of these *ad hoc* Committees, how would you safeguard them against the influence of partisan politics ?—There is a fair official element on these Committees. Of course, the officials are not in the majority, but there is a large official element including the District Magistrate.

23588. That would be resented by the public opinion ?—If there were an official majority it would be challenged in Council; but this is not the case, so it should not be resented. There is a non-official majority under our proposal.

23589. In the event of there being a non-official majority, there is likely to be some difficulty with regard to the influence of partisan politics ?—I think the official element would balance the two.

23590. With regard to the question of finance what is the present system of distributing grants to primary schools ?—The District Inspector through the Sub-Inspectors draws up what he thinks is the right distribution of grants and the scheme goes before the District Board and is generally sanctioned as it stands.

23591. You do not follow a system based on any definite policy ?—We have to rely on the District Inspector to be wise in his suggestions; that is all.

23592. Could you tell the Commission your views on the system of small grants—in and that you have in this Presidency ?—You mean the policy of supporting small schools here and there ? I think it would be a good thing if it were possible to alter it.

23593. I mean giving Rs. 2 here and Rs. 3 there and so on ?—That is a defect in the system. Whether it could be changed or not, I do not know.

23594. Would you agree that the system is defective ?—Yes. The reason is that if you close these small schools by taking away their grants and improve a school a couple of miles off, the children will not go to them at all and that is the reason why you require these small grants. You have got to have a school close by. Unless a school is near, children will not go to it.

23595. I think you have rightly laid emphasis on the fact that money is the main factor. The other day I was going through an American book where I also came across the same remark. I think to get the right sort of teachers is also a problem and you have already made reference to it in your note. I should like to get more information from you about *guru* training institutions. Who are the teachers that teach the *gurus* ?—In the new type of *guru* school we have a staff of three. One is the Head master, who is a graduate and B. T. and the other two are vernacular trained teachers. Their task is as I said before, to teach the *guru* not so much the principles of teaching which we would like to but simply to complete his own education,

Mr. E. F. Oaten.

23596 How long do they stay?—For one year only.

23597. How many of them are in each of your schools?—The number of *gurus* in the old type of schools is less but the new type of schools contains forty.

23598. With regard to the inspecting officers, that is another link in the system that has got to be perfected. What is the present arrangement here of your inspecting staff? What are their qualifications?—The Sub Inspector nowadays has to be a graduate and have a degree in teaching and also some experience of teaching. We relax the degree in teaching in the case of Mussalmans because we cannot get them with it always. We have to accept a lower standard in the case of Mussalmans but that is only temporary.

23599. The last link must be the change of curricula. You say in your note that when a real step forward can be made in rural primary education, the question of curricula will be of first rate importance. Could you tell the Commission how you propose to deal with the question?—It is not a question which we have taken up yet, but the Bill contemplates a rather radical departure by including religion; that is one point. Secondly, I personally would like to see music taught in every primary school. I think the absence of music, which is after all the nation's heritage, from schools is a very bad thing indeed and compares very badly with Western ideas of education. Of course nature study, i.e., some simple form of science must also be included. We must also have reading, writing and arithmetic. There might however be local variations which the District Committees might suggest but we must certainly have reading, writing and arithmetic.

23600. Who would decide the framing of the curricula and the system that we have just discussed? Would it be the Provincial Government or the different District *ad hoc* Committees as suggested by you?—All these matters are not yet worked out, but I would suggest that, instead of having one unified curriculum, the different districts, if they desired specialised curricula of different kinds, might have their own curriculum. In the beginning, however, we should doubtless have the existing provincial curriculum.

23601. The position is this, that you have a Bill and you propose an educational cess to get the necessary funds for the purpose, but you have not developed the system yet?—We have only as yet framed the administrative skeleton. The Bill may not become an Act for the next five years, and it is no good working out detail until the framework is settled. Even if the principle of the Bill are accepted by the Council, it will have to be brought into effect by executive orders at such times as may be suitable. It will take time before it can be got going and we have to train the teachers to start with, before we can begin.

23602. Mr. Colclard. On page 157 of your first note you say, "the cultivator's son is taking advantage of the system of higher education." Is he now being employed anywhere and more in your department as a teacher?—No, I should not think that many of them are coming in yet, because they are not naturally the brightest of the people, and I imagine that the qualifications they obtain are generally less than those of the others; so they do not meet the upper class man in competition yet.

23603. Is it part of your policy to get as many of them as possible?—We have not adopted that policy yet. Perhaps I should point out that there are no Government posts in primary schools. The Government teaching posts are in secondary schools. A lot of cultivators' sons go in for primary education, but we do not appoint the *gurus*. They just start a school, or get employed in a school; the department does not employ them. The schools recruit their own people.

23604. The Government Resolution of 25th September 1920 puts the cost of primary education at about Rs. 31 lakhs. Have you any rough idea as to how much of that is spent in rural areas and how much in urban areas?—I could not say without reference to papers.

23605. The cost per student in a primary school works out at Rs. 1-14-0. That is, I gather, the cost from public funds?—Yes, from taxation.

23606. Can you give us a rough idea of the total cost from all funds of primary education per pupil?—I should have to look it up.

23607. In the Punjab, it is Rs. 10 per pupil. Rs. 1-14-0 is only a very small proportion of the total cost?—I do not think it would be anything like Rs. 10 in Bengal. It might be in the region of Rs. 4, but I am not quite sure.

23608. Have you any idea as to what the proposed cess of 5 piees in the mpees of the annual value of lands amounts to per acre?—No.  
Dr. Hyder: 5 piees per rupee of rent paid, I think.

Mr. E. F. Oaten

Vol. 1, 13-40

23609. *Mr. Calvert*: Is the annual value the same as the land revenue here?  
*Dr. Hyder*: No, the rent.

23610. *Mr. Calvert*: In your note, generally, you say very little about the teacher of the primary school?—Yes

23611. It is not because you under-value the position of the teacher?—No; I think I appreciate him

23612. Do you not think that the wastage in the higher classes may be due to the inefficiency of the teacher?—Undoubtedly, it is due to that; many parents think it is not worth the trouble their boys continuing.

23613. You suggest a good primary school teacher with an increased agricultural bias?—I should like to train him better at the *guru* training school in elementary science and nature study, and so on. It will add to the cost, but it might be done without adding greatly to the cost by taking one of the *guru* training school staff and having him trained in agriculture.

23614. If you had a better type of teacher, with more rural sympathy, do you think he would be able to diminish the wastage in the higher classes?—I should certainly think that the better the teacher and the more his teaching is in relation to the lives of the people, the more the boys would tend to stay on.

23615. You also suggest that you might ensure that the inspecting staff should know something of agriculture. Is it part of your policy to select your inspecting staff from the sons of cultivators?—We have not adopted any policy of that kind.

23616. Do you think it is possible to give an urban-bred teacher an agricultural bias?—I certainly think that an urban teacher who had gone through a training in agriculture could help the schools in his charge.

23617. I was not quite clear on the suggestion from the Chairman of "contracting in." I gather, and I think you yourself have stated somewhere, that about 3½ per cent. of your total pupils reach the fifth class?—Yes.

23618. That means a very considerable wastage in the first two classes?—Yes; you can see that from the figures. It is 917,850 in Class I, and it goes down considerably afterwards.

23619. Would it be possible to make it a condition of a boy entering school at all that his parent should agree to send the boy to school up to the full school-going age?—If it is free education. That is the only incentive you can offer him. I do not think it is an impossible suggestion, it is a new one to me, and I shall have to think over it, but it does not seem to me to be impossible.

23620. Does your department attempt to work in close touch with the Co-operative Department in this matter of rural education?—We have not had much inter-connection at all.

23621. You do not utilise the Co-operative Department as a means of securing better attendance?—No.

23622. Do you try and get the staff of the Co-operative Department to lecture in schools on co-operation and rural economics?—No.

23623. Do your teachers obtain any training in rural economics?—No.

23624. There is mention in the report about Moga. Have you, as an expert, any view to give on the value of Moga?—I have referred to it in my note. I have said that in Bengal I should like to see the experiment made where the conditions exist. I have not seen Moga myself, but I have read about it, and I should like to see in Bengal many more schools on the lines of the Moga school. The essentials of such a school are very competent guidance and a residential system, also, a good deal of land is necessary. Certainly, I do believe in an increased number of schools on the lines of the Moga pattern. We are going to have one in Chapra in Nadia district; we have the machinery there.

23625. For the Moga system you would require a rather better class of teacher than you have at present?—Undoubtedly.

23626. The teacher is the real crux?—Yes. We have an analogous experiment in the Midnapore district; it is not agricultural, though; it is mainly industrial.

23627. *Professor Gangulee*. That is run by Missionaries?—Most of such schools are run by them. Competent guidance is the essential thing

23628. *Mr. Calvert*: On this question, I was just wondering how far the problem is financial and how far it is the teacher?—Both, because without finance you cannot attract the right man in the profession.

Mr. E. F. Oaten

23629. Much money is wasted on classes I and II ?—Yes.
23630. If there is the money it could be better spent ?—Yes.
23631. And the spending would be on the teacher ?—I do not quite follow that. You mean to say that we should teach a fewer number of children than we are teaching at present.
23632. You should get more boys for classes IV and V ; that is important ?—Yes ; and in desperation we are thinking of attempting to do something by having a public examination for Class V.
23633. *Professor Gangulce* : Do you think that it will make the boys stay on ?—Yes ; prebent certificates are considered to be valuable in Bengal and the hope of getting one by passing the examination could induce many to stay on. We had the examination before but it was abolished, and we are thinking of reviving it.
23634. *Mr. Gupta* : That would keep them on for a longer period ?—With a view to getting the certificate they would stay on in many cases.
23635. *Mr. Calvert* : Are your female teachers in primary schools paid higher than the male teachers ?—The female teachers get more, as the supply is very small.
23636. The female teacher is not a means of economy in this country as is the case in Western countries ?—No, she is not.
23637. It is not like in America and England, where she is a cheaper product ?—No ; the supply is so very small here.
23638. *Rai Bahadur Bannerji* : Supposing we have the money and we introduce the Punjab system of giving agricultural education in our schools, you have proposed taking up the middle English schools, not the high English schools or corresponding classes ?—High schools are included, I think it is in the proportion of 1 to 2, two middle schools to one high school.
23639. *Sir Thomas Middleton* : What method of aiding local authorities do you contemplate ? Are you going to approve of the scheme of a particular local authority and to promise to pay a percentage to the local authority, or are you going to say to the local authority "We approve your scheme and we are going to give you a grant of a fixed amount towards the carrying out of that scheme" ?—The money raised in the locality is to go to the locality.
23640. Is there not to be a provincial grant ?—There is to be a District Committee Fund, and the money raised in the district will go to that Fund.
23641. Is there no contribution from the Central Fund ?—The amount contributed will be the amount raised from taxation within the district.
23642. *Mr. Gupta* : There is no contribution from outside ?—The District Committee will have any funds that Government may like to give in addition.
23643. *Sir Thomas Middleton* : That will be to the District Fund as a whole, not for education ?—The Bill contemplates a District Committee Fund into which money from various sources will flow, and the money raised in the district will be paid into that fund. If Government desire to supplement it from provincial funds, that would be paid in to the fund.
23644. What would be the method of paying in from the provincial revenues ? Would it be by way of a percentage of the amount raised in the district, or would it be by way of a block grant ?—I am pretty certain it would be a block grant, just to supplement the netwicks of the District Committee.
23645. There is a provision for contribution from outside ?—Yes.
23646. Is it contemplated that the provision would be substantial ?—No.
23647. Nothing in the neighbourhood of 50 per cent. ?—No. For many years to come the main Government assistance towards this scheme would be the provision of training facilities for teachers.
23648. What proportion would the existing grant bear to the total revenue at the disposal of the District Board ?—The figure in the Resolution is 30 lakhs and the taxation we contemplate would raise it, I think, to 80 lakhs.
23649. *Professor Gangulce* : With reference to your guru training schools, are the students at any time taken to the Government farms and shown round ?—I do not think they are.
23650. It has not been the practice ?—No.

Mr. E. F. Owen.

No. 13—30a

23651. Is any *gunu* training school situated near Government farms, such as Rajshahi and other places?—There is one at Rajshahi. I think it is a good suggestion; but I do not think it has been done.

23652. The idea is that these Government farms in every district could be utilised for the training schools?—Yes, if they could be utilised. The training school staff do not know enough, and you would have to use the farm demonstrators to give instruction, I think.

(The witness withdrew.)

Mr. E. F. Oaten.

## APPENDIX

## Note on Adult Education in Bengal

In the past the department wrote of Adult Schools as "night or continuation schools," the object of the latter being stated by the Government of India in 1902 as follows:— "To enable students to complete their education in branches of study which may have been neglected or not attempted. Such continuation schools might be more or less connected with agriculture in rural districts and with industry and commerce in centres of trade." Sir Alexander Pollock, Director of Public Instruction, Bengal, stated in that year that the number of "continuation" schools was 1,607 and the number of pupils 13,846. He added that the standard of attainment in these schools was such that little more could be attempted than the cultivation of the general intelligence of the pupil, though something more might be possible in towns in a vocational direction and that they were not really strictly "continuation" schools at all, but merely night schools doing more elementary work than even the day school. On that correspondence Government sanctioned Rs. 10,800 for the creation of 200 continuation schools in the Presidency Division in connection with the existing day schools, the monthly stipend to the scholar being Rs. 2 and an additional reward of 2 annas being given for each pupil in regular attendance.

In the Quinquennial Report\* of 1918 Mr. Hornell wrote

*Night schools, their pupils and their cost*

The following are statistics relating to night schools.

District	Schools		Pupils		Expenditure	
	1911-12	1916-17	1911-12	1916-17	1911-12	1916-17
Dacca ..	379	751	6,628	6,912	Rs. 6,201	Rs. 6,319
Presidency (including Calcutta) ..	196	91	3,719	2,258	11,651	7,698
Dacca ..	201	910	3,631	1,817	3,290	5,291
Chittagong ..	9	30	181	701	291	1,159
Rajshahi ..	46	188	905	3,301	756	7,026
Chittagong ..	15	11	419	181	3,311	6,528
Total ..	761	886	15,516	18,563	25,512	37,038

## Continuation schools

*Difference between the ordinary night school and the continuation school*—There is some confusion as to the difference between the night school and the continuation school. The former is an ordinary primary school held after the ordinary school hours to suit the convenience of those who cannot attend day primary schools. Continuation schools are quite different. They are mainly intended for those pupils who have already left school. These schools are not necessarily held after school hours; they may be held in the early morning. There are two classes of these institutions, group I and group II. Group I schools are practically lower primary schools, teaching the three R's in their spare hours to boys who are working; group II schools attempt to impart some rudimentary professional or technical instruction.

*The continuation school scheme of the Presidency Division*—A scheme for "continuation schools" has been working as an experimental measure in the Presidency Division from 1907.

*Number and pupils of continuation schools*—The number of continuation schools in 1916-17 was 167 with 2,739 pupils as against 151 schools with 1,168 pupils in the previous quinquennium. There has thus been a decrease of 14 schools and 1,129 pupils during the quinquennium. The total cost of these schools was reported to be Rs. 13,226 in 1916-17 against Rs. 11,605 in 1911-12. These schools are not very popular. This was Mr. Hornell's description of the position in 1918.

\*Fifth Quinquennial Review, 1912-13 to 1916-17.

Mr. E. F. Oaten.

The present position is as follows : There are two main kinds of adult education now existing in Bengal, though all the pupils attending these schools are not adults.

1. Ordinary night primary school—purely primary schools held after school hours to suit the convenience of those who cannot attend day primary schools—These schools are attended by children as well as adults (day labourers, etc.) who have never been to school before. The school teaches the primary course.

2. Continuation schools—These are also primary schools intended for those who have already left the ordinary primary schools at a too early stage. They continue the work of the primary schools teaching the three R's. Some of these teach English and give religious instruction. They help to prevent relapse into illiteracy. Some vocational instruction is also often given, *e.g.*, tailoring, basket-making, joiner's work, etc., and a few of them (39) are purely vocational.

The figures for night continuation and adult schools for the past twenty-five years are as follows :—

Year.					Number of schools.	Pupils.
1899-1900	..	..	..	..	1,005	18,846
1911-12	..	..	..	..	769	15,511
1916-17	..	..	..	..	886	18,563
1921-22	..	..	..	..	1,551	34,036
1925-26	..	..	..	..	1,444	27,745

The total expenditure from Provincial Revenues for these schools in 1925-26 was Rs. 38,903. District Board and Municipalities provided Rs. 25,715 also. Of the special continuation type, there were in the Presidency Division in 1926, 127 attended by 2,761 pupils, carpenters, bricklayers, sweepers, cobblers, cart-drivers, book-binders, etc. They cost Rs. 11,580, the figure being part of the Rs. 38,903. Attendance at these schools and at other adult schools is very irregular, so that their value is minimised. The position appears to be that with adequate funds something more than is now accomplished might be done, but that irregularity of attendance will prove a very great drag on the full utilisation of such facilities as may be provided from additional resources.

Mr. E. F. Oaten.

## Mr. L. BURROWS, B.A., Collector of Faridpur (Bengal)

### Replies to the Questionnaire

QUESTION 2 (c).—The problem of unemployment among educated middle-class youths is already a serious one in Bengal. As a Magistrate-Collector with a comparatively limited amount of patronage, I find constantly that the number of qualified candidates for appointments in Government service is greatly in excess of the posts available, while the inability of Indian gentlemen of good position to find employment for their sons is positively pathetic. "Back to the land" is one solution of the problem, but it is a solution which both parents and youngmen are averse from, and which they will not adopt voluntarily without substantial inducements. Agricultural education of a suitable type may supply technical knowledge or practical experience, but there must also be scope and opportunity for the application of such knowledge and experience. In the district of Faridpur and in Eastern Bengal generally, there is no waste land nor jungle waiting to be brought under cultivation and it will consequently be difficult for students of agriculture to find land on which to use their special training. Government does, however, own extensive *Khas mahals* in which a certain amount of land is available for settlement by allotment every year over and above that which has to be settled on the basis of reformation in *situ* or accretion. My idea is that part of this land should be made available for settlement in small but remunerative quantities with selected boys of the *Mahantol* class, who would be required to cultivate it themselves after training in the nearest district agricultural farm. A start might be made in each district with five boys every year, preferably Matriculates or those who have completed the M. L. School course, though undergraduates and graduates need not necessarily be barred if their intentions are *prima facie* sincere. In order to obtain these five boys, ten would be selected and sent to the Faridpur Agricultural Farm for a year's training in practical agriculture. During this year's training they would also be instructed in agricultural carpentry at the Faridpur Industrial School, in elementary veterinary knowledge by the headquarters' Veterinary Assistant, and in the principles of co-operative credit by the local Inspector of Co-operative Societies. After this year's training, during which the boys would be paid nothing except what they earned for their labour on the farm (estimated at Rs. 12 a month), a theoretical and practical examination would be held under the instructions of the Director of Agriculture and the five best boys would proceed to the next stage, the other five having to rest content with the training they had received for application on their own land or on land to be procured for them by their parents or guardians. The five best boys would each receive provisional settlement of 15 *light* plot of *Khas mahal* land free of rent for three years, and would also be advanced Rs. 200 by Government under the Land Improvements or Agricultural Labour Act for initial expenses, these advances being made on the personal joint and several security of two persons acceptable to the Collector. The advances, with the usual interest, would be recovered in four annual instalments commencing from the second year after the money was advanced with proviso that, if for any reason, the settlement were terminated by the Collector at any time, the whole amount or such balance as was outstanding would be immediately recovered from the two sureties. The work done on the land would be inspected every half year by the District Agricultural Officer and the *Khas Mahal* Officer, and the Collector would decide on their reports whether the arrangement should continue. Any attempt to sub-let the land in farm or *teys* or otherwise would involve the immediate cancellation of the provisional settlement. At the end of three years, if satisfactory progress had been made and prospects were promising an ordinary permanent settlement would be made on the usual terms obtaining in the Government estate in which the land is situated, no *salami* being charged, however. As the average rate in this district is Rs. 1 a bigha and the average *salami* about Rs. 3 a bigha, the cost to Government for each boy would amount to Rs. 1 + 15 × 3 plus Rs. 200 or Rs. 500 in all, which seems a small price to pay in order to obtain tenants of a good class and to help in solving one of the most urgent problems of the day.

This scheme was discussed at a district agricultural meeting held at Faridpur on the 26th September 1924, and attended by the Director of Agriculture, the Director of Civil Veterinary Department, and representatives from all over the district. It was cordially approved by all present and I have already been approached by two Indian gentlemen who were under the erroneous impression that the scheme had been accepted and was being put into practical working.

QUESTION 3.—Experimental research in agriculture is of little more than academic interest unless its results are communicated to and adopted by the cultivators. The Agricultural Department in Bengal has a good record in research and can legitimately congratulate itself on the discovery of improved jute seeds and varieties of paddy which yield not only a larger output, but also a better quality for which higher prices are obtained. Its record in demonstration and propaganda is not, however, quite so

Mr. L. Burrows.

satisfactory. This has been due partly to causes beyond its control, but partly also to mistakes in policy and method. It is, for instance, no use demonstrating an improved variety on Government farm soil manured with nitrate of soda, irrigated by mechanical power through masonry drains, and protected from jugs and jackals by expensive fencing. The cultivator, if he is at all interested in the results, regards them as a sort of curiosity without practical concern to himself. He is not as conservative as he is often made out to be, but he will not follow expert advice nor try experiments until he has seen a particular crop grown under the conditions he has himself to contend with, or at least under conditions he can assure to, which are within his means, and within the capacity of his soil, his implements, his bullocks, and his own labour. The department is not now as much in touch with the people as is desirable but it is doubtful if it ever was or could really be in close touch with them. More demonstrators, properly trained and adequately supervised, are certainly necessary, but I think that, after providing such demonstrators, the department should work through and in combination with the Collector and his subordinate officers. Under latter-day conditions, the Collector has ceased to have any direct control over Municipalities and District Boards, and his principal constructive work nowadays in Bengal is in connection with Union Boards. These local bodies promise well on the whole, and could be utilised for demonstration and propaganda purposes. I have little faith in co-operative societies, agricultural associations and the like for such purposes because they are dissociated from immediate executive control and are unlikely therefore to produce fruitful results out of Union Boards.

The first essential is a detailed agricultural survey of each district showing what staple crops are grown in each part of it and which areas are suitable for particular departmental seeds and improved varieties. There are no such maps at present so far as I am aware, and seed distribution, etc., seems to be done in a somewhat haphazard way in consequence. After completing this survey, each district should be treated as a unit, its requirements studied, its possibilities investigated, and its improvement encouraged along practical lines. The District Agricultural Officer and the trained demonstrators should then evolve a definite general plan in consultation with the Collector, and demonstration should be done in the villages through actual cultivators on advances of seed to be recouped at the time of harvest if the crop is successful. This can be most easily arranged through Union Boards, which could also simultaneously manage seed-stores, and work as agents for the sale of departmental seed. In order that the Union Board members might carry on these subsidiary demonstrations (the main demonstrations being still done by trained departmental demonstrators at suitable centres) under skilled supervision, it would be necessary for all Circle Officers to be given a short agricultural course devised to meet the immediate end in view. My own idea is that the Bengal Junior Civil Service should be divided into two branches, one consisting of Circle Officers to be used mainly in developing the activities and utilities of Union Boards, and the other of officers employed on general duty. All recruits should be trained on both sides, and then selected for or allotted to one branch or the other, as is done with the executive and judicial branches of the Indian Civil Service. As regards propaganda, magic lantern and, better still, cinema lectures are more useful practically than leaflets which few cultivators read and fewer still understand. This propaganda could be carried on by Circle Officers and Union Board members with appliances and materials supplied by the Agriculture Department.

I am definitely of opinion that the practical utility of the Agricultural Department (and in fact of almost all the special departments) depends largely on the degree to which it can persuade the Collector to co-operate with it and further its objects. Much has been said and written about the personal influence and authority of District Officers having disappeared, but my own opinion based on experience is that what the Collector says still goes, not perhaps to the same extent as it once did, but also to a sufficient extent to enable him to be the greatest single factor for public good. For this reason also much more should be done on the Government *khās mahals* to improve agriculture and act as an example to private landlords.

**QUESTION 9.**—The measure which I wish to suggest would cover also the drainage of water-logged *bhils*, the re-excitation of silted-up *thals*, the repair of breaches in *thal* banks, and the construction of *bunds* to keep out floods or to hold up water for irrigation and other purposes. Almost every Union Board I inspect in the Faridpur district develops a local demand for some such small scheme which would be of great material benefit, but which is usually beyond the financial resources of the Union Board without being such as to require expert supervision or large capital expenditure.

There is now in Bengal an Agricultural and Sanitary Improvement Act of 1920 which was apparently intended to facilitate the carrying out of such schemes, but the Act has proved a dead letter practically because its machinery is too intricate and its procedure too cumbersome. The Act and Rules framed under it cannot be understood without special

Mr. L. Burrows.

study, while sound schemes take too long to mature even after the initial financial difficulties have been overcome. The applicants are usually unwilling to give any undertaking to deposit in advance the cost of the survey and preparation of estimates. The collector has to obtain expert opinions from the Departments of Agriculture, Irrigation and Public Health before he can pass an order under section 4. By the time this has been done, and the possibly conflicting opinions of these various departments have been reconciled, every one concerned has lost interest in the scheme and funds are not readily forthcoming for the further stage. After this, an engineer has to be appointed under section 5, objections have to be heard under sections 6 to 8, the scheme has to be carried out under sections 9 to 16, and costs have finally to be apportioned and recovered under sections 17 to 22. All this inevitably discourages the stoutest heart and breaks the most enthusiastic spirit.

The remedy is, in my opinion, (i) to do away with any differentiation of schemes as mainly agricultural or mainly sanitary, and (ii) to alter the present pecuniary limit of minor schemes. As regards the first point, it seems evident that the reclamation of a *bhal* or the re-creation of a *thal* is usually as much a sanitary as an agricultural improvement. Flowing water for irrigation means better water for drinking, while every stagnant marsh means more mosquitoes and more malaria. The distinction is made because the local authorities cannot legally subsidise schemes of agricultural improvement but almost every minor scheme can quite correctly be described as a work of sanitary as well as agricultural improvement. As regards the second point, I would suggest that the pecuniary limit of minor works be reduced to Rs. 5,000 and that the law and procedure be entirely different for major and minor works. All the present restrictions and precautions are probably necessary for major schemes because it is dangerous to interfere on any large scale with the natural processes by diverting the flow of drainage or checking the disposal of silt, or changing the general condition that determines public health. Such schemes must be handled by experts from beginning to end, but are not perhaps the kind of scheme that the Act of 1920 was primarily designed for. Most of the schemes I have seen or been told of are comparatively small affairs and would not cost more than Rs. 5,000 in any case. These are the schemes that are of real practical importance to the villager who wants either to remove water accumulated in the wrong place both to reclaim the land it covers, and to make his environment more healthy, or to collect water in the right place for himself or for his crops or for transporting commodities. Minor works defined as above do not need any elaborate survey or preparation of estimates. The villagers themselves know more about natural drainage lines than the surveyor can discover by means of contours. They can also usually say to within a few hundred rupees what such a scheme will cost. Official help and control will of course be necessary to examine such schemes, to arrange for land where required, and to supervise the actual work, but this could be reduced to the minimum necessary to secure useful schemes executed with economy and efficiency. On the financial side, the requisite funds could be advanced by Government on the joint and several liability of all interested persons as in agricultural loans, or on more material security as in land improvement loans. Alternatively, the financing could be done by Government or District Board advances as loans to Union Boards on the security of their rates. In either event, the cost, including interest on the advance, would be apportioned by the Collector after the work was finished and recovered by certificate procedure if not paid on demand or by reasonable instalments. Only such of the amount as was irrecoverable by these means would be payable by the Union Boards concerned. If such schemes were properly examined in the early stages and carried out expeditiously and efficiently, there would probably be fewer bad debts than from any other kind of loan or advance. I am convinced that some such simplified procedure would do immense benefit in this district by extending the area available for crops and pasturage, by increasing the normal output of agricultural produce, by revivifying accident tracks and improving the health of the population, and by facilitating navigation and transport generally.

I may add that these ideas were discussed at the district agricultural meeting already referred to and that it was unanimously agreed that "such minor works could be carried out with great advantage all over the district of Farukpur and constitute one of the most urgent local needs." The cultivable area would, it was estimated, be increased thereby by at least 10 per cent.

QUESTION 15 (b), (c) and (d).—In reply to this question generally, I attach a copy of my "Scheme for Thana Veterinary Dispensaries" (vide Appendix I).

One point not dealt with therein is the disposal of diseased carcasses. This is a very real danger in a district like Farukpur where there is little or no land to bury the carcasses in, and where the usual procedure is to throw them into the nearest *thal* and trust to vultures and jackals for the rest. The penal provisions regarding public nuisance in Chapter XIV

Mr. L. Burrows.

of the Indian Penal Code have proved insufficient and will remain insufficient until public opinion condemns such practices as dangerous to the community and produces witnesses willing to depose against those who break the law. It is doubtful whether legislation *ad hoc* would give any more satisfactory results. The same applies to the highly dangerous practice of skinning carcasses of cattle in times of epidemic disease. Compulsory notification, segregation and inoculation would not be advisable in my opinion at present. The advantages of inoculation as a preventive measure are being slowly but surely recognised and would soon be universally accepted and even welcomed with a Veterinary Dispensary in every *thana*.

QUESTION 16 (c) and (d).—The months of the year in which fodder shortage is most marked in the Faridpur district are August to October inclusive, the shortage amounting to scarcity in September and the first half of October. In the *khil* country, the cattle cannot move from the mounds on which the homesteads are built, and there is a shortage of cattle food all over the district because the land is flooded and little or no grazing is possible. Rice is still the staple crop of the district, but the substitution of jute to the extent of about one-fifth of the cropped area has reduced the amount of paddy straw available for cattle. This shortage of fodder seriously affects the condition of the cattle, and the cultivator has sometimes to sell his cattle in November for what they will fetch and buy fresh cattle when the ploughing season comes.

A certain amount of *mashkhalai*, *Lhesari* and peas are grown as fodder crops, while *lala* or *khala* grass is also grown on new *chars* partly as a cattle food and partly to increase silt deposit. During the rains, the leaves of certain trees (*aswatha* or *pipal* and *dato*), the bark of the plantain tree and water-hyacinth are fed to cattle, but the latter is said to cause diarrhoea. Another source of cattle food is the grass weeded out of the paddy and jute crops before the rains break.

The only means of improving and supplementing the fodder supply in this district is by the larger cultivation of fodder crops during the cold weather. There is no superfluous land in this district for grazing grounds. I think that the Agricultural Department should purchase plots of land in rural areas and demonstrate the growth and use of fodder crops (such as Guinea grass) recommended by the department and suited to the district. This might also be done eventually at the Thana Veterinary Dispensaries I have suggested separately (*vide* Appendix I).

QUESTION 17.—The flood-fertilised soil of the Faridpur district is thrice cropped in some places (with jute and *aman* paddy sown together followed by a *rabi* crop of garlic, oil-seeds or pulses) and twice cropped in 50 per cent. of the remaining area excluding the marshy *khil* country which only yields one crop. Agricultural work goes on throughout the year. *Boro* paddy is grown in nurseries in December, transplanted in January and cut in March. *Aus* paddy land commences to be ploughed in February, and *aman* paddy land in March. *Aus* is sown in March, weeded in April and harvested in July, while *aman* is sown in April, weeded in May and harvested in November-December. Jute land is ploughed and sown in April, and weeded in June, the cutting, steeping and stripping of the crop lasting from July to September, and its sale from July to November. As regards *rabi* crops, the land is ploughed and sown from October to December and needs little weeding, the crops being harvested from February to April. Every cultivator does not of course work continuously during all these months, and my estimate of the number of days of work done by an average cultivator on his holding during the year is 220 or about seven months.

It is evident therefore that the average cultivator of Faridpur has considerable leisure which he does not, however, use to economic advantage except when pressure of circumstances lowers temporarily his usual standard of comfort. After he has repaired his homestead, gossip, intrigue and litigation occupy his spare time sufficiently as long as he has food to eat and money to spend.

According to the late Mr. J. C. Jack, who made a special study of the economic life of the district, 49½ per cent. of the cultivators live in comfort and are "well-fed, well-housed and well clothed," while another 40½ per cent. are below comfort but above want. A part even of the most prosperous cultivator's income comes, however, from subsidiary occupations, followed, it may be added, in a more or less desultory fashion and taken in comparatively small doses at a time. Apart from fishing and weaving, service of various kinds is the main subsidiary occupation. In the rains, the cultivator works as a boatman and plies country boats for hire. From about August to December he earns good money in cutting, steeping and stripping jute, and in harvesting paddy particularly in the Backarganj district. There are practically no landless labourers in Faridpur, and this work is done for cultivators by cultivators who may have already engaged others in helping to cut their own crops. From January to March, the cultivator does earth work of various kinds though this work is generally done in Faridpur by imported labour. In April and May, he works under professional boat-builders, masons, etc.

Mr. L. Burrows.

The general question of subsidiary industries is, however, not without practical importance even in Faridpur. The average size of the cultivated holding being about  $1\frac{1}{2}$  acres or about 4 *bighas*, many cultivators are compelled, for longer or shorter periods of the slack season, to seek supplementary sources of income and might therefore be taught suitable subsidiary industries. The first necessity is a desire to raise the standard of living, and signs are not wanting that the Faridpur cultivator has aspirations in this direction at least so far as the improvement of his homestead is concerned. The high jute prices of 1925 were followed, for instance, by unprecedentedly large imports of corrugated iron to replace the thatched roofs of houses. Another result was that the prices of fish, milk and sweets went up because the cultivators began to consume their own supplies of milk instead of selling them, and to purchase fish and sweets in the markets.

Industrial organisation is of three kinds: (i) the factory industry supplying a large and continuous demand, working with the aid of science, capital and mechanical power, and employing a large labour force; (ii) the workshop industry working near the home and under the supervision of a master artisan, and employing a few fellow artisans and apprentices; and (iii) the cottage industry carried on at home by one or more members of the family and pursued either professionally as the whole-time business of the family, or still professionally with agriculture as a second line of support, or incidentally as a secondary occupation to agriculture of minor importance in the domestic economy of the household. It is only the third form of industry that concerns an Agricultural Commission, but it is an important living form all over India even in industries where the cottage competes with the factory and the workshop. This is so because handpower in India is cheap and plentiful, and because the possibilities of exchange and division of labour are limited by defective communications and restricted wants. Other reasons that account, and will continue to account, for the survival of cottage industries in India are (i) their incidental nature, (ii) the easy acquisition of the necessary skill as a part of family life, (iii) the accessibility of materials, implements and small but constant markets, and (iv) the durability of the products which also wear better while they last.

In spite of these local advantages, cottage industries do not flourish nor progress. They just stagnate without any will to improve or impulse to expand. Such improvement or expansion must be inspired from without and must be based primarily on knowledge of existing conditions and possibilities of development. The official "Summary of the Cottage Industries in the Districts of Bengal" is both incomplete and inaccurate at any rate so far as the Faridpur district is concerned. It contains no figures of castes, families or individuals engaged in each industry, no indication as to whether these castes, families or individuals carry on the industry as a whole-time profession or as an adjunct to agriculture, no information as to the sources of raw materials, methods of working, implements used, markets available, or capital required. A now systematic survey and intensive study of each rural industry is essential, and only then can practical measures be devised to improve conditions in the interests of the people concerned. Certain points in this connection are (i) that some cottage industries (such as basket-making) are considered derogatory because they are usually pursued by low caste people, (ii) that other such industries (such as sericulture in Faridpur) are impracticable in some localities because raw materials are not available, (iii) that others again (such as pisciculture and lac culture) are unknown though tanks abound and *baras* or *kool* trees for lac insects are plentiful, (iv) that others again (such as dairy farming and poultry rearing) are not likely to be successful except near towns and then only after the quality of the stock has been improved. On the other hand, economic pressure is becoming so great nowadays, particularly among the middle classes, that conventional prejudices are not likely to be persisted in if any industry can be shown to be paying without requiring much initial capital. Leather tanning, for instance, has obvious possibilities in a country where raw hides and skins are plentiful, while its disagreeable associations are said to be disappearing or disregarded.

Handloom weaving is, I think, the most promising of cottage industries especially as a subsidiary occupation for agriculturists. Once set up, the loom can be worked at any time by any member of the family and the cultivator can save money which he would otherwise have to spend on clothes. There is no caste prejudice against weaving and there are, I believe, parts of Bengal where people of all castes do handloom weaving. The cotton can be grown in the homestead, and the *charka*, *nalas* and *lant* can be worked in the *bars* and can be made, repaired and replaced on the spot. The policy of sending around peripatetic weaving instructors at the cost of Government and the District Board is therefore sound, but the instructions should not be confined to professional weavers nor to weaving centres. Even professional weavers need better yarn, better preliminary processes in preparing warps, better methods of weaving, better looms and better methods of finishing and marketing.

Mr. L. Burrows.

Other local industries with possibilities of development are (1) mats made of date leaves and *pali* grass, (2) rope making out of jute, (3) fishing nets out of hemp, (4) brass and bell-metal utensils, (5) pottery and tiles, (6) *gur* making, (7) mustard oil pressing in *ghams* and (8) rice husking in *dhenkis*. All these, except (4) and (5), are incidental cottage industries.

Generally speaking, the governing conditions are (1) that the cultivators will not leave their villages, or if they do, will stay away for as short a time as possible, (ii) that industrial factories in rural areas are almost a contradiction in terms and tend to convert rural into urban areas, while attracting mainly landless labourers, (iii) that improved methods, implements, etc., must be such as the cultivator can afford, can use and can have made and repaired in the village, (iv) that outside inspiration, aid, supervision and control are necessary and (v) that knowledge must be acquired before it can usefully be applied or imparted. As an example of a cottage industry started and encouraged without sufficient knowledge, the embroidering (*lantha*) of bed-covers, tea-cloth, etc., may be mentioned. This industry was started a few years ago in Faridpur to help needy widows of the better classes. The materials were supplied and the work became popular, but after a promising start due to the support of influential purchasers, no further markets could be found for the products and the industry languished and is now almost dead.

QUESTION 20.—I have answered this question with reference to paddy and jute which are the principal commercial crops of the district of Faridpur.

Faridpur is a typical water district of Eastern Bengal covered, except in the north, by a network of rivers, *khals* and drainage channels. During the rains, the only means of communication in the interior is by country-boat or steamer, and this is the season when almost all movement of jute takes place. The winter paddy crop is reaped in November and December, and is transported partly by boats along *khals* navigable throughout the year and partly by cart, pack-pony or carrier. Transport by boats is slow, but comparatively cheap. Carts are used in the north of the district, but the roads are all unmetalled and the bridges uncared for and often unsafe. *Halols* or dry beds of small water courses are generally used by pack-ponies and carriers, but these *halols* are being steadily encroached on by cultivated land. Generally speaking, the district is, except during the rains, seriously handicapped by the absence of convenient means of communication. In recent years, the water-hyacinth pest has increased this disability. In some places, the channels of communication have been choked up entirely, while in others, the movement of agricultural produce by water has been appreciably hampered.

The existing means of communication may be improved by :

- (i) Extension of railway lines. The E. B. Railway now runs through the north of the district from Panga to Gopalundo Ghat with a branch line from Rajbari to Faridpur. Extensions (a) to Churmugura and thence into Baharguna and (b) to Jessore, are contemplated. The former extension will open out a large and rich tract of country.
- (ii) Improvement of roads and particularly of feeder roads from large trade centres to steamer and railway stations. Roads have been badly neglected by the District Board in recent years.
- (iii) Eradication of the water-hyacinth pest.
- (iv) Re excavation of silted-up *khals* and other drainage channels, and reclamation of water-logged *bhils*. These could be effected partly by the Irrigation Department and the Agricultural Department and partly by minor works financed by Government or local bodies and paid for by the local people.

There are local *hats* or markets all over the district held twice a week usually. The cultivators bring their produce to these *hats* for sale to *beparis* and *farias*, who are middlemen working sometimes with their own capital and sometimes on a commission basis, the *beparis* being usually considered a somewhat more substantial person than the *faria*. These dealers also visit the villages when the *hats* are not sitting and purchase direct from the cultivator in his own home. At the larger centres of trade, there are European, Marwari and other merchants or *araddars* who take over agricultural produce from the *beparis* and *farias*, stock it in godowns, and despatch it either to the jute mills or other Indian consumers or to the exporting firms in Calcutta. In Churmugura and a few other centres, jute is pressed into *kutchas* bales before despatch in steamer flats. As regards paddy, most of the rice grown in this district is consumed locally and passes direct from the producer to the consumer of the *hats*. Rice has to be imported into the district to make up the food supply. These imports are handled by the merchants and sold by them both to retail dealers and to non-agricultural consumers.

The first intermediary is the *bepari* or *faria*, working either on a commission or with his own small capital which he can turn over quickly and profitably especially during the jute season. The *faria* is restricted in the matter of rates by the merchant or *araddar* for whom he works, while the *bepari* enjoys more liberty of action and can of course use

Mr. L. Burrows.

his own direction entirely where the capital is his own. This middleman has his economic uses and cannot be advantageously eliminated under existing conditions. He visits the cultivator in his own home or at his nearest *hat* and so saves the cultivator the time and expense of carrying his produce to the larger centres. He thus comes between the producer and the next intermediary.

The second intermediary is the European, Marwari or other Indian merchant or *aradhar*. The *aradhar* works on a commission basis for principals in Calcutta or elsewhere. The merchant works with his own or his firm's capital. Indian merchants are capitalists for some crops and commission agents for others. The European merchants are the agents of big Calcutta firms and buy and sell strictly in accordance with instructions from head quarters. They are financed by supply bills or telegraphic transfers through the local treasury or sub-treasury.

It is difficult to give accurate information as to the margin upon which these intermediate operations are concerned as they are naturally unwilling to disclose business secrets. The commission rates are said to vary from 8 to 12 per cent but the profits of those working with their own capital are considerably greater. They have, however, to lock up money while waiting for favourable prices and have also to take considerable risks which often result in correspondingly large losses. This is particularly the case with jute, jute being a relatively steady business.

As regards financing, banks is unknown. The capitalists use their own or borrowed capital, the latter being obtained from local moneylenders, loan offices or banks. The big firms operate on the usual methods of commercial credit. Commission agents work on commission capital or credit provided by their principals. *Hundis* are not used in this district. The *dadar* system of advancing money against standing crops is not common either. Under this system where it exists at all, the *mahajan* advances anything from 20 to 50 per cent of the estimated value of the crop which has then to be harvested under his directions and delivered to him for disposal. In default, the advance is recovered in the usual way with a satisfying rate of interest.

Apart from better means of communication, improvement in the existing system of marketing and distribution cannot be expected except by propaganda and instruction through co-operative sale and supply societies. Such societies should eliminate at least one lot of middlemen, protect the cultivator from having to buy seed and sell produce at a disadvantage, and so increase producing profits all round. I am of opinion that co-operative societies for the sale of jute should not attempt to compete in the commercial sale of the business, but should limit their activities to collecting the crop, storing it, and selling it on advantageous terms and at favourable times to the big commercial firms for export out of India or distribution to mills in India. Jute being a highly speculative business in which price fluctuations are considerable and inexplicable, I think that such societies will almost certainly come to grief in competition with business experts who have many reliable sources of information and who, even when they take risks, do so with their own money.

The Agricultural Department has done much to improve the quality of jute and paddy and to introduce improved varieties suited to local conditions. The links in the chain between the department and the cultivator are, however, incomplete. Better organisation is required in this respect because there is no co-operation among cultivators about adopting good seeds or improved varieties once their practical value has been demonstrated. The department does the experimenting very successfully, but the demonstrations are too restricted in scope to have anything but a very gradual effect. More agricultural demonstrators and more local centres of sale and distribution are required, and more care must be taken to ensure that the seed is not cheated, as is so often the case, by unscrupulous persons who profess to be selling departmental seed. The purity, grading and packing of crops are primarily matters for the purchasers, who can usually get what they want as has been shown in the case of jute. Weather and other conditions vary so much, however, that any approach to uniformity seems impracticable.

So far as the cultivator is concerned, any steps to place at his disposal information as to market conditions, etc., would at present be practically useless owing to his ignorance and lack of interest in anything outside his immediate environment. General primary education must be the first step in this direction, though co-operative sale and supply societies may also teach him much that is valuable. I suggested to Government in October 1931 that the preliminary and final jute forecasts should forecast demand as well as supply, but, though this might do away with the present feeling of unfairness, I doubt whether it would make any other material difference. The jute cultivator is no longer out of touch with market prices nor are the middlemen able to take much advantage of his ignorance as they did in earlier days. This year, the jute cultivators of Faridpur held up their jute for considerable periods because they thought (or more

correctly, were led to think) that the prices offered were not good enough. They had, however, to sell a part of their crops to meet their rents and their living expenses, but they kept back as much as they could with the result that, in some places, the falling of the rivers has made it difficult to get their jute to the market at a remunerative price.

So far as merchants and traders are concerned, they are quite capable of taking care of themselves. If they want more information, they will ask for it, but the mercantile community generally is distrustful of commercial intelligence collected by Government agencies. Some merchants would like to see the jute forecasts abolished altogether. But this would probably result in more confusion and speculation than now exists. The forecasts could of course be improved, but not without expenditure incommensurate with the advantages to Government. When the same agency is employed, and the same method used year after year, the margin of absolute error should be constant and the results should be relatively correct enough. The same disability attaches to all Indian statistics collected rurally, and the best course is to work out an average error and adjust accordingly. This is done by the Director of Public Health for vital statistics and is also done by many jute merchants. The best work that any one could do in this connection would be to convince the jute consumers (and particularly the jute mills in India) that, in the case of a monopoly crop, the interests of the producer and consumer are in the long run identical. Co-operation would bring mutual advantage and stop the present ruinous cycle of high prices followed by large crops followed by low prices followed by small crops followed again by high prices and so on.

QUESTION 25(a) — One of the most urgent measures for improving agricultural conditions in Eastern Bengal is some means of dealing with the water-hyacinth pest which is (and will become more so every year) a real menace to agriculture, communications and health. I have given this problem considerable thought during the last two years and have also discussed it with all sorts and conditions of men. The result is the attached "Proposed scheme for the eradication of Water-hyacinth," which has recently been submitted to Government (*vide* Appendix II). I am strongly of opinion that action is urgently necessary and that the more action is delayed the longer will such action take to have any practical effect and the larger will be the expenditure necessary.

(b) and (c) Economic surveys in typical villages cannot but increase knowledge of the economic position of the cultivators. The main difficulty is the extraction of the necessary information as such enquiries are often regarded with suspicion and alarm because their aims and motives are beyond the cultivators' understanding and admit of easy misrepresentation. It is important therefore that the confidence of the people should as far as possible be gained first. Where a settlement is proceeding in a district, the Settlement Officers make a very suitable agency. Elsewhere the enquiries should be conducted in consultation with the Collector, who can use his subordinate officers to clear up misunderstandings and counteract misrepresentations.

The attached report of such an economic survey of one village of the Faridpur district may be of interest (*vide* Appendix III). I cannot vouch personally for the figures, but I have visited the village and tested generally the validity of the conclusions. The figures were originally collected by a temporary clerk employed by the District Agricultural Officer, and were then checked on the spot by the officer who wrote the attached notes, and who is a very promising probationary Sub-Deputy Collector.

Mr. L. Burrows.

## APPENDIX I

## Scheme for Thana Veterinary Dispensaries

The necessity for more veterinary dispensaries in a country like Bengal is self evident. It was voiced in a resolution carried at the July 1926 session of the Bengal Legislative Council and more significantly so far as the district of Faridpur is concerned, at the first District Conference of Union Board representatives held on the 22nd January 1926 in a resolution which suggested that "for the health and prosperity of the people, there should be at least one Veterinary Hospital in every *thana* at Government expense." This resolution was the direct result of the heavy mortality caused by two bad outbreaks of cattle disease (haemorrhagic septicaemia in one case) in 1925-26, the first of which occurred at a season when cattle were needed for cultivating purposes, and both of which killed off thousands of cattle that might have been saved if information had been forthcoming more promptly, and if there had been more centres of preventive and curative treatment. The "at Government expense" portion of the resolution was of course impracticable, but the expression of public opinion in favour of veterinary dispensaries indicated a marked advance on times when *salim*'s spells and quack remedies were preferred to skilled treatment, and the mere mention of inoculation was sufficient to raise a riot. The present policy of Government is to establish a veterinary dispensary at every district and sub-divisional headquarters through the agency, mainly at the expense, of the District Board, Government bearing only one-third of the average charges of salary (including leave allowance and pension contribution) of the Veterinary Assistant in charge of each dispensary. Though dispensaries at district and sub-divisional headquarters are certainly not sufficient, especially in areas liable to epidemics of infectious disease, the District Boards will not, owing to want of interest, and cannot, owing to want of funds, take the initiative in establishing more dispensaries. The alternatives are therefore either to let matters slide or devise some scheme which will gradually provide veterinary dispensaries in every *thana* without throwing any unbearable burden on Government or the District Boards.

The present unsatisfactory state of affairs is due in part to defective information of the initial outbreak of epidemics. The disease has generally established itself and spread over a considerable area before information is received and acted on. By that time local resources are inadequate to handle the situation, serum has to be imported for from Calcutta, and temporary Veterinary Assistants have to be requisitioned from the Civil Veterinary Department. This has been remedied to some extent in Faridpur by the adoption of certain rules on the subject in consultation with the District Board. A copy of these rules is attached,\* but they can at most only be a palliative without the means to act quickly and effectively on the information received. The Veterinary Assistant of the sub-division may reach the affected village quite quickly, but cannot do much to check the spread of the epidemic without the pertinent serum, and can then only deal with a comparatively small part of the area for which he is responsible. Applications for veterinary assistance cannot apparently be complied with promptly owing to limitations of staff at headquarters, while the Veterinary Assistants sent are necessarily ignorant of local conditions and without the confidence of the local people. It is clear, therefore, that what is primarily required is more Veterinary Assistants on the spot who will be known to the people, ready to act at once on information received, and have at hand, or be able to obtain speedily, the essential necessities of curative and preventive treatment.

The only way in which Veterinary Assistants can be located in every *thana* with properly equipped dispensaries is through the agency of the Union Boards. Section 32 of the Village Self-Government Act authorises Union Boards to establish, repair, maintain and manage such dispensaries, and though each Union Board cannot afford a veterinary dispensary of its own, there is no reason why all the Union Boards in a *thana* should not combine to establish and maintain such a dispensary jointly. Faridpur will have Union Boards all over the district by the beginning of the next chowkidari year (i.e., *Baisakh* 1331 or April 1927). The machinery will then be available and the only remaining question is whether the Union Boards will be able and willing to find the necessary money.

There are 26 *thanas* in this district, but four (at the district and sub-divisional headquarters) already have veterinary dispensaries, while there is good ground for hoping that the District Board will before long establish a second dispensary in the Madaripur sub-division. This leaves 20 *thanas* to be provided for, and each *thana* will contain 8 Union

\* Not printed.

Boards on an average. The annual cost of running a veterinary dispensary has been estimated at about Rs. 1,800 made up as follows:—

	Rs.
(i) Pay (including local allowance, leave allowance and pension contribution) of a Veterinary Assistant at Rs. 62.5 a month—1 <i>vide</i> rule 3 at page 1 of the Bengal Veterinary Manual .. ..	750
(ii) Fixed travelling allowance of the Veterinary Assistant at Rs. 25 a month .. ..	300
(iii) Pay at Rs. 14 and travelling allowance at Rs. 2.8 a month of a peon .. ..	240
(iv) Medicines .. ..	350
(v) Repairs and replacements .. ..	100
(vi) Contingencies .. ..	100
Total .. ..	1,800

If, as is understood to be likely, Government assumes financial responsibility for the supply of all sera and vaccines, the District Board of Faridpur can reasonably be expected to contribute, and will probably have no objection to contributing, the amount it spends on such sera to the proposed *thana* dispensary. In 1925-26, this amount was about Rs. 4,000 which would not be in Rs. 200 for each of the 20 *thana* dispensaries. It should be remembered in this connection that Veterinary Assistants in each *thana* will mean that the District Board will not have to pay out considerable sums for the pay and travelling allowance of temporary Veterinary Assistants and that their four or five headquarters Veterinary Assistant, will be able to work more efficiently and effectively in a smaller area. The veterinary dispensary will be located at the *thana* headquarters and the Union Board in which the dispensary is situated will contribute the largest proportionate amount to the required balance of Rs. 1,600, the Union Boards nearest a little less, and those further away still less. This is fair because the people of the nearer Union Boards will undoubtedly derive more benefit from the dispensary than those further away. If one Union Board contributes Rs. 300, three Rs. 250 each and four Rs. 150 each, the total amount obtained would be Rs. 1,650 or a little more than the required minimum. The average Union Board has a population of 10,000 with 2,000 assessed *khana*s of five persons each. To realise the highest contribution of Rs. 300 the additional annual taxation under section 37 (b) would be As. 2.5 per *khana*, the average incidence of taxation being now, about Rs. 1.5 per *khana*. Several Presidents of Union Board with whom I have discussed this scheme have assured me that their rate-payers would be only too glad to pay this additional taxation in order to secure a *dorsti khana* for cattle nearby, and the additional taxation would of course be correspondingly less in the other Union Boards in the *thana*, i.e., As. 2 per *khana* in three of the Boards, and As. 1.21 per *khana* in four of the Boards. At a district agricultural meeting held at Faridpur on the 26th September 1926, and attended by the Director of Agriculture, the Director and Assistant Director of the Civil Veterinary Department, and representatives from all over the district, the present scheme was discussed and generally accepted, no financial difficulties being anticipated by the three or four Union Board Presidents who were present. If sera are provided free by Government, and if the district and sub-divisional dispensaries are fitted with under-ground serum chambers by the District Board, the *thana* Veterinary Assistants will be able to deal with epidemics promptly and effectively, and so not only save thousands of cattle, but also save much of the money that has now to be found by the District Board for the pay and travelling allowance of extra temporary establishment. At ordinary times, the *thana* Veterinary Assistants, would treat as outpatients all cattle brought to them by the Union Board rate-payers (and those exempted from Union rates) living in the *thana*, no charge being made except from those whose income exceeds Rs. 50 a month, and the scale of fees for the latter being fixed by the Managing Committee on the lines of Rules 60 and 61 of the Bengal Veterinary Manual. The Veterinary Assistants would be itinerant as well and be required to tour throughout their jurisdictions periodically giving instructions on cattle husbandry generally. After a time, accommodation for in-patients could be provided, a breeding bull could be kept, arrangements could be made for the castration of inferior bulls, growth of fodder crops could be experimented with and their special utility in a water district demonstrated, and subsidiary commercial activities, such as supply and sale of milk and *ghi* could be developed.

Points of detail are that the *thana* Veterinary Assistants will be recruited and controlled in exactly the same way as the present headquarters Veterinary Assistants. Government would not, however, be called on to pay one third of the establishment charges, but should instead give a lump grant once for all of Rs. 500 to each dispensary for the purchase of instruments and furniture. The dispensary would be under the general control of the District Board subject to the condition that the annual contribution to be paid by each Union Board within the limits of Rs. 150 and Rs. 300 would be fixed by the

Mr. L. Burrows.

Chairman of the District Board in personal consultation with the District Magistrate, and that any difference between them would be decided by the Commissioner of the Division. The local management of the dispensaries would be in the hands of Managing Committees consisting of one elected representative from each Union Board in the *thana*, the Circle Officer, and one other local gentleman, either official or non-official, nominated by the Chairman of the District Board in consultation with the District Magistrate. This Managing Committee would be responsible for the working of the dispensary on the lines of rule 55 of the Veterinary Manual, for the collection of contributions from the District Board and the Union Boards, and for carrying out the orders of Government or the Director of the Civil Veterinary Department received through the District Magistrate and the District Board. The District Board would also authorise the headquarter Veterinary Assistants to inspect each *thana* dispensary in his sub-division or part of the sub-division once every half year, and these headquarter posts would be filled by selection from among the *thana* Veterinary Assistants.

This scheme can only be introduced gradually as qualified Veterinary Assistants would not be available at once. Further, it should not on any account be forced on the Union Boards, but should be explained to them by the sub-divisional and Circle Officers who, will also have to arrange for land and *Lutchas* buildings. In this district, it will, I think be possible to introduce the scheme in five *thanas* quite soon, two in Midnapur, and one in each of the other three sub-divisions. These *thanas* would be selected carefully after preparation by propaganda and with particular reference to the chances of obtaining from a local zamindar or talukdar or other rich man the land and the *Lutchas* buildings necessary for the dispensary and Veterinary Assistant's quarters. Five successful dispensaries would be a useful nucleus and would attract others. In the same way as successful Union Boards have led to the establishment of other Union Boards in areas which were at first opposed to the idea.

Mr. L. Eutrows.

MO 1 13-31

## APPENDIX II

## Proposed Scheme for the Eradication of Water-Hyacinth

According to page 15, Vol. XX, No. 2, of the Bengal Legislative Council Proceedings, the District Boards of Backargunj, Faridpur, Dacca, Mymensing, Noakhali, Tippera and Chittagong passed resolutions on this subject in the last quarter of 1925 stating (i) that water hyacinth is a public nuisance and a destructive pest, (ii) that the existing bye laws are not workable nor sufficient, (iii) that simultaneous action is necessary throughout all the affected areas, (iv) that man-handling is the only method of eradication, and (v) that special legislation is required providing for compulsion and for funds in the form of license fees and tolls on boats or an octroi duty on imports and exports.

The Collectors of Eastern Bengal assembled for the final jute forecast conference at Dacca in September 1925 passed a resolution along much the same lines with the important addition that there should be provision for supervision over and co ordination of, the work in all districts. Finally, in December 1925, the Associated Chambers of Commerce of India and Ceylon resolved that the spread of water-hyacinth in late years has been so pronounced as "to constitute a serious menace to agriculture and communications," and urged on Government "the necessity for legislation enforcing the destruction of the weed."

2. The above are the opinions and recommendations of important public bodies and responsible Government officers. As District Magistrate of Faridpur, I have seen for myself the great inconvenience and delay caused and the very considerable damage done. The Post Office authorities are continually complaining of mails being delayed in rural areas where the usual runner has perforce to be a boatman. One missionary gentleman (Rev C. E. Prior of the Oxford Mission at Gola in Barisal) wrote that, with impenetrable barriers of water-hyacinth accumulated in tidal *dhals*, "traffic against the tide is practically impossible, and with the tide very difficult. Journeys need a double oar and about four times the normal time." The Rukendpur P. S. has been practically cut off from the rest of the district at certain seasons of the year, and I have myself had to turn back twice in attempts to reach that Police Station by launch. The District Board has found it "impossible to cope with *kachuri* even by spending money." The amounts the Board has actually spent have been Rs. 4,252 in 1923-24, Rs. 3,980 in 1924-25, Rs. 7,111 in 1925-26, while Rs. 7,000 has been budgeted in 1926-27. For all the lasting good this money has done, it might have just as usefully been dropped through a man-hole into a sewer. Finally, in an open letter addressed to His Excellency the Viceroy in July 1926, the writer welcomes the appointment of the Royal Agricultural Commission, and then goes on to say :—

"But we most respectfully beg to submit to Your Excellency that, so far as Bengal is concerned, the report and the recommendations of the Commission, however sound, profound and learned, may not be of any practical good to most parts of Bengal unless and until the water-hyacinth problem in that Province has been effectually and completely solved. This problem has hitherto baffled the genius and the resources of the Government and the scientists. It must be said, though it may not be a pleasant truth to many who are too busy with other things than the real interests of the people, that the people of Bengal have not yet been very earnest in their endeavours to devise means for, and to co operate with the Government, in the solution of this all important but at the same time immensely difficult problem. That the water-hyacinth has been devastating the agriculture of Bengal and rendering the occupation of cultivation a losing concern to the cultivators in Bengal is too well-known to be repeated here."

3. The material damage to agriculture is undeniable. I have seen it myself and can show it to anyone who is yet unconvinced. Besides the ordinary encroachment on cultivated land from the overflowing banks of hundreds of water-channels of various sizes, much land goes out of cultivation in this district in another way. The water-level over the low-lying parts varies from year to year. In a year of heavy early rainfall (such as the present one), such land does not get rid of standing water at all or too late for ploughing and sowing. This uncultivated land is then occupied in force by water-hyacinth during the monsoons, and is seldom or never cleared again. As quoted above, "the serious menace to agriculture" is put first by the Associated Chambers of Commerce. Coming nearer home, the first District Conference of Union Board representatives held at Faridpur on the 22nd January 1926 unanimously carried a resolution to the effect that, "in view of the fact that the water-hyacinth pest is seriously prejudicing communications and agriculture in the low-lying parts of this district, this Conference recommends that Government undertake special legislation for its eradication. Again, at a district agricultural meeting held at Faridpur on the 26th September 1926, and attended by the

Mr. L. Burrows.

Director of Agriculture and representatives from all over the Faridpur district, the following resolution was adopted:—

"That this meeting of representatives from all over the Faridpur district considers that, apart from the great inconvenience to traffic, at least 5 per cent. of the cultivable area has been put out of cultivation by water-hyacinth, and that this percentage is increasing and will go on increasing unless something is done to eradicate or at least check the pest; that this meeting accepts the principle of compulsory powers, with penalties, of adequate organisation, and of indirect taxation to pay for the manual labour and staff; and that this meeting considers that the district of Faridpur will in general be prepared to work such a scheme if put into practical operation."

This estimate of 5 per cent. is possibly exaggerated, though in my various talks with cultivators and landowners all over the district, I have been given estimates of anything between  $\frac{1}{2}$  anna and 1 anna, and even  $\frac{1}{2}$  an anna is over 3 per cent. Let us see what 5 per cent. damage means in terms of money. The normal area under jute in the Faridpur district is 211,700 acres, while that under *aman* paddy is 759,900 acres. The damage done is accordingly 10,585 acres of jute and 37,995 acres of paddy. The average outturn of jute is 3 $\frac{1}{2}$  buls or 16 $\frac{1}{2}$  maunds per acre, while the average outturn of *aman* paddy is 12 $\frac{1}{2}$  maunds per acre. The loss in maunds is therefore 1,958,822 $\frac{1}{2}$  maunds of jute and 471,937 maunds of rice. The average harvest price of jute and paddy for the last five years has been Rs. 0.8 and Rs. 0.2 respectively. The total loss consequently amounts to Rs. 1,569,313.12.0 plus Rs. 29,08,992.2.0 or well over 17½ lakhs of rupees per year. And this is the damage only one, and that by no means the largest one of the districts affected. Over and above this material damage to agriculture, there is also the loss of time and money in travelling and transporting commodities to and from thousands of villages and hundreds of *hats*, the personal delay and discomfort to those who have to travel by boat on business or pleasure and the by no means inconsiderable contamination of drinking water. Some of these items can be estimated precisely, but the total in rupees, annas and paise is only appreciable. This annual loss of the country's wealth must necessarily be reduced and go on increasing unless something is done. We may now talk of that "something" in lakhs, but we shall have to talk of it in crores within five or ten years if the pest is not eradicated or at least checked. The time is soon coming (if it has not already come) when water-hyacinth in Bengal will be as serious and difficult a problem as rabbits were in Australia, and when a *laissez faire* policy will no longer be open to a civilised government.

1. All that I have said is of course well-known. Questions have been issued and answered, conferences have been held and reports made, enquiring officers have come and gone, but nothing has yet been actually done, and the water-hyacinth meanwhile continues to reproduce itself rapidly and spread relentlessly over more and more water and land. Government has been considering the whole question earnestly for over a year, and the following outlines of a scheme are submitted in the hope that they may be of some assistance in arriving at practical conclusion regarding the action to be taken. The fact that, with immense resources and every mechanical aid that science can contrive, America and the United States of America have only been able to check the expansion, without diminishing the expense, of water-hyacinth need not discourage us in India where man-power, which is ultimately the only means of eradicating the pest, is comparatively cheap and abundantly available at a certain season of the year. This is the rising factor, but it is no use hoping that this man-power will be available on a voluntary or co-operative basis because the cultivator of Eastern Bengal is too well off and not sufficiently far-sighted. It will have to be organised, it will have to be paid for at least in the rate, and it will have to be forced where it is either too lazy or too luxurious to work even for payment. The mention of organisation brings up another fundamental point, i.e., that action must be, not necessarily simultaneous as some of the District Boards suggested but at least co-ordinated and concerted. Isolated action however well-motivated by local enthusiasm and financed by local contributions is of no permanent utility. The area is freed of the scourge for a time, but the natural flow of drainage, to say nothing of the monsoon floods from the Ganges and the Brahmaputra, soon brings it back from above. This is defect that has fatally marred the laudable efforts of the Faridpur District Board and of several Union Boards in this district and it must inevitably make any penal action under the bye-laws of the local bodies not only hopelessly ineffective but also radically unfair.

2. As I see the problem, three things are essential to any successful attack on the water-hyacinth pest. These are power, organisation and money.

Power.—This must be conferred by legislation. The Bengal Water-Hyacinth Act would extend to the whole Province, but would only come into force in those districts or parts thereof to which it might be applied by notification by the Local Government

Mr. L. FURROWS.

no 3 12-31a

in the "Calcutta Gazette." The Act would remain in force for five years from the date of such notification, with power to extend it by similar notification for one year at a time up to a maximum of ten years. This provision is important because, while with proper organisation five years should be sufficient, it is essential that the accompanying taxation should be definitely limited in duration. If the pest cannot be eradicated, or at least controlled within manageable limits, in ten years at the outside, there will be no further justification for an unprofitable impost. The Act would declare water-hyacinth a public nuisance within the meaning of section 268, Indian Penal Code, and make its possession or continued possession by owners or occupiers of land and water punishable under sections 290 and 291. It would be understood, however, and a definite undertaking given to this effect, that these penal provisions would not be enforced except as part of a general plan and as a *pis aller* after every other remedy had failed. The primary object being the destruction of the weed rather than the punishment of offenders, the ordinary penalty (to be enforced by the District Committees to be described later) for non-compliance with a requisition to clear land and water effectually on fair payment would consist of power (i) to execute the work of collection and destruction, and (ii) to recover the cost of such work from the owner or occupier by certificate procedure as a public demand or (where ownership or occupation is disputed, or where there are many co-sharers) by taking over the land or water in usufruct until the cost had been recovered with interest. This provision would apply equally to Government in the *khass mahals* and larger rivers forming part of the public domain and not include in any permanently-settled or other estate, to local bodies such as the District Boards, Municipalities, Local Boards and Union Boards, to Railway and Steamer Companies, and to private persons whether proprietors or tenants. If the District Committees proceeded tactfully and methodically, if the areas to be attacked were prepared by local propaganda, and if the people were made to realise that individual failure to act as required would be detrimental to the community as a whole, the above penalties should not often have to be applied, but must be rigorously applied where necessary. Payment at reasonable rates would be made for all work done on the requisition of the District Committee, and anyone failing to comply with such requisition would not only forfeit his right to payment, but would have to pay for the work as well.

**Organisation:** Under this head, it would be essential to have a Water-hyacinth Controller to direct the whole campaign, to regulate and co-ordinate the work of the District Committees, and to keep the latter up to the collar so that indifference or inefficiency in one district may not wreck or even prejudice the general plan. I am not in favour of a Water-hyacinth Board as the work is essentially a one-man job. The Controller would have to be most carefully selected of course. He must not only be enthusiastic himself, but must also be capable of arousing enthusiasm in others. The mental and other qualities of a good district officer will suffice, but there must be personality as well. The Controller must be provided with a "A" class launch on which to tour comfortably and safely, and he should also have the power of requisitioning smaller launches from district pools in consultation with the Collector concerned. He must have an office staff of three or four clerks including a stenographer-typist, and two peripatetic inspectors for each district in which the Act is in force. Technical advice and assistance of the Government Departments of Irrigation and Agriculture should be also placed at his disposal.

The actual work in each district would be carried out by a District Committee consisting of the Collector (as *ex officio* Chairman), the chairman and vice-chairman of the District Board (one being usually a Hindu and one a Mahomedan), the chairman of the Municipalities, the Sub-divisional Officers, and two elected representatives of the Union Board Presidents in each sub-division. In the Faridpur district, this would give a Committee of 18 members of whom four should form a quorum. The District Committee would need a small clerical staff and should meet at least once a month on the day before or the day after the District Board meeting. The Sadar Sub-divisional Officer should be the Secretary of the Committee. Each District Committee would work out its own plan of campaign in personal consultation with the Controller, and then proceed to carry out that plan as punctually and punctiliously as possible. In Faridpur, which is more or less cut off from external infection except through the Brahmaputra, Ganges and Gorai rivers, the best plan would perhaps be to attack first the water-logged *bhils* in the north of the district where the water-hyacinth collects and awaits the annual rise of water level that carries it south all over the district. Such areas would be fenced off and dealt with chemically by the Griffiths Spray or otherwise. This would destroy 80 per cent. of the weed without any risk of injury to human, animal or other plant-life, and the remaining 20 per cent. could be manhandled and disposed of on the spot. I should have thought that the dry season was the best time of the year for this operation, but remember that Mr. Malik told us at Dacca in April 1925 that it "should be done in the rains as the vital principle was greater then and a greater ratio of destruction for expenditure was obtained". Elsewhere than in areas which can be isolated and dealt with as above, the best methods

Mr. L. Burrows,

would be frontal attack during the dry season and flanking movements during the wet season, the latter being taken as extending from the 15th June to the 15th October. Direct attack would consist of uprooting by hand and effectual destruction on the spot by drying and burning, by burying, by mixture with cowdung in pits to form manure, by ploughing into the land, by storage for cattle-food during the rains, or by any other suitable means. This work would be done through the agency of the Union Boards which have suitable powers under section 27 of Bengal Act V of 1919, and would be paid for at reasonable rates to be fixed in consultation with the Union Boards with reference to local conditions. The Union Boards and other local bodies (i.e., the District Board and Municipalities) would pay out of their own funds for similar work on land or water (e.g., burrow pits in roadside lands or tanks) in their possession and under their direct control. This is what they are doing at present in many cases, but the work is wasted for all practical purposes. The flank-turning would consist of keeping the weed systematically on the move with the natural flood drainage from cultivated fields into small channels, from small *khals* into large ones, and from large *khals* into big navigable rivers en route to the sea. The Rev. Prior says that "once in the Madhumati river where the salt touches the weed it will die". I have no personal experience of the effect of salt water on water-hyacinth, but the Bay of Bengal would certainly absorb it at least. It should be the special function of the Irrigation Department to be responsible for this forward and southward movement in the big rivers and along steamer routes, the steamer companies being asked to assist in any way that may be feasible. Tidal waters would have to be treated with booms such as have already been used with success in the south of this district, and the same means should be used for stopping the re-infection of large *khals* from the rivers, and small *khals* from large *khals* as has also been done successfully in various places in this district. These suggestions are largely *a priori*, but they would soon be either justified by experience or dropped in favour of any better methods that such experience might evolve.

**Money:** This is the snag on which most schemes of public improvement are wrecked. It is not difficult to put together a scheme the details of which seem to dovetail beautifully until the dry light of finance shows up the gaping cracks. In this instance money, and much money, is needed for the pay of the Controller and his staff, for the staff and office expenses of the District Committee, and for the actual work to be done in frontal attack and flanking movement. License fees, tools on boats, and octroi duties would not yield nearly enough money and would be comparatively difficult to collect. What is wanted is some form of taxation that will reach all or most of those to be benefited, will be easy to assess and collect, and capable also of ready disbursement through the Controller and the District Committee. Agricultural interests, both zamindari and ryotwari, are primarily concerned and could be reached by a cess on the lines of the road and public works cesses under Bengal Act IX of 1880, paid to all rateable by the same agency, and credited to the Controller for distribution. In the district of Faizpur, such a cess at the rate of 2 pice would yield at least one lakh of rupees, the 1925-26 current demand for road and public work cesses at one anna per rupee of value having been Rs. 2,29,265. But non-agricultural interests are also concerned, and could be similarly reached by a small graduated addition to the income-tax which is not levied on agricultural incomes. If this were considered impracticable because the Income-tax Act is a Government of India Act the alternative would be to empower the District Committees to assess merchant and other non-agricultural interests, and to realise such assessments through the Municipalities, Union Boards and *Chaukidari* Unions. The assessments should be based on the municipal, union or *choukidari* rates, and should aim at producing half the amount derived from the cess on agricultural interest. Municipalities should be included because, though they may be comparatively cheap to clear of water-hyacinth, their urban population would be directly benefited by the work done in the rural areas. It is difficult to frame any reliable estimate as to the annual amount required for work in this district, but it may for the moment be taken at 1½ lakhs of rupees, of which 1 lakh would be spent on actual work and the other ½ lakh contributed towards the general establishment costs. The rates fixed in the Water-hyacinth Act would be maximum reducible by the Local Government if it was found that more money was being demanded than was required. In addition to the amounts realised as above, Government should give an annual provincial grant of at least two lakhs of rupees for expenditure on chemical destruction (where possible) and on work in the big rivers.

I have discussed the question of taxation generally with many Union Board Presidents, non-official gentlemen, and representatives of the cultivating classes. They have in most cases demurred at first to additional taxation as human nature instinctively does everywhere. A simple argument by analogy has, however, usually caused the withdrawal of this objection, that argument being that, like a Union Board, Government has its budget on a larger scale which covers all ordinary receipts and expenditure, and cannot

Mr. L. Burrows.

undertake any extraordinary expenditure without adding to its receipts by taxation. Any still surviving objection has always disappeared when it has been pointed out that the only alternative will be to "let things rip" and watch the damage increase from year to year. As long as it is made clear that the proposed taxation is not permanent, that it will be rigidly spent *ad hoc* and that such expenditure will return the larger part of the taxation to the people's pockets, no serious objection need be anticipated from the rural areas in my opinion.

If Government is not prepared to introduce penal and compulsory legislation, and to impose additional taxation, without some stronger indication of public opinion on the whole subject, I would suggest the very early appointment of a committee of officials and non-officials with rural interests adequately represented. The terms of reference to this committee should assume that water-borne disease is an evil and a growing evil, a real menace to agriculture, communications and health, and should ask the committee to suggest practical means for dealing with it after considering such schemes as have already been suggested, and taking such evidence and making such enquiries as it may consider necessary. If such a committee reported in favour of legislation along the same or similar lines to those which I have suggested, there need be no hesitation about placing an official Bill before Legislative Council. Personally, I do not think that there should be any further delay, but I quite understand that conditions nowadays require that a bill of the nature contemplated should be assured of as much non-official support as possible.

Mr. L. Burrows.

## APPENDIX III

## Notes on an Economic Survey of Talma Village

I. *Situation and communications*.—The village is situated about 11½ miles to the south of the Faridpur town. A *Lutchia* District Board road which allows wheeled traffic in the cold season only connects it with the town. Boat communication from the Kumar river, and from Bhanga and Nagarbanda, exists throughout the year.

II. *Population and occupation of the people*.—There are 170 families in the village with 810 persons, of whom 237 are males, 303 females, 215 boys and 155 girls. There are 21 Hindu families numbering 117, and the remainder are Mohammedans.

The village is almost entirely agricultural in occupation as 133 families with 756 people have cultivated land and are engaged primarily in agricultural work. Of these 58 families with 274 people are exclusively dependent upon agriculture.

Besides the 133 agricultural families, there are 16 families (with 57 people), who live by agricultural labour alone, 6 more families (with 46 people) who rely on non-agricultural service, 5 families (with 16 people) of professional fishermen, and 10 others engaged in miscellaneous occupations. Table "A" shows the division of the people by occupation.

III. *Supplementary occupations*.—Forty-one families (with 261 people) supplement their agricultural or service income by trade or business. The most general trade is the selling of jute in small quantities from September to December. These petty traders (most of whom are themselves substantial cultivators) purchase jute from other cultivators and sell it to *mahajans* of Faridpur and Madanpur, the local agents of the latter. There are two stationery shops, five vegetable sellers and four Hindu barbers who also deal in hotel nuts. Four very poor families, of which three include no adult male, make a small profit by borrowing unhusked rice and selling it after husking, two families get substantial support from the *biri* trade, while two others supplement their income by dealing in cheap vests and shirts.

Three families (about the richest ones) derive extra income from the farming of the *hal* which sits on Mondays and Thursdays, while eleven more get small amounts by subletting lands and by petty talukdaries. There are no blacksmiths, potters or carpenters in the village, these services being performed by men of the neighbouring villages who come to the Talma *hal* twice a week. Fishing is not resorted to as a regular supplementary occupation, while the only two *Tarikar* families are weavers in name only.

IV. *Area and extent of cultivation*.—The area of the village according to the settlement papers, is 2,150 standard *bighas*, and the area actually found in possession of the villagers was 1,320 local *bighas* of 50 yards square or 2,050 standard *bighas* of 40 yards square excluding that under roads and water.

Of the above 1,320 *bighas* 1,081 are under cultivation, 144 *bighas* are the homesteads of agricultural tenants, and 92 *bighas* of non-agricultural tenants.

Of the 1,081 *bighas* of cultivated land, jute is grown in 387 and paddy in 697. All except 180 *bighas* is twice cropped, the latter being unfit for *rabi* crops because it remains under water till January or February. *Alasalai* is grown on about 700 *bighas* for feeding cattle and the remainder is under pulses, mustard, etc. Practically every cultivator's holding is split up into small plots in different places. This is due here mainly to the fact that there are several separate zamindars or other proprietors owning land in the village and that most cultivators hold land under each of them.

V. *Rents and Taxes*.—The average rent is Rs. 2 per *bigha* for cultivated land and Rs. 3 per *bigha* for homestead land. The total rent of the village is therefore about Rs. 2,900, a figure which corresponds closely with the total rent charges stated by the tenants. This represents another Rs. 300, and the incidence of rent including cess works out to Rs. 16½ per family or Rs. 3½ per head, Mr. Jack's figure being 3s. 4½d. per head.

The only local tax is the Union Board rate, which amounts to about Rs. 275 for the whole village. This means about one-third of a rupee per head as against Mr. Jack's figure of 3½ pence. Local taxation has naturally increased somewhat with the establishment of a Union Board, but its assessment is not yet satisfactory. Most of the families having 49 to 99 *bighas* of land (representing a net income of two to three thousand rupees) pay rates of from Rs. 2 to Rs. 3, while families living in want or just above want pay eight annas to Rs. 14. If the 8 annas per Rs. 100 of income standard had been even approximately adopted, the Union Board rates would yield about Rs. 1,000 in this village.

VI. *Income—chief and supplementary consumption*.—Imports and Exports.—It has been stated that 133 families (with 756 people) depend chiefly on the produce of their

Mr. L. Burrows.

land, but it may be added that the entire population depends primarily upon agriculture either directly or indirectly.

The articles of common use may now be considered one by one and the economic position of the village in respect of them examined.

(a) *Fish*.—Except very young children and adults of the respectable class, all the people of the village catch fish occasionally for use in the family. When cultivators go to cut jute, they ordinarily take a fishing spear with them and use it as opportunity offers. Fishing traps and hand-nets are resorted to in the rainy season. Money is spent on fish especially during the *khar* season, the average expenditure throughout the year being 12 annas per family per month. The village thus pays about Rs. 1,500 for fish.

(b) *Vegetables*.—In almost every homestead country vegetables are grown on a small scale for family use. Cauliflowers, cabbages, potatoes and similar expensive vegetables are seldom seen or used by the villagers. They generally grow brinjals, pumpkins and the like. The purchase of these by the villagers may be roughly estimated at Rs. 10 per *hât* (for  $3\frac{1}{2}$  days' consumption), thus giving a total of about Rs. 1,000 a year.

(c) *Pulses*.—Pulses are grown on about 200 *bighas* in the cold season. This meets the needs of the villagers, very nearly a further expenditure of Rs. 500 being sufficient to cover all requirements.

(d) *Spices, &c.*.—Tobacco for family use only is grown irregularly by 6 families. At 5 *chittas* per head per month, the total consumption of tobacco for 100 people would be about 40 maunds worth about Rs. 800. I have taken 400 people as some of the children and about half the females smoke also. Molasses cost about Rs. 20, mustard, chillis, turmeric, &c., along with salt (an important article of daily use specially with these people), sugar, &c., are also purchased for about Rs. 1-12-0 per head per year, thus accounting for another Rs. 1,500 of expenditure.

(e) *Cloth and piece-goods*.—These are imported. The only two weaving families of the village manufacture and sell a few napkins occasionally as a secondary occupation. Men of the agricultural class generally use a 28" wide piece of cloth and a napkin. The older children use the same. Women use cloths of the ordinary width, i.e., 42" to 44". Excluding the younger children who remain naked, and allowing 4 cloths per head per year, the average expenditure per head of population may be put at Rs. 2-12-0 per year. This means Rs. 2,500 for cloth and napkins. The cost of cheap vests, &c., used in the cold season by some of the people is about Rs. 100 at least.

(f) *Fodder and fuel*.—As regards fodder, *Lalai*, and paddy straw supplies the needs of the village and there is also a certain amount of grazing though there is no village grazing ground. No cultivator spends money to feed his cattle. He prefers to let them suffer from scarcity or to sell them for what they will fetch.

As regards fuel, jute sticks and straw supply the needs of the village to a large extent. Shrubs and the dry branches of trees add to this supply. Several people told me that they have to buy fuel in the early part of the rainy season, but the money spent on this account is negligible.

(g) *Mustard oil and kerosene*.—At 2½ seers per family per month (a tolerably low average) the total consumption of mustard oil in the village amounts to about 125 maunds per year. This and kerosene at 2 seers or 2 quarter bottles per family per month costs the village about Rs. 4,000 a year.

(h) There remains the cost of tin, iron, ploughing material, lanterns, utensils, construction of boats, purchase of cattle, and expenditure on festivals and births, deaths and marriages. Mr. Jack's estimate of Rs. 5 for a birth holds good now, though it was perhaps rather high in 1910. The average cost of a death is about Rs. 100 in families of comfortable position and about Rs. 20 in indigent families. The general average would be about Rs. 10 as against Mr. Jack's figure of Rs. 25. The present cost of marriages is considerably more than Mr. Jack's figure of Rs. 12 and the villagers agree that the cost now is seldom less than Rs. 50 even for the indigent. This statement is corroborated by the facts disclosed in the enquiry into the causes of debt which show that about 60 per cent. of the debts are incurred for marriages. The cost of a man's marriage is much more among Mohammedans than girls', but the average of Rs. 50 is not excessive.

On these items the total expenditure may be estimated at Rs. 3,100 or Rs. 20 per family per year.

(i) Expenditure on rent and rates has been shown above to be about Rs. 3,500.

(j) *Paddy*.—According to the Government standard, 62½ maunds of rice can be obtained from 100 maunds of paddy. The Famine Commission took 7 maunds of clean rice as the average consumption per head per year. Mr. Jack's estimate is 12 maunds of milial and

Mr. L. Burrows.

rice per head. Taking an average of 11 maunds per head, the total consumption of unhusked rice in the village is about 10,000 maunds per year. Of this the 700 *bighas* of land gives about 4,000 maunds at 7 maunds per local *bigha* on the average, because about 500 *bighas* grows both *aus* and *aman* paddy. The remaining 5,100 maunds cost the village about Rs. 20,200. This completes the expenditure side of the village budget, the total being Rs. 34,200.

As to income, the first item is sale of jute. The 387 local *bighas* of jute land yields about 2,800 maunds of jute, which at Rs. 9 per maund brings in Rs. 25,200 a year. Trade and non-agricultural service brings in about Rs. 6,500 and Rs. 5,500 respectively, these figures being exclusive of local trade and service. The sale of milk gives about Rs. 800. The total money earned is therefore Rs. 36,000. Against the expenditure of Rs. 30,200 this gives a deficit of Rs. 1,200 a year.

I have omitted the cost of seed and cultivation in calculating the value of agricultural produce. Jute seed is purchased, but the cost is small. Paddy seed is generally kept from the previous crop. As regards labour the 200 working men are able to work the 1,081 *bighas* or 5 *bighas* per man. A few outside labourers come from the Mudaripur side in years of good harvest. When the local harvest is bad some of the more enterprising villagers go to Barisal to cut paddy.

I also tried to ascertain the way in which the villagers spend their time when not occupied with cultivation. The people say that they get very little leisure and that, when not occupied with weeding, cutting, steeping, and stripping jute or harvesting paddy from April to December, they spend their time in ploughing. It is certain that they do not employ any leisure they may have in any remunerative occupation, but it is also true that they do not get long periods to themselves. Work is comparatively light in the cold season, but they plough in a leisurely fashion throughout that season and do no work on *rain* crops. Ploughing does not take more than an hour or so daily, and weaving is not pursued much as a secondary occupation.

VII. *Indebtedness*.—Of the 170 families, 107 (with 550 people) are in debt to a total amount of Rs. 21,780. Of this Rs. 8,270 has been borrowed from the Co-operative Bank at Talma. This figure has been checked from the bank papers. The remaining Rs. 13,500 represents private debts, which could not of course be checked so reliably. Allowing for exaggeration, the total debt of the village may be taken at Rs. 16,000.

It is noteworthy that, of the total debt, about Rs. 5,800 has been incurred by 20 families living in comfort, Rs. 3,800 by 17 families living below comfort, Rs. 4,600 by 26 families living above want, and Rs. 4,500 by 33 families living in want. The people in comfort run into debt more heavily than their poorer neighbours partly because they have to spend more on ceremonial occasions. Mohammedan cultivators as a class do not save or invest money (except in land) and must therefore borrow when a marriage or other such event occurs. About 57 per cent of the debt was incurred for marriages (often second or third marriages), 15 per cent for purchase of cattle or land, and the rest for various other reasons. Not more than 6 or 7 debtors had incurred debt for food by taking small temporary loans of a few rupees now and then when in great want. When such loans accumulated and they were pressed for payment, they borrowed money on bonds to pay their small creditors.

The total debt represents an average of Rs. 214 per family and Rs. 43 per head of the population under debt, and Rs. 135 per family and Rs. 21 per head of the population of the village. Mr. Jack's figure of Rs. 11 per head may thus seem too low, but it should be remembered that interest is usually compounded and that the village is a deficit one. Details of debt have been given in Table "C" annexed.

VIII. *Classification of families*.—Following Mr. Jack's division, families in the village have been classified into four categories, (1) living in comfort, (2) living below comfort, (3) living above want and (4) living in want.

The allowance was Rs. 50 per head of people in comfort and Rs. 20 per head for those in want. The price of almost all foodstuffs have doubled since Mr. Jack wrote, and the standard of living requires about double his figures. My enquiries lead me to think, however, that the demarcation between the four classes does not depend so much on a mathematical ratio of expenditure as on a variation in some items, a saving in some and an omission of others. A family in want, for instance, does not reduce its staple food ration of rice much, but omits the curry or the pulao or the fish. Then again, a family that gets paddy from its fields is more comfortably off than one which earns comparatively more in money, but has to buy rice. I believe the figures given in Table "D" represent the condition of the people correctly. Of the families, 58 or 31.1 per cent (with 377 or 39.2 per cent people) have been found living in comfort, 21 or 12.2 per cent (with 129 or 11.2 per cent people) below comfort, 12 or 22.0 per cent (with 205 or 21.8 per cent people) above want, and 39 or 21.8 per cent (with 109 or 21.8 per cent people) in want.

Mr. L. Burrows.

TABLE A.

## AREA, POPULATION AND DIVISION OF PEOPLE BY OCCUPATION.

1. Total area of the village according to settlement papers. 709 Acres  
(=2,150 Standard *bighas*)
2. Area now found in possession of the village people 1,320 *bighas*  
(=2,050 Standard *bighas*)
3. People Caste. Families. People. Percentage to total population.

—	Hindu	..	..	21	117	12·8
	Mahommedan	..	..	149	703	87·2

4. Total number of agricultural holdings and land under them.

Caste.	Families.	People.	Bighas of homestead land.	Bighas of cultivated land.
Hindu	9	46	144	1,084
Mahommedan	124	709	82 per cent of the total land of the village	

5. Average amount of cultivated land. Per family of agricultural families, 8·15 *bighas*.  
Per head of agricultural population, 9 *cattas*.
6. Area under non-agricultural holdings: 92 *bighas*.

## OCCUPATION.

7. Dependent wholly on agriculture: Families 58, people 271.
8. Dependent partly on agriculture and partly on trade, service, labour, etc.: Families 75, people 482.
9. Wholly non-agriculturist: Families 37, people 151. (This includes 16 families with 57 people—all Mahommedans—who are dependent upon agricultural labour alone) Of the above, 12 families with 72 people are Hindus and 25 families with 82 people are Mahommedans
10. Service other than agricultural service: 6 families with 46 people.
11. Agriculture and trade: 20 families with 128 people.
12. Agriculture and agricultural Labour: 20 families with 110 people.
13. Profession: Fishermen, 5 families with 16 people.  
Casual weavers—Two families  
Casual silversmith—One family.  
Trained physicians—One  
Untrained physicians (quacks)—Two  
Mullas (Mahommedan priests)—One family.
14. People engaged in cottage industries—Nil. The only two weaver families weave rarely. Ladies of the few respectable families know needle work.

Mr. L. Burrows.

TABLE B.

(1st PART)

*Crops and other Produce.*

No	Crops and other produce.	Area or Quantity.	Amount of produce.	Market value of produce.
			Mds.	Rs
1	Jute ..	357 <i>bighas</i>	2,400	5,200
2	Aw. and Aman paddy jointly ..	400 "	3,020	20,000
3	Only Aman ..	207 "	1,030	
4	Pulses, Mustard, etc. ..	200 "	100	
5	Kolan (toddies) ..	700 "	.....	2,400
6	Milk ..	10,000 cows	900	1,600

(2nd PART)

*Import, Export and Consumption (in rupees).*

No	Article.	Import	Export.	Production.	Home Consumption.
1	Jute ..	Nil	25,200	25,400	200
2	Paddy ..	20,200	Nil	19,800	40,000
3	Pulses, etc. ..	500	Nil	2,400	2,000
4	Toddies and fuel ..	.....	.....	.....	.....
5	Vegetables and fruits ..	1,000	Nil	1,550	2,550
6	Milk ..	.....	400	1,300	3,700
7	Fish ..	1,500	Nil	1,500	6,000
8	Spices, tobacco, etc. ..	2,500	Nil	100	2,600
9	Mustard oil, kerosene ..	1,000	Nil	Nil	1,000
10	Wheels, tin, ploughing implements, etc. ..	3,100	Nil	Nil	3,100
11	Cloth ..	2,600	Nil	Nil	2,600
	Total ..	35,700	26,000	59,250	67,050
12	Rent taxes, etc. ..	3,500	.....	.....	.....
	Earned by service outside the village ..	.....	5,500	.....	.....
13	Earned by trade from outsiders ..	.....	0,500	.....	.....
		30,200	39,000	.....	.....
	Net deficit ..	1,200 per year.			

TABLE C

*Indebtedness of the People.*

				Rs
1. Total debt of the village .. .. .	..	..	..	21,782
From Bank .. .. .	..	..	..	8,275
From private persons .. .. .	..	..	..	13,507
2. Number of families in debt—				
		Families.	People.	Rs.
(1) Of "comfort" class .. .. .	..	20	172	8,813
(2) Below comfort .. .. .	..	17	80	3,784
(3) Above want .. .. .	..	28	160	4,628
(4) In want .. .. .	..	33	150	4,657
		107	560	21,782
3. Percentage of families in debt—63.				
4. Percentage of people in debt—63·7.				
5. Average debt per family in debt—Rs. 203.				
6. Average debt per head of population in debt—Rs. 37.				
7. Average debt of people of the village—Rs. 24 per head.				
8. Average debt per family of the village—Rs 125.				

The bank rate of interest is Rs. 1·0 0 per hundred per month when loans taken are below Rs. 100. In case of multiples of Rs. 100, the rate is 12 per cent per annum.

Interest on private debts varies from 3 pice in the rupee per month to one anna, equivalent to Rs. 50-4-0 and Rs. 75 per month for short-term loans, and Rs. 24 to 48 per hundred per year in big or long-term loans. It varies also according to the solvency of prospective debtors.

Total interest at the average rate of  $1\frac{1}{2}$  pice per rupee per month is about Rs. 6,100 which means :—

Annually Rs. 57 0-0 per family of families in debt.  
 Rs. 10-8 0 per head of population in debt.  
 Rs. 35-12 0 per family of the village.  
 Rs. 6-10-0 per head of people of the village.

This expenditure has not been included in Table "B"

TABLE D.

Class, of family.	Average income per head.	Number of		Percentage of		Average debt per	
		Families.	People	Families.	People.	Head.	Family.
						Rs.	Rs.
Comfort ..	120	58	377	31.1	39.2	51	303
Below comfort ..	100	31	120	18.2	14.2	42	222
Above want ..	75	42	205	22.0	21.8	27	162
In want ..	60	39	199	24.8	21.8	20	111

## Oral Evidence

23659. *The Chairman* Mr. Burrows, you are Collector of Faridpur?—Yes.

23654 You have provided the Commission with an interesting note of the evidence which you wish to give and we are greatly obliged to you for your note. Do you want to say anything in addition to what you have stated in your note?—No.

23655. Your note is very full on the points that you deal with, and I have very few questions to ask you. I want you to tell the Commission what view you have formed of the efficiency or otherwise of the Irrigation Department in this Presidency?—I have only had anything to do with them since I have been in the Faridpur district where they control the Muduripur khul route, but do not have any irrigation works as such.

23656 You think there is room for irrigation in the district?—Yes, certainly. By irrigation I do not mean irrigation literally, but schemes of drainage, re-excavation and the like.

23657. And the control of these deltaic rivers is a very complicated matter, is it not?—Yes.

23658 It affects communications, because of navigation, it affects health, it affects fertility, both because of the potential water-supply and still more because of the valuable silt which is pissing down to the sea?—Yes.

23659 The policy in the past has been to dam up these rivers and that has had the effect of depositing silt within the river bed, and of raising the bed of the river?—We have not anything of that sort in Faridpur; there are no irrigation works at all that I know of.

23660 No damming of the rivers?—No; not in Eastern Bengal.

23661. You are on higher land?—We are not on higher land. There has been no damming of rivers in order to provide water for irrigation or anything of that sort.

23662 *Mr Gupta* No embankments?—No embankments at all.

23663 *The Chairman* : What I wish to get from you is whether you think that the organisation and personnel of the department concerned is sufficiently active and sufficiently large to cope with these problems. Have you formed any view on that point?—No, not definitely. I certainly think that there is a lot that could be done.

23664. Do you know whether there is any policy?—Not that I know of.

23665 That does not suggest that the organisation is very active, does it?—No, it does not.

23666 You have set before the Commission an interesting scheme for dealing with the water-hyacinth pest. Have you formed any view yourself as to the time which it might take if every conceivable measure be adopted to come to grips with the problem?—I am inclined to think that it could be done in five years if it were properly organised.

23667. You think that water-hyacinth could be eradicated in certain districts in five years?—Yes; certainly in ten.

23668 Do you notice any active demand by the public for schemes such as those to deal with water-hyacinth?—The public of my district make a very strong demand and they are willing to submit themselves to any form of taxation or anything else in order to get rid of the water-hyacinth.

23669. Then on page 472 of your note on demonstration and propaganda you say that you have "little faith in co-operative societies, agricultural associations and the like"?—Yes, for such purposes.

23670. Have you much experience of those organisations performing that particular function?—No.

23671. You think the Union Boards having the official organisation and the Collector behind them are better equipped?—Yes; I think they would be better.

23672 Then on the same page you give it as your view that the Collector's word still carries a great deal of weight and that the Agricultural Department might well remember that in devising their schemes for propaganda?—Yes.

23673. Do you form the impression that the Agricultural Department has not made as much use of the Collector as they might have made?—I think they have. At least I know I have been made use of. What I suggest is that the Circle Officers and the Union Boards should also be used.

23674. *Ra Bahadur Bannerji* : You have been made use of by the Agricultural Department?—Yes.

Mr. L. Burrows,

23675. *Professor Gangulee* : Have the Collectors made use of the Agricultural Department in getting information and so on ?—Yes, certainly.

23676. *The Chairman* : In the section in which you deal with your views about the provision of fodder, you say, 'The only means of improving and supplementing the fodder supply in this district is by the larger cultivation of fodder crops during the cold weather'. Have you considered the possibility of preserving fodder during the season of plenty ?—That could be done if they care to. They have got water-hyacinth and they could cut and keep it.

23677. That apparently does not agree with the cattle very well ?—Since I have written my note, I have made further enquiries and learnt that where it is cut and kept it does not have a bad effect.

23678. That is rather the view of the Agricultural Department who made certain experiments I understand ?—That is also what I have ascertained from the people in my district ; if it is dried and kept, it does not have a bad effect.

23679. Are they using it as a cattle food ?—Not to a great extent ; if they cannot get anything else they use it.

23680. Do you think there is any appreciation in the villager's mind of the importance of feeding his cattle properly and adequately ?—I should say not.

23681. Do you think that is a direction in which propaganda might usefully be employed ?—I think he does not recognise that if his cattle were properly looked after he could get more service from them. If anything has got to go, he thinks it is the cattle that should go.

23682. Then I am interested to notice in your answer to Question 17, under Agricultural Industries, that you see signs of a desire for a better standard of living. Do I understand that you see those signs apart from the pressing phase of a greater purchasing power, the result of very high jute prices ?—Yes ; it is accentuated by that.

23683. In spite of these various advantages, which you detail you say that the cottage industries do not flourish or progress. Can you suggest any reasons other than those which you have given in this note as to why the cottage industries are not taken up ?—No ; nothing other than what I have stated there.

23684. I find it difficult to reconcile what you say here with your statement that there is a desire and a demand for a better standard of living ?—I think that whatever improvement there is in the standard of comfort is simply due to getting more money for their crops.

23685. You think that the stimulus towards raising the standard is not sufficiently strong to drive them to supplement their income ?—Yes.

23686. You form the view that there is a possibility of developing pisciculture on an important scale ?—I should say certainly.

23687. Do you know at all the extent to which pisciculture has been developed in China ?—No. But in Eastern Bengal all the raw material is there ; you cannot build a house without making a tank, pisciculture is mainly done in tanks and not in streams.

23688. In China, I believe the eggs are collected and protected from natural enemies and the fry released not merely in stagnant waters but also in navigable canals and channels ?—I did not know that, but it makes the possibilities of development greater.

23689. You form the view that while co-operative organisations may help it is necessary for the present that Government should give a lead ; is that your view ?—Yes.

23690. You think no other agency is available ?—No, no other agency that will carry the necessary weight and influence.

23691. Then you give a very interesting note on marketing as regards certain kinds of produce. You form the view that if the cultivator were sufficiently literate to be able to read or keep accounts, he would be better equipped to look after his own interests and be advised of the markets ?—Yes, but I think he is becoming more and more self-reliant in that respect already.

23692. Since you have known the country do you think he is now better off ?—Yes, as regards jute in the Faridpur district. I have no experience of other crops.

23693. I would like to have two interpretations from you. What is a *hundi* exactly ?—A *hundi* is a promissory note largely used amongst Hindu merchants. It passes just like a bill of exchange.

23694. Then you say : "The *dadon* system of advancing money against standing crops is not common" ?—Yes ; not in my district.

Mr. L. Burrows.

23695 Is there anything peculiar about the *dadan* system?—It simply means advance.

23696 Then you go on and talk about the possibility of the development of co-operative sale and supply societies and you say they "should not compete in the commercial side of the business". You think they can operate without competing to some extent on the commercial side of the business?—My idea is that they should not deal directly with the mills or do export, but they should do the collection and other work.

23697. You have not included the marketing agencies in the commercial side of the business?—Not the first middleman, but only the second middleman.

23698. Then you go on and talk about the possibility of disseminating information about market prices. It does not help the cultivator very much to know what the probable trend of prices is for the crop which he has already either sown or is about to sell, does it?—No.

23699. What he wants to know is what the next year's demand is likely to be?—Yes, he should know what the stocks are when he is sowing.

23700. That is the real point, what are the stocks of pite in the hands of merchants and middlemen at the time?—Yes.

23701. And that at the moment is not available for the cultivator?—It is not available from any Government agency.

23702. When was this survey of a village in the Faridpur district made?—It is within the last couple of months.

23703. And you have looked it through and so far as your experience goes, you believe it to be reasonably accurate?—Yes. I have been to the village and gone through it with the people there.

23704. Do you attach importance to fragmentation where it exists in your district?—It exists largely, but I do not think anything could be done to change it.

23705. Does it interfere with the cultivation?—Yes.

23706. It involves waste of time and energy?—Yes; each cultivator as a rule has got about three tenancies under different landlords and situated in different places, and naturally it must take him a longer time to attend to them.

23707. Does the land vary from plot to plot in your district?—Not from plot to plot.

23708. Could consolidation be effected without doing violence to the interests of any particular individual, if the villagers were agreed that such experiments should be made?—I should like to see it tried as an experiment. We have got orders now to try it in certain selected Government estates. But the trouble is the diverse proprietary interests. It is not only the cultivator, but also the tenure holder who would object to having his land changed.

23709. Do you attach value to the collection of statistics about rural economies and rural life over a series of villages?—Yes, certainly.

23710. You think that a certain amount of money might well be spent in that direction?—Yes, if it is going to be followed up. There is a tremendous amount of statistical information in the Settlement Reports which is never used.

23711. It is a question of getting it together and interpreting?—Yes. There is more information in the Settlement Report than probably anywhere else.

23712. *Sir James MacKenna*: One question about the veterinary side. Is there no Act in Bengal which lays down general rules applicable throughout the Province with regard to the reporting of outbreaks of cattle diseases and problems of that sort?—No; I do not think so.

23713. All these rules are made under the Village Self-Government Manual by each District Board?—Yes; we made them in our district.

23714. One District Board might have these rules and the next might not?—Yes. There is also a Bengal Veterinary Manual which is for the guidance of the Veterinary Assistants, but I do not think it is much used.

23715. So these rules are made under the Local Self-Government Act?—They are executive orders. The only part that is obligatory under the Statute is the duty to report. It is purely general; it simply says, "any information which the District Magistrate may require".

23716. The water-hyacinth problem is probably as big a question in Burma as it is with you. I take it that you are practically convinced that legislation without a scheme of operation is useless?—Yes.

Mr. L. Burrows.

23717. You have seen the Burma Bill, I suppose?—Yes.
23718. What do you think the result of that would be?—I have not seen it recently, but so far as I recollect it did not provide for the doing of the work.
23719. Then on account of the extraordinary case with which the plant establishes itself, do you think that the scheme should be taken up on a big provincial or inter-provincial basis? Do you think it is big enough for Bengal, Assam and Burma to combine?—I certainly think Assam and Bengal might combine.
23720. Burma?—It is far away, but it might be useful from a research point of view.
23721. Therefore it would be an extraordinarily big scheme involving a combined engineering problem. Have you considered the engineering method of tackling it?—No. I think it is possible for Bengal to deal with it even if Assam does not come in. It comes down by the big rivers and if we prevent it from coming into the smaller rivers and *khals* which lead into the district it would be kept in the big rivers and go straight down to the salt water.
23722. I should like to know your methods of dealing with it. Take first *jhils* or lakes; how do you tackle the problem?—By fencing round and by chemical means.
23723. Have you experience of your own?—I have no personal experience.
23724. In a concentrated area the chemical process would be easily applicable?—Yes, where there is no danger of infecting other plant and animal life.
23725. Then how would you tackle the problem in your small creeks?—During the dry season by man-handling, and during the rains by getting it to move down into the big rivers.
23726. How do you deal with the stuff when it is handled by men?—Burn it principally.
23727. Then in the larger rivers?—It would be the job of the Irrigation Department to keep it on the move.
23728. As a district officer you will see that it is one of the most important administrative problems?—I think it is of the greatest importance. Primary education is more fundamentally important, but this is more immediately important.
23729. Professor Gangulee: Do the Local and District Boards show any effective anxiety in eradicating the water-hyacinth pest?—I have said in my note that the District Board of Faridpur has spent thousands of rupees in the last few years with absolutely no effect at all.
23730. They are anxious to tackle the problem?—Yes, they have all passed resolutions I do not think you need anticipate any opposition from them at all.
23731. What has happened to the scheme that you have discussed at the District Agricultural Meeting at Faridpur on the 26th September 1926, in regard to the utilisation of land belonging to *thas muhals*?—I have sent it up to Government and I have not had orders.
23732. It rests with the Government now?—Yes.
23733. You have consulted the Director of Agriculture in drawing up the scheme?—He was present at the meeting.
23734. And you think that there is a great deal of scope in that direction in Faridpur?—Yes.
23735. To what extent is land available for that purpose?—It is difficult to say because the amount varies from year to year. The land is continually altering as there is a lot of alluvion and diluvion. New land has first to be settled on the legal principles of reformation *in situ* and accretion, and only that remaining over is available for allotment. But I should think that I can get about 1,500 to 2,000 *bighas* a year.
23736. With regard to financing the schemes, would you have a co-operative organisation for settlers?—I propose that Government should do that because they are Government estates. Government will take no rent for three years and demand no *salami*. It will also make advances for initial expenses.
23737. For how many years?—Indefinitely. It would pay Government to get a better class of tenant.
23738. Do you think that young men would be attracted to such a scheme as you suggest?—Yes.
23739. Then with regard to your scheme for *thana* veterinary dispensaries, that also is under consideration I suppose?—I have sent it up to the Government. The Veterinary Director was present at our September meeting. I have consulted the Union Boards

Mr. L. Burrows.

and am convinced that they will accept the scheme and raise the money. They have already agreed to do so in three *thanas* out of the five in which we wish to start.

23740. One question about your District Agricultural Officers. You do come in contact with your district Agricultural Officers, do you not?—There is only one in my district.

23741. Wherever he is posted to your district he comes in contact with you?—The District Agricultural Officer is attached to the farm in my district at headquarters.

23742. Did you ever happen to be present at one of his demonstrations?—I have not personally seen anything of his demonstration work.

23743. Are you in touch with his work?—Yes.

23744. What is your view about his efficiency?—This particular officer who is attached to my district is a first class man.

23745. Do you think that he is an effective agent for propaganda work?—Yes.

23746. Mr. Calvert: In your district are there many tenants, people cultivating purely on rents?—About two-sixths; and one-sixth on produce rents. The greater part is cultivated by tenants on rent.

23747. Is there not any scope for an enterprising cultivator to extend his activities by taking more land on rent?—There is very little land left for settlement.

23748. He could not oust other people by bidding a higher rent?—No.

23749. Supposing you gave a cultivator better education in agriculture, could there be any scope for him to utilise it by taking more land?—Not in the Tarnapur district except by buying it.

23750. Mr. Gupta: He could buy more land?—Yes.

23751. Mr. Calvert: He could not take more land on rent?—Most of the tenants have got occupancy rights.

The Punjab system is that they can take more land on rent.

23752. Rai Bahadur Dannerji: In the Punjab you have more land, but here the case is quite different.

Mr. Gupta: The ryotwari system is in force.

23753. Mr. Calvert: Why do you wish to apply this scheme to the *bhadralog* and not to the cultivator class?—The question I am answering is only with reference to middle-class youths.

23754. Would you give preference to *bhadralog* over rural agriculturists in a scheme like that?—As part of the problem of unemployment. Whether for good or bad, we have educated these people and find that we have far more men educated than can find employment.

23755. I do not understand why they cannot find work; there is plenty of work for them?—Do you mean actual manual labour of any kind?

23756. Yes?—That is where you come up against the *bhadralog* tradition against manual labour.

23757. You suggest a detailed agricultural survey in your district. Is not that within the province of the Collector?—Not that I know of, except for some particular or specific purpose; as a general survey, it is not.

23758. Are you not supposed to be responsible for the economic development of your district?—No, not directly.

23759. We in the Punjab are supposed to be in charge practically of everything which is for the good of the district, and as such the agricultural survey would fall on the Collector?—If it had to be carried out, it would be the Collector who would have to do it, but at present it is not his duty to do so, except as I said as a means to some thing else. If there was any scheme, the Collector would do it.

23760. But a Collector who is keen on the agricultural development of his district would do it, so that there is no need to make any recommendations?—Government would have to provide the funds. The Collector has not got the establishment to make a survey of that sort.

23761. You have not got sufficient local officials to do the work?—We have practically no subordinate establishment in Bengal at all.

23762. And you have not got the statistical information readily available for this purpose?—No.

Mr. L. Burrows.

23763. In the note on a village survey the calculation is made that the interest on the debt is Rs. 6,000 odd a year and the rent is put at Rs. 2,000?—Yes.

23764. Then there are cesses or local rates too, about Rs. 300, so that practically there is ample scope for increased taxation if the debt can be reduced?—Yes.

23765. The people are actually paying Rs. 6,000 which could be made available for other purposes if the debt could be reduced?—Yes.

23766. Is there in your district any extended use made of the Usurious Loans Act?—Not so far as I know.

23767. Can you suggest the reason?—These things are done before the Civil Courts in Bengal and of course as District Magistrate or Collector one has nothing to do with the Civil Court.

23768. Here again is it not a part of the Collector's duty to help the people by bringing the matter to the notice of the Government?—I do not think it is part of the Collector's duty to tell the judges what to do.

23769. One of the witnesses who appeared before us has said that one of the reasons why this Act is not enforced is that most judicial officers either belong to, or have sympathy with, the money-lending classes?—I would not like to support that.

23770. In your two notes you say nothing at all about co-operation: Is not co-operation at all a force in your district?—It is to a small extent. My impression is, I have little direct experience, that in my district there were too many societies started without sufficient enquiries being made, with the result that now about half the time of my certificate officers is spent on realising dues from the members of liquidated co-operative societies.

23771. That I take it has given a distaste for the co-operative idea in the district?—I would not say that. I agree fully with the principle of co-operation, but it must be done on proper lines. The position must be explained and you must get people to understand what the idea is. I say again my impression is that many of these societies were not started with this knowledge and the money which was obtained was largely wasted with the result that such societies had to be liquidated and the difficulty of realising the money was created.

23772. Have you as Collector met bodies of co-operators for discussion?—No.

23773. You do not on your tours inspect co-operative societies?—Yes. All I have inspected is the Central Co-operative Banks of sub-divisions.

23774. You cannot say whether the people have imbibed the ideas of co-operation?—No.

23775. We have got two quite contradictory bits of evidence. One is that the co-operative movement consists of all that is best in the best possible world and the other is that co-operation is on the decline?—I should say that the idea is good and can be carried out and should be carried out, but that it should be carried out on lines which would give better practical results.

23776. That is a matter of better or more careful education in starting the society?—Yes, and better personnel, I think, in the inspecting staff; that is, the people who organise these societies on the spot. That again I say is only my impression.

23777. Would you give us your opinion on the working of the Agriculturists Loans Act?—It is used practically at present only in times of scarcity and the Collector is limited by the amount which is in his budget for the year. Of course he can apply for more if it is needed and it is always given, but only on the ground that there is scarcity or if any crop fails or anything of that sort takes place.

23778. Are you as Collector encouraged by Government to make fuller use of that Act, or do you experience any difficulty in getting money?—I have no difficulty in getting money during times of scarcity, but it is not used during ordinary times at all.

23779. Is that just a practice built up, or is it the policy of the Government?—I could not say.

23780. Do you have much in the way of losses of principal sums lent out?—Not a great deal. I believe that for the Province as a whole about 10 per cent. has to be remitted. I do not know what the figures are, but the loss in Faridpur in my time has been practically nothing. It all depends on the manner of making the initial enquiries. If you make proper enquiries and see that the people who want loans are not people of straw but of some substance and able to stand the racket, then your money is safe.

Mr. L. Burrows.

23781. One witness objects to the lending of money on security ?—That is not a practical proposition.

23782. What about the Land Improvements Act ? Is that used at all ?—Very little, but it can be used much more.

23783. There are projects which might be put in hand ?—Yes.

23784. Is the lack of use due to any lack of encouragement on your side or to the lack of enterprise on the part of the owner ?—On the part of the people applying, I can get the money if the security is satisfactory and the scheme seems sound. I can quote one instance of lack of enterprise. A company of persons applied for Rs. 10,000 to develop certain land. They only had a leasehold right which was not sufficient security. I offered to accept the personal security of two of their number whom I know to be good for the money, but the thing went no further.

23785. The difficulty comes from the people, does it ?—As far as we are concerned, if we get applications we deal with them. As a matter of fact, it is the duty of the Collector to deal with them. We make enquiries to see that the security is sufficient and then ask Government for the money. I have never known of a case in which the money was refused by Government.

23786. The point I am driving at is this. The Imperial Government has made four large efforts to help the rural population by introducing legislative measures. There are the two Loans Acts, the Co-operative Societies Act and the Usurious Loans Act, and I gather that they are not being made the best use of. One Act is not used; one is an emergency measure, one is very little used and as for the Co-operative Society you are not very enthusiastic about it ?—I would not say that. As I said before, if it is worked properly, I do think that co-operation is a very sound thing and a very good thing.

23787. What change would you wish to see in order to make the co-operative movement more popular and more efficient ?—My experience is limited, but I should say that it is the proper organisation of societies.

23788. And the education of members ?—Yes.

23789. Do you think that if we had men really skilled in rural economics to teach the people, it would help the movement ?—I think there is much better chance of the movement being helped through the Circle Officers in the way I have suggested. These are the officers who are appointed under the Village Self-Government Act and look after the Union Boards.

23790. Are they drawn from the actual cultivating classes ?—They are members of the Bengal Junior Civil Service.

23791. *Professor Gangulee* : Do you think they are able to do this work in addition to their administrative duties ?—They could do all their duties together in conjunction with the Union Boards.

23792. *Rai Bahadur Bannerji* : For that purpose they will require a co-operative training ?—Certainly.

23793. *Professor Gangulee* : You would train the Circle Officers for this purpose ?—I think there is far more hope for the co-operative movement in that way.

23794. *Rai Bahadur Bannerji* : These Co-operative Inspectors who are generally responsible for the organisation of the societies at the outset are as highly educated men as the Circle Officers ?—Their standard of education is not the same, so far as I am aware, they have not the same service traditions, and there is not the same control over them on the spot as the Collector would have over the Circle Officers.

23795. Are not these Co-operative Inspectors equally under the control of the District Magistrate ?—No.

23796. *Mr. Calvert* : So you have really no practical suggestions to make to improve the working of these four important Acts ?—As far as co-operation is concerned, I have made a practical suggestion, namely, that it should be worked through the Circle Officers and the Collector.

23797. That is the executive staff ?—Yes.

23798. You do not fear the charge of making the movement too official ?—I do not personally.

23799. Would you not interfere with the Usurious Loans Act ?—I do not know sufficient about it, to tell you the truth. The only place in which I have applied it is Darjeeling where I tried civil suits. What the civil courts do in the districts, I do not know.

*Mr. L. Burrows.*

We are supposed to examine existing conditions and make recommendations. We find that the Government have already passed several important Acts which are not being made as full use of as is perhaps desirable in the interests of the rural population.

23509. *Rai Bahadur Bannerji* : Does the rural population really know of the existence of these Acts? Most of them do not?—They certainly do not know much about the Usurious Loans Act. From my limited experience of it in Darjeeling, I should say that it does not have much effect on the current rate of interest. You can only apply it when the man goes to realise his loan by a suit in court. You do not effect transactions at all between individuals, which they settle amongst themselves and where the interest goes on from year to year. The Usurious Loans Act has no effect there at all.

23501. *Mr. Calvert* : It applies when either party goes to the court?—Only the man who has lent the money will go to the court.

23502. Is mortgage common in your district?—Yes.

23503. Is that an important factor?—I should say so. There is a good deal of mortgaging of land, but it is largely temporary.

23504. Does the mortgagor experience any difficulty in securing redemption from the mortgagee?—Not that I know of.

23505. The mortgagee does not try to avoid redemption?—Not to any extent so far as I am aware.

23506. *Rai Bahadur Bannerji*. Regarding your scheme of veterinary dispensaries where several Unions group together in order to have one, that does not require the passing of any special Act?—No. They have the power under the Village Self-Government Act.

23507. So you can give a start to it provided the Unions in question agree at once? Yes. I have got three *thanas* who have agreed and I am only awaiting the Government approval. The District Board has agreed to give Rs. 200 to each.

23508. Supposing you do not have this grant from the provincial revenues and the District and the Union Boards agree to defray their parts of the expenditure, could you not give it a start?—I think so.

23509. As matters stand in our Presidency, if you have to wait for Government sanction, then nobody knows how long you will have to wait?—The only difficulty is that I have got to work through the Government because I can only get the Veterinary Assistants from among qualified men.

23510. If your Union Boards can provide the necessary funds, the Veterinary Director I am sure will be able to give you at least 24 Assistants who are available at the present moment?—I do not think he has got 21 Assistants, but he has promised me five at once, that is to say, as soon as I want them.

23511. In the case of the other scheme regarding water hyacinth, you want a certain law which empowers the Government to collect a certain cess?—Yes.

23512. Regarding the consolidation of holdings, if the lands are of equal quality in a certain village you think the difficulty is that the tenure holder, as you said, does not care?—What I meant is that the consolidation of holdings means the fragmentation of tenures.

23513. Can they not do it with the consent of the zamindar?—Certainly. My idea was that I do not think you will get him to agree.

23514. The zamindars will always agree if they are paid their *salami*, the commutation fee?—If you have got one zamindar to deal with, it is quite easy, but the difficulty comes in when you have five or six zamindars to deal with.

23515. In my district I have succeeded in making three zamindars agree to do it. Three co-partners of the same zamindari have agreed to do it and a very large area has been consolidated in that way?—Your opinion is then certainly worth much more than mine because I am only talking on theoretical grounds.

23516. As far as my information and experience go, all these Co-operative Inspectors in the districts have to work under the guidance and perhaps under the orders of the District Officer?—Not as far as I know.

*Mr. Gupta* : No, they do not work under the orders of the District Officer.

23517. *Rai Bahadur Bannerji* : In Bhuban. I have seen the Co-operative Inspectors always called and ordered by the District Officer to do the co-operative work and I do not see any reason why it should be different in different districts. They are equally educated with the Circle Officers. My impression is that nobody objects to the Circle Officers doing this work but they have got many things to do and unless you appoint

Mr. L. Burrows.

extra Circle Officers for the purpose, the co-operative work will suffer?—If you keep to the present standard of one Circle Officer for 25 or 30 Unions, he can do all the work. You have got to remember that, as the Union Boards go on developing, the work of the Circle Officer in that connection becomes less and less. In my district, the Union Boards are classified into three classes and the Circle Officer is required to inspect the A class Unions once in a quarter, the B class Unions once in two months, and the C class Unions once every month. As the level of efficiency goes higher, the less need there is for the Circle Officer. That is the general idea.

23818 Leaving aside the Usurious Loans Act, if propaganda work be done to enlighten the common people regarding the existence of other Acts, namely, the Land Improvements Act or the Agricultural Loans Act, will not that improve matters?—I should say so. In this connection, I may say that the Irrigation Commission of 1903 has already suggested that these Acts should be used much more than they are used at present, that larger grants should be made and that it should be made the part of the District Officer to spend the money. If that were done, there would certainly be a great improvement.

23819. *Sir Thomas Middleton*: With reference to the feeding of cattle in the district, you point out that the cultivator does not seem to recognise the service done by cattle and that it is for that reason that he does not feed them. In all the evidence that we have had it has been pointed out that the cultivator recognises the necessity of feeding his cart and plough bullocks but that he neglects his cows. Is that also your experience in Faridpur?—I do not think I have said anywhere that the cultivator does not recognise the necessity of feeding his cattle. What I said was that if he had got any choice, the cattle would go by the board.

23820 My point is this. In letting his cattle go by the board, does he discriminate between his plough cattle and his cows?—He will naturally take more care of his plough cattle.

23821 You propose to attack the water-hyacinth, in the first place, in the *jhils*, by the Griffiths Sprays. You have indicated that the hay made from water hyacinth is quite a reasonably good food. Would it not pay for collection?—I do not think so.

23822 While the cattle are starving for want of fodder, a large supply is available?—That is the only time in which they do use it, when they have got any shortage of fodder.

23823. Why should they not make hay and store the hay?—I could not tell you for what length of time it could be stored; I have no practical experience of that at all.

23824. You do not think it would pay for collection?—I do not think so. That would be only an incidental way of disposing of the water-hyacinth.

23825. We have had evidence before us that it is of value as manure?—Yes; but in Eastern Bengal they do not need manure.

23826 There was an economic enquiry conducted in Faridpur district by the late Major Jack. The detailed figures were never published?—No.

23827. Where are those figures?—They are in my record room. As far as their completeness is concerned, I can only say that when I tried to get them for the purpose of comparing them with the figures of our Talma survey, I could not get anything as a basis for comparison, because there were figures for only 26 families.

23828. We have evidence that all the figures were handed over to the Collector of Faridpur in 1912?—That is right; they are reputed to be under seal in my record room.

23829. You suggested that for the working of agricultural improvements, there should be agricultural surveys. What type of surveys did you have in mind?—A survey as to what particular kind of paddy or jute was grown in particular tracts.

23830. You wanted a rough classification of the soils of the tracts?—Yes.

23831. What time would such a classification be likely to occupy?—I should not think more than about a couple of months, because the areas are homogeneous.

23832. You have got most of the information already available?—In a general way.

23833. All that wants doing is to pick out the information and map out the land roughly?—Yes.

23834. How do you propose to carry out the work? To whom would you entrust work of that sort?—To people of the same standing as the Agricultural Department demonstrators, under the District Agricultural Officer.

23835. Is it your suggestion that they should go and examine the village papers, question the villagers as to the extent of the different types of soil in the village, make

Mr. L. Burrows.

a note roughly indicating the character of the soil in each village tract, and then make a small district map?—Something of that sort; I have not worked it out in detail.

23836. To conduct anything like a soil survey would be a laborious business. I wanted to know what you had in mind?—Simply a survey showing where particular crops could be grown and what sort of seed could be distributed in particular areas.

23837. And the information is available in an accessible way in the village books; it wants collecting?—It would be in the village notes and in the crop statement, but these are rather old now.

23838. In the villages of Faridpur, do the soils vary rapidly from place to place? Would you have four or five different types in an average village?—Two as a rule, up-land and low-land.

23839. With reference to your scheme for the training of boys, what is the quantity of  *khas mahal*  land that you have got available in the Faridpur district? Is it an extensive area?—I have got  *khas mahal*  land which pays a rent of over Rs. 2 lakhs. 1,500 to 2,000  *bighas*  can be settled in a year; on account of the law of reformation  *in situ*  and accretion, it cannot be increased.

23840. In any case, the land is available for an experiment such as you contemplate?—Yes.

23841. What sort of quality is the land? Is it worse than the ordinary cultivated land?—It is just the same as ordinary cultivated land. Some of it is in permanently settled areas, and some in areas settled temporarily.

23842. Have you worked out the probable return to the boys?—No, I have not worked it out. I thought providing them with a living was quite enough. I have fixed the amount of land at fifteen  *bighas*  in consultation with Mr. Finlow, with the idea that that land in itself would be quite sufficient to give each a living.

23843. He would want a small capital for bullocks, etc.?—I have suggested that he should get a loan under the Land Improvements Act or the Agricultural Loans Act for initial expenses, repayable by him in instalments, on two personal sureties.

23844. Was it your suggestion that it should be repaid in full in 4 instalments, or was the loan for a longer period?—It would be repaid in four instalments, commencing from the second year after the money was advanced.

23845. If it were repaid in four instalments, the charges would be very heavy?—The period may be longer; there is no objection to that.

23846. You note the difficulty in getting the cultivator to adopt the methods which he sees carried on on Government farms. You say he regards them with curiosity, but without practical concern to himself. That is a view I have very often had before me, but do you not think that the cultivator is shrewd enough to know a good thing if he sees it, even if it is on a Government farm?—If he sees a crop on a Government farm he sees that it is a very much better crop, but he thinks he cannot grow it himself.

23847. He sees the crop, and this has an effect?—If it is done under conditions he has himself to contend with, that does have a good effect.

23848. The cultivator is shrewd enough to discount the cost of cultivation in a Government farm?—Yes, but he would not be inclined to go in for experimenting.

23849. He is not asked to experiment, he is asked to imitate on his own land the growing of the crop that he sees on the demonstration area?—I think the demonstration has a much better chance of success when it is done in his village.

23850. And when it is done on his own land?—Yes.

23851.  *Dr. Hyder* : What is your definition of the annual value of land?—It is the rent paid; that is the definition in the Cess Act.

23852. Will you require a great deal of money for the eradication of water-hyacinth?—Certainly, provided you pay for the work. In my scheme, I provide for payment to the man doing the work.

23853. Suppose you had legal power to conscript every man for five days in the month, would you not be able to eradicate the evil in a few years?—No.

23854. What is the difficulty?—The problem is on too big a scale. How will you control your conscripts?

**Mr. L. Burrows.**

23855. Supposing the men who live above you along the course of the river clear up their side and you then clear your side and the process is continued all along the course of the rivers and streams, and if all the Collectors concerned took the matter up by conscripting all men right up to the age of 80, do you not think the evil could be eradicated?—If it was practicable, it might have an appreciable effect, but it would not eradicate it. Even if small bits are left lying about it will grow. You will not be able to eradicate it unless it is very thoroughly done indeed.

23856. My idea is to get rid of it first, and then we could look after the little bits. It seems to me that this problem of the water-hyacinth is there because of the apathy and the want of energy on the part of the people?—Quite so, but the danger was not realized.

23857. If it is not dealt with in time, it will choke up your water ways and your fields?—That is quite certain.

23858. With regard to the four Acts passed by the Imperial Legislative Council for the benefit of the cultivators, of what use are they to them? Take, for instance, the Usurious Loans Act, of what use is it to the poor cultivators if it is not enforced by the courts? The knowledge on the part of the cultivators would not help them very much if the Act were not worked out for the purpose for which it was devised?—The Act, as far as I know, must be applied by the courts.

23859. That application rests with the court entirely. If the court simply passes a decree without looking to the merits of the case, then the purpose for which the Act was devised is defeated?—In those circumstances, it would be.

23860. With regard to this question of "Back to the land", have you served as Collector in many districts of Bengal?—I have served in Chittagong, Dacca, Faridpur and Daryeling.

23861. Is there a cry of "Back to the land" in any of these four districts? Does it not arise mostly in papers edited in big towns?—I think I have stated that the people concerned, the middle classes themselves, are averse from it.

23862. I was thinking of the agriculturists. Is there any cry of "Back to the land" among the people of Faridpur, Chittagong, or Dacca?—Are you referring to the *bhadralog*?

23863. Not the *bhadralogs*, the cultivators?—They are already on the land.

23864. Even these *bhadralogs* are only a small percentage of the people, congregated in two or three big cities like Calcutta?—No, we have got them all over the important districts.

23865. They have got no manner of connection with the land?—Yes, they are connected with land; most of them have got a certain amount of hereditary land.

23866. Then, if you maintain your educational system which produces these *bhadralogs* how is this cry of "Back to the land" going to help them? It seems to me that what you have to do is just to choke your educational system, and the thing will solve itself. Do you agree?—That is a thing which I am not prepared to express an opinion on. My idea is simply to give a suggestion which would deal to some extent with the existing problem of unemployment.

23867. The existing problem of unemployment arises on account of the supply exceeding the demand?—Yes.

23868. If you maintain your educational system which turns out streams of these educated *bhadralogs* who will take up only one kind of work and no other work, you will have that problem constantly before you?—Quite so.

23869. Therefore, the proper solution of the problem is the choking of the evil where it arises?—I would not be prepared to agree to that.

23870. Mr. Gupta: In the first section of your supplementary note you say, "I am definitely of opinion that the practical utility of the Agricultural Department (and in fact of almost all the special departments) depends largely on the degree to which it can persuade the Collector to co-operate with it and further its objects." Do you not think that instead of the Agricultural Department trying to persuade each cultivator it would be a great advantage if a comprehensive Resolution of Government directed the attention of District Officers to this important matter of all the Departments which might help to raise the people economically?—Yes.

23871. It would be a great help?—Yes.

23872. For instance, although you take such an immense interest in the prosperity of agriculture in your district, you do not seem to be so familiar with the co-operative activities of the district?—No, I am not.

Mr. L. Burrows.

23873. But you hold, and rightly hold in my opinion, that all these things go hand in hand?—I agree.

23874. So that you think a comprehensive resolution would be a great help?—Yes.

23875. You say, "I have little faith in co-operative societies, agricultural associations and the like for such purposes, because they are dissociated from immediate executive control and are unlikely therefore to produce fruitful results out of Union Boards." I think there is a slight confusion of ideas in that statement; they are not intended to produce fruitful results out of Union Boards; there are two separate organisations. Is it your opinion that Union Boards would be better agencies for doing this kind of work, propaganda and demonstration, than co-operative societies?—That is what I mean, yes.

23876. But of course you fully realise that the essence of these organisations is to try to help the people to do these things themselves as far as possible without executive assistance?—The Union Boards are the people themselves.

23877. That is what I say, so that the executive control does not come in except to give them a little encouragement at the start?—Yes; my general idea is not to have separate organisations such as Agricultural Associations when you have your Union Boards.

23878. But they are entirely different in the sense that the Union Boards have different duties; they have first to levy a tax and collect the *chowkidari* cess. Of course, the ultimate aim is to assist the people to help themselves. You would not discourage these associations and proceed with the help of the Union Boards alone, would you?—My ideal is a Union dealing with all these concerns within its area.

23879. But they would do that by encouraging people to help themselves. You know that there are co-operative unions and primary societies?—Yes.

23880. If the unions of the co-operative societies were coterminous with the Union Boards, there would be no harm in that, would there?—No.

23881. It would be desirable that both organisations should exist?—Yes.

23882. But you think in the present circumstances you can make much more use of the Union Boards?—Yes.

23883. I suppose you do not want to give the impression that you consider it is no part of the Collector's duty to help the co-operative movement as much as possible?—No, not at all.

23884. Because an inference of that kind might be drawn from what you have said. You do not wish to create such an impression?—That is not my intention, no.

23885. You say, "My own idea is that the Bengal Junior Civil Service should be divided into two branches, one consisting of Circle Officers to be used mainly in developing the activities and initiatives of Union Boards, and the other of officers employed on general duty. All recruits should be trained on both sides, and then selected for or allotted to one branch or the other." In view of the fact that they are to be used for such duties, would there be any point in making these Circle Officers pass examinations in such subjects as law?—One has to keep in mind the status they have as members of that service.

23886. If there were not that fixed standard, and you had the same class of men, would there be much point in making them go through these law examinations?—No.

23887. On the other hand, there would be a great advantage in giving them a training in agriculture, the co-operative movement and so on?—Yes, exactly.

23888. You are in favour of giving them a full training in those subjects?—Certainly.

23889. And making him development officer for his Circle generally, so that he would take an interest in all these matters?—Yes, certainly.

23890. That is an idea which I entirely support. Would you be in favour of having a unified Local Board service or of having all these activities separate from the work of the Sub-divisional Officer so that men who did well as Circle Officers might in future be appointed Secretaries of important District Boards with a view to holding out something for them to look forward to in the kind of work to which they are accustomed and in which they may have given proof of their capacity?—Personally I should prefer, at any rate in the initial stages, that they should be members of the Bengal Junior Civil Service.

23891. Yes, but after they have joined these Services. You know that the Union Boards are under the District Boards, and you could not have Union Boards separated from the District Boards?—No.

Mr. L. Burrows.

23892. They must get financial assistance from the District Boards. If there were a service in which these men while they served the Union Boards might also serve the District Boards, later on they might rise to be secretaries of the District Boards, and that would be a good thing, would it not?—Yes.

23893. Mr Calvert drew attention to these important Acts which have been devised by Government with a view to helping the agricultural and rural population. The Agricultural Loans Act of 1884 definitely states that its object is to deal with times of scarcity. Is not the great difficulty there that we have to insist on joint security, but there are needy people who find it very difficult to offer joint security; is not that one of the reasons why we are unable to make as much use of the provisions of that Act as we might if we were not compelled to demand joint security?—Are you speaking of ordinary times or times of scarcity.

23894. I am speaking of times of scarcity?—I have experienced no difficulty in getting the joint security.

23895. I have heard that advanced as one of the reasons why that Act cannot be utilised to the extent which may be desired in times of scarcity; it is said that people prefer to go to the *mahajan* rather than to the Collector owing to their difficulty in finding three or four men who will join together to take the loan?—That is not my experience, if the preliminary work is properly done.

23896. One of the great difficulties with regard to the Land Improvements Act is that you make the loan repayable generally within five years. Borrowers want a longer time in which to repay the loan, and that is probably one of the reasons why they do not make use of the provisions of the Act to a greater extent?—I do not think there is any definite period laid down in the Act.

23897. The period laid down in the Act is 25 years, but as a matter of fact do you not as Collector limit it to five years?—No, I generally try to extend it over the life of the work to be done.

23898. How many years do you permit?—It varies; I give different periods for different work.

23899. You say that no use is made of the Usurious Loans Act; are you speaking from experience?—I said as far as I know; I do not know what is done in the Civil Courts.

23900. Then what reason have you for making such a statement? You do not know what use is made of the Act by the Munsiffs. When the Act was passed provision was made for reports by Collectors, but perhaps you were not a Collector then?—No. I have never reported specially on the Act.

23901. Then you are not in a position to say how far it is being utilised?—I think I told Mr. Calvert I did not know.

23902. If the Commission require further information on this point, it may be advisable to send an enquiry to the Government?—Yes.

23903. And perhaps I can supply them with information on that point. With regard to the Bengal Sanitary and Drainage Act of 1920, this limit of Rs. 5,000 is merely an approximate limit which you have fixed?—Yes.

23904. As to the Engineers to be employed under these Acts would you be satisfied if the District Engineer were entrusted with the laying out of the scheme and the preparation of the plans? Is it necessary to go to an expert for these small schemes?—No.

23905. You think the District Engineer would do?—Yes.

23906. With some training from the Agricultural Department if necessary?—Yes.

23907. That would be a great advantage, because you would have in each district an officer readily available for the work?—Yes; I would prefer to have a man of the overseer type working under the Collector.

23908. But if the District Engineer helped, that would be better?—Yes, certainly.

23909. As to working under the Collector, would you be opposed to letting the chairman of the District Board have the same and concurrent powers with the Collector?—I have no objection at all.

23910. It would be a good thing, would it not?—Yes, certainly.

23911. You remember the last circular of Government drawing the attention of Collectors to the methods of making fuller use of those powers. One method would be

Mr. L. Burrows,

to let the Chairman of the District Board have the same powers of initiative as the Collectors now have; you would have no objection to that?—With District Board funds, no.

23912. *Sir Henry Lawrence*: What is the size and population of your district?—2,400 square miles and about 2,250,000.

23913. How many Circle Officers have you got?—None.

23914. *Mr. Calvert*: I should like to get my mind a little clearer as to the scope for the enterprising cultivator in face of the prevalence of occupancy rights. You are familiar, of course, with the talk in England as to providing an agricultural ladder for enterprising men to rise from the status of small cultivator or labourer up to that of a big farmer?—Yes.

23915. Does the prevalence of occupancy rights prevent or deter the enterprising cultivator extending his activities?—That is a question I should not like to answer straight off. I do not know of any such enterprising cultivators.

23916. But we hope to improve the education of the cultivating class?—Yes.

23917. That will be of very little use to them if they cannot then find scope for their enterprise and education?—If they have got the money, they can purchase land with occupancy right.

23918. But that would probably absorb all the capital which they will need for their agricultural operations?—The only alternative is that the landlord should be allowed to let out his land by a kind of auction, which would be very much worse; the occupancy right is the cultivator's stronghold and safeguard against eviction.

23919. That is what some people think?—That is my opinion.

23920. But does it not also serve to deter the development of agriculture by maintaining the inefficient on the land and preventing the efficient from taking over the land?—I should say that is not the effect of the occupancy right as such.

23921. But if through the more vigorous efforts of Government there arose in your district an educated and enterprising body of cultivators seeking to find scope for their new-found energy and enterprise, would not the occupancy rights stand in their way?—Naturally it would stand in their way in getting land, except, of course, by purchase; they could not get land simply by making a higher bid at a higher rent or anything of that sort; I presume that would be the only alternative.

23922. Does that mean that any attempt to improve the education and enterprise of your cultivators would be suffocated because they would come to a stage when they would not be able to find scope for their enterprise and education?—No, I should not say so. The population always goes on increasing and there has got to be some method of employing them; it is much better that they should be taught improved agriculture because there are the people and they must be supported on the land.

23923. But do you rule out the possibility of the less efficient being driven off the land by the more educated and more efficient?—As the law stands at present of course it could not be done.

23924. It cannot be done owing to the occupancy rights?—Partly.

23925. So that really the occupancy rights are a bar to agricultural progress?—No, I should not say that because those rights constitute a great protection to the cultivator.

23926. The question of tenure is outside our purview, but all the elements of occupancy rights are not necessary for the protection of the cultivator; the hereditary principle need not be there?—I suppose that is so, but I have not considered it much, and I should not like to give evidence before this Commission as to the effect of occupancy rights on the improvement of agriculture.

23927. It seems to me if the educated enterprising cultivator cannot find scope for his activities, it is very little use educating him?—That as a proposition is correct, of course.

23928. After all, we are only concerned with the agricultural aspect; if a certain number of men are driven off the land by the more enterprising, that does not come within our terms of reference really?—But if you improve the agriculturist and his methods, surely that is better in itself than letting him remain as he is, even though in a certain proportion of cases his enterprise may not find sufficient scope.

23929. But at the same time, you are wasting time, effort and money in improving his education both technical and general, if he cannot utilise the knowledge which has been instilled into him?—But surely a very large proportion would be able to utilise that knowledge.

**Mr. L. Burrows.**

23030. Your average holding is about three or four acres, is it not?—Yes, it is between three and four acres.

23031. If you are really going to educate your cultivating class and give them a better knowledge of agriculture, they would want to cultivate much more than that?—I have never contemplated giving the agriculturist a technical education in agriculture. I have never thought about that; I simply say, improve his methods and enable him to get a better return from his land by using manures in districts where they are necessary, better seeds and things of that kind.

23032. But do you think with existing holdings in your district, that more improved methods would go far to relieve the position of economic stress?—There is no economic stress in my district.

23033. The figures given to us show it?—You mean because they have such small holdings.

23034. Small holdings and a low standard of living?—Of course I have no basis of comparison except in the Province itself, and my impression is that the cultivators in the Faridpur district are comparatively well off.

23035. Compared with what, European standards?—No, with other cultivators in other parts of Bengal.

23036. You do not contemplate any such improvement in their position as would raise them to a European standard?—No, I never have.

23037. *Mr. Gupta*: Your district is permanently settled?—Yes.

23038. You would not like to give the zamindar the power to rackrent his tenants doing away with occupancy rights and so enabling the zamindar to give the land to the man who promises to pay the highest rent; do you think that would be in the interests of your ryots?—Obviously not.

23039. Then you are opposed to giving the zamindar power of giving out land on an auction basis, for instance?—Certainly.

23040. Then taking the facts as they are, there are three different ways in which a man can acquire land. Has not each zamindar a lot of land which is not leased out and which he is continually leasing out? His books continually show fresh lands being taken and fresh leases being given?—Yes.

23041. There is also the waste land to which you have referred?—Yes.

23042. And there is land which people can get by paying the price for it?—Yes.

23043. There are three different ways open to an enterprising ryot who wants to increase the size of his holding in your district?—Yes. In my district there is practically no waste land.

23044. Is all cultivable land under cultivation?—Over 90 per cent of it is, I should think.

23045. Do you mean that all the cultivable land is under cultivation?—Practically all, yes.

23046. But taking the whole Province, there is a very large proportion of land which is cultivable but is not under cultivation?—That is so.

23047. As regards the condition of your tenants, of course you do not say they are very well off, but would they considerably improve their position if they could grow more crops on the holdings which they have at present?—Naturally.

23048. They might double their incomes if they liked?—Yes.

23049. If they then saved, they might acquire enough money to be able to buy land, so that under present conditions there is nothing to deter us from pursuing these efforts to enable tenants to improve their position by growing more, saving more and combining?—No.

23050. *Professor Gangulee*: You allowed 15 *bighas* per occupant in your scheme?—Yes.

23051. What is the basis of that?—As a matter of fact, I consulted Mr. Finlow and took his figure for that; that is what he thought would be the minimum to support a man, and give him a fair living.

23052. When you are touring in your district does the Registrar of Co-operative Societies occasionally see you?—I have not seen the Registrar of Co-operative Societies in my district since I have been there.

*Mr. L. Burrows,*

Mr. F. W. H. SMITH.	

**Mr. M. WEST, M.A., I.E.S., Principal, Teachers Training  
College, Dacca.**

**MEMORANDUM ON EDUCATION AFFECTING AGRICULTURE.****THE TEACHING OF SPECIFIC SUBJECTS (AGRICULTURE, HYGIENE, ETC.) IN PRIMARY SCHOOLS.****1. (a) The smallness of the schools.—**

To teach agriculture, or hygiene or any "specific" subject of that kind, involves a certain amount of apparatus and an intelligent teacher trained in the subject. In countries where the average roll number of the schools is 100, or more, these conditions are attainable; for the cost of the apparatus divided by 100 does not work out at an excessive rate per head; and the school having a number of teachers can arrange to specialize them; this reduces the cost and increases the efficiency of training. Similarly the cost per head of expert supervision is comparatively small owing to the larger size and smaller number of the schools.

The average primary school in Bengal contains only 30-40 boys, and the vast majority of the schools have only one teacher, who is supposed to be instructing four classes simultaneously in all subjects; at the best there are two teachers with a couple of classes each. This is not due to irregular distribution of population in the country side for it will be seen from pages XXV-XXVI of *Survey of Primary Education, 1918*\* that in towns or large villages which could be served by one, or two, or three large schools, there are five, or ten, or twenty small schools. Thus Bankura Municipality has 12½ schools per square mile. In two mofussil areas taken at random, 10 per cent of the schools were within half a mile of some other school.

The causes are :—

1. A carelessly administered system of small grants-in-aid.
2. The lack of any policy as to the distribution of the grants.
3. Inspecting officers who have not been trained in the problems of primary education, but only as secondary schoolmasters.
4. National psychology.

**(b) The depletion of the top classes of primary schools :—**

Teaching of agriculture, or other such subjects would be given in the two top classes. But 61 per cent of Class I leaves at the end of the first year; 78 per cent of the first year has been lost by the beginning of the third year. As a result in the two top classes of a primary school of forty boys there are seldom more than ten pupils. Dividing the number of pupils in these classes in 1922-23 by the number of schools, we find that the actual average size of Class III is five pupils and of Class IV only two pupils.

The causes are :—

1. The bottom class of the high English school is Class III; hence boys who are going on to the high schools wait in the primary school only until they are old enough for that class.

\* Not printed.

2. Lower class boys are sent to primary school (to get them out of the way) until they are old enough to earn anything. Then they are taken away. The only real remedy is compulsory education; but there are two palliatives:—

(1) To use central schools, as suggested below, so as to group these small top classes into teachable units. (This would be necessary even with compulsory education.)

(2) To meet the parents' need of the children's labour by instituting 'continuation classes' and part-time classes, for adults as well as children, in the agricultural slack seasons.

(c) *The need of central schools:—*

What seems to be needed is a system of central schools in the larger villages, with four or five teachers and a roll of 120 (or more) boys, in charge of a headmaster of some education and initiative. These would not merely be schools, but centres of communal life, and of continuation classes. The central school would be the village headquarters of the Agricultural, Co-operative Credit and Public Health Departments; would contain the village hall for meetings (and the village wireless set). The older boys from the surrounding hamlets within one mile radius would walk to the central school. Hence the higher classes would be of full strength.

Small children in the infant classes cannot walk to school. Hence there must be feeder schools in the outlying hamlets, containing only the two lowest classes, with two teachers. Or, in very small hamlets, there would be one teacher holding two sessions in the day one for each class. The school radius for such feeder schools might be quarter of a mile.

This involves organisation and compulsion. The problem must be tackled as a whole, systematically. Compulsory education is needed not so much to compel people to send their children to school, but to get some semblance of order into the school system. No amount of money spent on the present system will produce literacy, and still less will it produce agricultural education. The money will merely be frittered away in duplicating and quadruplating existing schools. And money for agricultural instruction would be scattered in grants of annas to incompetent *mundits* in simultaneous charge of four classes.

2. *The provision of teachers for rural schools:—*

A central school would have a staff of four or five teachers. It is always economical to specialise. Consequently such teachers must be trained in an institution with a "selective" course, which will allow specialisation. Such a course is under consideration for the Normal schools. These schools are situated at Divisional headquarters, where the Agricultural, Public Health and other Departments are also represented. Agriculture, hygiene, etc., could be introduced into the course if the department concerned were prepared to teach or to supervise it.

We have also to consider what can be done to give the ordinary teacher in the ordinary primary school some agricultural "bias," and enable him to make some use perhaps of the school garden. Such teachers are trained at guru training schools. Gardening forms a part of the curriculum of such schools. Some of these schools are located near a station of the Agricultural Department. It would be easy to re-adjust the marks to give extra weight to gardening. A teacher trained in the normal school, as above, could be put in charge of this work (in addition to other duties); or an officer of the Agricultural Department could run the course himself.

3. *The teaching of nature-study:—*

The Commission may judge for itself how nature study is taught by the *mundit* under present conditions. Please see page 32, 33, and Appendix I-VII of "Survey of Primary Education" \* for verbatim reports of their lessons.

4. *Is illiteracy due to poverty?—*

Please see "Survey of Primary Education," \* page 61 for a study of this actual problem. Not income means nothing; it is actually less in the case of children who attend school than in the case of those who do not. This probably means no more than that the families of the school-going children are smaller. The facts are:—

Family income per month divided by the number of members in the case—			Ra.	n.	p.
Where children attend school	..	..	3	11	2 monthly.
" " do not attend (Municipal area)	..	..	3	1	7 "
" " do not attend (District)	..	..	2	12	10 "

The difference above is probably accounted for by the fact that the primary school is the poor man's school; but that some of the better classes send their children there;

\* Not printed.

Mr. M. West.

whereas all illiterates are poor. (Please see the graph facing page 61 of the *Survey*.) In fact there is very little difference: there are children just as poor in the school as there are out of it.

The main cause of illiteracy in the children is illiteracy on the part of the parents and failure to realise the importance of literacy—a vicious circle.

5. *The scarcity of vernacular books for village reading :—*

There is no scarcity of Bengali books of poetry, fiction, drama and of general literature; but there is a great deficiency in books of knowledge. The facts will be found in "*Bilingualism*" (Government of India, Occasional Reports, No. 13)\*, in which the whole of this question is discussed at considerable detail. In brief the situation is as follows.—

Arts.			Average Number of Bengali books per annum, 1910-1923	Sciences.			Average Number of Bengali books per annum, 1910-1923.
Art	..	..	31	Physics	..	..	0.2
Biography	..	..	42	Chemistry	..	..	0.3
Drama	..	..	58	Astronomy	..	..	1.0
Fiction	..	..	167	Natural Science	..	..	7.2
History and Geography	..	..	88	Agriculture	..	..	3.1
Language	..	..	361	Sericulture	..	..	0.2
Poetry	..	..	98	Animal-culture	..	..	0.8
Religion	..	..	206	Politics	..	..	5.0

*Average annual output of Bengali books on various subjects, 1910-1923.*

There are 48 English and American technical books published for every one such Bengali book; and the Bengali books are almost all of the very popular "cheap-book" variety.

Printing is so cheap in India that the failure must be a failure of demand rather than of supply.

I believe that the causes are :—

1. Neither the primary schools nor the secondary schools at present create reading ability in the vernacular. There are many literates but very few readers. (See the note below on "Relapse into illiteracy"). Hence the demand for vernacular books of knowledge is very small.

2. Nor is there a large army of translators; for the power of reading English is even more limited. The English reading ability of an M.A. is equivalent to that of an English girl aged 15, of a B.A., to age 14, of a Matriculate to age 10. (See *Occasional Report* \* No. 13, page 200.)

6. *Relapse into illiteracy :—*

No person who has once learned to read with fluency, understanding and enjoyment could possibly relapse into illiteracy any more than one could forget how to swim. The supposed relapse seems to be due to two causes :—

(a) Between 37 and 45 per cent. of the children who go to the primary school leave the school before they have learned to read (see the Table below).

(b) The method of teaching reading in the primary school is such that it produces the power of reading aloud words without any understanding of their meaning.

\* Not printed.

Mr. M. West.

*Children leave school without having learned to read*

The Table may be seen on page 29 of "*Survey of Primary Education*".

Service number of enrolment of those who	Months	Number of boys in -th year class	Lost at end of -th year	Per cent of Class I lost to date
Class at end	5	First year (1922)	....	....
First losses	10	769,608	....	....
Second losses	11-13	Second year (1923)	....	....
Real difficulty	10-15	277,235	Lost at end of first year.	84
Third year	21-24	Third year (1924)	491,845 Total lost at end of 2nd year.	....
		167,012	601,168	75
Total enrol of primary schools in 1922			1,313,714	....
First-Second year losses per cent of this			....	36.6 per cent.
First-Third year losses per cent of this			....	41.7 per cent.

Thus, at least 75 per cent of the initial enrolment of the school leaves school with out a tincture of reading.

*The school of teaching reading at the primary school.*

Aspects of it are almost exclusively in teaching aloud, with almost no questions on the subject. (Please see *Survey of Primary Education*\*, page 30). Moreover, the school is full of such poor quality and so dull that the child is not interested in it at all. Hence the children learn to read aloud with no thought of the substance read, and are unable to improve a single line. The result is an extraordinary that of a child leaving 13<sup>th</sup> year without being able to read. Please see pages 287-8 of *Survey of Primary Education* for confirmation. Most children in England probably teach themselves to read more than they can teach, their mother being to read some particular message. In Bengal there are a certain number of picture books for infants but extremely little juvenile literature, and therefore, is not very good and not at all interesting. I have never seen a book of fairy tales in a primary school library. Hence the children never get any practice in reading with interest and enjoyment, and are unable to acquire this power.

And the teacher, with the teacher. Most of it lies with the group training schools and normal schools, where training in the art of teaching reading is entirely defective. The school is full of the reading books, which are short, dull, and uninteresting in every way. But the great defect of all is of lending libraries for children.

*Teaching of adults*

All the schools have two purposes:—(i) To teach adults to read, and (ii) to continue the education of adults who can read. The former are not uncommon; the latter almost everywhere.

The type of features of the adult school are:—

1. That the adults want to learn.
2. That they have some power of teaching themselves.
3. That the opportunities vary greatly; so that each pupil must progress by himself.

In the last two years we have been experimenting with "Correspondence Courses" in the P. N. T. system for women, and I believe that this system would do for the adult school generally. The system is as follows:—Printed assignments are sent to the women (about ten days' work). The teacher goes through the assignment with the pupil. The pupil sends the teacher again (or the teacher sends the pupil) when

\* Not printed.

Mr. P. West

Jan 12-53

he has finished the work, and the teacher gives him a very short test (also provided ready-made). If a pupil has difficulties he can of course see the teacher in between wholes. Some finish an assignment in a week; some take a month over it. They may go as fast as they like, or as slowly; and they may take any subject they like. The crucial point of the system is the assignments. These are drawn up with extreme care and a very high measure of skill. A research student is spending a whole year, whole time, drawing up one such set of assignments in one subject. The reason for this care and trouble is that these assignments must be as far as possible self-teaching; they must be independent of the lack of skill of the teacher. In the case of the assignments for literates, the teacher is merely a post-office. Assignments are sent out complete, with pencils, paste, rubber because our pupils have not got such things, and cannot buy them.

The system was suggested by Lord Lytton. I believe there is a great future for it.

Mr. M. West,

## Oral Evidence

23977 *The Chairman*, Mr West, you are in charge of the Teachers' College at Dacca?—Yes.

23978. You have provided the Commission with a note of the evidence that you desire to give. Do you want to say anything of a general nature on this subject in addition to what you have written?—I should like to explain one point about the evidence that I have given, and that is that I do not suggest that any of the proposals which I made should be adopted whole-sale at present. I feel that all I have suggested here is a matter for experiment first before it can be broad-casted and that we do not know sufficient of the difficulties which may be met in establishing a system of the kind I have proposed. It would be necessary to go very slowly.

23979. Upon that would you wish to say anything about the order in which you would like the various component parts of this experiment to be undertaken? Or do you think that that is evident on the face of your proposals?—Supposing I were asked as to what I proposed to do about this note, I should say that the first thing would be to take one limited area and to set about realising in that area what one imagines to be, or what I have suggested is likely to be, an effective and practicable organisation for primary education. One would certainly make a lot of mistakes at first, and one would probably spend a considerable amount of money on things which might have been done more cheaply but eventually one would have in that area a practicable system complete and working in such a way that it would not require expert supervision; and it then might be possible to say—Now there you are; that is what you want. If you want education in your area you can go and do the same. There is no tradition, there is nothing to imitate at present in primary education. There is nowhere to begin from.

23980. So that you would go for a small scale experiment of an intensive nature? Would you like one area and make your experiments?—One Union. Even then one could not get far from an East Bengal Union as to what could be done in Birbhum and in the country is so completely different. But it would give a pointer and gradually one would be able to see what could be modified, but that would be the starting point.

23981. How do you advocate a system of what I think you call central primary schools, fed by children who have passed the first and second standards from a feeder school in the neighbourhood?—Yes.

23982. Have you worked out the financial aspect of the proposal?—I have worked out in the Survey, of which I have submitted a copy, what the cost of providing education for the whole Province would be. All round the figures were 1918 figures but I do not believe that this central school system would be more expensive than the larger system which I have proposed there. The chief thing about it is that these feeder schools would be added to a very large extent the existing *pathshalas*, and I cannot think of any other system which would not involve the rapping of the existing *pathshalas*.

23983. And you propose to have one or two teachers in the feeder school?—That is all dependent on the size of the hamlet. In a small hamlet one could do with one teacher holding two classes a day as is done in some mission primary schools. In a large hamlet, however, three teachers would be required. They would always aim at reading and writing and nothing else.

23984. I wonder whether you could give the Commission any ideas as to adult education? Do you feel yourself that that is a direction in which effort and funds might be judiciously invested with advantage?—Yes. I feel very strongly that it is a line on which one should most emphatically ought to be done in the villages, because it is a source of making the village life more interesting. The *lobu* class regard it as a hardship to be sent out into a school in the mohussil, i.e., in a small village place. They say that it is dull; and it certainly is dull, just the same as it is in England. When the village is dull people with more brains tend to drift away. But if we could do more in this respect to provide provender for the mind and make the village more interesting there would be less reason for such depletion of intellect from the villages and such a drift of people from the village to the towns.

23985. I suppose the apathy as to education which is found amongst a considerable proportion of parents is due largely to the fact that the parents are illiterate themselves. Do you not appreciate the value of education?—I think that must be the main cause. As I have shown in the Survey and in my written evidence, the question of parents has absolutely very little significance.

23986. Do you feel yourself that adult education is a field in which more experiments are required before a policy can be decided upon?—I think it would be necessary. It is dangerous to broadcast anything in this country as one broadcasts in England. For

Mr. M. West.

pp. 13-39

instance, a thing that is successful in England is often a hopeless failure here, and a thing that has proved a failure in England has sometimes done very well here. There are so many unexpected difficulties and a scheme may break down and get a bad reputation through some quite unforeseeable details. In our experiments in the zenanas, for example, one little difficulty which occurred, which we never thought of, was that a zenana would not possess such a thing as a pencil. If we broadcast a scheme straightaway, there may be countless mistakes.

23967. Have you anything that you would like to say about female education?—It is one of the things which has been neglected, comparatively. The more the women are educated, the more they will demand education for their children. I think the women to a certain extent are the offenders in Bengal for withdrawing small children from schools. When I was teaching in a *pathshala* in Dacca town, the mothers used to come and call their children out for jobs in the home. I think they are the offenders in that wastage of children from the lowest classes.

23968. In this matter of the wastage from the lower classes, have you ever considered the possibility of instituting a system by contracting in that parents would undertake to send their children to the school and would receive for them free education provided they left them there for the whole period of the primary education system; but, if the parents decided to take the children away from the school, say, after they entered the second class, then that would be a breach of the contract and a fine would result. If the children remained in the school until Class III, then a smaller fine would result because there again there will be a partial breach of contract?—I had thought of a system of that sort but there is so little enthusiasm for sending the children to the school that I am not certain that it would work; it would merely act as a deterrent. The man may say; my neighbour was fined Rs. 10 because his child left school early, so I shall not send my child at all.

23969. Do you think it is any good sending a child to a primary school and taking him away again at the end of the year?—I think it is not only of no use but may actually result in harm because it distracts the attention of the teacher. The school will be filled up with babies who are not going to stick to the school for any length of time.

23970. And those babies never stop long enough in the school to get any benefit? I mean the ones who leave the school get no permanent benefit either?—They sit there and get a smattering of something which they do not understand.

23971. So that it might be that, although some such scheme as I outlined a moment ago might reduce the total number of children going to school, that reduction would be without advantage if it did not proceed too far. Do you agree with that?—I think it would be necessary to add to such a scheme a provision regarding the age of first admission. This difficulty of the lowest class might be dealt with by some means whereby one could see that children are not to be taken into a primary school below a certain age. Of course, the ages of Bengali children are not known, but one could fix a physical sign. One could say that the child is not to be taken into the school before he appears to be six years old, which is a very easily identified physical age. But it is doubtful whether a rule of that sort could be made unless it were embodied in a Compulsory Primary Education Act. And then, of course, there would be a lot of newspaper criticism of it. The first thing that they started cutting in England, when they started to cut the expenditure, was the kindergarten, which is a luxury.

23972. Would you tell the Commission what teachers pass through your College exactly?—I train mainly teachers for secondary schools. I also have Sub-Inspectors, that is, Inspectors of primary schools. But my present work is mainly connected with the training of secondary teachers. I was an Inspector of Schools before I came here.

23973. I understood from Mr. Oaten yesterday that no primary school teachers pass through the normal colleges. Was I correct in so understanding him? Do you know if primary teachers go through normal schools?—I do not think that was quite correct. There are three grades of training institutions in this country. In the *guru* training schools there are only primary teachers and they are mostly situated in quite small places.

23974. So all primary teachers must come through either those schools or higher schools?—Most of the primary teachers are trained by the *guru* training schools. Then there is another thing called the normal school. A normal school takes teachers who have passed the middle school examination. There are only three normal schools in East Bengal. Quite a good proportion of the men trained in the normal schools go out as vernacular teachers in high and middle schools and a small number of them go as teachers of primary schools. They were originally intended as primary teaching institutions but nowadays things have changed and they mostly supply vernacular

Mr. M. West.

teachers for the lower grades. Then there is the Training College, which is my place. That college trains English-speaking teachers who are graduates.

23975. What type of schoolmaster would you suggest for these central primary schools that you have suggested?—I think we need the teacher who will be turned out by the revised normal schools. There has just been a Committee on the re-constitution of normal schools, and in general the proposal is that the normal schools should take in matriculates, and that they should have a very selective course. That is to say, a man should have a small number of compulsory subjects and the rest of his subjects he should choose, so that one teacher might be turned out with nature study or agriculture as his special subject, and another man would be rather an art master. Those are the men who would be specialist teachers in central schools. But the headmaster of a central school needs to be a man who is specially trained in my college through the L. T. course. A smaller central school might have a better class of man from the normal school as its headmaster. The main supply of assistant teachers for these central schools should come from these reconstituted normal schools. This is what we hope to achieve.

23976. What do you say about the present salaries of primary school teachers?—The present salaries are so small, or rather the grants are so small, that a man may not be able to live on his grant. I have given the exact figures in the Survey which show that a good half of a primary teacher's income is derived from sources other than the school. There is a list of these other sources of income given in the Survey, e.g., land, a shop, making fireworks, and so on. Now if this other occupation needs his attention, and the school needs his attention,—it is obvious which of them will get it. Personally I think that the aided system is hopeless for primary education. It will not work. The only thing to do is, not to have a State system but, a system run by local education authorities. We should not only dispend on with these aided schools, but we should have power whereby one could deliberately dispose of them—where you get a decent District Board school having its children drawn away by competition from one of these individual private schools, one ought to be able to close the private school or amalgamate it with the District Board school. In one village in West Bengal there are eleven primary schools. Even if you withdraw the grant they do not mind it, because the grant is so small.

23977. *Professor Ganguly*. Do you follow any particular policy in making these grants?—There has never been, to my knowledge, any pronouncement by the department saying that a grant is not to be given to two primary schools within a certain distance of each other. Some of the Sub-Inspectors do realise the evils of competition and do endeavour to prevent the over-schooling of areas, but they do not like to deprive the poor *pundit* of his living, or something of that sort. A very large number of the Sub-Inspectors have no idea of the subject and do not realise that it is an evil, because the majority of them, as I have pointed out in my written evidence, have been given the ordinary B. T. course which is a course for secondary masters and contains nothing about primary education. It is only since 1920 that I have begun to give a special course for Sub-Inspectors.

23978. *The Chairman*. Do you expect to see many Union Boards taking advantage of the Compulsion Act?—I do not know sufficient of the administrative side to say how quickly it would move, but I think if they could see some practical example before them such as I have suggested, something that they could do, that was obviously a good thing, they would probably take it up more quickly than they took up Mr. Biss's proposal a few years ago.

23979. Do you expect the adoption of compulsion to affect the social position or pay of the teacher in any way?—I do not think one could adopt compulsion until one had got a new system of schools and a teacher of a better status than at present.

23980. You cannot conceive of a compulsory and free system of education founded on the present arrangements?—No.

23981. Have you any constructive suggestions to make as to how this lack of books of knowledge in modern Bengali might be remedied?—The main thing is that the teaching of reading in the schools should be such as to enable a boy to read for pleasure. At present, the boys in the primary school are taught to read in such a way that in most cases there is a stream of words coming out of their mouths, but not an idea enters their head. I have tried it myself. Give a boy an easy and interesting story, and he will read it aloud and very rapidly and fluently; but ask him the simplest question and he cannot answer it. At present the schools are producing reading power, but not silent reading power; and, to a certain extent, the same thing is true of the high schools and the intermediate colleges. The figures given show that an intermediate college boy has extraordinarily little power of reading. This is all partly due to bad methods of teaching, and it is also due to the absence of libraries. Any library that there may be in a school

Mr. M. West.

is locked up in the building's room. There is of a village, Indian library, comprising, truly, a new one.

23982. *Professor Ganguly*. You have nothing in the direction of what they have in Paris?—I have heard of the French system, but I have not seen it. I find nothing a lending library, in a little private school in this town, and I cannot say it is improved by the extraordinary character of the boys. There was one boy who had read out books of fairy tales. I do not think he had ever read a fairy tale before, he was fascinated by the books, they were a revelation to him.

23983. *The Chairman*. Do you notice any disappointment on the part of the parents or older students on account of the fact that the present system produces a store of words, but no ideas? Do you think the system is really of any value at all?—No, I think that is too long a point for the public to realize. The boys themselves do not read aloud, and they say, "How much my boy reads."

23984. They do not read the literature but even expecting the mind and exercising conversation?—No. They do not understand the difference between a book and a piece of printed matter and do not understand it.

23985. *Sir James MacKenzie*. There is a great deal to be said for the system of the present type of school books which you have been mentioning. Are they better and more than any great extent in primary school books? The English books were only published at a cost of one or two months ago, and they are of course a deal for high school. It may be a little better before they are adopted in primary schools for the first time of 1891. They have got to get through the District Boards and the District Education Committees have in most cases their own ideas of text-books. The English text-books need a year's time before they are ready to be used, and if they are not found satisfactory at the end of the year they will have to be replaced by a new one. There may be a certain number of instances where you have to use a limited number of books, and I see that no "outlets" would get in. The only way of finding out what is the best suitable is by teaching them in a class.

23986. How are the Bengali books produced? Are they a better system, and better?—There was one Bengali text-book produced under the orders of the District Government by Mr. Majumdar and Mr. Das. It is a fairly good book though the style is very difficult to place; it is very patchy. The rest of the system for Bengali is produced by teachers. They want a little better style; producing is not a simple matter. The control of Government over text-books is not so strict as it is in England. It is not possible to produce a text-book for a few rupees. Hence that is a great deal in the way, and one or two other books in the neighbourhood of English composition with them, and he risks a few money out of it.

23987. Are they translations from English school books or original composition?—Very large numbers of them are copies of that book by Messrs. Majumdar and Das. They are with something about the same style, and in almost every one of them you find the story of George Washington who could not tell his.

23988. *Professor Gregory*. And the cherry tree?—Yes. And "The Crow and the Pitcher" is almost universal in them.

23989. *Sir James MacKenzie*. Is there any definite system of producing books for primary schools by the Education Department, and if so, is it really a system? I think they go on very much as they please, but the present system is not a system. The District Boards for the District Education have a great deal to say in the matter now, but there has been some change since I was an Inspector. I do not think the present conditions, but I think the present system of books for primary schools is not normally done by the District Boards; but they do not do very much better than the present.

23990. You have a Text-book Committee for the District Board?—It is a committee in regard to text-books for primary schools. There are two text-books for primary schools, one in Bengali and one in Calcutta, and if you get the book of it.

23991. That is for high school and the University?—Yes.

23992. *Mr. Bishnu Basu*. The District Board have to make a selection out of this prescribed list?—Yes.

23993. *Professor Ganguly*. What is the object of sending the list to the District Board? The Department is now revising the whole system, because there is a great number of books in the list that it is really no longer helpful at all.

23994. *Sir James MacKenzie*. As Principal of a Teachers' College, what are your opportunities for inculcating your ideas into the minds of your pupils? Are you more

Mr. M. West.

or less bound by a rigorous course, out of which you cannot go very far?—We are very fortunately situated here, because the new Dacca University courses are drawn up by a Committee on Courses, which consists of the staff of the college and one outsider, so that we can alter our courses almost every year. I think that, with the exception of this year, we have made some modification every year since the Dacca University was instituted. It is very easy to change a course, and the University is a very good master; they do realise the disadvantages of a cut and-dried course.

23995. I was wondering if you had opportunities of inculcating some of the various ideas which you yourself have about educational improvement?—I think one has all the opportunities one wants.

23996. Obviously, it is from your teachers that you get good work going?—Yes, but of the 80 teachers I am training this year, only about half a dozen are Sub-Inspectors who are going to primary schools.

Still that is a little.

23997. *Professor Gangulee*. Do you have agricultural subjects in the curricula of your Teachers' Training College?—No.

23998. None at all?—No. I do not know that they would serve any purpose. If a boy goes in for study in a high school, it means he is lost to agriculture. He is the one extra in the family that the father has got no room for on his land.

23999. From what class of people do your students come?—They are B.A.'s.

24000. They come to you for training?—For training, mainly to be sent into high schools; it is in the normal schools that we want agricultural education.

24001. They do not get any idea of education in rural economics?—I do not think that the subject would be required at all there; it is useful in the normal schools.

24002. *Mr. Collett*: Is not your inspectorate taken from your College?—It is the demand for the specialist that has to be considered. Supposing one had agricultural teaching in the central schools, I imagine that, for the inspecting of the agricultural side, one could make special arrangements.

24003. *Professor Gangulee's* question was with regard to rural economics?—One could make special arrangements for inspecting that subject in the central school by getting the Agricultural Department to train a certain number of men. I do not think it would be necessary to make arrangements for that in this Training College. If you appoint one or two men who are also qualified in agriculture to the Education Department and then give them training as inspectors, that would serve the purpose.

24004. *Professor Gangulee*. But these teachers will have to come into contact with rural life; their profession will bring them into touch with the rural population?—Yes, that is true. But if there is only a year's course we could not do very much; we could only polish up in the College the things they know already, and teach them the professional educational part.

24005. What about scientific education, nature study, for instance? Do you teach the B.A.'s that come to you the method of teaching science, or any thing of that sort?—There is a proposal in that connection before Government. Two years ago, I proposed that we should be allowed to teach biology, and I hope that we will get the money for that next year.

24006. Up till now nothing has been done?—We used to teach physics and chemistry; it was found to be no good and we dropped it. It would be useful to teach the teachers some biology. It was not specially as a rural subject that I thought it would be valuable, but I thought it would be valuable from the hygienic and moral side.

24007. A scientific outlook in the teacher is always valuable?—These are optional subjects; they are not compulsory.

24008. On page 510 you make a reference to national psychology. What particular aspect of national psychology have you in mind?—I have been thinking of it since I submitted my note. I do not think national psychology is the root cause. 'National psychology' is a vague term. The use of the term 'national psychology' implies that the nation has some congenital deficiency in organising ability. No nation is pure stock and organising ability is not a Mendelian characteristic. I think the real root cause is not national psychology, but lack of educational tradition. When they started it in England, there were the Lancaster schools. They could say that they wanted a school designed on those lines. There is nothing like that in Bengal. There is no proper system of primary education anywhere in the Province that we can start from; I think that is the real thing; it is lack of an educational tradition.

Mr. M. West.

21009. You do not mean to suggest that we have not an educational tradition in this country?—I mean that there is nothing that you can start out to imitate. If you want to start a system of primary schools, you must say that you want them after a particular pattern.

21009. Are you familiar with the rural life of Bengal?—I have been touring round doing inspection work.

21010. What are the serious handicaps or obstacles to developing rural schools into community centres, as you would like to do?—Chiefly water in East Bengal, and the extreme dislike or timidity of parents about sending their children any distance to school. From the figures given in the *Survey*, I think I am correct in saying that about 81 per cent. of the children mentioned in the *Survey* walked a quarter of a mile or less to school. They have got no idea as to what distance a child can walk to school. Of course, in certain parts of the country during the monsoon, it would be very difficult to organise economically, using the system of central schools that I propose one would have to lose money on one half of the Province and gain it in the other half.

21011. What about the school in a big village, where the children need not walk great distances? Could you not develop that particular school into a community centre?—I think that certainly might be done in the big village. I am thinking of a central school as a community centre, with its outlying feeder schools in neighbouring villages, but there would be difficulty with regard to that in the flooded areas.

21012. I wonder whether you can tell us why it is that we could not develop that school in the big village into a community centre?—I think it could be done, if one had the power to make it the one school in the village: at present in big villages there are several schools.

21013. You make a very interesting suggestion in your note that the Co-operative, the Agricultural and other Departments of Government could make the school the centre of their work. When they visit the village they could hold their meetings there, and they could discuss problems with the villagers in that school. In that way you could develop it into a community centre?—I think it could be done, but nobody has ever tried to do it.

21014. So it has not been tried?—No.

21015. You ascribe the failure to national psychology?—No; I think that the community centres are a comparatively new idea to India. It was first mooted in the Fleming Report.

21016. I want to ask you one or two questions about adult education. It is officially stated that about 39 per cent. of the people educated in India relapse into illiteracy within five years of their leaving school. Do you agree that that situation calls for an adult education movement in India?—Yes, certainly.

21017. It is a case for carrying on propaganda for adult education?—I think that relapsing to illiteracy must mean that they are not properly educated. I cannot conceive how one can become illiterate if he is properly trained. If you read and enjoyed fairy tales in your youth and shut yourself up in prison for ten years, you will still never forget how to read.

21018. The adult education movement in Great Britain, as you know, was followed up by University Extension. There is the Workmen's Education Society and many other organisations. Is there any organisation in Bengal that you can think of that might take the initiative in this direction? Who is going to carry on this adult education movement? What agency would you look to?—I think probably part of it has got to be done by the central school system. One might suggest the Social Service League, which is doing it in a small way, but this is too big a job to be entrusted to private agencies. It has got to be organised, and it ought to be done by the central school.

21019. Do you think the University could take part in it?—I do not think so. They might do a little here and there. The University students have a Social Service League and they run a night school here; but it is very spasmodic. I tried to help them but they were not very keen. The movement has got to have money and organisation behind it and must be done systematically. Private agencies can help, but they are not sufficient. It is much more important in India than in England; in England there are lots of ways by which adults are educated, but here it is a crucial point.

21020. A University Extension Service could be organised?—They might give one or two lectures in villages, but we want something permanent. There must be somebody to do the donkey work.

Mr. M. West.

24021. Do you think the co-operative movement could be utilised for this purpose?—I think education is mainly the duty of the Education Department. Others may help, but the main responsibility, the donkey work, has got to be done by the Education Department. It should arrange for the lecture and say to the Co-operative Department, "Here is the hall at your disposal; we shall be only too delighted if you will give your lectures here; you can exhibit your lantern slides here,"—and so on.

24022. *Mr. Calvert*: Is it not begging the question? You say the Education Department is responsible?—Adult education should be organised by the Education Department, but they may ask others' help. One could not make the Co-operative Department responsible for the adult education of a certain area all the year round. Their business is co-operative credit.

24023. Are you not in danger in using the word "education" in two quite different meanings? Is not the Agricultural Department an education department? Is not the Public Health Department an education department? Is not the Co-operative Department an education department?—Quite so. I am referring to the organisation of the thing. Someone has got to be there and see that everything is ready and tell the people about the lectures and so on. He must see that the hall is ready. The organisation might be done by the central school, and all these other departments would use that organisation for their educational efforts, instead of each having their own organisation.

24024. *Professor Gangulee*: You cannot think of education by compartments, can you? Education is alive, is organic?—I think each department should have a decent share in it, but someone has got to be responsible and someone has got to do the spade work.

24025. When the MacLagan Committee sat and reported on the co-operative movement, they laid stress on the fact that the backwardness of this country was largely due to stagnation; that was precisely the word they used. How can you remove that stagnation without educational forces working in conjunction and co-operation with the co-operative movement?—I think that is quite right; but the organisation has got to be done by somebody.

24026. I want to find out from you, if I may, whether we have in this country any organisation which could be utilised to make a start in the adult education movement. First I asked you whether we could utilise the Universities or the Colleges; then I wanted to know whether the co-operative societies could be utilised. Now I want to ask you whether the weekly rural markets or the *hats* in the villages could be utilised for the purpose?—I think it will be more useful if I just indicate to you what I mean by adult education, because, we are rather at cross purposes. I do not deny that each department has got its own propaganda to do. By adult education I rather mean that there should be a certain place in the village where the grown up man can go and get teaching in a class and can say; "I want to study such and such a subject". There must be classes held as they are held in the evening by technical institutions in England. Or if the man is busy all day long and his available time is very spasmodic, I think, there is a considerable future for the sort of correspondence course where the man gets his lessons, studies them at home and brings them back after a time as soon as they are ready. If any particular department wishes to run a course in its own particular subject, there is the organisation open for it to run that course. But I was not referring to the sort of propaganda of occasional lectures in *hats* and village halls.

24027. What would be the organisation which would co-operate with all other various departments and organise these courses?—That should be the central school.

24028. Just as in England, where they have the Workmen's Education Society organising series of lectures in the various parts of the country? Would you have an Association like that?—I would have a central school.

24029. Which would co-operate with the Co-operative Department, the Public Health Department, the Agricultural Department and so on?—Yes.

24030. And also utilise all these agencies in the country, the weekly *hats*, the festivals and so on?—The weekly *hats* are outside the job of the central school master. His job is to institute lectures in the school building. The other work should be done by the propaganda agency. Still, that is a minor point.

24031. What is your idea as regards agricultural training being introduced as an optional subject in the Matriculation course?—I have no very definite idea about that. I think the boy who comes to the Matriculation class does not mean to go back to the village as a cultivator, and if you introduce that subject it will rather tend to make him hope to get some sort of job, say as an Inspector in the Agricultural Department. But I am rather doubtful about that; I do not know what the attitude of the boy would be.

Mr. M. West.

After all, matriculates have got a lot of work to do in learning English. The Intermediate stage might be more hopeful.

21032. Do any of your students in the Teachers' College visit the Dacca Farm? Do you take them there?—Yes; they go out each year.

21033. *Mr. Calvert* On the last page of your note you criticise certain things. You speak of the carelessly administered system of small grants in aid, the lack of policy, inspecting officers not being trained and so on. Who is responsible for this state of things you are criticising?—It is very difficult to say.

21034. Is it not your department?—Yes, I thought you were asking where in the department the lapse occurred.

21035. If these defects have been noted, why do the defects continue to exist?—Defect No. 3 of course is gradually being dealt with, but only in a very small way; the training college in Calcutta has only just been opened; they have not got their new course going yet; I hope they will have a special course for inspecting officers. "The lack of any policy as to the distribution of the grants" is due to lack of training in the Sub-Inspectors.

21036. These are really defects in the department which the department itself can correct?—Yes.

21037. Without any further stimulus from us or from Government?—I think stimulus is needed. The extent of the defect is not generally realised; I mean, it may be realised in Writers' Buildings, but I doubt whether the average Additional Inspector realises the harm that is done by the present system of distributing grants. I doubt whether a grant-in-aid system is practicable for a general system of education.

21038. But the present defects in the grant-in-aid system can be removed by the Department itself without any recommendation from us asking Government to interfere?—It would be very difficult to set things right now by removing grants from schools and so on; the harm has been done.

21039. *Professor Ganguly* How would you propose to remedy it?—By organising a small area and seeing how best it could be remedied. We should certainly need powers to control the opening of schools and to say that people may not open a rival school.

21040. You need legislation to do that?—I think it probably would be necessary; I cannot see any other way of controlling schools that are not wanted.

21041. *Mr. Calvert* Later on you refer to the parent's need of the children's labour; do you think that the need of the children's labour is a cause of absenteeism from schools, or is it just the parents' laziness?—I cannot say how far it is really necessary for them to use the labour of their children; but they do; and I think that is an important cause of absence from school. In one town the children of the sweepers were able to earn something and they were taken away from school because of the actual value of their earnings. In other cases, I think they are just used when they are useful, and when they are in the way they are sent to school.

21042. We have had both kinds of evidence; some say that the children's labour really is required; others say it is not required at all, that it is merely an excuse and is not the reason?—I am not prepared to say to what extent that is so; I think that is a question which a Bengali who goes inside the home would be able to answer better than I can.

21043. You suggest compulsory education is needed for two purposes, but you do not mention economy. Would not compulsory education, even in a small area, lead to much more efficient utilisation of the same amount of money?—I think more money would be required, but the money would be used more effectively if compulsory enabled one to produce an organised system of schools in that area instead of the present chaos.

21044. Actually, with your present number of teachers, with a local compulsory system, you could educate far more children than you do now?—We could use our existing facilities more economically by putting one teacher to teach one class of 50 children instead of teaching a fluctuating number divided into four classes; we should make better use of what we have got now; but, of course, it would cost more to educate all the children than the small percentage who are now being educated.

21045. In view of the list given us by Mr. O'Brien showing £17,000 in Class I and only £7,000 in Class IV, which I take to be the literary stage, you would get better value for your money with 300,000 children in each class?—Yes; you would get better value for your money if you had larger schools with four teachers, or centralised schools with the top classes grouped under specialised teachers and one teacher teaching one class. You

Mr. M. West.

would not get better value if you did what they have proposed to do in one Municipality, where, when I asked them how they would organise their compulsory education, they said, "We have now so many schools, we should then have so many more." They would have had about fifty schools; they had no idea beyond that of the one-teacher school. If those schools were organised, there would be considerable economy.

24046. The objection that compulsion would involve more expenditure is by no means universally accepted; it has been urged that compulsion would mean economy, and that so far from being unable to afford compulsion, you cannot afford this present haphazard method?—Under compulsion the education which would be given would be far cheaper per child and more effective. Well, I will not say cheaper, but certainly more effective and giving better value than at present.

24047. For your 30 lakhs a year you would turn out a vastly larger number of literates?—Yes.

24048. You say we must consider what can be done to give the ordinary teacher some agricultural bias. Do you attach importance to an agricultural bias being given to the teacher?—Yes, I think it would be a valuable thing to do. That was said rather with reference to the work of the guru training school. Personally, I should like to see it provided as a selective subject, to have a range of subjects from which the teacher would choose one. I do not think it is much use making it a compulsory subject in all guru training schools, as some men have no natural aptitude for it.

24049. I am not speaking of the school curriculum?—But I am thinking of the curriculum for training teachers.

24050. Which do you think is more important, the curriculum or the teacher?—The teacher. Here is, "We have also to consider what can be done to give the ordinary teacher in the ordinary primary school some agricultural bias and enable him to make some use perhaps of the school garden. Such teachers are trained at guru training schools."?—The suggestion is that it might be possible to give certain of the teachers of the ordinary small primary schools, as they exist at present, a certain interest in that work.

24051. We have been told that the teacher is more important than the curriculum?—I certainly agree with that.

24052. And it is more important to have the agricultural bias in the teacher than in the curriculum?—Yes, and you get that in the teacher by giving that as a subject in the training course to those teachers who have a leaning in that direction and giving them facilities for developing that line of interest.

24053. On page 512 you refer to some of the main causes of illiteracy, but you do not there mention the teacher. Do you not think your defective teachers are a cause of illiteracy?—The inefficiency of the system as a whole.

24054. The inefficiency of the teachers?—Yes, that is one of the causes. Of course, under present conditions with four classes the best teacher in the world could not do anything. For example, the Sub-Inspectors of Schools are graduates and some of them are very able men; as part of their training I put them to teach in primary schools with two classes at once, but they cannot do very much, and the best of them can only make a very poor job of teaching four classes at once. No man can teach four classes at once; a woman could not do it.

24055. But if your teachers stood out in the countryside as fine examples of what education can do for a man, do you not think they would have more success in removing illiteracy?—Yes, I think they would; but then there are other examples of the advantage of education; I am in the teachers are not the only educated people in the village. I think one of the causes of illiteracy is that the social position of the primary teacher is not good and his is not held in very much respect; he does not carry much weight.

24056. That is a great defect in the whole system, is it not?—That is one of the great defects, yes.

24057. Would you go so far as to say that a really first class teacher could surmount the difficulties of the system?—You mean if we staffed the present schools with the best teachers obtainable?

24058. Yes?—No; I think they would break their hearts.

24059. Similarly on pages 513 and 514 when you are dealing with adult education you do not mention the teacher; do you not think the teacher is an important factor in the success or failure of adult education?—I am not quite sure what that question means.

Mr. H. West.

You mean that the influence of the teacher is important in persuading adults to come to him for education ?

24060. Yes, in attracting adults ?—If we refer back to the beginning, supposing there were a central school with a man at the head of it who really had personality and energy, certainly by his personality and the respect in which he was held he would be able to make adult education in his area a success where a man with less personality and energy would fail.

24061. A teacher who could attract adults to his school by his personality would have far better chances of success than one who took up teaching as a method of earning a few extra rupees a month ?—Yes ; and a fairly big school like a central school would be able to pay an adequate salary to a schoolmaster who had those qualities. At present these tiny little schools of thirty children and a few rupees grant do not get that type of man, and it would be a ridiculous extravagance to provide that sort of man for such schools. One of the reasons why we want bigger schools is to get, above all, a better headmaster.

24062. We were told by Mr. Oaten that it is no part of the policy of his department to insist on getting a maximum number of primary school teachers from the agricultural classes, whereas in the Punjab it is the policy of the department to get as many teachers as possible from the agricultural classes ; in the Punjab education is doing well, while in Bengal we are told it is not quite so successful. I was wondering to what extent that is due to the personality of the teacher and the class from which he is drawn ?—I think the most important thing in a teacher is energy and initiative, wherever he comes from.

24063. Would you not add sympathy with his pupils ?—Yes, certainly ; naturally, other things being equal, I would rather have for a rural school a man who comes from the country and is familiar with country life, but I would not make that an absolute rule and say that a particular appointment was only open to people who had lived so many years in the country. The most important thing in a teacher is energy and initiative, and if you cannot get a man from the land with energy and initiative, you must get him from elsewhere ; but he must have energy.

24064. You talk of removing "unteachables" from the elementary classes. What do you mean by that expression ? Do you refer to children who are sent to school and are too young to learn ?—They are sent merely to get them out of the way in the home.

24065. Were you thinking of the menial class ?—No. I simply meant children who were too young.

24066. On this question of wastage in classes I to IV, is any encouragement inadvertently given in reports by stressing merely numbers on the rolls ?—I think that is the tendency. I have often looked back with a certain measure of doubt upon the abolition of the system of payment by result. There is nowadays too much swelling of mere numbers on the rolls.

24067. Was much stress laid on the increase of numbers in the rolls and not on the increase of numbers in the IV class ?—Yes ; there is not enough stress on the actual results.

24068. Are your grants based on roll numbers ?—Yes, they tend to be.

24069. They are not based on class IV ?—No.

24070. If you based them on class IV would that not encourage the production of literacy ?—I do not know what the effect of that would be. It might be based on the number of boys who passed a certain primary examination in the school. But then of course there might be some fraud ; they might use the same boy over and over again.

24071. With regard to your training college students, you told Professor Gangulee that they had to go to the Dacca farm. Do you attempt to get them lecturers from the Co-operative Department, or the Public Health Department, or the Agricultural Department ?—I should like to explain that point by saying that my training college students are meant as teachers for high schools. They are B.A.'s and they come to me for only nine months. I cannot possibly hope to teach the men in that time any new subject. I can hope to open their minds a little bit, but our main duty is to teach them how to teach, and we teach them the essentials of the educational theory. Supposing somebody wrote to me and said, 'I want a teacher qualified in agriculture,' the way one would set about it would be this ; one would want a man who knew something about the matter to start with.

24072. But supposing what was wanted was not somebody qualified in agriculture but some one who took an interest in agriculture ?—Well, these men are teachers of high schools, and personally I am very doubtful whether agriculture in the high schools

Mr. M. West.

is either a practical proposition or is wanted, or whether the right place to introduce it is in the high school, and, therefore, I have not made any attempt in my college to teach agriculture to these men who are going to the high schools. It is not a subject which they would teach under present circumstances. If agriculture were made a subject in the Matriculation examination, it would be up to me to produce teachers for that.

24073. *Professor Ganguly*: But could not a rural outlook be provided?—Yes, but the time is so very short that we have not been able to do very much of that. I like them to see something and to get an idea of what is being done at the farm as a part of their general education. But my function here is to produce secondary teachers and I have got my work cut out. One has not got the time to remedy the defects of their general education. We have a course on the problems of education in Bengal, in which the problem of village education and the sort of thing we are discussing now are discussed, and that is where they would deal with these problems.

24074. *Mr. Calvert*: Do I take it then that you do not attach much importance to your students having a general knowledge of the work being done by the allied Departments of Agriculture, Co-operation, and Public Health?—Certainly I attach great importance to it, but one cannot do very much in the short time at one's disposal. In that short time we do all we can. They go out for a visit to the farm and see Mr. Griffin's work in the Public Health Department, and he comes and lectures at the college. It is part of their regular routine. They go round the various Public Health Departments in the town. Then again, we ask various outside lecturers to come and talk to us. This is not only confined to the Public Health and Agricultural Departments, but the Police Department are also asked to come and lecture on their working. This is all a part of the general education of the college. As I say, the time is so short and much cannot be done. We do the very best we can.

24075. *Shri Bahadur Bannerji*: Who is Mr. Griffin?—He has been building up the village system of Dacca and doing other things.

24076. *Mr. Calvert*: In the training centres for primary and middle schools, is there any attempt made to teach these teachers rural economy and the economics of village life?—No; but in the proposals for reorganising normal schools that is one of the subjects, and this would in my opinion bring about an immense amount of good.

24077. You have probably heard of Maga in the Punjab where technical courses in village economics are given?—Yes.

24078. Do you not think that a great deal of good might result from getting the teacher interested in the problems of village life?—I think it is the most essential part of the work of the normal schools.

24079. One suggestion made to us is that Inspectors of Schools should be drawn from Bachelors of Science or Agriculture?—What is the idea of doing that?

24080. To ensure that your Inspectors of Rural Schools have some knowledge of the countryside and its problems. You take B.A.'s; why not take B.Sc.'s?—This college is expending most of its time training out ordinary high school teachers and we have to do the best we can for the Sub-Inspectors to let them into our existing organisation. The ideal would be to have a special training course for the Sub-Inspector which would definitely fit him for his work and in so far as the study of matters of agriculture and rural economics goes, these things would be a necessary part of the course. At present we have to compromise because there are only about five Sub-Inspectors appointed each year.

24081. *The Chairman*: How old is the average man when he goes in for his Sub-Inspectorship?—In the twenties.

24082. *Mr. Calvert*: Do you take graduates in your college?—Yes; graduates in arts and science.

24083. Have you any objection to taking graduates in agriculture?—I should have no objection to taking graduates in agriculture for training as Sub-Inspectors, and I think that it might be useful to do so, except that we could not get enough men for all the vacancies at once.

24084. Would you take half the men graduates in agriculture to begin with?—That would tend to limit the range of selection or else there would be a tremendous rush of men to take up agriculture in the University with the idea of getting sub-inspectorships.

24085. But why should that strike you with a feeling of horror? Why should not your Inspector know something about agriculture? Why do you give preference to men with history and such like qualifications over agricultural men?—I do not think that

Mr. M. West.

we give preference. In appointing a Sub-Inspector one naturally appoints the smartest fellow.

24086. What do you mean by the smartest fellow? Do you mean smart in understanding village problems?—One who has got active brains. But if you limit your range, if you say for instance that this man has got to be a Mahommedan or a Hindu, then you simply limit the range of selection and naturally you do not get the very best men.

24087. I do not understand your outlook. Do you admit that if you had in your rural schools really inspired teachers you would get better results?—Yes

24088. Now where is that inspiration to come from if it does not come from your Inspectors?—I think I could make the point clear in this way. The first essential of an inspecting officer is the man himself. We want the man with the most active brains, with the greatest energy, with the greatest enthusiasm, and we have got to have him irrespective of anything. When we have got them we can certainly take into consideration, other things being equal, the desirability of having men who have been brought up in the countryside and have full sympathy with country conditions and difficulties. Having got them, if we need certain extra subjects we can just give these to the men. But having got second-rate men we could not give them first class brains. We can add knowledge afterwards through a specific course. I am against any limitation being put on the range of selection as this tends to get second class men.

24089. But why should you not attempt to select the best man for the post, the man who is in that line already, instead of getting the best man in history for instance, to take up this job in agriculture?—I think that might be done eventually if there were sufficient graduates in agriculture and a wide range of selection.

24090. *Mr. Gupta* How many Sub-Inspectors do you recruit every year?—I do not know what the total number would be for the whole Province annually.

24091. *Mr. Calvert* You would like to have men who are active, energetic and enthusiastic, but surely those qualities vary with all subjects. For instance you might have activity at games and enthusiasm for bridge. What I want to know is, why you would not like to get men who are interested in agriculture also?—That is certainly desirable, but I would not like to see any specific limitation made to the effect that only men with certain qualifications would be taken.

24092. But at present you are taking none with agricultural qualifications?—I do not say that we bar them, but there are not many B.Sc.'s in Agriculture in Bengal I think. Their number, I think, is very small. The rule with Government is that a man nowadays must have been trained before he can be appointed. I do not remember any B.Sc. in Agriculture applying for training in my college.

24093. But if the Government were to issue orders that B.Sc.'s in Agriculture should be appointed to inspectorships?—If Government said that preference should be given to B.Sc.'s in Agriculture, since the unemployment problem is very acute, it is not unlikely that such men would come to the college for training with a view to obtain inspectorships; and if, in the course of the training, these recruits were found to be men of the required type, they would certainly get these posts. I do not think that any harm would be done if this were introduced. All I say is that I would not like to make any hard and fast rule.

24094. Now, in the evidence which you have just given I gathered that you were judging men by their examination ability, because a man who had passed high in his B.A. examination was given preference over the man who had taken only his B.Sc. in Agriculture?—I should not say that one would judge them entirely on their examination results, because examination results are very deceptive. I would put it in this way: The number of Inspectors we appoint is five per annum. If a rule is made that there must be Bachelors in Agriculture and there are only five such Bachelors of Agriculture in the Province, then we have got to appoint those five men even if one of them passed at the bottom of the third class in Agriculture and is a very feeble sort of fellow. Other things being equal, namely, the general records, the physique, the impression you get from the interview and the testimonials, the man with the knowledge of agriculture would be the more suitable man. That is a recommendation for him.

24095. Assuming that there is not any defect in the general side, you would give preference to the agricultural man?—I would not like to make a fixed limitation, because then you would be compelled to appoint those five men even if one of them is a very hopeless fellow.

24096. *Rai Bahadur Bannerji* Were you ever in West Bengal?—I was Inspector of Schools in the Presidency Division.

Mr. M. West.

24097. You admit that the condition of things in West Bengal is quite different to the conditions prevailing in East Bengal?—Most of my training for the survey done in 1918 was done in West Bengal because I knew less of West Bengal.

24098. If any experiment is tried in any particular area in West Bengal regarding compulsory free education, then necessarily a similar experiment has to be tried in West Bengal simultaneously?—Not necessarily simultaneously. One would do it first in either West or East Bengal and then consider what modifications would be necessary in transplanting it or adapting it to the different conditions of the other side of the Province.

24099. That would mean eventually that one part of Bengal, either East or West, would have to wait?—The experiments might be made simultaneously or successively.

24100. *Sir Henry Lawrence*. Could you tell us what scheme you would consider as most suitable for the improvement of the primers in use in primary schools? Would you like to have only one set of primers, authorised by the Government?—I do not think that would be desirable; that would be rather an interference with public competition. It is an extremely difficult problem and I do not know what I am going to do. I know that the experimental primer is a valuable piece of work, but when you come to the business side of it, it becomes difficult. What I propose to do, when these particular primers are finished, is to send them to the Director of Public Instruction. I shall say that the production of these primers has cost so much and whose property they are. I imagine the Government would say, "Well, we require a certain number of primers and the men who wrote them should have royalties and Government, if they consider them useful, will encourage them." I think they would go on the list with other primers as is laid down in the new proposed Text-book Rules. They propose to give a choice of four.

24101. Are there some new proposed Text-book Rules?—The present Text-book Rules are rather hopeless, but there are new rules under consideration and the new rules, I believe, are modelled on those in use in Assam, in which they say that there shall be only so many books on the list. If a new book comes along, it is up to the author of the new book to prove that it is better than the other books. With that system, as text books are improved, the newer and better ones would tend to replace the books on the list.

24102. Do these text-books contain lessons on hygiene and sanitation and matters of that kind?—The present Bengali books do not contain such lessons, but we have got a specific course of hygiene for women who can read. These books are all done for the zenanas. The English books have got lessons on hygiene.

24103. At what stage is hygiene taught?—Hygiene in English is taught to those boys whose vocabulary is about 500 words.

24104. What about the vernacular schools?—They have not yet reached that stage.

24105. There is no lesson at all on hygiene in the vernacular?—We have got one book which teaches the alphabet, but that, of course, does not include any lessons on hygiene or anything of that kind. The child's vocabulary is far too small at this stage. There are a few story readers for the later stage, which were done last year. We have not got on to that stage yet.

24106. What is the earliest age at which such lessons could usefully be given?—One could do something in Class III, which contains boys of the age of 8 to 9, and a certain amount could be done with boys of the age of 9 to 10.

24107. You have a separate hygiene primer at the present time?—At present in the primary schools there are hygiene primers. I believe the East Bengal syllabus says that hygiene is supposed to be taught without a primer, although the teachers actually use one. But, of course, the teaching, as you will see from the verbatim lessons given here (the Survey) is rather a farce. That is largely due to the fact that the teachers are not taught hygiene very effectively in their normal schools. We have been teaching hygiene in my college only for the past five years.

24108. Do you attach any importance to the introduction of hygiene teaching in primary schools?—I think in the higher classes of primary schools, say class IV, one might do an immense amount of good but not in the primary manner that is reported here (the Survey). Proper hygiene teaching can be given only by the primary teacher who has passed through the normal school and who has been taught real hygiene by a man who has learned hygiene in the Training College.

24109. Do you know anything about the primers that are in use in other Provinces?—I have not made a study of them.

24110. You have not seen them?—No.

Mr. M. West.

24111. Do you think that if a set of primers is prepared as a model it would be of value if translated into different languages in India?—The sort of primers which we are working on, building in the letters of the alphabet one by one and the words in the order of their frequency, cannot be translated. You have to rebuild them again for every language, and it involves such an amount of labour that I do not think any author would care to do it from a commercial point of view. I think that the Provincial Governments might make a start and get some one to construct that type of reader. But it means a tremendous amount of labour, and it takes a long time.

24112. It has to be done for each separate language quite separately?—Yes.

24113. I suppose the idea underlying the preparation of your primers is their universal application?—The technique and the method whereby they are prepared is described in a bulletin of the University which will be published very shortly.

24114. Who is preparing that?—I wrote an account of the procedure and that procedure is being used in the Bengali version.

24115. Sir Thomas Middleton. Is your Training College affiliated to the Dacca University or is it part of the University?—It is in rather an anomalous position. The members of the Training College staff are honorary teachers of the University.

24116. You do not train for any specific diploma or degree?—Our degree is a degree of the University and the teachers of the College are appointed honorary members of the University staff. Of course, the Dacca University in virtue of its Act may not give any external degrees.

24117. So that you have approved courses for the University?—They take the ordinary degree of the University.

24118. How many students attend the Training College?—Eighty.

24119. Of whom five to six are trained as Inspectors and the rest as high school teachers?—That is about the ordinary number. It varies, of course, from year to year.

24120. The entrance qualifications are a degree, I take it, of an Indian University?—We are supposed to give two courses; the L. T. course is for those who have passed the Intermediate and the B. T. course is for those who are graduates. Actually, we do not take any candidates for the L. T. course, though there is a very big pressure for admission, unless they are actually sent to us by the Government of Bengal or by the Government of Assam or by Hyderabad.

24121. Are there many candidates sent who are not graduates?—There are very few. The L. T. class list each year is under a dozen.

24122. Your course is for nine months. How many lecturers are employed in connection with the Training College?—Six.

24123. As the course is for nine months, the six subjects are running concurrently, has each pupil six classes to attend?—There is the general professional subject like the method and theory of teaching which all have to attend. Then there is a number of subjects from which they can select any three. Those subjects may be added to from time to time. The idea of these selective subjects is that a man takes up a subject of which he already knows something and we polish him up in that subject. For instance, if a man is going to be a teacher of English, he has already taken his degree of B. A. or M. A. in English, and in the English course I teach him English pronunciation and the art of teaching English and so on.

24124. Supposing a man wants to become a high school teacher in physics and chemistry; you do not teach physics and chemistry and therefore all that you teach him would be the methods to be employed in teaching physics and chemistry?—That is rather an unfortunate example. That is one of the subjects in which really our system does not fit in very well. Supposing a man is going to be a high school teacher in history, then we should take a man who has already taken his degree with history as one of his subjects. He will work through a course in which history is taught. We will polish up his weak points in history and he will also receive instruction in the art of teaching that subject.

24125. I heard you say in answer to a previous question that you had formerly given instruction in physics and chemistry but had ceased doing so now, and the question occurred to me as to how men who teach physics and chemistry in high schools get their technical qualifications? I suppose they must get their technical qualifications entirely from the University?—The main reason why we gave up teaching science as a subject is that practically no schools teach physics and chemistry. I believe they used to teach physics and chemistry at one time in the local collegiate school. I cannot personally think of any other school in which physics and chemistry are taught.

Mr. M. West.

24126. Is that so throughout Bengal?—Yes.

24127. Then by what method is the teaching of physics and chemistry supplied?—It is done by the Intermediate College.

24128. Are there, in fact, any Intermediate colleges now at work here?—There are three for men and one for women in Dacca. Of course, the Sadler Report pointed out, what is true, namely, that the Intermediate colleges are really schools, and recommended that they should be cut off from the University and made into separate institutions, and that some of the high school classes might be joined to them. That has been done in Dacca, but even in Dacca as yet, the colleges have not been organised in small classes with school teaching, nor have they any number of trained teachers. The intermediate college man, I think, does not like to be regarded as a school teacher; he considers himself to be a "lecturer," and that is one of the obstacles.

24129. Outside Dacca, there has been no alteration since the Sadler Commission reported?—None.

24130. In connection with your scheme for central schools, you mentioned the difficulty of the flooded areas. For how many months in the year is that a real difficulty?—It varies, of course, in different places but it is difficult for six months in some areas.

24131. In other respects, one would suppose that your conditions are highly favourable for central schools?—Even in flooded areas, of course, you might have your central schools with feeder schools strung out along the District Board roads. In certain parts there are good roads in the flooded areas but there are certain areas where roads are few and there the problem is difficult. In Chittagong it would not be difficult. You will have to consider the geography of each Union area where you propose to have a central school.

24132. You are aware that the central school idea is receiving attention in Britain at the present time?—Yes.

24133. And there the conditions are by no means so favourable in country districts, as we have not got the density of population that you have and the children have to be brought to school by motors from considerable distances?—Yes; of course distances in Bengal would be less than they are in England.

24134. You mentioned the assignments which you have prepared in connection with zemana work; have you any specimens or copies?—I am afraid I did not bring them with me; I could send you the copies; they are in the Exhibition.

24135. Just to show the type of thing that you have been doing?—Yes; I will certainly send it along.

24136. With reference to your note about a carelessly administered system of small grant-in-aid, I think you have already stated that the carelessness is due to the difficulty of getting qualified inspecting officers?—Not exactly that; I think it is due to the fact that the inspecting officers in the past have not received specific instruction in the problems of primary education. Such training as they have had has been training as secondary teachers; there has been no specific training for the inspecting officers for primary schools. I do not think that the training now is really sufficiently specialised, but that is the best we could do.

24137. *Dr. Hyder* Is there a large diminution in the number of pupils who attend school when the whole of this country is under water?—It gets irregular. For instance, on a day on which there is heavy rain, you will find the school practically empty, or even closed altogether.

24138. The boys have to come from two or three neighbouring villages?—Yes; they get very irregular in the rains. Of course there is a combination of causes, it is not only the water, but there is malaria of course, and the parents are using them also.

24139. What is this system of assignments? You draw up questions which have to be answered by the women in the zemana?—It is just a piece of work for a given time, just as you have in a correspondence college. They send you so much work for the week; you usually send out work for the month. You do those lessons and you answer questions on them. You do what has been set in the lessons, like drawing a map and things of that sort. When you have finished your lessons you receive some questions to see whether you have really learnt the lessons and understood them.

24140. But the pupils never come into contact with the teachers?—The teacher goes round the zemanas distributing the lessons. She goes round again when they finish their assignment and brings it back to the training college. She brings it to us and we correct it.

Mr. M. West.

109 X 13—34

21140. How could this deficiency of books on useful subjects in Bengali be overcome?—By creating a demand. There is not the slightest reason why they should not be produced. This is one of the cheapest countries you could possibly have for printing. The only way to overcome it is to create a demand, that is to say, to improve the teaching of reading in the schools.

21141. But at present no books on these useful subjects worthy of mention are written in the Bengali language?—Because, if you publish them they would not be bought.

21142. Is the newspaper competing with books as regards reading?—In the *vice* *core* examinations in the University, one of my favourite questions is to ask the student how long ago he read a newspaper, and as often as not, the reply is, a fortnight ago. But when I ask him whether he can tell me anything of what he has read, the reply is that he does not remember. They do not read the newspaper; it is extraordinary how little they read.

21143. *Professor Gangulee*: These are graduates of the University?—Undergraduates who have just been admitted, and they have to pass a test called the English oral test.

21144. *Dr. Hyder*: What is Captain Petaval's scheme of reducing unemployment among the *bhadralog*? Are you familiar with it?—I have read something about it; I cannot say that I know very much about it. I was not very much interested in it, but I am a little doubtful of its effects. It looked to me like several other former schemes of the same sort.

21145. *Mr. Gupta*: What kind of powers would you like to take to be able to close such primary schools as are not wanted, or as are not useful in any particular locality?—I am not certain whether the mere withdrawal of the grant would be adequate. If there were a primary examination, that is to say an official examination at the end of the primary stage as there used to be, and you made it a rule that no boy from an unrecognised school was admitted to that examination, that would have some effect. There is no such examination at present. I think that would be the best way of coping with it. You cannot close the school as if it were a gambling house.

21146. You could not make it a penal offence for a *guru* to keep a school. You will either have to withhold your grant or make admission to this examination impossible for a student from a school which is not recognised. Some kind of Government recognition or District Board recognition will have to be withheld. There would have to be some such ban. You could not take any powers under legislation. What sort of legislation do you think would be suitable?—I think that the really essential thing would be this. In an area where you organised a system of schools you would probably find it necessary to have some sort of test of literacy at a certain stage in the primary course, and you could say that children from schools other than those run on an organised system would not be admitted to the test. In this country that means a lot to the school.

21147. In that way you attract all the boys to your schools; and there will be very little attraction for the boys to go to the other schools. That of course will take time?—That alone would not do. I think the parents in some cases would rather send their children to a bad school which is five minutes' walk away, than send them to a good school which was ten minutes' walk away.

21148. What about the proposed Primary Education Bill? Have you studied it? I wanted to know if the calculation of 5 pice in the rupee of taxation proposed is based on any figures that you have submitted. The cost of primary education will have to be met by the imposition of this fresh taxation. Is that based on any figures that you have submitted?—I believe that it is partly based on the estimate of the 1918 report. After all, the 1918 report is based not on the last Census but on the previous Census of 1911; so that to what extent my figures have been brought up to date I do not know. I know that Mr. Lindley took this estimate into consideration.

21149. If we could not get the 5 pice; if, for instance, the Council only passed 3 pice, or 2 pice, could you modify your recommendations in a manner which would make only that additional income sufficient to carry out that scheme?—I do not think that in the first year it would be possible to use anything like the full yield of any tax of that kind. We have to make an experiment to find out how to do it. We have to provide the teachers capable of running the thing; it will have to be a very gradual growth.

21150. It will not be necessary to hold up the scheme if the Bill does not pass in the shape in which it is sent up to the Legislative Council?—No, so long as there is sufficient money to run an effective system in a limited area. If the money is from provincial revenues and could be distributed in certain areas, well and good, but if it means that you collect 5 pice only in certain areas, and that is all on which you have to run your system, it might be difficult.

Mr. M. West.

24151. That is rather an important point in your suggestion, that we should just try it in a limited area, and if it succeeds extend it gradually in the light of experience gained. The Government could probably find the money for an experiment in a limited area?—Yes.

24152. If the experiment succeeds, it might be a sort of definite result to be placed before the Council, to show to them that we have succeeded. Instead of placing it before the Council without experience, it might be better to give them the results of our experiments. I am only trying to visualise what might happen if this Bill does not pass the Legislative Council. We cannot hold up our hands and say that we cannot do anything because the Council has not passed the Bill; we must move?—There is no reason why there should not be money available for an experiment, except, I suppose, it would be the old reply that money will be made available in two years' time, after the next budget is passed, or something of that sort. The cost of the experiment would not be prohibitive, and there is no reason why the experiment should not be made before the Bill goes through. Whatever system of primary education is employed, money will be necessary, and the passing of the Bill will help it.

24153. *The Chairman*. About the problem of leakage, I suppose a certain amount of the leakage between class III and class IV is due to the fact that parents find that they cannot do without the labour of their children and take them away in order that they should work?—Yes. I am not prepared to say how they cannot do without their boys' help. The result is that it leaves us with a less number of boys.

24154. The same applies to the leakage between class II and class III. But do you not think that the fact that class III of the primary school corresponds to the bottom class of the higher English school is responsible for some part of the leakage?—I am not certain how much of it is accounted for by that. Of course parents do send their children to a primary school until they are old enough to go to the high school, but I cannot find out from the figures to what extent the leakage there is due to the boys going on to the high school.

24155. Is not that a sort of thing which would be very useful to know? Are the facts not available?—I have failed to extract them from the reports. It is difficult to separate out the classes. It would be possible to find out, say for Dacca city, by actual investigation how many of the boys admitted into Class III this year have come from primary schools. You cannot get anything from the official statistics.

24156. Then these boys who go straight from class III to the English high school? Do they not go to the middle school at all?—The middle school is the lower half of the high school.

(The witness withdrew.)

**Khan Bahadur MAULVI WASIMUDDIN AHMED, B.L.,**  
**Chairman, District Board, Pabna (Bengal)**

**Replies to the Questionnaire**

**QUESTION 2 — AGRICULTURAL EDUCATION.—(i) No.**

(i) Yes in the districts of Pabna, Bogra, Rajshahi, Rangpur, Dinajpur, Malda, Nadia, Faridpur, Wymensingh and Barisal in Bengal.

(ii) Yes.

(ii) No. The reason is the cultivators are mostly uneducated and they are not aware of the advantages to be derived from agricultural education—the blessings of such education have not been brought to their notice. The number of demonstration farms is very limited and situated in headquarters of a district far away from the rural areas. They are also carried on under a costly system and their working cannot teach people nor explain to them that the agriculturists would profit by adopting those measures.

If demonstration farms could be run economically and the balance sheet (profit and loss) were published and explained to the agriculturists pointing out to them the larger profit to be derived from the new system and if the sons of agriculturists were taken as labourers offering them suitable stipends or wages the agriculturists are likely to take more interest in agricultural education.

(v) If it could be made clear to the agricultural lads that they would immediately profit by agricultural education in the shape of better crops bringing them larger profit than what they would get by following the old system. Stipends equal to living wages would induce lads.

(vi) Yes.

(vii) I am in favour of:—

(a) Nature study that would be useful to lads in their avocation in life.

(b) School plots cannot give an idea of what obtains in ordinary agricultural pursuits.

(c) School farms—the same.

(ix) At present most of the pupils come to qualify them for service and they seek for such employment. They do not carry their knowledge to the field nor try to make any other use of their knowledge.

(x) In Bengal, agriculture is not at all profitable to middle class people. They do not like to do manual work. The labourers are not honest workers; they always try to cheat the employers. If by introducing new methods agriculture could be made profitable and less subject to failures owing to freaks of nature or insect pests, early floods or want of floods, the middle class youths would take largely to agriculture.

(xi) By establishing small agricultural farms in rural areas by experimenting on the fields of agriculturists or near fairs, *hats* and bazars where agriculturists would have facilities for seeing with their own eyes the advantages of new systems of agriculture.

(xii) Administration and finance should generally be by Government and where enthusiastic people would be available such enterprise may be subsidised by Government on suitable conditions.

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.—(a)** In some demonstration farms new varieties of crops have been introduced successfully, such as cultivation of *Chinaura green* jute which gives larger profits to cultivators and cultivation of new varieties of sugarcane with better system of crushing and preparing molasses of higher quality; these have induced people to take to the cultivation of these crops and to seek expert advice and these have improved the practice of cultivation.

(b) In case of field demonstrations similar crops as are grown in the locality should be raised and accounts should be kept and profits should be explained to cultivators. New varieties of crops may be raised in some plots and better results should be brought home to the cultivators. Even if they cost more it should be explained to the cultivators how they can avoid some expenditure and can grow those crops at a lesser cost and with profit.

(c) Besides working in the demonstration farms, the experts should visit the fields of the cultivators and select some plots where the cultivators should be induced to follow their advice in the process of ploughing, sowing, weeding and gathering crops and making them fit for market and if they can show better results the cultivators would be induced to seek their advice.

**K. B. Maulvi Wasimuddin Ahmed.**

(d) I am aware of great success of growing *Chinsura green jute* and *indrasail* paddy and failure of *katalara aus* and potatoes in some alluvial soil. Failure of *katalara aus* is due to bad selection of areas as it cannot stand drought and failure of potatoes is also due to bad selection of areas as in alluvial soil its plants grow luxuriantly but are eaten up by insects which largely swarm in these tracts.

QUESTION 4.—ADMINISTRATION.—(i) No. In both cases the number of officers with lower pay should be increased. Larger number of demonstrators can approach larger number of cultivators. If veterinary students were taught in the vernacular with equal expenditure to local bodies (District and Local Boards and Municipalities) a very larger number of doctors could be entertained which would avoid much greater facility to cultivators for treatment of their cattle.

(ii) No. Owing to abuses prevailing in these services none but the shrewd *Miswars* and others venture to entrust their commodities with these officers. Their conduct with the public shows as if they do not get any pay from those departments but they are harnessed to live on the gratifications offered by the dealers.

(iii) Extinguished are quite insufficient and ill kept and they cannot afford sufficient facilities to cultivators or citizens who have to carry produce to market.

(iv) Informations gathered and supplied by the Meteorological Department do not reach the cultivators, even ordinary farmers.

(v) Postal Department render useful services yet greater facilities should be secured by increasing the number of postal officers taking the services of village teachers and giving up pupils who may serve as Postmasters and persons at much lesser cost.

(vi) At the present stage wire is little known and is of little use to cultivators. Teachers are doing much good both by carrying information and transmitting messages to distant places.

Abuses in the railway and steamer services may be removed by appointing better educated men in the services. It is an open secret that some semi-educated station masters make princely income besides getting huge supply of food materials not only for themselves but for a large number of friends. They have also to share their profits with superior inspecting staff.

QUESTION 5.—FINANCE.—(a) Loans should be advanced to cultivators mainly for productive purposes. Long-term loans at a moderate rate of interest and easy terms should be allowed to cultivators for purchase of lands, cattle and for building where necessary. Short-term loans at the lower rate of interest should be allowed for purchase of provision, seed, fodder and for wages of labourers. Government should generously come forward with *tasari* advances to individual cultivators without insisting on joint bonds or joint loans by several cultivators which system is open to many objections. The present Co-operative Societies Act which rests on unlimited liability in case of agricultural societies is not open to serious objection and the system is getting unpopular. The ignorant rascals have scarcely an idea of joint and unlimited liabilities when they are forced to contribute to any amount, pending on the discretion of the liquidators, they retire and lament their situation. Already there is a growing tendency not to join any co-operative society. Moreover owing to illiteracy of many and improper conduct of the ignorant few many abuses have crept into the societies. To my mind each individual member's liability may be unlimited so far as his own debt is concerned but his liability for contribution in default of others should be limited to shares.

(b) Yes. *Tasari* should be advanced to individuals on easy terms but strict supervision should be kept so that none can make default when he is able to pay.

QUESTION 6.—AGRICULTURAL INDEBTEDNESS.—(a) The main causes of borrowing are—

(i) (1) Purchase of cattle, (2) supply of food when provision runs short during the months of April to July, (3) hire of labourers during cultivation season from April to July, and (4) marriage of children and funeral charges of parents.

(ii) Sources of credit are the village *shukras* who demand exorbitant rates of interest during the months from April to July.

(iii) Failure of crops or proving insufficient to leave margin for repayment of loan, and often improvident habits of agriculturists who are generally uneducated and wanting in foresight.

(b) Steps should be taken to provide loans at a lower rate of interest but with strict supervision for enforcing instalments. The law of *dandopal* should be enforced. The operation of the Usurious Loans Act is not at all satisfactory. The judicial officers have been allowed to use their discretions which are seldom used in favour of the debtor, as

K. B. Maulvi Wasimuddin Ahmed.

most of the judicial officers either belong to or have sympathy with the money-lending classes.

(c) Yes. The cultivators should not be allowed to mortgage or alienate all their lands and rates of interest should be fixed. Provisions of the Law of Limitation should be changed. Fresh start of limitation from the date of payment of interest or part of principal should not be allowed in the case of cultivators. Those provisions of the Limitation Act (Sections 20 and 19) are open to much abuse in many ways. The following are among the abuses :—

(a) False entries are very often made to revive barred debts and to get fresh start of limitation without the knowledge of the debtor and (b) by accumulation of heavy interests the debtors are crushed.

(c) It is a patent fact that bonds are seldom returned to debtors (cultivators) even when bonds are satisfied. So long as good feelings prevail between the parties no harm is generally done but when there arise any differences the barred bonds are revived by endorsing false entries.

(d) Often barred bonds remain with the creditors and after his death his heirs being in possession of them think that these bonds are really unsatisfied and they put false entries of payment of interest. The courts seldom believe the plea of payment even when supported by substantial evidence so long as the bonds remain in possession of the creditors.

(e) It is generally found in cases of enmity with a cultivator people often forge bonds for smaller amount as bonds for large amount without being registered are looked upon with suspicion and by putting series of false entries of payment, suits are brought after six or seven years when the amounts have increased to a big amount sufficient to crush the debtor. These are again the reasons for my advocating the provision of the law of *damdapat*. Cultivators should not be allowed to mortgage or sell more than half their lands. Non-terminable mortgages should be prohibited.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—(a) If the cultivators could be induced to have joint cultivation but to have shares in the produce in proportion to the lands held in such joint cultivation then loss consequent on excessive sub-division of holding may be minimised. This can be attempted through the co-operative system.

(b) The cultivators have special liking for his own land and quality of land varies within a very limited area. So the cultivators fight shy to exchange their lands. So the difficulty can be obviated by legislation providing safeguards in the shape of adequate compensation when a tenant has to part with a land of superior quality for a worse land especially when he had improved his land by his capital and labour.

**QUESTION 8.—IRRIGATION.**—(a) In the Pabna district, there is hardly any irrigation, but introduction of irrigation system would greatly improve both quality and quantity of produce. Owing to failure of rain during the sowing season, late sowing takes place resulting in damage due to destruction by early flood in the area subject to annual inundation.

**QUESTION 9.—SOILS.**—(a) (i) In the Pabna district, millions of acres of land have gone out of cultivation by formation of *bhils* (water-logged area). In this district there are many rivers and rivulets to which the rain and flood water could find their way through channels. But in course of time the mouths of these channels have silted up and excess water cannot go out with the subsidence of annual flood. The soil does not dry up in time to allow cultivation. Even when these lands are cultivated crops are often damaged by flood as the water does not rise with the river level but flood water enters by overlapping the banks, and water rises suddenly and paddy and other growing crops cannot keep pace with the rising water.

(c) Government should encourage free recourse to the Bengal Agricultural and Sanitary Improvement Act (Act VI of 1920) without leaving its operation to private individual or local bodies who have scarcely sufficient funds to finance such big operations.

**QUESTION 10.—FERTILISERS.**—(a) Education to the cultivators and demonstrators by Government officials of the utility of fertilisers by inducing the cultivators to preserve dung and refuse matters and applying to their fields and showing them the difference of produce.

(b) By legislation and teaching people how to detect such adulteration.

(c) By free distribution of samples and by demonstration in small fields the difference in produce of two adjacent fields, one treated with fertilisers and other ordinary, may be demonstrated and explained.

K. B. Maulvi Wasimuddin Ahmed.

QUESTION 11.—CROPS.—(i) By introduction of better system of cultivation and irrigation existing crops may be improved both in quantity and quality.

(ii) There are ample scopes for introducing new crops. In this district there are lands which cannot produce crops that are generally grown in the district but they are capable of growing new crops such as ground-nuts, cowpeas, various kinds of grass including other fodder crops.

(iii) There should be suitable centres for distribution of superior kinds of seeds.

(iv) Of late this district has fallen a special victim to wild boars. This seems due to the fact that when the anti-partition agitation and the non-co-operation movement prevailed in the Province, indiscriminate cancellation of gun licenses took place, and the country was left quite unprotected and the number of wild boars increased to an enormous extent even in well cultivated tracts such as Serajgunj sub-division where a wild boar was a curiosity twenty years ago. There should be a regular campaign for destruction of wild boars. Reserve police during the winter season may with advantage be employed to destroy wild boars.

(v) *Indrasul* paddy, yellow *tanna* sugarcane that are being gradually introduced in this district are giving more crops of better quality.

QUESTION 12.—CULTIVATION.—(i) Even existing system of tillage may be improved if the cultivators were provided with more capital to purchase healthier and stronger cattle and to engage more labourers at the time of weeding and gathering crops.

(ii) Often cultivators are ignorant as to what other crops their lands are capable of producing. Provision for thorough examination of soil and judicious selection of crops which take from the soil different kinds of plant food and dissemination of this knowledge to ordinary cultivators would ensure rotations and mixture of important crops.

QUESTION 13.—CROP PROTECTION, INTERNAL AND EXTERNAL.—(i) So far as I am aware, hardly any measures are known to cultivators for protection of crops for infectious diseases or pests.

(ii) It is highly desirable that such measures should be found out and widely made known to cultivators.

QUESTION 14.—IMPLEMENTS.—(a) Besides tractors and other highly costly foreign implements there is hardly any attempt to introduce any new implements nor are there any sort of implements known to cultivators which can be called better than those already in use. Encouragement in the shape of rewards and large orders from Government for newly invented useful implements.

(b) Demonstration of difference in the utility and greater advantage of new implements would greatly induce the cultivators to take to new ones. In the beginning it may be necessary to allow *subsidy* or lower prices, the Government paying the difference.

QUESTION 15.—VETERINARY.—(a) The present arrangement is working well.

(b) (i) The dispensaries are under the local bodies. It cannot be said it is working well. They are under dual control and local bodies have scarcely sufficient funds to provide adequately for treatment of cattle. If Government be prepared to expend more for this department, it is better that the dispensaries should be under Government.

(ii) No, more and well-equipped dispensaries badly needed.

(iii) Yes, provided Government be prepared to expend adequate funds in the real work of providing more dispensaries with adequate supply of medicine.

(c) (i) No. The dispensaries should be provided within easy reach of the cultivators.

(ii) Not always. There are prejudices against inoculation and other scientific treatment though it is satisfactory to note that they are vanishing.

(d) There are no proper arrangements for segregation of diseased animals. Even such animals are allowed to graze in the common even after the disease has made considerable havoc in the flock. Yes, I strongly advocate legislation and wide publication of hand bills explaining the dangers of present mode of dealing with diseased animals and disposal of carcasses.

(e) Yes, in the most convenient way from railway or steamer stations it is very difficult to get serum just in time.

(f) The number of Veterinary Assistant Surgeons is inadequate. No fee is charged in the district of Pabna.

(g) Yes.

K. B. Maulvi Wasimuddin Ahmed.

QUESTION 16.—ANIMAL HUSBANDRY.—(a) (i) Breed of livestock may be improved by providing pasture grounds, better veterinary arrangements and by judicious selection of sires and by castrating the existing worthless sires and importing better variety of males.

(b) (i) During the winter animals from different parts of the district are brought to common pasture lands without examining the animals, diseased animals spread contagion. Last year there was considerable havoc in such areas.

(ii) There is hardly any enclosed pasture in the Serajmuj sub-division where the land is very valuable.

(iii) This district being a jute growing area, fodders of all kinds are quite insufficient.

(iv) Yes, except in *habd* areas where pulses are grown for grazing cattle, there is hardly any green fodder available during the dry season.

(c) Fodder shortage is marked from April to November. Nearly five or six weeks after November young growing cattle begin to thrive.

(d) By reserving public grounds and encouraging cultivation of fodder crops.

(e) By remission of land revenue and rents in proportion to the lands reserved for pasture.

QUESTION 17.—AGRICULTURAL IMPROVEMENT.—(a) In this district cultivators work throughout the year. This being a jute growing district there is hardly any slack season. Whenever they are off agricultural work they generally prefer to repair their houses or do some subsidiary work, such as purchasing agricultural produce and selling in the nearest market.

(b) When crop are damaged by flood or some other reason the cultivators get leisure. The cultivators may be taught jute weaving, car making, basket making, cane work, etc. The cultivators should be taught these manual work and should arrange for disposal of their produce and also be supplied to improve machines in hire purchase system.

(c) Bee-keeping is unknown in this district. Ordinary cultivators do to a certain extent poultry rearing in the crude way; the poorer section sells them but the well off section does not do so. No instructions are imparted and no encouragement are given in the district in sericulture or bee culture. Holdings of ordinary cultivators are *ryoti* holdings and zamindars do not allow them to excavate tanks therein to rear fish. Law should be changed and the ryot should be allowed to excavate tanks and construct *pucca* houses which are essentially necessary for carrying on their business on improved method.

(d) Yes.

(e) Yes.

(f) Yes.

(h) They should be educated and the supreme value of good health should be impressed on them. By improving the ether condition of one or two villages, the idea should be brought home to them and the possibility of better mode of living should be explained to them.

QUESTION 18.—AGRICULTURAL LABOUR.—(a) (i) and (ii) Step should be taken to acquaint the unemployed labourers where they can find employment and facilities for journey by steamer and railway should be secured by allowing the concession rates. This is for seasonal unemployment for migration. It should be explained to people where ample lands would be available at what cost. They should be supplied with capital in the beginning and better right to the land should be secured to them.

(b) There is a shortage of agricultural labour in Bengal. If Santhals and upcountry labourers could be induced to settle in Bengal, this shortage would be removed. I think indigo industry was flourishing in this district. The planters imported many Santhals who were the ancestors of the *banias* in whose accent we notice Santhal tinge.

QUESTION 20.—MARKETING.—(a) No. There are no good roads or canals to good markets. Better roads and canals should be provided.

(b) No. The cultivators' produce has to pass through many middlemen who make their own profits and the shares of the producers are minimised. I refer to jute, rice, turmeric and *simul* cotton.

QUESTION 22.—CO-OPERATION.—(a) (i) By Government.

The Co operative Societies' Act should be amended so as to limit the liability of the members of the agricultural societies. Liability of the members so far as the amount borrowed by him may be unlimited but their liability for contribution should be limited

K. B. Maulvi Wasimuddin Ahmed.

to the shares held by them. Government should undertake to finance where private financiers are not forthcoming. The societies should be absolved from paying audit fees or at least these be considerably reduced. As explained above, the cultivators cannot fully understand the joint liability and they are often ruined for faults not their own. The members should be educated and the full extent of their liabilities should be explained.

(ii) By non-official agencies.

They should be encouraged by recognising their services and by rewards. Non-officials may do much by popularising the movement.

(b) Credit societies have done some good by reducing the rate of interest and by securing credit to people of smaller means. But when members fully realise the extent of liability they try to dissociate themselves as soon as they are in a position to pay off their individual dues.

(ii) Purohita societies have not generally succeeded in their object as most of the members lack in business habit and knowledge and owing to unsteadiness of markets which are under the control of people who have antagonistic interest.

(iii) Ditto as (ii).

(iv) These societies have not been largely tried or formed.

(v) Not yet formed owing to practical difficulty of getting people who would throw their plots in the hotel-potch.

(vi) None I know of.

(c) Legislation is necessary.

(d) I have personal knowledge of working of Central Banks and agricultural societies. They have secured some benefit to the rural population but owing to ignorance and illiteracy of ordinary cultivators they generally fall victim to designs of literate few who form the managing committee.

QUESTION 23.—GENERAL EDUCATION.—(a) (i) Meritorious sons of cultivators in some cases have succeeded in improving their own plots but in many cases they are useless burden on the other members of the family causing loss in agriculture.

(ii) and (iii) Number of educated among the cultivators, the young men receiving some education are quite unwilling to follow their ordinary avocation. I am of opinion that when most of the young men will be educated they will not feel hesitation in following their profession notwithstanding their education but such education will greatly help them in improving cultivation and adopting improved agriculture.

(b) Primary education should be free and compulsory and the syllabus should include agricultural subjects.

(ii) There should be arrangement for free or compulsory education in this Province.

(iii) The cultivators do not understand or appreciate the real object of education. They think of securing service of some sort; that is the only objective. When they find no chance of securing such services they think it waste of money and time in sending their boys to school. Moreover such half educated young fellows become useless burden on the family.

QUESTION 24.—ATTRACTING CAPITAL.—(a) If steps be taken to minimise the risk to crops and better methods of cultivation.

(b) Agriculture under the present state of affairs is not at all attractive as it is subject to loss. The crops are liable to damage in many ways and price unsteady, being regulated by people who have no sympathy with agriculturists and Government being quite apathetic to effect any improvement or saving agriculturists from such loss. This year the price of jute cannot compensate the expenditure not to speak of any profit. Last year many labourers took to agriculture and this year many *bona fide* cultivators are thinking of selling off their lands owing to unusual difference in price of jute in these two years.

QUESTION 25.—WELFARE OF RURAL POPULATION.—(a) Health of mofussil should be improved by introducing sanitary measures by Government initiative, such as digging more tanks and wells, reclamation of waste lands, re-excavating or filling up old and unhealthy tanks. Legislation should be undertaken to compel the owners of unsanitary tanks, jungle *dobas* and *bhis* to part with their interest or to pay the cost when improvement is effected by private individuals, local bodies or Government. The cultivators should be protected from the wily designs of unscrupulous moneylenders and the tenants should more secure interest in their holding, more free to excavate tanks, wells and erect *pucca* structures.

(b) Yes. Inquiry should be directed towards the profit and loss of the cultivators on a standard of healthy living.

K. B. Maulvi Wasimuddin Ahmed.

## Oral Evidence

24157. *The Chairman* Khan Bahadur Maulvi Wasimuddin Ahmed, you are Chairman of the District Board, Pabna ?—Yes.

24158. You have very kindly provided the Commission with a note of the evidence which you wish to give. Have you anything in general to say at this stage or shall we ask you questions ?—You may ask questions.

24159. I see you are interested in the problem of demonstration farms. Have you any personal experience of the demonstration farms ?—I have some experience of the farm at Pabna ; otherwise I have not got any detailed knowledge of their working.

24160. I am sure you realise that if it is proposed to illustrate the economic possibilities of a particular agricultural practice, then you must separate experiment entirely from demonstration ?—Yes.

24161. Do you not think that demonstration on the cultivator's own holding is probably the most effective method ?—Yes, I think so.

24162. I am a little surprised to see that on page 532 of your note you give it as your experience that labourers in the part of the country with which you are familiar are not honest workers and that they always try to cheat their employers. What form does that take ?—Unless there is supervision over them they will always spend their time in smoking, doing this and that and they work very slowly, so that the employer does not get sufficient return for the wages he pays.

24163. Is it impossible to devise any system of piece-work ?—For agricultural purpose it is not always possible. In some cases it may be possible and that is often done in the case of reaping paddy. In theory the labourer is to get one sheaf for every ten sheaves ; but that one sheaf will be equivalent to three sheaves so that in practice he takes about a third.

24164. They do not like the idea of payment by result ?—No ; they do not.

24165. You employ labour yourself ?—Yes.

24166. So that the alternative is to provide sufficient supervision ?—Yes. Of course, I engage some people for supervision, but I do not know whether they supervise properly because they also come from the same class as the labourers.

24167. On page 333 of your note, in answer to our Question 4, Administration, paragraph (ii), you say "No. Owing to abuses prevailing in these services none but the shrewd Marwaris and dealers venture to entrust their commodities with these officers." What services are you referring to there ?—I refer to the booking of goods and commodities.

24168. So, that refers to Question 4 (c) (ii), Railways and Steamers. Is that right ?—Yes, it refers to railways.

24169. You say "Their conduct with the public shows as if they do not get any pay from these departments but they are licensed to live on the gratifications offered by the dealers." Does that refer to the Railway Company's officers ?—Yes.

24170. It is your experience that the Railway Company's officers are corrupt, is it ?—I often notice that.

24171. *Rai Bahadur Bannergji* What about the officers of the Steamer Companies ?—I say both railway and steamer services.

24172. *The Chairman* On the same page of your note you say, "Abuses in the railway and steamer services may be removed by appointing better educated men in these services. It is an open secret that some semi-educated station masters make princely income besides getting large supply of food materials not only for themselves but for a large number of friends. They have also to share their profits with superior inspecting staff." Do you associate education with integrity in your experience of life ? Do you think that the fact that they are semi-educated is the cause of the malfeasance where it exists ?—I expect that the educated man would be more honest. He has ideas of self-respect and other things.

24173. He has a different view of life ?—Yes.

24174. On the same page again you are talking about advances to cultivators and the possibilities of meeting the financial requirements through co-operative credit societies, and you make the statement that there is a growing tendency not to join the co-operative societies. On what do you found your view when you say that ?—I have worked in the Co-operative Departments since 1910 and I have got some experience in the district. I was the Managing Director of the biggest Central Bank in this Province, the Pabna Central Co-operative Bank. None but the people who verge on bankruptcy join the co-operative societies.

K. B. Maulvi Wasimuddin Ahmed.

24175. Let us hear then exactly what your experience was. Did you begin with primary society first of all?—I first tried to organise some societies.

24176. Did you succeed?—Yes.

24177. Credit societies?—Yes, I found that none but the people who had no credit would join the societies; they fought shy of taking the risk of unlimited liability. There is every chance of losing one's all for the fault of others.

24178. You suggest that the individual member's liability may be unlimited so far as his own debt is concerned. That is a fairly conservative form of liability?—Whatever loan he takes he may be made responsible for the full amount of that; but he cannot be made liable to forfeit all the earnings of his life.

24179. Do you think you could build up a great system of co-operative credit on a scheme such as that?—I think so.

24180. Have you anything to say about the Irrigation Department other than that which you set down in your note? Have you any experience of its work?—It did no work in my district. There was an Act of 1895 and it was on the Statute Book till 1920, that is, for 25 years. When I first went to the Council the first question that I put was whether any irrigation works were undertaken under that Act. I found that except for two or three acres very close to Calcutta no area was tackled and nothing was done. And ever since the enactment of this Bengal Agricultural Sanitary Improvements Act, they have done very little work. I myself submitted proposals for several works and they have been put off from year to year without any sufficient reason. The tenants are suffering the most and they are willing to pay for the works, and if the District Boards were free to take up the work they would have been completed by this time. But under the rules the Government will have to be approached and their sanction is necessary. When we write to the Government they say that matters are pending with the Irrigation Department. I have been crying myself hoarse over the matter and I am writing letters every two or three months, but I get no satisfactory reply and the matter is hanging fire for more than three or four years.

24181. What are the requirements of your own district in the matter of irrigation?—In my district irrigation on an extensive scale is not necessary; irrigation is only necessary in some districts. The strange thing is that the *bhil* area is covered with water during the rainy season but during the dry season it gets no water; some of the winter crops, such as wheat and barley require irrigation, they do not get sufficient water.

24182. Are there wells?—They have no wells.

24183. If they had wells, do you think they would provide water?—They would be small wells which would not supply any large quantity of water for a reasonably large area; they do not go to a lower depth than 25 or 30 feet.

24184. *Rai Bahadur Bannerji*: Then what system of irrigation would you propose for *bhil* areas?—Canals to which the surplus waters could find access after the rains, so that sufficient water could be pumped up and kept and distributed for irrigation by pipes.

24185. *The Chairman*. On page 536 of your note, in answer to our Question 17 as to non-agricultural industries you say, 'In this district cultivators work throughout the year. This being a jute growing district there is hardly any slack season.' Have you made close enquiries before making that statement, because that is hardly in accord with evidence we have had from other witnesses?—Yes.

24186. You are satisfied that there is no important slack season. When is the jute sown?—In April.

24187. When is it reaped?—In August and September.

24188. What attention does the jute require between April and August and September?—Almost all the cultivators grow jute as well as paddy and other things. In April they are engaged in sowing; after two weeks they will have to weed again, and weeding will continue all through between April and August.

24189. Then we come to October; what happens in October?—That is the retting season.

24190. That takes them to the end of October?—Yes.

24191. What do they do in November?—In November they begin to gather winter crops.

24192. What is the winter crop?—*Amra* paddy; that is sown broadcast.

24193. That comes in during November?—Yes.

K. B. Maulvi Wasimuddin Ahmed.

21194. Is that all in by the end of November?—Yes. In some areas it is all over; in the *Madia* area it continues in December.

21195. Does the cultivator as a rule have two classes of crop on his holding?—Yes.

21196. What happens in December?—In December, there are the early *rahi* crops; then they are engaged in sowing winter crops, and from December to February is the time when they are engaged in repairing their houses. That is a somewhat slack season.

21197. What happens in March?—From the end of February they begin to prepare lands for the next crop, for paddy as well as paddy.

21198. So that in your experience they have about two months to mend their houses and do other odd jobs?—Yes, smaller works. In one year there was a failure of crops during the rainy season brought about by early flood, and I inquired the Deputy Director of Industries to send out people to teach them guany bag making. A party was sent, and they gave some illustrations, but ultimately the people did not take up that occupation, partly because they did not like it and partly because they had not sufficient money to purchase materials and machinery necessary for the purpose.

21199. Is there much malaria in your district?—There is especially in the Sadar Sub-Division.

21200. Could you give the Commission any indication of the number of days in the year on the average the cultivator spends incapacitated by malaria? I have not thought about the matter.

21201. In one section of your evidence you mention the system known as *dandajal*, I should like from you a statement of what that system comprises?—That system is a Hindu law; it was formerly in use during the Hindu time; even now in the Presidency towns of Bombay and Calcutta that law is in vogue. It says that no court shall pass a decree for any amount as interest more than the principal.

21202. That is to say, when the interest paid equals the principal borrowed, nothing remains to be paid but the first principal; is that right?—No, the parties between themselves may pay anything, but when the matter comes before the court, the court should not pass a decree for interest more than the principal. The reason is that a small sum may be borrowed and allowed to accumulate with interest, and subsequently in five or six years the lender comes to court and obtains a decree for a very large amount which crushes the borrower.

21203. On page 533, in an answer to our Question 6 (b), you say the law of *dandajal* should be enforced. Is it in fact a law?—Of course I use the term very widely, I think that is a law in practice in the Presidency towns of Calcutta and Bombay, and it may be extended.

21204. Is it a statute law?—No.

21205. *Mr. Hyler*. Is it part of the customary law?—Yes.

21206. It is the rule of *dandajal* embodied in the customs of the country?—That was in practice during Hindu period.

21207. *Sir Thomas Middleton*. You criticize the demonstration farms; you think there ought to be more of them and they ought to be less costly. Have you demonstration farms in your own district?—Yes, I have one.

21208. What is it that you complain of chiefly?—My complaint is not with the workmen; my complaint is that it is intended to illustrate to the people something they can follow up, but we find that a highly paid officer is in attendance for supervision and some labourers are employed at a very high cost; no doubt the buffaloes and bullocks that are kept are well fed, but it is at a very exorbitant cost, and when you compare the cost with what the producer gets in return, it is not sufficient to warrant such expenditure, and it does not encourage the cultivator to take it up.

21209. But on page 532 of your note you say, "In some demonstration farms new varieties of crops have been introduced successfully, such as cultivation of *Chromola green* jute which gives larger profits to cultivators"?—Yes, it does.

21210. Has not that improvement been introduced as a result of maintaining these costly farms?—Yes. Of course I do not complain of expenditure being incurred for demonstration purposes simply and for research, but that expenditure would not do for the ordinary cultivator.

21211. But you cannot get something for nothing, and unless you maintain the farm there will be nothing for the cultivator to benefit by?—Yes, from that point of view it may be justified.

K. B. Maulvi Wasimuddin Ahmed

21212. For example, how would you have got your *Chinsura green* jute if you had not had the farm?—But it could be done in a single farm in the Province; it is not necessary that in every district there should be such a farm for demonstration; these things could be done at the Dacca farm and the seed distributed when its success had been proved. It is not necessary that it should be demonstrated at every district farm.

21213. If the study of the needs of Bengal were confined to the Dacca farm, do you think you would get useful modifications in practice introduced in the other districts?—It would be sufficient for a great part of Bengal.

21214. *Dr. Hyder*: Is much land passing out of the hands of cultivators in Eastern Bengal?—Yes.

21215. You would like to have a law in Bengal similar to the Punjab Land Alienation Act?—Yes, exactly.

21216. You think that is necessary? All the land of the cultivator should not be made saleable. There is a law providing that the implements of artisans, etc., cannot be sold; the ordinary cultivator's homestead cannot be sold; but the homestead is not sufficient; some land alongside the homestead should be prohibited from being sold. I found in one district that more than 70 per cent. of the land had gone into the hands of *soncears*, and the ryots who were holding immediately under the landlord have become wage labourers.

21217. Do you find that about 90 per cent. of the civil litigation in Eastern Bengal centres round indebtedness and rents?—I should think that 80 per cent. of suits centre round these two subjects.

21218. Have you any criticism to make as regards the present policy of increasing primary education among the cultivators of Bengal?—Primary education should be imparted to the cultivators.

21219. You think the cultivator is getting back in the form of beneficial services, such as education, a portion of the taxes he is paying?—A portion of the tax. Of course, if primary education cannot be imparted without taxation, we should pay the tax.

21220. What do you think of the *maddah* schools?—They are nothing but primary school teaching a little reading of the Koran.

21221. *Professor Ganguly*: Are you connected with the co-operative movement now?—Yes. I am one of the Directors of the Central Co-operative Bank. I am also an organizer of societies in the district. With regard to the latter I do very little work, having lost much of my energy.

21222. You say that the system is getting unpopular. Why?—Because of the fault of others many innocent people have had to suffer and during the liquidation process they had also to suffer very much.

21223. Who is fault was that?—The fault was of course theirs.

21224. But you say the system is unpopular?—Because there is the fear that in the case of agricultural societies the liability should be unlimited. In that case if a man takes on unlimited liability he has a chance of losing all his properties just through the fault of others.

21225. What steps would you yourself take to stop this?—Of course we try to impress on the people that the entire money belongs to them and that they are responsible for the entire amount. We also impress upon them at the time of distribution to see that amiable people should not be given any money, and also that they should be very vigilant in their activities to get back as much money as they could from the members whenever there was money to spare. Notwithstanding all these things, principally because they are uneducated, they have no foresight. They do not understand the ultimate liability they have to run, and for all these things they care very little. They entirely depend on *pradhans*, in which bodies there are always one or two educated men who usurp the entire functions. These *pradhans* are seldom called and everything is done by these one or two educated men. It so happens that the secretaries and the chairmen of these bodies are the worst defaulters, so that for their fault the innocent people have got to suffer.

21226. You were at one time Managing Director?—Yes.

21227. During your tenure of office as Managing Director what steps did you take to stop these abuses which crept into the societies?—At that time we had also to instruct our supervisors to the effect that the *pradhans* should not get any loans without the special sanction of the Central Bank, and we wanted to have a safeguard in that way, but it failed. We found that loans were advanced *headsmen*, and whenever the borrower was approached he said that he did not take the money but that the money was taken by the

K. B. Masumi Wasmuddin Ahmed.

Secretary who had simply asked him to put his signature which he did. These people were uneducated and did not understand the responsibility of putting their thumb impression on the paper and thereby having their necks put into a halter. Therefore all their endeavours in that direction failed.

24228. So that you put the blame on the educated people?—I said in my answer that the ignorance of the many and the literacy of a few are really responsible for these things.

24229. Do you mean to suggest that the educated man may be legally honest but morally dishonest?—In these villages you do not really get any educated men. They know only how to read and write and they can only read printed matter.

24230. You are the Chairman of the District Board?—Yes.

24231. What is the crying need of your district?—The crying needs are good roads, sanitary measures, primary education.

24232. With regard to primary education, what are your views?—To have free and compulsory education.

24233. Would you be prepared to pay an extra cess?—The principal thing that we want is education, and for that purpose if the Government be in a position to give it to us without any taxation that would be very desirable and it would also be very popular, but if the Government could not do it without taxation, I would not hesitate to go to the length of getting the education by paying a tax.

24234. *The Chairman*: How many primary societies were you familiar with?—Nearly 250.

24235. And is this experience of yours (namely, illiterate members being taken advantage of by the more literate individuals) based on experience gained in most of these societies?—Yes.

24236. Or are you thinking of any one particular society?—No, it is widespread. There are a few exceptions no doubt, but these could not be more than 5 per cent.

24237. So that you think that 95 per cent of these societies are improperly managed?—Yes.

24238. *Professor Gangulee*: And at any time did you bring this matter of mismanagement to the notice of the Registrar of Co-operative Societies?—Yes, and I think this is a fact which is known to everybody. You will find it mentioned even in the annual reports of the Registrar.

24239. *Rai Bahadur Bannerji*: Is there not a very great demand for these societies and is it not a fact that the Registrar cannot cope with the registration as he has been receiving such a flood of applications?—The number of bankrupts is large.

24240. *Professor Gangulee*: What steps did you take to educate these primary societies?—We distributed some money from our Central Bank savings towards starting night schools and giving individual help.

24241. These abuses you refer to could not exist, you say, if they had had the real public support of the educated people and the District Boards behind them?—The District Boards had nothing to do with them.

24242. But at present the educated people must be taken to be men belonging to the District Boards?—In the District Boards there are only eighteen to twenty members.

24243. *Mr. Calvert*: Would you, as Director of a Central Bank, prefer to lend money to the society with a limited liability or would you lend it to the society with an unlimited liability?—We have lent money to both kinds of societies, but in the case of agricultural societies we would prefer an unlimited liability society, as a creditor.

24244. With unlimited liabilities there are certain advantages?—Certainly, but that advantage is for the creditors and not for the members of the primary societies, the debtors.

24245. Do you believe that unlimited liability has any educative effect on the members?—In most cases they do not understand the real extent of the liability they undertake by being members of unlimited societies. If they were to understand it I do not think that they would become members.

24246. This is the unlimited liability to which you are taking exception. Is not that the general rule of all life throughout Bengal?—Only in the case of co-operative societies.

K. B. Maulvi Wasmuddin Ahmed.

24247. Except for banks and co-operative societies are not all transactions based on unlimited liability?—In most cases.

24248. And a limited liability in this country is a comparatively modern thing?—I do not quite follow you.

24249. Limited liability was only introduced into India about sixty years ago?—It may be so, but in the case of an ordinary cultivator he has no experience of unlimited liabilities. He executes bonds in favour of *mahajan* and he understands that he is responsible to the *mahajan*. It is only when the society goes into liquidation that unlimited liabilities become known to the ordinary cultivator.

24250. There are defects in the teaching of the members, I suppose?—Yes, and they are not quite prepared to understand what those defects are.

24251. *Dr. Hyder* : With regard to the application of the Usurious Loans Act, you say this Act is not enforced because the judicial officers have sympathy with the creditors?—Yes. I found this to be the case frequently.

24252. What would you suggest to overcome this defect?—There should be a hard and fast rule to the effect that, beyond a certain percentage of interest, nothing should be allowed, and the Courts should be tied down. In that case the Courts hands would be tied down to giving a decree for nothing more than the principal.

(The witness withdrew.)

*The Commission then adjourned till 10 a.m. on Friday, the 7th January, 1927.*

Friday, January 7th, 1927

## DACCA

## PRESENT :

The MARQUESS OF LINLITHGOW, D.L. (*Chairman*)SIR HENRY STAVELEY LAWRENCE, K.G.S.I.,  
I.C.S.

SIR THOMAS MIDDLETON, K.B.L., C.B.

SIR JAMES MACKENNA, Kt., C.I.L., I.C.S.

Raj A. C. BANNERJI Bahadur

Mr. J. A. MADAN, I.C.S.

Mr. F. W. H. SMITH

Mr. H. CALVERT, C.I.E., I.C.S.

Professor N. GANGULEE.

Dr. L. K. HYDER.

(*Co-opted Member*).} (*Joint Secretaries*).

Mr. S. N. ROY, a Member of a Deputation of Representatives  
from certain districts in Bengal

## Oral Evidence

24253. *The Chairman.* Mr. Roy, I understand you are a cultivator in this Presidency ?—Yes.

24254. From what district do you come ?—I come from Burdwan.

24255. We are glad to take the opportunity of your visit to Dacca in connection with the Agricultural Exhibition to hear some of your views in these important matters. What, in your view, are the principal difficulties with which the cultivator in your district is at present faced ?—The chief difficulties are malaria and the want of irrigation.

24256. Do you connect those two things in your mind ?—Yes.

24257. Because with good irrigation you get good drainage; is that the point ?—Yes.

24258. How many days in the year does the cultivator in your district as a rule find himself incapacitated by malaria ?—From September to March.

24259. Is it a common thing for men to be unfit for hard work during the whole of that period ?—Yes.

24260. Has malaria grown worse, that is to say, has the incidence of malaria risen in your experience ?—Yes, very highly.

24261. Do you think there is more malaria amongst the population that you know now than there was when you were a boy ?—Yes.

24262. To what do you attribute that ?—It is due to the embankment of the Damodar canals and high roads.

24263. Do you think it is all a question of interference with the drainage ?—Yes.

24264. What are the main crops in your district ?—Paddy, sugarcane, potato and pulses are the main crops.

24265. There is no jute ?—There is very little jute. We have avoided this crop because it increases malaria.

24266. The jute increases malaria ?—Yes, because we have not got any river in our district. We have only stagnant ponds and these increase malaria.

24267. Do you get more than one crop off the land in the year ?—Not in the case of all crops. We get only one crop in the case of winter paddy; we get only one crop of sugarcane; we get two crops of potato and also of pulses.

24268. Do you grow potatoes in rotation with other crops ?—Yes.

24269. What is the ordinary rotation ?—Pulses and hemp. As soon as we cut the pulses we plant potatoes, and then in that land we plant autumn paddy.

24270. That is the third crop ?—Yes. We get two crops in the year.

24271. Are you satisfied with the yield of the paddy ?—No.

Mr. S. N. Roy.

21272. Have you any knowledge of the varieties of paddy at present being recommended by the Agricultural Department?—Not at all. We are not in touch with that department. We do not know even whether that department exists. Of course, we know something about it from the newspapers. In fact, this is the first time that I have come in contact with that department.

21273. You have been round the Exhibition?—Yes, and I have had very sad experience of it.

21274. You had a sad experience at the Exhibition?—Yes, and also very sad experience of the help that we get from the officers there.

21275. What has been your experience?—No one can explain the matter thoroughly.

21276. Just tell us about that, will you?—I am very much interested in paddy. I went to the paddy stall and the officer in charge could not explain to me the nature of the soil from which that particular paddy was produced. I wanted to know its outturn per *cho*, the measure used and various other things, but he told me nothing.

21277. You did not get the exact advice that you sought?—Yes, and this was the case with most of the stall. I am, for instance, interested in the growing of tobacco in my place, but I did not get any suitable reply from the man in charge of the tobacco stall.

21278. You mean to say that at the Exhibition itself you did not get the advice that you sought?—Yes, I could not even get the opportunity of going to the farm. We are shy here to roam about.

21279. *Professor Gangulee* But there is a farm in Burdwan?—We do not know it; we do not even know of the existence of it.

21280. How far do you stay from Burdwan? What is your village?—My village is Pan hata; it is half an hour's journey from Burdwan.

21281. And yet you do not know of the existence of the Burdwan farm?—No.

21282. *The Chairman*: Have you ever been visited on your farm by an officer representing the Agricultural Department?—Never.

21283. Has there been no propaganda or demonstration in your neighbourhood?—Never.

21284. What is your view as to the service which science might be able to render to you and neighbouring cultivators? Do you think there are things which could be put before you which would be of use to you? Have you confidence in the possibility of applying science to practice?—Yes, a good deal.

21285. Do you think that the time has come when the experience of cultivators in other countries and all that science has to teach ought to be made available for you?—Yes.

21286. And you are anxious to learn?—Yes.

21287. Do you think yourself that there is much unreasonable conservatism amongst cultivators?—Yes.

21288. I want you to understand the question. Do you think yourself that cultivators are too conservative or do you think that cultivators are ready to adopt new methods?—They will adopt new methods if they are convinced by practical demonstration. They will adopt only that method which they have seen to be successful with their own eyes; otherwise they will not adopt it.

21289. What, do you think, is the best form of demonstration? Demonstration on a plot of land managed entirely by the Agricultural Department or demonstration on a cultivator's own holding, arranged in conjunction with the department?—My own feeling is that the experiments should be carried on in Government farms.

21290. The experiments should be carried on in Government farms?—Yes, and if they are successful, they should be brought to the villagers' notice. There are educated cultivators in villages who are eager to adopt new and improved methods. If these officers approach them and give them their advice and help, they will be very glad to have that experiment demonstrated in their fields.

21291. It is a more convincing experience to see the crops or methods tried on the cultivator's own holding?—Yes.

21292. Because, there you have conditions, both as regards the size of the holding and the nature of the soil and the practice of agriculture, with which you are thoroughly familiar?—Yes, and that is the best form of agricultural education, as far as I understand.

Mr. E. H. Roy.

NO. 13—35

24293. Have you anything to say about indebtedness?—A good deal.
24294. Is there a co-operative society in your district?—Yes.
24295. Are you a member of it?—No.
24296. Why not?—I have not been approached. My father was once a member of the co-operative society, but he got disgusted with it.
24297. He did not like it?—No.
24298. Why not?—Because it did no good to the cultivators.
24299. Do you mean that they could not borrow money any more cheaply from the society than they could from the moneylender?—Yes, the rate of interest is very high.
24300. Is it your suggestion that the rate of interest was as high from the society as it was from the moneylender?—Yes, in our part of the district.
24301. At what rate can you borrow from a moneylender?—12 per cent.
24302. That is, if your credit is good?—Yes.
24303. At what rate does the local co-operative credit society lend?—At 12½ per cent.
24304. The rate is ½ per cent. higher than the rate charged by the local moneylender?—Yes.
24305. How long has the society been at work?—For a long time.
24306. How do you account for the fact that the society exists if it lends money at a rate which is ½ per cent. higher than the local moneylender's rate? Surely, nobody would go to the society?—They lend money to the townspeople.
24307. Have you a local town?—Yes, Burdwan.
24308. Does your local credit society lend money to townsmen?—Yes.
24309. What for?—For building purposes, or things of that sort. We have no opportunity of finding out any transactions done in the village by this society.
24310. You know very little about the society?—Yes.
24311. Has there ever been any propaganda in favour of co-operative credit societies?—No.
24312. Nothing of that sort?—In name only. We heard that our Union Board was approached by letter to open up a co-operative credit society in our village. We have got an anti-malarial society.
24313. How is that working?—Quite well.
24314. *Rai Bahadur Bannerji*: It is a co-operative anti-malarial society?—Yes.
24315. *Professor Gangulee*: Are you a member of that society?—Yes, and I take a good deal of interest in it.
24316. *The Chairman*: Have you a local Union?—Yes.
24317. Does the anti-malarial society work in conjunction with the local Union?—Yes.
24318. Does the moneylender who according to your evidence lends at 12 per cent., claim exact and regular payment?—No. He wants to have it accumulated to get compound interest and to get hold of the holdings. That is the case with the people who have got holdings. From the ordinary cultivators who have got no holding and who are merely labourers, he gets his interest yearly in paddy.
24319. Are the holdings very small?—Yes.
24320. Are they fragmented?—Yes.
24321. Has there ever been any idea in the village of attempting to consolidate the holdings, so that each man might get a large bit of homogeneous land to cultivate as possible?—No; but nowadays it has become the practice, especially amongst the educated classes, when any division is being made amongst the sons or the heirs, not to divide each plot but to divide it by valuation.
24322. So as to try and keep the land together as much as possible?—Yes; several people in our village have done it.
24323. Whose idea was that?—That was my idea.
24324. Have you found any difficulty in carrying that out?—No.
24325. Have you found any difficulty in connection with the original tenure holders? You make the arrangement, as I understand it, in this way, that instead of dividing the holding you satisfy the younger sons in money; is that the idea?—No.

Mr. S. N. Roy.

24326. Will you explain what is the procedure?—If there are several plots of land, one of 2 *bighas*, another of 2 *bighas*, and another of another size, instead of dividing each plot of land we make a valuation of the plots and divide the plots.

24327. You do have sub-division but without fragmentation?—Yes. The zamindars are in our way; they charge too much.

24328. *Rai Bahadur Bannerji*: A commutation fee?—Yes; it is 6 annas.

24329. Per rupee of the price of the land?—Yes.

24330. *Sir Henry Lawrence*: What is that charge for?—They charge 6 annas out of 10 annas; if it is Rs. 100, they will charge about Rs. 30.

24331. For what purpose?—The landlord charges it for the transfer of the land.

24332. *The Chairman*: At the time when the father dies and the sons share the property, this commutation fee is levied by the zamindars?—Yes. But there is a difference in the case of transfer and in the case of hereditary right.

24333. What is the difference?—They charge too much for transfer.

24334. *Dr. Hyier*: How much do they charge for succession?—It varies according to the wish of the zamindar.

24335. What is your idea of it?—Some charge Rs. 2 per Rs. 100, some Rs. 10 per Rs. 100, and some charge 1 anna in the rupee of the rent.

24336. *The Chairman*: Where do you get your plough bullocks from?—Locally.

24337. Have you sufficient fodder to feed these animals throughout the whole year as they should be fed?—No.

24338. At what season of the year does the shortage occur?—There is a shortage throughout the year.

24339. Is there not a season of particular shortage?—It is at this time of the year.

24340. Does anybody in your neighbourhood grow fodder crops for their cattle?—No; they have only paddy straw.

24341. Did you see any of the fodder crops exhibited at the Exhibition?—No.

24342. Do you think that cultivators would be willing to grow a certain amount of fodder crops at the sacrifice of a certain amount of food or money crops?—Yes, they are ready. For a winter paddy, we can grow only one crop, after harvesting the winter crop there is one crop of *koshi* pulse which is very good fodder for the cattle in our district, but for want of irrigation and moisture that fodder cannot be grown.

24343. Would it be possible to grow that fodder on land on which paddy had been grown?—Yes.

24344. I am thinking of the danger of breaking the soil pan. Could you grow that fodder? Would not deep ploughing interfere with the existing soil pan, so that it would not hold water for the next year's paddy?—The crop that I am speaking of, *koshi* pulse, is only sown.

24345. It does not involve ploughing at all?—There is no ploughing at all.

24346. You could grow it without in any way spoiling the land for paddy growing next year?—Yes.

24347. What you want is water?—Water, and at the same time there should be no malaria; that has affected our labour supply, and there is the labour difficulty.

24348. Do you and your neighbours consume any dairy produce yourselves? Do you get any *ghi* or milk?—We have not got any dairy, but we have our cattle; milk is very scarce; it is very difficult to get it.

24349. Do you realise how important it is for health that one should have some of these things in one's diet?—Yes, certainly.

24350. I expect you realise that people who do not eat meat require milk and *ghi* even more than people whose diet does contain meat?—Yes; in our villages the cultivators seldom get meat; they live on fish, vegetables, *ghi* and milk. I am a vegetarian, but I find great difficulty in getting pure *ghi*. Whatever *ghi* we get in the bazaar is adulterated; in fact, every article of food is adulterated and it is very difficult to get anything pure.

24351. Have you got any such cattle yourself?—Yes.

24352. Do you get milk from them?—Yes.

24353. Do you consume that milk?—Yes.

Mr. S. H. Roy.

No. 13—36a

24354. Do you make any *ghi* or butter?—Very little. The milk supply is deteriorating; in our boyhood cattle were giving milk to the extent of 6 to 7 seers, that is about 12 to 14 lbs., but nowadays, it is very difficult to get a cow giving even 4 to 5 lbs. of milk.

24355. That may be due to the cow being of a bad milking family. May it not also be due to the fact that the cow does not get enough food?—We do give it enough food; it is due to deterioration of the animals. We do not also get pasture lands; all the pasture lands have been usurped by the zamindars.

24356. But even pasture land does not help in the season of shortage, unless there is irrigation?—It will help in winter and in June.

24357. There is very little grass in those seasons in the pasture lands?—Yes.

24358. In your village, are there many days in the year in which the cultivator has little to do?—There are.

24359. How does he employ his time during those days?—He wastes away his time; he has not got any occupation.

24360. What is your own view about the possibility of introducing village industries? Do you think it might be done and might be useful?—It might be useful.

24361. Have you yourself any experience of any spare-time occupation of any sort?—Yes. We grow cotton and make cloth, also we grow hemp and jute and from jute we make thread and ropes.

24362. But there are no spare-time occupations in existence at the moment?—No, there are none.

24363. So that when a man has mended his roof and perhaps cleaned out his tank, that is all he has to do?—They seldom clean the tanks.

24364. After he has mended his roof and patched his house up he has a great deal of spare time on his hands?—Yes.

24365. Is there a school near your village?—In the village we have a middle English school.

24366. And how about the primary schools?—That is the only school we have got.

24367. The cultivators in your district believe in education for their sons?—Some do.

24368. Half or less than half?—More than half.

24369. Do you think that more cultivators believe in education for their sons now than was the case when you first remember?—Yes.

24370. Education is more popular than it used to be?—Yes.

24371. What do you think of the education given in your local school?—That is not at all satisfactory.

24372. What is the matter with it?—We have not got good teachers; we cannot afford to pay good teachers.

24373. Do you happen to know how much your teachers are getting?—Yes; the headmaster gets Rs. 25 a month; the head *pundit* gets Rs. 15.

24374. How many masters are there?—Five.

24375. What does the junior master get?—Rs. 5.

24376. Rs. 25 and 5 are the figures?—Yes. Our school is one of the best in the district.

24377. And the children go straight from their homes to this school?—Yes.

24378. They do not pass through any primary school?—No; we have got arrangements for educating small children also in that school.

24379. *Professor Gangulee*: And these teachers belong to the village?—Some do.

24380. *Dr. Hyder*: Have they got other sources of income?—Besides getting pay from the school they have got other income; they have lands.

24381. And you like the system?—Yes.

24382. *Sir Henry Lawrence*: Who pays the salaries?—They are paid out of subscriptions from local people and from students' fees; we also get some aid from the District Board.

24383. You get no grant from the Government?—We got a grant only from the District Board, not from the Government.

Mr. S. N. Roy.

24384. *Rai Bahadur Bannerji*: What is the grant from the District Board?—Rs. 20 a month; that is the highest that could be given.

24385. *The Chairman*: Would you mind telling me how much land you yourself cultivate?—I cultivate 50 acres.

24386. Is that one of the biggest holdings in the neighbourhood?—It is not in one plot; it is scattered.

24387. In how many different plots?—More than 100 plots.

24388. And you cultivate all the 100 plots?—Yes; I do.

24389. When you must be spending all your time in walking from plot to plot?—I work from 5 in the morning till 10 at night.

24390. You make what a disadvantage fragmentation is, do you not?—Yes.

24391. You know how much more valuable your time would be if you could go on to your farm and work on it all day without ever having to step off your own land?—Yes.

24392. Is it impossible for you to achieve, by arrangement with your neighbours, any further degree of consolidation?—I had a talk recently with some of the villagers on the possibility of working on a co-operative basis, but I do not know whether I will be successful in carrying out the work.

24393. It is very important that we should understand the position, because you have retained a portion of the land on which all your various plots are situated of equal value, of equal quality?—All the plots are not of equal quality, but most of them.

24394. What is the great difficulty now in achieving this consolidation?—It is a new idea and our cultivators are very conservative.

24395. Do you think there is some hope that you may succeed?—If education spreads, we may succeed.

24396. You associate the spread of education with the achievement of consolidation and with many other progressive improvements?—Yes.

24397. Does the small farmer consume his own paddy or does he as a rule market it and purchase from the market for his own consumption?—In our place they do not purchase it in the market as long as they have paddy.

24398. They keep their own paddy?—Yes.

24399. Where do you sell your paddy?—There are merchants who come to our village and they take it to the railway station, and there are *haudilars* who send it to Calcutta and other places.

24400. How do you know whether you are getting a fair price from the merchant?—We could enquire.

24401. He comes to you as a merchant; he does not sell on commission?—No. We know the price prevailing in the market. Our village has very exceptional advantages; we have very good roads; but there are villages where there is no road communication and therefore it is difficult there; they cannot send their produce at all in the rainy season; they can send it only in the dry season.

24402. And do they get as good a price in those villages as you get?—No.

24403. They are more at the mercy of the man who comes and buys in the village?—Yes. Moreover the small cultivators take advances from the big men, or from the owners of the village.

24404. How far away is the agricultural farm, which you have referred to, from your village?—It is an hour's journey by train.

24405. I am surprised that a man who pays so much attention to these matters as you evidently do should not have gone that half an hour's journey in order to see the farm. I am sure there must be some reason why you have not done that?—I did not know it at that time was a farm.

24406. When did you discover it?—Only some two months ago.

24407. How?—I used to buy nitrate of soda and sulphate of ammonia from Messrs. Shaw, Williams and Co. and the Chikna Nitrate Committee. They have a branch in Dacca. One day they told me that they were supplying these manures to the farm here. Then I went to the office in the compound of the Government building and there I found a sign board hanging. I went inside but I could not find the office; I was told that he was on tour.

Mr. S. N. Roy.

24408. *Rai Bahadur Bannerji* You were told that the District Agricultural Officer was on tour?—Yes. Afterwards a friend of mine might have told the officer about me because, one day when I went to Burdwan, he sent for me and had a talk with me.

24409. *Sir James MacKenna* How long have you lived in Burdwan?—From my boyhood.

24410. You told the Chairman that you were an actual cultivator and that you spent 17 hours a day in the pursuit of your agricultural operations. To what extent do you actually cultivate yourself?—I have got my labourers and servants to do the work.

24411. These 17 hours you spend in supervision?—Yes.

24412. You do not sub-let any of your land?—I do.

24413. How much do you sub-let?—I do not sub-let on rent but on division of paddy.

24414. Half and half?—Yes.

24415. Do you spend all the 17 hours on agriculture or have you any other occupation?—No other occupation at present.

24416. Might I ask where you were educated, because I see you have a very good command of English?—My school education was in Midnapur.

24417. Did you take a University course?—Yes, up to the F.A.

24418. I was surprised when you told the Chairman that you had not been cognisant of this Burdwan farm which was started in 1887 and which is one of the oldest farms in India?—It might be.

24419. How many cultivators do you think there are in Bengal?—90 per cent. are cultivators.

24420. How many members of the Agricultural Department?—I do not know, not many.

24421. Would it not be easier perhaps for you to go to them than for them to try to find you out in your remote village?—We have only one officer in our district.

24422. Do you know about his existence?—I have come to know about it.

24423. Quite recently?—Quite recently.

24424. I suppose the fact is that you are so busy in your own village that you do not go out of it?—No, I go to Burdwan very frequently.

24425. Then I must express my surprise. But now you have got in touch with them, I suppose you are going to make use of their help?—Yes, certainly.

24426. *Professor Gangullee*. How much of your 150 bighas do you farm yourself?—With my own hands?

24427. No, I mean under your direct supervision?—Most of it I cultivate myself.

24428. Now, I want to know how much of it is given over on the half anna crop basis?—Very little.

24429. Fifty bighas?—About that.

24430. About one-third. What is the exact basis? Is it the half anna basis?—Yes.

24431. Is most of your crop paddy?—Yes.

24432. I also must express my surprise that you did not know of the existence of Burdwan farm. You have told the Chairman that you are interested in adopting improved methods of agriculture, and you say you have come to know about this Department of Agriculture through newspapers?—Yes.

24433. I take it that you do read newspapers?—Yes, I do.

24434. What newspapers do you read?—I read the "*Statesman*," "*Forward*" and "*Telegraph*"; I am a regular subscriber to "*Forward*".

24435. And you have never noticed that Burdwan farm mentioned in any of those newspapers?—Never.

24436. You certainly know of the existence of an Agricultural Department?—Yes.

24437. Have you at any time written to the Department of Agriculture for information?—I did not actually do it but my father once when he was a member of the co-operative society got seeds from the Agricultural Department; but our experience was very sad; it was a total failure, and from that we lost our faith in that department and did not care to deal with it.

Mr. S. N. Roy.

24438. You say you use the artificial manures, sulphate of ammonia and nitrate of soda; in that connection you never thought it necessary to ask the Agricultural Department for any information?—No, the representatives gave us it.

24439. The representatives of Messrs. Shaw Wallace and Company and the Chilean Nitrate Commission?—Yes.

24440. Do you take part in teaching at the village school?—No.

24441. You yourself are an educated man in the village, but you do not care to take part in teaching of your village boys?—No.

24442. Do the teachers in the middle school often come and see you?—Yes, we occasionally meet.

24443. What is the attitude of the landlords towards the question of consolidation of holdings? Who is your landlord?—We have got several landlords and there are the zamindars.

24444. Can you tell us the attitude of these men towards the problem of consolidation?—They are against it.

24445. Did you ascertain the reason for their opposition?—We cannot approach them.

24446. Have you Union Boards in your district?—Yes.

24447. Are you a member?—No, I am not a member; my father is a member.

24448. Do you think the Union Boards are popular?—To a certain extent they are popular and to a certain extent they are unpopular.

24449. Would you tell the Commission your views with regard to Union Boards?—I can speak of the Union Board of our village Union. These Union Boards are run more or less by one individual, the President; the other members more or less do as he directs. If the headman is honest and takes an interest, the Union works satisfactorily; otherwise it does not.

24450. Are you satisfied in your own mind that Union Boards could be made very effective rural organizations?—Yes.

24451. Under proper guidance?—Yes.

24452. Who elects the Chairman of the Union Board?—The President is elected by the Government.

24453. And the Secretary?—The Secretary is a paid man.

24454. Do you know how much he gets?—Rs. 15 a month.

24455. Do you know what his duties are?—To collect rates, to keep accounts and to look into the papers.

24456. Could you give us an idea of the income of your Union Board?—I cannot say exactly, but the rates collected will be about Rs. 1,100.

24457. Could you give us an idea of the area of this Union Board?—We have got five villages, about 4 or 5 miles long and 2 or 3 miles in breadth.

24458. Rs. 1,100 for five villages?—Yes.

24459. You are an educated man in that village; is there any other educated man in the village?—There are several.

24460. Do they stay in the village?—Some stay and some do not.

24461. You stay in the village?—Yes.

24462. Throughout the year?—Not throughout the year but most of the year.

24463. I want to get from you your relations with the cultivators of your neighbourhood?—I mix with them very freely.

24464. In what way do you mix with them?—I give them advice; I work with them. If possible, I lend them my seeds.

24465. Do you lend money?—Not much.

24466. You do lend some?—No, not at interest or anything of that kind; only to friends.

24467. You lend money as a friend. You say you give them advice?—Yes.

24468. Advice on what?—On production, of course, and cultivation; I try my best to give them any help.

24469. Do you have these meetings regularly or sporadically?—I mix with them very freely.

Mr. S. N. Roy.

24470. *Mr. Calvert* : You have told the Chairman that you grow potatoes and a certain amount of pulses. Do you also grow vegetables ?—Yes.

24471. And fruits ?—Not fruits.

24472. We have heard a great deal about the deficiency in the diet of the rural population of Bengal, could you say whether the consumption of potatoes, vegetables and pulses is increasing ?—Pulses are decreasing while potatoes are increasing.

24473. And vegetables ?—Last year we had a great scarcity of vegetables for want of water, but at present we have got good vegetables.

24474. Are English vegetables like cauliflower and cabbage being grown there now ?—Yes, I grow them.

24475. So that there really is a slight change in the diet of the people ?—Yes.

24476. Assuming that funds were available, is there any improvement of your land which you would like to carry out ?—Yes.

24477. What would you do if funds were available ?—If funds were available, I should grow vegetables in certain fields, use manures and keep good bullocks.

24478. Is there any improvement in the land itself which you would like to carry out, such as sinking wells ?—No, that would be no good in our part of the village ; we want canal water. I want to grow potatoes and sugarcane, but for that we require irrigation from tanks.

24479. Or wells ?—No, in our part of the Province we require water from tanks.

24480. *Professor Gangulee*. How do you lift the water, by pump ?—No, there are other means. There are tanks just at the outskirts of the villages, and around these tanks potatoes and sugarcane are grown. These tanks belong to the villagers ; there are certain lands adjoining the tank to which from time immemorial irrigation has been done from the tank. The proprietor of the tank will not give any water from that tank outside that limited area, so that if anyone wants to grow potatoes or sugarcane, he cannot do it for want of water, and for the supply of water for irrigation the proprietor cannot get anything.

24481. *Rai Bahadur Bannerji* : But can the cultivators not make their own tanks on the land ?—They have only got about one *bigha* of land and there is no space to make any tank. These tanks are now being silted up. If we can arrange to re-excavate these tanks, that is another thing. Old silt is good manure and the re-excavation of these tanks will supply good water to these lands growing potatoes and sugarcane. There are several tanks, but the proprietors are very poor now. If money or a loan can be arranged for the re-excavation of these tanks, there will be a very great increase of the cultivation of potatoes and sugarcane, and if there is legislation enabling the proprietors to charge a certain rate for supplying water from these tanks, the cultivators would very gladly pay those rents to the proprietors in order to get the water from the tanks.

24482. *Mr. Calvert* : What is the difficulty with regard to wells ?—We have got wells that supply water for drinking purposes.

24483. Not for irrigation ?—No, and even for drinking purposes they are dried up in the summer season.

24484. Do you mean there is no sufficient subsoil water for wells ?—There may be very deep ; but we have got five wells in our villages.

24485. *The Chairman* : How deep ?—Forty and forty-five feet.

24486. *Mr. Calvert* : Have you ever had any borings done by the department ?—No.

24487. *Rai Bahadur Bannerji* : You want to re-excavate the silted up tanks ?—Yes.

24488. Has the system which is in vogue now in Birbhum and Bankura for re-excavating silted up tanks by the formation of co-operative societies even been tried in your part of the district ?—Yes.

24489. In Birbhum a very large number of tanks have been re-excavated in that way, and there is no reason why it should not be tried in your part ?—I do not know in what way you did it in Birbhum and Bankura.

24490. I cannot take up the time of the Commission ; I will explain it to you later on if you see me. In your part of the district irrigation is not carried on from wells ?—No.

24491. You only have drinking water from wells ?—Yes.

24492. And no experiment has been tried to ascertain whether the wells will supply any required quantity of water for irrigation ?—No ; we get water from the Eden canal.

*Mr. S. N. Roy.*

21493. For how many months do you get your water from the Eden canal?—July, August and September. They supply drinking water in summer, but the arrangement they have is very wasteful; the canal is very far from the village and there is no distributary. If we want a little water for the summer season, we have to get water through all the fields and there is loss of water by evaporation and wastage. If there were village channels and distributaries, water could be supplied to the village very efficiently.

21494. Did you ever apply to the canal authorities for that?—Yes, we applied, but we were told that under the Eden Canal Act one could not get any channel.

21495. *Rai Bahadur Banerji*: There is another canal being made now?—Yes, the Damodar canal.

21496. Would that be useful to you?—We do not know really what we would do, and moreover the irrigation authorities do not care about the welfare of the cultivators. Our crop however was very good this year, it was really a bumper crop, but if we had a supply of water in October we would have got a cent. per cent. crop.

21497. *The Chairman*. How much? A cent per cent. crop. We cried ourselves hoarse and applied to the Assistant Executive Engineer but he had not even the courtesy to reply to our letter. Then I approached the Collector, and a month or so ago an officer of the Irrigation Department came to me with a copy of this letter which I sent to the Collector, who had requested the former to give a note on that. We even approached the higher authorities in the Secretariat but we got very little remedy. But when our Maharajadhiraj of Burdwan was in charge of that department there was an excellent response made. Any complaint made to him was at once taken up. Once we had a very bad experience. There was a very great demand for water in October and there was water in the canal at that time. We wrote several letters to the Executive Engineers, the Sub divisional Officers and Zildars, but they paid no heed. Then it appears that some cultivators cut the embankment and obtained their water supply. The irrigation authorities brought a criminal case against us and they stopped the water. Then we sent an urgent telegram to the Member in charge of Irrigation and the Maharajadhiraj was at that time in charge of Darjeeling. He telegraphed to the people concerned to supply water at any cost and a copy was sent to us. Then we had all the high officials coming to us; we got the water and the case was withdrawn.

21498. So you think generally that the staff of the Canal Department is indifferent to your interests?—Yes, with a few exceptions.

21499. You told the Chairman that you were raising two crops in the year, rice and potatoes, mainly, but as you said just now, by September you did not get any more canal water. How then did you grow your potatoes?—We grow them through tank irrigation.

21500. You told the Commission that when you had been to the Agricultural Exhibition that was held here the other day, the gentleman in charge there could not explain to you the different things you wanted to know. Was it not because you did not come across the right officer?—I do not know. But later on some gentleman came to me and told me that he was in charge of the propaganda work. It was explained to me later in the afternoon.

21501. So you were satisfied that the man you came across was not the right man to provide the information you wanted?—That I do not know. I was told that that particular gentleman was the demonstrator of the farm.

21502. *Professor Gangulce*: But then you did get the information you wanted from the Exhibition finally?—Yes.

21503. *Rai Bahadur Banerji*: And you have told the Commission that you do not have very much correspondence with the Agricultural Department?—No.

21504. So that if you did not receive any information on agricultural matters it was not so much the fault of the Agricultural Department as your own?—The thing is that I might have known of the existence of the department but that department is meant for the uplift and the good of the cultivator. The poor cultivator, do not read newspapers, nor there is distal news of the Government. It is the duty of the agricultural officers to go to the cultivators and teach them, to spread their propaganda work. I do not know whether they have got the time to do it.

21505. And you do not know, I suppose, whether they have the required officer for it?—No.

21506. From the co-operative credit societies money is generally taken on an interest of 12½ per cent and from the village *mukajan* you get it at the rate of 12 per cent. with compound interest so that the interest is a little more in the case of the co-operative societies?—I do not know what the system is in vogue in co-operative credit societies is.

Mr. S. N. Roy.

24507. They do not take any compound interest ?—But only yesterday I was informed by a brother delegate that these banks do charge compound interest.

24508. *Professor Gangulee* Co-operative banks ?—Yes.

24509. *Rai Bahadur Bannerji* Do you think that Messrs. Shaw Wallace and Company for instance have got better arrangements for propaganda work than the Agricultural Department ?—I think so.

24510. Is not the President of the Union Board elected by the members of the Union ?—The President is not elected.

Yes, he is elected by the members.

24511. *Sir Henry Laurence* Can you tell me something of the work of the Circle Officer in the Union Board ? Have you ever seen the Circle Officer ?—No.

24512. What does he do ? What are his duties ?—He audits the accounts.

24513. Is he primarily a financial officer ?—Yes.

24514. Does he do no propaganda work ?—Never.

24515. Do you know who this man is in your area ?—No.

24516. Or where he lives ?—No.

24517. There is a Collector at Bardwan, is there not ?—Yes.

24518. How many Circle Officers work under his instructions ?—That I do not know.

24519. How many villages are there in your Union ?—I think about five.

24520. And that forms a Circle, does it ?—That forms a Union and several Unions form a Circle.

24521. How many Unions form a Board ?—A Union and a Union Board are one and the same thing.

24522. Then what is the area of the Circle ?—Several Union Boards make a Circle.

24523. How many ?—In our part of the country I cannot say how many, but I think it may be four or five Unions.

24524. Are the principal landholders of a Circle ever called together to discuss matters of common interest ?—Never.

24525. For instance, men like you who hold about 50 acres of land or thereabouts ?—Never. We are kept in awe by the zamindars.

24526. Do zamindars discourage your meeting and taking part in the work of the Circle ?—The zamindars do very little; they take very little interest in village affairs; their case ends as soon as they get the rent; if they do not get the rent they charge four annas in the rupee as interest per month.

24527. How much rent do you pay to your zamindar for your land ?—I think about Rs. 250 or Rs. 300 and we pay something to Government, say Rs. 250 or Rs. 300 for 50 acres. There are certain lands which we hold as *talhraj*, rent free.

24528. How much rent do you pay per acre for the land for which you pay rent to the zamindar ?—We pay Rs. 2 per *bigha*. This differs; sometimes we pay Rs. 1-6-0 or even Rs. 3.

24529. Can you give me a figure for say a consolidated holding of 50 acres ?—I cannot say; there are different holdings. There are several plots of land and we sometimes pay Rs. 16 for one plot.

24530. And you have never made out your accounts ?—We do not make it out per *bigha* because there are different rates for different lands.

24531. Can you not give me the total ?—I gave you the total just now when I said about Rs. 250 or so.

24532. But you told me certain areas were rent free ? I want to know what you pay for these ?—I cannot say.

24533. *Rai Bahadur Bannerji* For 100 *bighas* you pay this rent of Rs. 250 ?—About that; I cannot say definitely.

24534. *Sir Thomas Middleton* Is your father associated with you in these 50 acres ?—My father is the owner and I simply work for him.

24535. How many brothers work in this manner ?—Two; I look after this work and my younger brother is a physician.

24536. So that only your father and you are in charge of the fifty acres ?—No, I have got cousins too; we are a joint family.

Mr. S. N. Roy.

24537. I want to find out how many people share in the fifty acres?—Five.
24538. *Rai Bahadur Binnerji*: And all the five live in the joint family?—Yes.
24539. *Sir Henry Lawrence*: Are they five adult males or do they make five including women and children?—Women have got no right.
24540. *Sir Thomas Middleton*: There are five of you who are concerned with looking after the land. How many hired labourers do you have in addition?—We have three permanent servants.
24541. And how many part-time servants?—Several, there is no fixed number.
24542. There are eight of you altogether, then, who are working on the 50 acres?—All of us are not working in the fields. For instance I and a cousin of mine do this other work.
24543. Then how many are actually working?—Two.
24544. And the three servants?—Yes.
24545. And of the 50 acres 15 are let on the share system?—Yes, about that.
24546. So that five of you are working on 35 acres. How many cattle do you require for the working of the 35 acres? how many plough bullocks?—Four pairs.
24547. Are the 5 cattle jointly owned, or do your cousins and you have cattle separately?—No, jointly.
24548. Supposing one of your bullocks dies or grows old, do you buy the bullocks you require in the neighbourhood or do you get them from some distance? We try to get them as near as possible, going a little distance away, say two or three miles out.
24549. Is there very little breeding in the neighbourhood?—There is no breeding at all.
24550. You complain of the cows giving a very small supply of milk now. Could you tell me how you feed them?—I feed them on straw and paddy.
24551. Have you any idea as to how much you give?—I cannot give you the amount in weight but I can in bundles.
24552. Can you give me any idea of the weight of the grain you give them?—We do not give any grain but milk-cakes.
24553. How much?—About 14 lbs.
24554. For how long a time do you feed them?—For the whole period.
24555. While the cow is in milk?—No, always.
24556. You told us the difficulties you had because of malaria, and you mentioned the embankments. Have you been reading Dr. Bentley's book?—Yes.
24557. Your views are the same as his on that subject?—I myself have got some experience of that. I live just by the side of that embankment along the Dimodar river.
24558. And do the people in your district generally hold these views that you have expressed?—Yes.
24559. Are the people in your district fairly well off or would you describe them as very poor? I am, of course, referring to the ordinary cultivators in your district?—They are very poor.
24560. Do you think that they get enough to eat?—Not all.
24561. So there is not much chance for their cattle?—Last year the cattle had to live on a very small quantity of straw.
24562. *Dr. Hyder*: Do you require an extension of primary education in your district?—Yes.
24563. Are you willing to pay for it?—No. We are paying too much taxes and the poor cultivators cannot pay a single farthing more.
24564. Do you read newspapers?—Yes.
24565. Supposing the Agricultural Department issued a very simple fortnightly newspaper devoted chiefly to agriculture and containing information about crops, manure, diseases of cattle and things of that kind do you think such a newspaper would be popular?—It would be very popular provided the cultivators can afford to pay for it. The price of such a paper should not be too high.
24566. Would you like to have an agricultural show like the one we have here once a year at the headquarters of a district?—Yes, provided something substantial is done there.

Mr. S. N. Roy.

It is certainly worth having such shows if some good comes out of them. They should not be shown in name only.

24567. Is much land passing from the hands of the tenants? Are they selling their rights?—Not all; some of them do.

24568. Is that an acute problem in the district of Bardhaman?—The land problem is not very acute but the decrease of produce is a very great problem.

24569. Do you do moneylending business yourself?—No.

24570. What is the origin of this rent free land that you hold? Did you get that because you are a priest?—We purchased it as *lakhraj*.

24571. It did not belong to you originally?—No.

*A delegate* I think the Commission should inquire from us the reason why we contract loans.

*The Chairman* I am afraid we cannot have extraneous opinions of this sort because it is not possible to record them, but if you put your views in writing we undertake to give them the most careful consideration.

(The witness withdrew.)

**Khan Bahadur MAULVI EMADUDDIN AHMED, B.L., Chairman,  
District Board, Rajshahi (Bengal)**

**Replies to the Questionnaire**

**QUESTION 2.—AGRICULTURAL EDUCATION.**—(i) No; not sufficient.

(ii) There is an urgent need for the extension of teaching facilities in almost all the districts of Bengal especially in the districts of the Rajshahi Division of which I have a personal knowledge.

(iii) Teachers in the rural areas should be drawn exclusively from agricultural classes.

(iv) The attendances are not at present as numerous as they should be. The reason is that the students are mainly drawn from non-agricultural classes who attend the course in the hope of getting Government service, which they often do not get. If the course of instruction is restricted to agricultural classes only, they will not merely seek Government service but will also try to improve their own lands with the knowledge derived.

(v) As at present, Government service.

(vi) No; they are rather mostly drawn from non-agricultural classes.

(vii) More attention should be paid to the practical training in the field.

(viii) I give preference to (a) nature study, (b) school plots and (c) school farms. It is only by school plots and school farms that agriculture can be taught with real benefit to the students. Each school should have separate school plots and farms and boys from 10 to 15 years of age should be compelled to attend these plots and farms. A teacher recruited from the agricultural class should be selected for special training in some agricultural school, who after finishing his course may be put in charge of these plots and farms to teach the students the practical side of the science.

(ix) A few of the students enter Government service but a large number get no occupation.

(x) On finishing the course of training the student should be provided with a certain amount of capital to purchase implements and cattle, etc. Effective measures should also be taken to prevent failures of crop on account of drought by irrigation canals, tanks, ponds, and wells.

(xi) To my knowledge, there are none.

(xii) Adult education in rural areas can be popularised by appointing demonstrators and by carrying out demonstrations on the plots of big farmers.

(xiii) More demonstrators should be appointed for giving educational facilities in rural areas.

(a) *Administration.*—A small Advisory Committee consisting of five members with the District Magistrate as Chairman should control these demonstrators with the Director of Agriculture as the final authority.

(b) *Finance.*—A beginning should be made by starting co-operative societies. Highly-paid officers may be done away with and thereby some savings effected.

**QUESTION 3.—DEMONSTRATION AND PROPAGANDA.**—(a) Big cultivators should be induced to attend field demonstrations as well as to apply their knowledge in their own cultivation.

(c) Yes; cultivators may be induced to accept expert advice by offering them prizes and by holding fairs and *melas*.

**QUESTION 4.—ADMINISTRATION.**—(c) (i) I am not satisfied with the Agricultural and Veterinary Services.

(ii) Not satisfied with the present limited Railway and Steamer services. There should be more extensive services of both kinds, which will afford easy transport facilities of the produce of the cultivators.

(iii) There are practically no roads in the interior of a district. There should not only be roads but they should be installed and bridged.

(v) and (vi).—Posts and telegraph services should likewise be extended and made cheaper. The extension of these services will enable the cultivator to know the latest market rate of the crops and also help them to advertise their own produce.

*Agricultural Services.*—More low paid officers having expert knowledge should be attached all over the district.

**K. B. Maulvi Emaduddin Ahmed.**

**Veterinary Services.**—The number of Veterinary Assistants at present working are very few and more are needed.

**QUESTION 5.—FINANCE.**—(a) Co-operative societies under the direct supervision of Government should be established.

(b) The co-operative societies are the only means which can induce the agriculturists to spend money frugally.

**QUESTION 6.—AGRICULTURAL INDENTEDNESS.**—(a) (i) Borrowing is due to extortion by landlords in the shape of taking *abrarab*, enhancement of rent by them, the recklessness in the matter of expenditure on the part of agriculturists and the highly lowering down of the prices of jute.

(ii) The sources of credit are greedy *mahajans*, landlords, *tahsildars* and well-to-do *prodhans* of the village.

(iii) The reasons preventing repayment are failures of crop, perennial extortion by landlords, exorbitant rate of interest charged by creditors and insistence on repayment in kind instead of cash.

(b) Change of attitude of Government by paying more attention to the grievances of the ryots, taking special measures to prevent landlords to demand *abrarab* and advising agriculturists to be thrifty by appointment of special officers if necessary. These are some of the measures which will lighten the agriculturists' burden of debt. Special measures to deal with rural insolvency are, in my opinion, necessary.

**QUESTION 7.—FRAGMENTATION OF HOLDINGS.**—(a) Compelling the cultivators to cultivate their land under co-operative system is necessary.

(b) The Hindu and Mahomedan laws stand in the way of consolidation. They can be overcome by co-operative societies and by compelling the agriculturists to work under co-operative system.

(c) Legislature is not necessary but it is essentially needed to keep disputes out of courts. Co-operative societies with a Government servant of some position to look after them may settle disputes out of court.

**QUESTION 8.—IRRIGATION.**—(a) Almost all the districts of North Bengal require irrigation. They should have either canals or tanks and wells. Want of fund is the obstacle to the extension of irrigation.

(b) I have not seen any canal water being distributed to cultivators.

**QUESTION 9.—SOILS.**—(a) Soils should be improved by application of manures.

(b) *Barind* land in the districts of Rajshahi, Maida, Bogra and Dinajpur has suffered great deterioration on account of poor or no supply of manure.

(c) Many lands have become overgrown with jungles which need reclamation. Government should compel zamindars to clear the jungles and bring labourers from abroad to settle down and cultivate lands by giving them advances and by making sanitary arrangements to improve their health, etc.

**QUESTION 10.—FERTILISERS.**—(a) Artificial fertilisers may be profitably made more use of. Sulphate of ammonia, potash, etc., may be more extensively used by giving them on credit and taking the prices after the harvest. The prices of these manures should also be reduced.

(c) To give them on credit and take the prices after the harvest. In my part of the district the use of artificial manures is just begun and is likely to lead to a considerable increase in the use with the better yields.

(e) Sulphate of ammonia has been tried in my district and the result appears to be satisfactory.

(f) By lowering the prices of coal.

**QUESTION 11.—CROPS.**—(a) (i) Timely supply of water either by irrigation canals or tanks or ponds will greatly improve the existing crops.

(ii) Sugarcane, potato and vegetables may be more extensively cultivated.

(iii) Seeds should be distributed on credit and the prices realised after the harvest.

(iv) Supply of fire-arms to members of co-operative societies under the supervision of Government officials is essentially necessary for the prevention of damage of crops by wild animals.

(c) Cultivation of sugarcane, potatoes and jute has met with success.

**QUESTION 13.—CROP PROTECTION, INTERNAL AND EXTERNAL.**—(i) There are practically no measures for protection.

K. B. Maulvi Emaduddin Ahmed.

QUESTION 14.—**IMPLEMENTS.**—(a) and (b) Improved implements and machineries should be given to the co-operative societies and prices recovered by long-term credit.

QUESTION 15.—**VETERINARY.**—(a) The Civil Veterinary Department should be independent.

(b) (i) Yes, it is working well, but the local bodies have not been able to provide sufficient number of dispensaries.

Itinerant Veterinary Assistants are more useful than dispensaries.

(ii) No.

(iii) Yes, provided the District Boards are not called upon to pay anything.

(c) (i) No; more itinerant Veterinary Assistants are necessary. If the cultivators are brought under the co-operative system, they can themselves employ a Veterinary Assistant.

(d) Cultivators are conservative in having resort to inoculation by Veterinary Assistants but when they have once found the utility of inoculation they are eager to take it. I do not advocate legislation. Appointment of sufficient number of Veterinary Assistants for treatment and propaganda work will remove the difficulty a great deal.

(e) There is some difficulty in securing sufficient serum, to meet the demand. The serum ought to be distributed free.

(f) Conservativeness of the people, inaccessibility of the places, insufficient number of doctors and prices of serum are some of the obstacles. To my knowledge, no fee is charged.

(g) Yes, I consider it desirable. I would advocate the extension of Provincial Veterinary Research Institutions.

(h) (i) No.

(ii) Yes.

QUESTION 16.—**ANIMAL HUSBANDRY.**—(a) (i) Yes.

(ii) Certainly.

(iii) Yes.

(b) (i) At present considerable overstocking exists, and as a result cattle do not get sufficient grass which is injurious to their health.

(ii) There are at present very few enclosed pastures in tilled fields where the cattle may temporarily graze when unyoked.

(iii) Yes.

(iv) Yes.

(v) Yes.

(c) August, September and October are the months when the shortage of fodder is keenly felt, due to transport difficulty.

The health of the young growing cattle is permanently ruined.

(d) Yes, by compelling the cultivators to grow fodder on certain portions of their land and by insisting on the zamindars to set apart a certain tract of land in each village for pasture, cultivation of fodder as "catch crops" by the Agricultural Department should be encouraged.

(e) By legislation only.

QUESTION 17.—**AGRICULTURAL INDUSTRIES.**—(a) eight months. He idles away the rest of the year.

(b) Yes. Weaving, sericulture, poultry, goat, sheep and cattle-breeding, pisciculture, etc.

(c) Want of encouragement, knowledge and capital are some of the obstacles.

(d) Yes.

(e) Yes, industrial concerns may be moved to rural areas by offering them subsidies and sufficient transport facilities.

(f) Yes.

(h) Yes, by co-operative village societies under the strict supervision of special officers of Government.

QUESTION 18.—**AGRICULTURAL LABOUR.**—(a) By inducements in the shape of giving them advances and free quarters.

K. B. Maulvi Emaduddin Ahmed.

(b) There is a shortage, it can be removed by indenting outside labour by inducements as suggested above.

**QUESTION 20.—MARKETING.**—The existing market facilities are not satisfactory. I refer to paddy, *rub*, and jute markets. It is mainly due to want of proper transport facilities and as a result the cultivators are deprived from getting the highest prices of their produce. The construction of metalled roads and extension of railway and steamer services will remove the difficulty. The reduction of rate of freight is also essentially necessary.

Besides, there should be co-operative sale societies of the cultivators themselves which should control the sale and advances should be made to cultivators when prices are low. The minimum prices of jute should be fixed and its demand should be broadcasted before the sowing of the jute commodities.

**QUESTION 22.—CO-OPERATION.**—(a) (i) Government should appoint special officers to encourage the growth of co-operative movements. The existing system is not satisfactory. Every village should come under co-operative society and rules should be framed to suit the condition of the villagers. Government should contribute some amount at least at the beginning.

(ii) Respectable villagers should be requested to do the propaganda work.

(b) These are the societies which will do immense good but I should like to have co-operative societies first, which in their turn, may have these societies as their branches.

(vi) and (vii) Agricultural and joint farming societies are the societies which to my mind may do immense good to the cultivators and I wish to establish them on co-operative basis.

(c) Legislation is necessary to compel, as far as possible, such persons to join for the common benefit of all.

(d) Naogaon Ganja Cultivators' Co-operative Society which is managed by Government has proved a great success with immense potentiality for further development.

**QUESTION 23.—GENERAL EDUCATION.**—(a) (ii) and (iii) Each middle school, under which I include also the upper primary school, should have school plots and school farms attached to it, as I give preference to practical training in the fields, under teachers specially trained in agriculture. In our poor country, where the agriculture is the main occupation, to draw away the cultivators from their primary occupation will add to the middle class unemployment and be ruinous to the country.

(b) (i) If in middle schools the pupils are required to get practical training in the field I think both the purposes will be served.

(ii) I have no experience of compulsory education in rural areas but I think it is absolutely necessary.

(iii) The general poverty of the people who cannot bear the growing high expenses of education, and therefore cannot afford to keep the boys in the school. They require the services of their boys on their field or their wages for their family maintenance.

**QUESTION 24.—ATTRACTING CAPITAL.**—(a) Government should advance money to big agriculturists to carry on improvements. The money is to be repaid on easy instalment system. Persons having capital do not advance money as agriculture has not been found paying.

(b) Uncertainty of the results from the improvements effected and want of funds and of proper knowledge.

**QUESTION 25.—WELFARE OF RURAL POPULATION.**—(a) Drastic measures should be adopted to put a stop to illegal *abuses* and other illegal exactions. Special officer should be appointed for the purpose and every encouragement should be given to cultivators to proceed against the wrong-doers.

(b) I am in favour of Government conducting economic survey. There should be enquiries as to how much the landlord men extort from tenants in illegal ways, how much the tenants themselves recklessly spend money, how the *mahajans* and traders taking advantage of cultivators' poverty purchase their produce at nominal prices.

(c) I know much of rural life and I know illegal exactions by landlords, exorbitant demand of *nazars* by landlords for allowing tenants to excavate tanks and other sources of water supply, advances made to agriculturists by traders and *mahajans*, to get their produce at cheaper rates and their own recklessness as some of the causes which have brought about their present extreme poverty and utter helplessness.

K. B. Maulvi Emaduddin Ahmed.

## Oral Evidence

24572. *The Chairman* : Khw Bahadur Maulvi Emaduddin Ahmed, you are Chairman of the District Board, Rajshahi?—Yes.

24573. You have provided the Commission with a note of evidence that you wish to give. Have you any statement of a general character that you wish to make at this stage or shall I ask you some questions?—I have only one statement of a general character to make, which I have also put in in my note. The landlords and the *mahajans* have been oppressing the tenants to a great extent and unless they are relieved of the burden of these *mahajans* and *zamindars*, there is no hope for the ryots.

24574. Are you yourself a cultivator?—I am not a cultivator but I am a *jotedar*. I have got about 300 acres of land, I cultivate 100 *bighas* and the rest I give to other cultivators on the *adhi* system.

24575. That is, half and half the produce?—Yes.

24576. Your note is very clear on the points that you have dealt with and there are only one or two questions that I should like to ask you. On pages 557 and 558 of your note you say that you are not satisfied with the Agricultural and Veterinary Services. What is the matter with them?—I do not wish to make a general complaint nor do I wish to speak against the Director of Agriculture. I know him personally and both he and the Chemist take a good deal of interest; but I cannot say that I hold such a high opinion of other officers. For instance, the Deputy Director of Agriculture does not take so much interest as he ought to take nor do the Superintendents of various farms take so much interest in demonstration as they ought to. Of course, small demonstrators do take a little interest. The low paid officers who are getting Rs. 25 or Rs. 30 do take a good deal of interest in the cultivators. Now, with regard to the Veterinary Service, the District Boards are required to keep Veterinary Assistants and we pay practically the whole of their pay. Government do not pay anything. Not only have we got to pay the salary of those Veterinary Assistants, we have also got to pay the price of the serum that we get. This is a terrible sum for the District Board. What I mean to say is that the resources of the District Boards are too small and they cannot afford to pay the price of the serum when there is an epidemic. On account of the shortness of funds, they cannot employ a sufficient number of Veterinary Assistants nor can they purchase a sufficient quantity of serum to deal with the epidemic. I may tell you that this year there was an epidemic in my district and the cattle have died by hundreds and the poor cultivators are now crying themselves hoarse.

24577. You complain also about the lack of communications?—In that direction I do not want any pecuniary help from the Government. All that I want is that the District Boards may be empowered to metrol the roads and realise the cost by taxation. They have provided for this in the Municipal Act but they refused to give us sanction. We then moved the then Minister and he also refused sanction saying that the Government of India might come in the way and so it could not be done. Of course, if you can give us money, it is all right; but I say that there ought to be a section in the Local Self-Government Act which would enable the District Boards to metrol the roads and levy tolls. There is a provision in the Local Self-Government Act for bridges and I have constructed big bridges costing Rs. 1,50,000 which are being paid by the levy of tolls, and the people have not murmured.

24578. On page 558 you attribute the extortions of the landlords as the first cause of indebtedness and of borrowing in this Presidency. Is it within your knowledge that debt exists in the ryotwari areas in the same way as it exists in the zamindari areas?—What I mean to say is this that the landlords are, generally speaking, absentee landlords. Of course, the landlords are very good persons but the sad part of the whole thing is that they leave the country and go to the big towns, and leave their affairs to be managed by their manager who are low paid officers. They really exact 4 annas for each rupee every year and sometimes they have refused as much as 8 annas per rupee.

24579. *Professor Gangulice* : For what?—For *abraras* only, for self-interest. I know of instances. One absentee landlord sent a telegram to his manager saying "Borrow on steel, but let me have Rs. 1,000". There are real facts. The landlord only wants Rs. 1,000 but the manager collects Rs. 5,000 and steals Rs. 4,000 and sends the landlord only Rs. 1,000 down in Calcutta.

24580. *Sir Henry Lawrence* : What is the *abrar*?—It is an illegal exaction and is not authorised by the law. This sort of thing is happening every year.

24581. *The Chairman* : Would you turn to page 559 of your note. In answer to our Question 18 (c) (i) you say, "No; more itinerant Veterinary Assistants are necessary. If the cultivators are brought under the co-operative system, they can themselves employ

K. B. Maulvi Emaduddin Ahmed.

a Veterinary Assistant." Do you mean a Veterinary Surgeon in private practice?—What I mean to say is that more men would be in demand and they would be employed as private practitioners.

24582. They would be entirely non-official?—They would be entirely non-official but they would be under the supervision of the Government.

24583. Did you have personal experience of the difficulty in obtaining serum during the recent epidemics of which you spoke a moment ago?—There is some delay no doubt, but we do not care so much for the delay as we do for the price of the serum. We find it beyond our means to pay the price. This year I had to spend Rs. 4,000 extra on serum. Beyond that I could not go because our budget does not allow of it. Serum ought to be absolutely free, and I pray that you should pass orders just now to that effect.

24584. You recall that somebody has got to pay for it?—I know that Government will have to pay but the Government have been taking taxes. They can curtail the appointments of Circle Officers and other big officials and pay the price of serum.

24595. Do you in this connection distinguish between Government and the tax-payer as such?—What I mean to say is that the Government can do it. In fact, whatever Government wish to do, they can do. They can abolish the posts of Circle Officers where they are not needed, so that they may give serum free.

24586. On page 560, you suggest that for the protection of the cultivator a minimum price for jute should be fixed by rule. Have you ever studied the problem of the fixation of prices?—I have not studied it but I may be permitted to point out that it would have been much better if jute had not been grown in Bengal at all. We do not know the extent of the demand; no one tells us what the demand is. Ignorant people grow a large quantity of jute and in the forecast the quantity is reduced. Why not let us have the demand as well, so that the cultivators may be warned or the Circle Officers may warn the cultivators. I did not grow jute in my whole life; I was against it. But my headman prevailed upon me to grow jute last year and I did it in 3 *bighas* and obtained Rs. 300. This was very tempting and this year I grew jute on 15 *bighas* and I have not been able to realise the amount that has been spent on it.

24587. Do you not see some danger in fixing minimum prices? If you fix them by statute, they are inclined to be maxima as well?—In that case I shall grow a little less. They have been doing it with regard to *ganja*.

24588. What you require, perhaps, is information as to the amount of jute in storage?—In storage, as well as what will be required for export to European countries. We do not know exactly what should be done; something ought to be done. With regard to *ganja*, Government have been doing it. If a larger quantity is grown, they burn any quantity which is above their requirements, in order to get better prices. In the same way, some sort of arrangement should be made.

24589. Some attempt at limiting the extreme fluctuations in prices?—Yes, I mean that.

24590. *Sir Henry Laurence*: Who is it that burns the *ganja*?—It is done by Government.

24591. Who makes good the cost of the burnt stuff?—They do not pay for it. They burn a certain quantity proportionately. The whole of the quantity grown is taken into one storage, and the quantities grown by various people are proportionately burnt. The result of this is that all the growers get a price.

24592. Somebody must pay for it?—Those who grow more have to suffer. It is a Government monopoly, and it is managed in that way, which has the effect of raising the prices.

24593. *Rai Bahadur Bannerji*: Is it not a monopoly of the co-operative society?—No, it is a Government monopoly; Government keep a certain quantity, burn the rest and fix the prices.

24594. *Sir Henry Laurence*: You suggest that jute should be treated in the same way?—It is a very great problem in regard to jute. I cannot at once say what sort of arrangement ought to be made, but something in that direction ought to be done.

24595. You are aware that *ganja* is grown on a few thousand acres, whereas jute is grown on a good many lakhs of acres?—Yes.

24596. You want to enforce the principle?—Yes.

24597. *Sir Thomas Middleton*: You let most of your land on the half and half system?—Yes.

K. B. Maulvi Emaduddin Ahmed.

2159. What does it mean exactly; do you get half the gross produce of grain and also half the gross produce of straw, or is it half of the grain only?—There are several systems, but only two are in vogue; in certain cases, half the grain as well as half the straw is shared, and in others only half the grain is shared and not the straw.

2160. You supply the land. Do you supply any assistance by way of cattle or any other to the cultivators?—Yes; I give them cash in advance. Of course, there are persons who take interest on it, but personally I do not take any interest. I advance for 3 dunnies the season and get it back.

2161. So that the cattle belong to the tenant?—Yes, they do not belong to me.

2162. Do you do anything in the way of assisting them to get seed?—Yes. Sometimes I get seed from the farm and distribute it among my tenants, getting the price for it afterwards.

2163. You recommend sulphate of ammonia; you say that sulphate of ammonia has been tried in your district; for what purpose?—For paddy. I have used it for paddy, and I may be permitted to say that I am thankful to the private company which thrust it on my notice. They have been taking more interest in this direction than Government. It is just I tried it on transplanted paddy, and the results have satisfied me. Some of the cultivators have tried it for jute, and they say that it has done some good to their jute crop too.

2164. When you say that it has satisfied you, could you give an estimate of the profit?—Without using sulphate of ammonia I used to get 5 maunds per bigha or 15 maunds per acre, and after applying the fertiliser I got about 24 maunds per acre.

2165. How much sulphate of ammonia did you give to the land?—Fertiliser worth Rs. 9 for 5 bighas. The company recommended that that quantity should be used for 4 bighas but my friend told me that it would perhaps be too much and we had better use 5 bighas.

2166. You point out that, as a result of the neglect of cattle, young growing cattle are permanently injured?—That is because they cannot get fodder. As you have come all the way from England, I may be permitted to relate to you one little experience of mine. A gentleman from England was coming out to India to join the Police Service, and he was coming out here for the first time. I met him on board the steamer. After he came out here, I asked him what struck him most in this country, and he replied that the cattle struck him most. He said that they were extremely poor specimens compared with those in England, so much so that he could scarcely call them cattle.

2167. Your proposals for improving the condition of cattle are to compel the cultivators to grow fodder crops on certain portions of their lands?—Yes, and the Government should set apart a portion of land as pasture.

2168. How can you compel them to?—Some sort of persuasion can be exercised by the Government. In this connection, I may say that Government have taken the wrong step in putting these appointments of Circle Officers. In my opinion, they ought to have looked to the improvement of agriculture first, and then taken in hand the other things. I say that there is not so much necessity for some of the other things which Government are doing; they do not pay as much attention to agriculture as they ought to. Instead of the Circle Officers, there ought to have been agricultural officers.

2169. How can agricultural officers compel the cultivators to grow fodder crops?—By persuasion they can do it, by persuasion many things can be done. If they know that it is the order of the Collector, they will grow it.

2170. You as landlord are in a stronger position to exercise compulsion? Have you any land set apart for fodder?—I myself keep some land for fodder, but landlords do not generally do it. As regards persuading the cultivators to set apart such land, I have not done anything and if I am to blame I am quite willing to take the blame; the Government do little for the tenants.

2171. Supposing you did compel your cultivator to set apart land for fodder, would there be enough land left to feed himself?—That is the great problem; most of the cultivators have not got sufficient land for the purpose.

2172. Sir James MacKenzie: Where does the District Board get its serum from?—Not from Maltesar?—No have been getting it from Kasauli.

2173. Is it an underground serum?—Yes.

2174. Do the District Boards charge the cultivator for it?—No.

2175. It is a direct charge on the District Board's fund?—Yes.

X. B. Maulvi Emaduddin Ahmed.

24615. *Professor Gargulee* Do you receive the necessary guidance from the District Magistrate in your District Board work?—There is no necessity for it.

24616. You do not want the District Magistrate to have anything to do with the District Boards?—As sufficiently educated persons are available in the district, there is no necessity for it. But with regard to agriculture, the District Magistrate, with the help of four or five non-official persons, will be able to do much because there is no other person who is in touch with the district to that extent.

24617. Can you tell the Commission something about the chief activities of your District Board? Are you paying more attention to roads?—I have been paying more attention to dispensaries. When I first became Chairman, there were only eight dispensaries, but now there are 30 dispensaries for saving human life, but unfortunately there is nothing to save the cattle. We also pay some attention to education and there is work in other directions.

24618. Have you any Union Boards in your district?—They have just begun.

24619. What are your views about the Union Boards?—I have already told you that the Union Boards will be able to do a little work, no doubt; but I think it would be better if these Circle Officers paid more attention to starting agricultural associations than these political bodies.

24620. You do consider the Union Boards to be political bodies?—I do consider them to be so, to a certain extent.

24621. In what way?—Because, the District Magistrate wants to be in touch with the people, and the Circle Officers exercise a good deal of control over the people politically also.

24622. Your main idea is that the District Magistrate should not have anything to do with the people?—I do not mean that. The District Magistrate is not to blame; the idea must come from Government, if the District Magistrate is required to pay more attention to agriculture than he does at present, he will be glad to do it.

24623. Just now, you said that the Union Boards are really political institutions?—Yes.

24624. We should like to get from you your reasons for holding that view? After all, what have they been doing?—They have been looking after some roads and collecting choulidari taxes. All these things they have been doing, but not much work for the improvement of the country. I do not personally see any very useful work that is being done by the Union Boards. Government want to keep more control over the people through these Union Boards.

24625. You are in touch with their work?—Yes.

24626. What is the relation between the District Boards and the Union Boards?—There is not much relation between us; we only pass their budgets; we are to a certain extent rather aloof from them; I, as Chairman, do visit them.

24627. How did you come to know about this sulphate of ammonia?—Mr. S. N. Wallace and Co. sent their agents to me. In fact they thrust it upon me and I am thankful that they did so. At first I was conservative, but they sent their agent again and again and thrust it upon me.

24628. By their intensive propaganda?—Yes.

24629. Do you get any assistance from the Rajshahi farm?—I do get assistance from it, more assistance from the demonstrators and other low paid officers than from the high officers; I do not get any assistance from the Superintendent. In this connection, I should like to suggest that when anything has been tried and found successful, that thing should not be grown on the Government farm.

24630. Have you, at any time, visited the Rajshahi farm?—I have visited it several times, and I take a good deal of interest in what they are doing. This year I have grown sugarcane from seedlings of the Rajshahi farm. In this connection, I may be permitted to say that if the department grows these things sometimes they look to their own interest. If sugarcane is grown there, they look to their own interest in the matter of how the cultivation is done; sometimes they are in need of seedlings, and they cannot afford to give them to other persons. What I mean to suggest is that now that sugarcane has been provided in our district and it has been found profitable for cultivation, they should not cultivate it on the farm. That will assist the farmers, and there will not be any competition between the farm itself and the cultivators themselves as regards seedlings.

K. B. Maulvi Emaduddin Ahmed.

21673 What is your complaint?—Yes, the other thing is they are conservative and the cultivators do not like to pay.

21654 You think that if coal is offered at a cheaper rate it could be accepted in the country generally as fuel?—Yes.

21655 How can that be possible?—I do not know exactly how it can be done; but that is the only suggestion that I can make.

21656 The price of coal must be reduced and the railways also must reduce their railway freight?—Yes. I have suggested that the railway freight must be reduced. That is another grievance, the railways have increased their freight.

(The witness withdrew.)

*The Commission then adjourned till 9.30 a.m. on Monday, the 10th January, 1927.*  
at Patna.

## INDEX.

(Finlow) 17,599,  
18,630.  
(Mitia) (127),  
low) 18,622,

Figures in brackets refer to pages of written memoranda; figures to questions in oral evidence.

### ADMINISTRATION.

- Agricultural Adviser, should not act as Director of Pusa but responsible for co-ordination of research (Hutchinson) (29).  
21,825. (Finlow)
- Agricultural Department, budget of, before and after retrenchment (Finlow) 18,378-18,380, 18,430-18,444, out of touch with cultivators and unrepresented (Momen) (322), 22,198-22,201, 22,428. retrenchment of (Finlow) 18,145-18,159, 18,201.
- service afforded by, unsatisfactory (Ahmed Ali) (557), 24,576.
- should co-operate with Collectors in demonstrations (Burrows) (472).
- staff of, insufficient (Momen) (321), (Jute Mills Association) (414), (Peddie) (424), 23,292, (Mitia) (128).
- organisation of (Finlow) 17,519-17,560.
- proposals for increasing (Finlow) 18,158, 18,598-18,600.
- subordinate, requires increasing (Mukherjee) (177), 20,077-20,080, 20,226-20,233, (Momen) (322), 22,410, 22,428, 22,429, (Ahmed Ali) (557).
- top heavy (Momen) (322), 22,320-22,337, 22,417, 22,418.
- Annual meeting of Directors of Agriculture, desirable (Finlow) 18,616.
- Associations representing jute industry (Jute Mills Association) 23,193-23,197.
- Board of Agriculture, sectional meetings of, unsatisfactory (Hutchinson) 21,899, 21,900.
- should meet annually (Hutchinson) 21,896-21,898.
- Bengal (Finlow) 17,839-17,842, (Mullick) 22,508-22,515.
- Central organisation for agriculture, suggested organisation and functions of (Finlow) (2), 17,604-17,612, 18,613-18,619, (Mitia) (127), 19,781-19,783, (Hutchinson) (297), 22,081-22,083, (Morgan) (272), 21,463-21,465, 21,660, (Momen) (321), 22,104, (Mullick) (349, 350).
- Onco officers, agricultural training for (Peddie) 23,418.
- duties of (Roy) 24,511-24,516.
- might act as secretaries to Union Boards (Momen) 22,442.
- should interest themselves in agricultural development (Peddie) (424), 23,415-23,417, (Burrows) (472).
- see also Revenue officers.
- Circles, consist of four or five Unions (Roy) 24,522, 24,523.
- Collectors, importance of their collaboration in agricultural work (Burrows) (472), 23,672-23,675.
- resolution directing their attention to importance of assisting agriculture, desirable (Burrows) 23,670-23,674.
- see also Revenue officers.
- Communications, improvement of, important as improving marketing facilities (Mitia) (134), (Indian Tea Association) (387).
- suggestions for, in Faridpur district (Burrows) (476).
- see also under Railways, Roads and Waterways.

# INDEX

## ADMINISTRATION—contd.

- Public Health Department, co-operation of, with Education Department (Bentley) 21,188.
- — — — —, with Irrigation Department (Bentley) 21,259, 21,260, 21,460.
- — — — —, difficulties of, owing to cumbersome system of control (Bentley) 21,180.
- — — — —, in Bengal, wrongly regarded as minor department (Bentley) 21,319, 21,350.
- — — — —, staff of (Bentley) 21,162-21,169.
- — — — —, insufficient (Bentley) 21,353

## Passes see under RESEARCH.

- Railway Advisory Committee, constitution of (Morgan) 21,467-21,469.
- — — — —, complaints from actual growers do not reach (Morgan) 21,470.

Railways, and steamers, competition between, has not benefited the cultivator (Mitra) (129).

- — — — —, are apt to starve stations where there is no steamer competition (Morgan) (272), 21,466, (Jute Mills Association) (115).

— — — — —, branch and feeder lines, need of Government assistance for (Mitra) (129).

- — — — —, facilities provided by, satisfactory (Peddie) (425), (Morgan) 21,171-21,174 (Jute Mills Association) (111)

— — — — —, should be improved and cold storage provided (Mullik) (350)

- — — — —, unsatisfactory (Ahmed M.) (557, 560).
- — — — —, feeder roads for, necessary (Indian Tea Association) (327).

— — — — —, freight rates for jute, unduly high (Jute Mills Association) (115), 23,265-23,271. See also Transport of jute.

— — — — —, making of representations to (Finlay) 17,772-17,778.

- — — — —, officials of, are corrupt (Ahmed U) (533), 21,167-21,171.

— — — — —, better educated men should be appointed for (Ahmed U) (533), 21,172, 21,173.

- — — — —, policy for, lack hitherto of progress, but position improving (Indian Tea Association) (327).

— — — — —, scope for further (Indian Tea Association) (327), 22,973-22,975.

- — — — —, wagons, supply of, for jute traffic (Morgan) (21,172-21,174).

Recording results of experiments and administrative experience, machinery for, capable of improvement (Finlay) 17,752-17,759.

Revenue officers, interest taken by, in agriculture (Finlay) 18,667-18,669.

- — — — —, should be instructed to pay special attention to agriculture (Finlay) 18,655-18,666, 18,670.

— — — — —, value of interest of, in agriculture (Finlay) 18,654-18,657.

— — — — — see also Circle officers and Collectors.

Road Board, need for provincial (Peddie) (125).

Roads, bridging of (Mulherjee) 20,186-20,190.

- — — — —, condition of, a hindrance to marketing (Ahmed U) (531, 536)

— — — — —, in Western Bengal (Finlay) 17,781, 17,782, 18,111, 18,415.

- — — — —, need for improvement of (Mullik) (350).

— — — — —, effect of motor traffic on, see Motors.

- — — — —, improvement of, will have good effect on agricultural, economic and sanitary conditions (Mulherjee) (177, 181), 23,109-23,112.

— — — — —, financing of, by means of tolls (Mulherjee) (181), 20,118-20,123, 20,309-20,315, 20,527-20,532.

- — — — —, must go hand in hand with improvement of education (Mulherjee) 20,117

— — — — —, lack of (Mitra) (129).

— — — — —, need for extra taxation (such as cart tax) to improve (Peddie) (125), 23,290, 23,290, 23,420, 23,190.

- — — — —, under District Boards, deteriorating (Finlay) 17,783, 17,784, (Morgan) 22,117, 22,118, (Peddie) (425), 23,225.

## INDEX.

### ADMINISTRATION—*contd.*

- Rural development, financing of (*Mukherjee*) 20,118-20,155, 20,177-20,185, 20,212-20,215, 20,309-20,315, 20,318-20,326, 20,400-20,405, 20,529-20,532, 20,545-20,576.
- Steamship facilities, satisfactory (*Jute Mills Association*) (414) (*Peddie*) (425).
- \_\_\_\_\_, should be improved (*Mullick*) (350).
- Trainways, possibilities of (*Indian Tea Association*) 23,128-23,130.
- Transport of jute, difficulties of, co-operative societies to solve (*Morgan*) 21,755, 21,756.
- \_\_\_\_\_, give rise to number of middle-men (*Morgan*) 21,758.
- \_\_\_\_\_, improvement of (*Morgan*) 21,754.
- \_\_\_\_\_, rates for (*Morgan*) 21,791, 21,792.
- Union Boards, area of (*Bentley*) 21,186, 21,187.
- \_\_\_\_\_, area and income of (*Roy*) 24,456-24,458, 24,519, 24,520.
- \_\_\_\_\_, are in some respects political institutions (*Ahmed M*) 24,618-24,624.
- \_\_\_\_\_, can become effective bodies for rural work (*Momen*) (319), 22,212-22,214, (*Roy*), 24,450, 24,451.
- \_\_\_\_\_, chairman of, largely run them (*Roy*) 24,449, 24,452, 24,510.
- \_\_\_\_\_, failure of, probable (*Bentley*) 21,182-21,185, 21,445-21,448.
- \_\_\_\_\_, relations of, with Co-operative public health societies (*Bentley*) 21,181-21,185, 21,876, 21,377.
- \_\_\_\_\_, with District Boards (*Ahmed M*) 24,625, 24,626.
- \_\_\_\_\_, secretaries of, salaries and duties of (*Roy*) 24,453-24,455.
- \_\_\_\_\_, should receive more help from Collectors (*Momen*) (319), 22,215-22,218.
- \_\_\_\_\_, unit for, artificial (*Bentley*) 21,371-21,375.
- \_\_\_\_\_, see also Local bodies.
- Veterinary Service, see under VETERINARY.
- Water hyacinth, Bill for eradication of, in Burma (*Burrows*) 23,717, 23,718.
- \_\_\_\_\_, conscription of labour for eradication of, difficult (*Burrows*) 23,853-23,855.
- \_\_\_\_\_, destruction of (*Finlow*) 18,180-18,182.
- \_\_\_\_\_, first appeared 15 years ago (*Finlow*) 18,560.
- \_\_\_\_\_, if not dealt with will choke waterways and fields (*Finlow*) 18,186-18,189, (*Burrows*) 23,857.
- \_\_\_\_\_, interprovincial co-operation to check (*Burrows*) 23,719-23,721.
- \_\_\_\_\_, legislation against, useless without scheme of operation (*Burrows*) 23,716.
- \_\_\_\_\_, need for concerted action against (*Finlow*) 18,183, 18,184.
- \_\_\_\_\_, proposed scheme for eradication of (*Appendix*) (*Burrows*) (482-486), (478), 23,666-23,668, 23,722-23,730, 23,811.
- Waterways, danger of silting up of (*Jute Mills Association*) (415).
- \_\_\_\_\_, take the place of roads in Eastern Bengal (*Jute Mills Association*) (415), (*Finlow*) 17,780, (*Burrows*) (476).
- \_\_\_\_\_, use of, for jute transport (*Morgan*) 21,607-21,614, 21,640-21,643.

### AGRICULTURAL INDEBTEDNESS.

- Abwabs, taking of, by landlords, should be prohibited (*Ahmed M.*) (556 560), 24,579, 24,580.
- Agricultural income of Bengal, is decreasing (*Mukherjee*) 20,540-20,544.
- Availability of money, not a cause of borrowing (*Mukherjee*) 20,504-20,507.
- Bengal Tenancy Act, effect of (*Mitra*) 19,515-19,517.
- Capital, invested in moneylending rather than agricultural improvements (*Morgan*) 21,730-21,736.
- Causes of borrowing (*Finlow*) (5), (*Mitra*) (129), (*Ahmed H.*) (169), (*Mukherjee*) (177), (*Bentley*) (210), (*Morgan*) (272), (*Momen*) (323), (*Mullick*) (350), (*Peddie*) (425, 426), (*Ahmed U.*) (533), (*Ahmed M.*) (559).
- Credit, as a cause of debt (*Momen*) 22,279-22,287.
- \_\_\_\_\_, control of, may raise rate of interest (*Mitra*) 19,894, 19,895.
- \_\_\_\_\_, undesirable (*Ahmed H.*) (169), (*Mukherjee*) (177).

# INDEX.

## AGRICULTURAL INDEBTEDNESS—*contd.*

- Credit, control of, undesirable except in case of backward tribes (*Mitra*) (130), 19,825, 19,826.
- Cultivators, comparative incompetence of, a cause of debt (*Finlow*) (5), 17,818, 17,819.
- credit of, *see* Credit
- cultivating jute, better off than others (*Finlow*) (5), 18,490-18,491.
- , income of, per acre (*Finlow*) (5), 18,366-18,373.
- , improvidence of (*Momen*) (323), (*Roy*) (366), 22,690, 22,691.
- income of (*Finlow*) 18,357-18,359, (*Momen*) (323, 328), 22,401-22,406.
- , indebtedness of, a measure of prosperity rather than poverty (*Bentley*) (210).
- , causing them to become landless labourers (*Momen*) (328), 22,204, 22,205.
- , inquiry into, desirable (*Finlow*) 17,797-17,801.
- , is increasing (*Roy*) 22,691-22,697.
- , usually extends to full extent of their credit (*Bentley*) (240, 241).
- , not selling their land in any numbers (*Roy*) 24,567, 24,568.
- , occupancy rights of (*q.v.*).
- , percentages in and below comfort and above and in want (*Momen*) (323), 22,403.
- , poverty of (*Momen*) (323, 328), 22,271, 22,297.
- , present economic position of (*Finlow*) 18,671-18,677.
- , proportion of, in debt (*Finlow*) (5), 17,820-17,822.
- , prosperity of, declining (*Momen*) 22,346-22,358, 22,431-22,437.
- , *see also* Standard of living.
- Damodar, rule of, should be enforced (*Ahmed U.*) (533), 24,201-24,206.
- Dishonest accounting by moneylenders, not common (*Mulherjee*) 20,508, 20,509.
- , prevention of (*Peddle*) 23,436-23,440.
- , regarded as cause of indebtedness (*Mitra*) (129), 19,813.
- Interest charged by moneylenders, excessive (*Peddle*) (426, 427).
- , excessive from April to July (*Ahmed U.*) (533).
- , from ordinary cultivators, taken in paddy (*Roy*) 24,318.
- , ratio of, (*Roy*) 24,301-24,304.
- , reduced by credit societies (*Peddle*) 23,309, 23,310, (*Mitra*) 19,490, 19,497.
- , should be limited (*Peddle*) (427).
- Jute and rice, effect of high prices of, on prosperity of cultivators (*Finlow*) (5, 6).
- , fluctuations in price of, a serious cause of indebtedness (*Mitra*) (129), 19,810-19,812.
- , note on average price of (*Finlow*) (81).
- Land, is passing out of the hands of real cultivators (*Peddle*) (426), 23,301.
- , is not passing from cultivators (*Roy*) 24,567, 24,568.
- Landlords, and moneylenders, are oppressing cultivators (*Ahmed U.*) (558, 560), 24,573, 24,578.
- , discourage meetings of cultivators (*Roy*) 24,525, 24,526.
- , take little interest in village affairs (*Roy*) 24,526.
- Limitation, law of, abuses under (*Ahmed U.*) (534).
- Litigation, as a cause of debt (*Mulherjee*) (177), 20,446-20,450.
- , is chiefly with regard to indebtedness and rents (*Ahmed U.*) 24,217.
- Medical charges as a cause of debt (*Mulherjee*) (177), 20,279-20,282.
- Mohammedans, do not generally object to taking interest (*Ahmed U.*) 20,062-20,070.

## INDEX.

### AGRICULTURAL INDEBTEDNESS—*contd.*

- Moneylenders, dishonest accounting by (*q.v.*).  
 ———, interest charged by, *see* Interest.  
 ———, large numbers of 'amateur' (*Peddle*) 23,442.  
 ———, need for more control of, by licensing and inspection (*Peddle*) (427), 23,319-23,354, 23,437-23,441.  
 ———, numbers and capital of, increasing (*Peddle*) 23,431, 23,435.  
 ———, the chief source of credit (*Peddle*) (420), (*Mullick*) (350), (*Ahmed U.*) (533).  
 Moneylending landlords (*Mitra*) 19,890-19,904.  
 Mortgage and sale, right of, should be limited (*Ahmed U.*) (531), 24,214-24,216.  
 ———, should not be limited (*Mitra*) (130), (*Momen*) (323), (*Peddle*) (427).  
 Mortgages, redemption of (*Burrows*) 23,802-23,805.  
 Non-terminable mortgages, should be restricted (*Mitra*) (130).  
 ———, should be prohibited (*Peddle*) (427).  
 Occupancy rights of cultivators (*Mullick*) 22,503-22,507.  
 Primary education and social reforms, need for, to lighten burden of debt (*Peddle*) (426).  
 Reasons preventing repayment (*Finlow*) (5), (*Mitra*) (129), (*Ahmed H.*) (169), (*Mukherjee*) (177), (*Morgan*) (272), (*Mullick*) (350), (*Ahmed M.*) (559).  
 Rural indebtedness, a necessary evil (*Bentley*) (241).  
 ———, amounts to about 60 crores in Bengal (*Mitra*), 19,819, 19,829.  
 ———, is more or less stationary (*Mitra*), 19,823, 19,829, 20,000-20,003.  
 ———, methods of reducing (*Mitra*) (130), 19,815-19,818, (*Bentley*) (241), (*Peddle*) (426).  
 ———, special measures to deal with, unnecessary (*Mitra*) (129), (*Mukherjee*) (177), (*Ahmed M.*) (559).  
 ———, statistics regarding, value of (*Mitra*) 19,650-19,659.  
 Sources of credit (*Mitra*) (129), (*Ahmed H.*) (169), (*Morgan*) (272), (*Ahmed M.*) (559).  
 Standard of living, increase in, harmful because due to borrowing (*Mullick*) (350), 22,619-22,621a.  
 ———, *see also* under WELFARE.  
 Usurious Loans Act, not used in Faridpur district (*Burrows*) 23,766-23,769, 23,799, 23,801, 23,853, 23,859, 23,890-3,902.  
 ———, of no assistance (*Momen*) (323), 22,291, 22,295.  
 ———, provisions of, too vague (*Peddle*) (427), 23,307.  
 ———, should be enforced (*Ahmed H.*) (169), 20,056-20,061, 20,071, (*Peddle*) (427), 23,367-23,393.  
 ———, should not be enforced (*Mitra*) (129), 19,814.  
 ———, unsatisfactory because many judicial officers are in sympathy with moneylending classes (*Ahmed U.*) (533, 534), 24,251, 24,252.

### AGRICULTURAL INDUSTRIES.

- Bengalis, are backward in matters of trade and industry (*Ray*) 22,802, 22,803, 22,837-22,845, partly owing to permanent settlement 22,862.  
 Committees on lines of Indian Central Cotton Committee, might foster subsidiary industries (*Finlow*) (12).  
 Conditions for success of subsidiary industries (*Burrows*) (476).  
 Co-operative and Industries Departments, should organise societies for cotton-ginning, rice-husking, &c. (*Finlow*) (12).  
 ———, should study market facilities for subsidiary industries (*Finlow*) (12).  
 Co-operative rice mill, experiment with (*Mitra*) (139).  
 Cottage industries, cannot be reorganised on bigger scale (*Mullick*) (351), 22,465, 22,466.  
 ———, Official Summary of, inaccurate (*Burrows*) (475).

# INDEX.

## AGRICULTURAL INDUSTRIES—*contd.*

- Cottage industries, prejudices against, likely to disappear under economic pressure (*Burrows*) (475).
- , reasons for survival of (*Burrows*) (475).
- , survey and study of, essential (*Burrows*) (475).
- Cultivators, activities of, during different periods of the year (*Morgan*) (273), (*Ahmed U*) 24,180-24,188.
- , are confined to bed for 60 to 90 days a year through illness (*Mullick*) (351), 22,467-22,461, 22,483, 22,484; see also *Malaria under Workers*.
- , attitude of, towards subsidiary industries (*Mitra*) (133).
- , have ample time for subsidiary industries (*Ahmed H*) (170), (*Bentley*) (244), (*Roy*) (366, 367), 22,893, (*Peddie*) (430), (*Burrows*) (474) (*Roy*) 24,358-24,361, (*Ahmed M*) (559).
- , have little spare time in Pabna district (*Ahmed U*) (536), 21,185.
- , number of days worked by (*Finlow*) (12), (*Mitra*) (133), (*Mulherjee*) (179), 20,470-20,472, (*Bentley*) (243).
- , number of days worked by, no indication of their ability to adopt subsidiary occupations (*Finlow*) (12).
- , should be occupied all year round in intensive agriculture (*Finlow*) (12).
- , can be so occupied in irrigated tracts (*Finlow*) (12).
- , usually have some subsidiary occupation (*Finlow*) (12), (*Momen*) 22,176-22,180.
- Demand for products of subsidiary industries, creation of, the best means of encouraging them (*Bentley*) (244).
- Factories in rural areas, establishment of, difficult as they require whole-time skilled labour (*Morgan*) (273).
- , hindered by bad communications (*Momen*) (327), (*Peddie*) (431).
- , on co-operative or joint stock basis, desirable (*Mulherjee*) (179).
- , subsidies and adequate transport facilities for, should be provided (*Momen*) (327), (*Ahmed, M.*) (559).
- , must be started by Government (*Ahmed, H.*) (170), (*Momen*) (327), (*Burrows*) 23,690, 23,690.
- , result of (*Finlow*) 18,007-18,013.
- , undesirable (*Mullick*) (351).
- Failure of certain subsidiary occupations, reasons for (*Burrows*) (474).
- Fruit and vegetable growing (*Finlow*) (12), 18,002, 18,003, (*Bentley*) (244).
- , work on, by Agricultural Society of India (*Morgan*), 21,803-21,807.
- Future of subsidiary industries, doubtful owing to industrial competition (*Mullick*) (351), 22,462-22,464.
- Government, rôle of, in regard to subsidiary occupations (*Mitra*) (133), (*Ahmed, H*) (170), (*Momen*) (326, 327), 22,369-22,374, (*Roy*) 22,921-22,928, (*Peddie*) (430).
- Gunny bag making (*Ahmed, H.*) (170).
- Hydro-electric development (*Finlow*), 18,004-18,006, 18,009.
- Industrial unions, need for starting (*Peddie*) (431).
- Investigation of possibilities of rural industries, need for (*Peddie*) (431).
- , not needed (*Mitra*) (133), 19,835, 19,836.
- Jute spinning and weaving (*Mitra*) (133).
- Lac culture (*Finlow*) (12), 17,992-17,996.
- Marketing, importance of facilities for, for subsidiary industries (*Finlow*) (12), (*Mitra*) (133), 19,830.
- , provision of better facilities for, work of Co-operative and Industries Departments (*Finlow*) (12).

# INDEX.

## AGRICULTURAL INDUSTRIES—contd.

- Marketing, question of, does not arise when products are consumed at home (*Mitra*) 19,831, 19,832.
- Mat-making (*Ray*) 22,711-22,713.
- Necessity for subsidiary industries, should be taught in schools (*Peddle*) (430).
- Non-official help, essential for subsidiary industries (*Peddle*) (430).
- Obstacles to subsidiary industries (*Mulherjee*) (179), (*Bentley*) (241), (*Peddle*) (430), (*Ahmed, M.*) (539).
- Part-time occupations, are under Industries Department (*Finlow*) 17,990.
- , distinct from subsidiary industries (*Finlow*) 17,981, 17,982.
- , suggestions for (*Finlow*) 17,990-17,992
- , value of, in areas where one paddy crop only is grown annually (*Finlow*) 17,992-17,993.
- Pisciculture (*Finlow*) 18,133-18,135, 18,374-18,377, 18,381, (*Bentley*) (245), 21,277, 21,278, 21,281. (*Burrows*) 23,686-23,688, (*Ahmed, U.*) (536).
- Rope-making (*Mitra*) (133)
- Rural industries, decay of, has increased pressure of population on soil (*Ray*) (365, 366), 22,697-22,699, 22,897, 22,898.
- , due to importation of manufactured products (*Ray*) (366), 22,891-22,896.
- Sericulture (*Finlow*) (12), (*Bentley*) (245).
- , average income from, 23,839.
- , note on (*Appendix*) (135-142), 23,280-23,281, 23,310.
- , should be made whole-time occupation where possible, 23,311, 23,315.
- , see also under **CHAUDHURI, Mr. P. C.**
- Spinning and weaving, advantages of (*Mitra*) (133), (*Mullick*) 22,470-22,482.
- , economics of (*Ray*) 22,777-22,781, 22,791-22,801, 22,804, 22,805, 22,822-22,830, 22,892-22,916, 22,929, 22,930.
- , formerly the universal subsidiary occupation of India (*Ray*) 22,787-22,793, 22,816-22,820.
- , generally undertaken by women (*Ray*) 22,810-22,821.
- , most suitable subsidiary occupation for cultivators (*Ray*) (397), 22,714, 22,761-22,769.
- , must go together (*Ray*) 22,732-22,738, 22,931.
- , propaganda for, effect of (*Ray*) 22,714-22,716, 22,770-22,776.
- Standard of living, desire for better, not a sufficient inducement to take up subsidiary occupations (*Burrows*) (475), 23,682-23,685.
- Subsidiary industries, Definition of (*Finlow*) 18,007.
- , Suggestions for (*Women*) (326), (*Ahmed, U.*) (536), (*Ahmed, M.*) (559).
- Tree cotton growing and spinning (*Finlow*) (12), (*Mitra*) (133), 19,462-19,462.
- Weaving, handloom, the most promising sub-sidiary industry (*Burrows*) (475).
- , need for instruction in (*Burrows*) (475).
- Village improvement by spare-time labour, possibility of (*Mitra*) 19,833, 19,834.

## AGRICULTURAL LABOUR.

- Cultivable uncultivated lands, area of (*Bentley*) (245), (*Finlow*) 18,317-18,362, 18,419-18,423, 18,428, (*Women*) 22,154-22,161
- , colonisation of, suggestions for (*Mitra*) (134), (*Mulherjee*) (180), (*Bentley*) (245).
- , difficulties of cultivating (*Finlow*) 18,424-18,431.
- , inhospitable (*Finlow*) (13), 18,108-18,110, 18,354-18,356.

## INDEX.

### AGRICULTURAL LABOUR—*contd.*

- Cultivable uncultivated lands, method of obtaining, by ryots (*Momen*) 22,162-22,172.  
 \_\_\_\_\_, unsuitable for giving to agricultural graduates (*Finlow*) 18,111.  
 \_\_\_\_\_, *see also* Middle-class youths under **EDUCATION**.  
 Importation of labour into Bengal, considerable (*Finlow*) (12).  
 Labour for tea gardens, details regarding (*Indian Tea Association*) 22,937-22,990, 23,059-23,067, 23,076-23,087, 23,101-23,106, 23,131, 23,132, 23,119-23,151.  
 Labourers, as a rule dishonest (*Ahmed U*) (532), 21,102-21,106.  
 \_\_\_\_\_, piece-rate wages for (*Ahmed U*) 21,163, 21,164.  
 Migration of labour, confined to wandering tribes (*Peddle*) 23,357-23,395.  
 \_\_\_\_\_, from Bengal (*Finlow*) (13), 18,014-18,019, 18,360-18,365.  
 \_\_\_\_\_, is local only (*Mullick*) 22,467-22,495.  
 \_\_\_\_\_, obstacles to, and suggestions for overcoming (*Indian Tea Association*) (350), 22,986.  
 \_\_\_\_\_, seasonal (*Mitra*) (134).  
 \_\_\_\_\_, value of publicity to assist (*Momen*) (327).  
 Shortage of labour, causes of and remedies for (*Finlow*) (13), (*Mitra*) (134), (*Mukherjee*) (160), (*Bentley*) (215), (*Mullick*) (352), 22,467, (*Ahmed U.*) (536), (*Ahmed M.*) (559, 560).  
 \_\_\_\_\_, malaria and other illnesses as cause (*Mukherjee*) (160), (*Bentley*) (215), (*Mullick*) (352).  
 Unemployment amongst *bhadralog* and Anglo-Indian classes (*Finlow*) (12)  
 \_\_\_\_\_, proposal for meeting, by establishing larger farms (*Finlow*) (12, 13).  
 \_\_\_\_\_, report of committee of investigation (*Finlow*) (12), 18,370  
 \_\_\_\_\_, scope for settlement, in Assam (*Finlow*) (13).  
 \_\_\_\_\_, *see also* Large farms under **ATTRACTING CAPITAL**.

**AHMED, Khan Bahadur Maulvi Homayut Uddin, Pleader, Barisal, Bengal,** (169-171), 20,011-20,075.

### AGRICULTURAL INDENTEDNESS:

- Causes of indebtedness (169).  
 Control of credit, undesirable (169).  
 Mohammedans, do not generally object to taking interest 20,062-20,070.  
 Reasons preventing repayment (169).  
 Sources of credit (169).  
 Usurious Loans Act, should be enforced (169). 20,056-20,061, 20,071

### AGRICULTURAL INDUSTRIES:

- Cultivators, have ample spare time at their disposal (170).  
 Government, should establish industries using agricultural products (170).  
 Gunny bag and chat making (170).

### ANIMAL HUSBANDRY:

- Fodder crops, such as guinea grass, can be fitted in with present rotation 20,016-20,020.  
 \_\_\_\_\_, need for growing (169).  
 Improvement of breeds, badly needed (170)  
 \_\_\_\_\_, may be effected by provision of better bulls and grazing grounds (170).

### CO-OPERATION:

- Audit by Co-operative Department, defects of 20,030-20,037, 20,055.  
 Central Banks, number of primary societies under 20,026, 20,027.  
 \_\_\_\_\_, procedure at meetings of 20,045-20,049.  
 \_\_\_\_\_, procedure of, in dealing with loan applications 20,043, 20,044.  
 \_\_\_\_\_, supervision by 20,025, 20,028, 20,029.

## INDEX.

AHMED, H.—*contd.*

### Co-operation—*contd.*

- Co-operative movement, chiefly confined to credit societies in Barisal district (170).
- , illiteracy the main obstacle to (170).
- Credit societies, audit of, *see* Audit.
- , reserves of, *see* Reserves.
- , success of (170, 171).
- Government, role of, towards co-operative movement (170)
- Registrar, some of work done by, should be entrusted to private persons (170), 20,049-20,051.
- Reserve funds, control of by Registrar undesirable (170), 20,040-20,042

### DEMONSTRATION AND PROPAGANDA.

- Cultivators, disinclined to take expert advice on account of cost of methods suggested (169).
- Demonstration farms, should be self-supporting (169).
- Demonstrations, if showing fair margin of profit and within cultivator's means, will be adopted (169).
- , should be made on cultivators' own holdings 20,012-20,015.

### EDUCATION:

- Agricultural middle schools, need for (171).
- Compulsory primary education with agricultural bias, should be introduced (171).
- Primary education, present system of, unsatisfactory (171).
- , should include education in agriculture (171).

### FINANCE:

- Co-operative movement, the best means of financing cultivators (169).
- Taccavi, is not popular (169).

### HOLDINGS:

- Legislation to keep disputes out of the Courts, need for. (170).

### VETERINARY:

- Contagious diseases, suggestions for control of (169).
- Dispensaries (169).
- Research, should be conducted in Provinces (170).
- Serum, cannot always be obtained in time (170).
- Veterinary Department, should be under Director of Agriculture (169), 20,038, 20,039.

AHMED, Khan Bahadur Moulvi Emduddin, B.L., Chairman, District Board Rajshahi (557-560) 24,572-24,585.

### ADMINISTRATION:

- Agricultural Department, need for increasing subordinate staff of (557).
- , service afforded by, unsatisfactory (557), 24,576.
- District Boards, relations of, with Revenue officers 24,615, 24,616.
- , with Union Boards 24,625, 24,626.
- , should be empowered to metel roads and recover cost by taxation 24,577.
- Posts and telegraphs, need for cheaper and more extended service by (557).
- Railway and steamer facilities, lack of, a hindrance to marketing (557, 560).
- , unsatisfactory (557).
- Union Boards, are in some respects political institutions 24,618-24,624.
- , relations of, with District Boards 24,625, 24,626.

## INDEX

### AHMED, M.—*cont.*

#### AGRICULTURAL INDEBTEDNESS:

- Abwabs, taking of, by landlords, should be prohibited (558, 560), 24,579, 24,580.
- Causes of borrowing (558).
- Landlords and moneylenders, are oppressing cultivators (558, 560), 24,573, 24,578
- Reasons preventing repayment (558).
- Rural insolvency, special measures to deal with, unnecessary (558).
- Sources of credit (558).

#### AGRICULTURAL INDUSTRIES

- Cultivators, work only eight months a year (559).
- Factories, may be encouraged to move to rural areas by offering subsidies and adequate transport facilities (559).
- Obstacles to subsidiary industries (559).
- Suggestions for subsidiary industries (559).

#### AGRICULTURAL LABOUR:

- Shortage of labour, suggestions for overcoming regional (559, 560).

#### ANIMAL HUSBANDRY:

- Cattle, health of, permanently ruined by underfeeding (559), 24,605.
- Common pastures, overstocked (559).
- Fodder, cultivation of, as catch crop, should be encouraged (559).
- , shortage of, due to transport difficulties (559).
- , period of (559).
- , supply of, may be increased by compelling cultivators to grow certain amount and landlords to set aside land in each village for pasture (559), 24,606-24,610.

#### BATAI SYSTEM: Operation of 24,597-24,601.

#### CO-OPERATION:

- Agricultural and joint farming societies, value of (560).
- Co-operative movement, existing system unsatisfactory (560).
- , should be encouraged by appointment of special officers (560), 24,633, 24,634.
- Credit societies, should be under direct Government supervision (558), 24,636.
- Naogaon Ganja cultivators' co-operative society, success of (560), 24,635.
- Sale societies, need for (560).
- Villages, should each come under co-operative society assisted by Government funds (560).

#### CROPS:

- Firearms, should be supplied to members of co-operative societies to prevent damage by wild animals (558).
- Seed, should be distributed on credit and cost realised after harvest (558).

#### DEMONSTRATION AND PROPAGANDA:

- Cultivators, large, should be induced to attend demonstrations and adopt improvements (557).
- , may be induced to adopt expert advice by offer of prizes and holding of fairs (557).
- Demonstration work by Agricultural Department, hindered by lack of staff 24,644-24,648.
- Demonstration farms, work of 24,629, 24,630.
- Demonstrations of fertilisers by private firms, better than that of Agricultural Department 24,627, 24,628, 24,644, 24,645.

## INDEX.

**AHMED, M.—cont.**

### **EDUCATION :**

- Adult education, may be popularised by appointing more demonstrators (557).
- Agricultural graduates, should be provided with capital for purchase of implements and cattle (557).
- Child labour, demand for, interferes with education (560).
- Compulsory primary education, necessary (560).
- Government service, the chief inducement to study agriculture (557).
- School farms or plots, should be attached to upper primary and middle schools (560).
- Teachers in rural areas, should be drawn from agricultural classes 24,638-24,642.
- Teaching facilities, urgent need for extension of (557).

### **FERTILISERS :**

- Artificial fertilisers, price of, should be reduced (558).
- , propaganda for, by private firms 21,627, 24,628, 24,645, 24,646.
- , scope for employment of (558).
- , should be supplied on credit and price recovered after harvest (558).
- Cowdung as fuel, use of, may be limited by lowering price of coal (555), 24,643.
- Sulphate of ammonia, use of (558), 24,602-24,604.

### **FINANCE :**

- Co-operative movement, the best means of financing agricultural operations (558).

### **HOLDINGS :**

- Co-operative societies, with Government assistance, may keep disputes out of courts (558).
- Cultivators, may be compelled to cultivate land co-operatively (558).
- Hindu and Mohammedan law, an obstacle to consolidation (558).

### **IMPLEMENTS :**

- Improved implements, may be supplied to co-operative societies on long term credit (559).

**IMPROVEMENTS :** Government should advance money to big agriculturists to carry out (560).

### **IRRIGATION :**

- Irrigation, lack of funds for, the chief obstacle (558).
- , scope for, in Northern Bengal (558).

### **MARKETING :**

- Co-operative sale societies, need for (560).
- Existing market facilities, unsatisfactory (560).
- Jute, in storage, making information concerning known to cultivators 24,568.
- , minimum price of, should be fixed and broadcast before sowing commences (560), 24,580-24,590.
- Post and telegraph services, extension of, will enable cultivators to learn market rate of crops (557).
- Transport facilities, lack of, an obstacle (560).

### **SOILS :**

- Barind land, has deteriorated for want of manure (558).
- Jungles, need for reclamation of land covered by (558).

### **VETERINARY :**

- Cultivators, organised co-operatively, might employ Veterinary Assistants (559), 24,581, 24,582.
- District Boards and dispensaries 24,617.
- Inoculation, popular once its advantages are realised (560).
- Serum, cost of, borne by District Boards 24,611-24,614.

## INDEX.

### AHMED, M.—*cont.*

#### VETERINARY—*contd*

- Serum, cost of, militates against use 24,650-24,653.
- , occasionally difficult to obtain (559), 24,583.
- , should be distributed free (559), 24,583-24,585.
- Veterinary Assistants, itinerating, more useful than dispensaries (559).
- , need for further (558).
- Veterinary Department, should be independent of Agricultural Department (559).
- Veterinary research, should be conducted in Provinces (559).

#### WELFARE

- Economic surveys of villages, should be carried out by Government (560).

AHMED K.B. Moulvi Wasim Uddin, B.L., Chairman, District Board, Pabna (532-537), 24,157-24,252.

#### ADMINISTRATION.

- Agricultural Dept., need for increasing subordinate staff of (533).
- Meteorological Dept., information supplied by, does not reach cultivators (533).
- Postmasters in villages, should be appointed from village teachers (533).
- Railway officials, are corrupt (533) 24,167-24,171.
- , better educated men should be appointed for (533) 24,172, 24,173.
- Roads, bad condition of, a hindrance to marketing (533, 536).

#### AGRICULTURAL INDEBTEDNESS:

- Causes of borrowing (533).
- Damodar, rule of, should be enforced (533), 24,201-24,206.
- Law of Limitation, abuses under (534).
- Litigation, is chiefly with regard to indebtedness and rents, 24,217.
- Moneylenders, demand exorbitant interest from April to July (533).
- , the principal source of credit (533).
- Montgago and sale, right of, should be limited (534), 24,214-24,216.
- Usurious Loans Act, unsatisfactory because many judicial officers are in sympathy with moneylending classes (533, 534), 24,251, 24,252.

#### AGRICULTURAL INDUSTRIES:

- Cultivators, activities of, during different months, 24,186-24,188.
- , have little spare time for subsidiary industries in Pabna district (536), 24,185.
- Suggestions for subsidiary industries (536).
- Tanks for pisciculture, excavation of, often forbidden by zemindars (536).

#### AGRICULTURAL LABOUR:

- Labourers, as a rule dishonest (532), 24,162-24,166.
- , piece-rate rates for 24,163, 24,164.
- Shortage of labour, exists in Bengal (536).
- , seasonal, methods of meeting (536).

#### ANIMAL HUSBANDRY.

- Common pastures, facilitate spread of disease (536).
- Fodder, period of shortage of (536).
- Pasture, reservation of land for, may be encouraged by remission of revenue (536).
- Improvement of breeds, suggestions for (536).

#### ATTRACTING CAPITAL:

- Liability to loss occasioned by fluctuating prices of agricultural produce, discourages investment of money in land (537).

## INDEX.

AHMED, U.—*cont.*

### Co-OPERATION :

- Audit fees, should be reduced or abolished (537).
- Central Banks, have been of benefit to cultivators (537).
- Credit societies, growing unpopularity of, due to unlimited liability of members 24,174-21,177, 21,222-24,225, 21,243-24,250.
- Ignorance of majority of members of co-operative societies, renders them liable to exploitation by literate few (537), 24,227-21,229, 21,234-24,242.
- Liability of members of co-operative societies, should be limited (533), 24,178, 24,179.
- Non-officials, may render valuable help to co-operative movement 537.
- Purchase and sale societies, generally fail through ignorance of members (537).

### CROPS :

- New crops, scope for (535)
- Wild boars, need for campaign to destroy (535).

### CULTIVATION :

- Soil examination, value of, to ensure proper rotation and growing of suitable crops (535).
- Tillage, improvement of existing system of, depends on provision of better implements and more labour (535).

### DEMONSTRATION AND PROPAGANDA :

- Demonstration farms, are run on expensive lines (532), 24,207, 21,203.
- , experiments at, must be kept distinct from demonstrations 24,160.
- , examples of success of (532), 21,209-24,212.
- , profit and loss accounts should be kept at (532)
- Demonstrations on cultivators' own fields, value of (532), 24,161.

### EDUCATION :

- Cultivators, do not appreciate the real object of education (537).
- Maktab schools 24,220.
- Nature study, useful (532).
- Primary education, financing of 24,219, 21,233.
- , need for compulsory (537), 21,232.
- School farms and plots, of little value (532).

### FERTILISERS :

- Adulteration, should be prevented by legislation and instruction as to its detection (531).
- Demonstrations of value of fertilisers, useful (531).

### FINANCE :

- Long term credit, should be given on easy terms for purchase of land and cattle, and building (533).
- Short term credit, at low interest, should be given for seed, fodder and wages (533).
- Taucavi, need for strict supervision of repayment of (533).
- , should be given to individual cultivators and not on joint bond (533).

### HOLDINGS :

- Joint cultivation, may minimise loss due to excessive subdivision (534).
- Legislation for consolidation, should provide for adequate compensation where necessary (534).

### IMPLEMENTS :

- Improved implements, extra cost of, should be paid by Government to start with (535).
- , need for (535).
- , value of demonstrations of (535).

# INDEX.

## AHMED, U.—*cont.*

### IRRIGATION

Irrigation in Pabna district, damage due to lack of (534).  
 —————, need for (534), 24,181, 24,184.  
 —————, nothing done to provide 24,180.  
 —————, wells for, unsatisfactory 24,182, 24,183

### MARKETING

Communications, need for better, to facilitate marketing (533, 536)

### SOILS

Agricultural and Sanitary Improvements Act, use of, should be encouraged (531).  
 Soil investigation, need for (535).  
 Waterlogging, damage done by, in Pabna district (534).

### VETERINARY

Common pastures, lead to spread of disease (536).  
 Dispensaries, may be under Government rather than local bodies (535).  
 —————, need for further (535).  
 Inoculation, prejudices against, disappearing (535).  
 Legislation to prevent spread of contagious disease, need for (535).  
 Veterinary Surgeons, number of, inadequate (536).

### WELFARE

Economic surveys of villages, need for (537).  
 Government should take initiative in promoting sanitary measures in rural areas (537).  
 Tenants, should be given power to make wells, etc. (537).

## ANIMAL HUSBANDRY.

Agricultural Dept., has neglected animal husbandry (*Momen*) 22,192.  
 Animal nutrition, importance of adequate, not recognised by cultivators  
 —————, (*Burrows*) 23,680, 23,681, 23,819, 23,820.  
 —————, investigation of value of (*Kerr*) (101) 19,201-19,208,  
 19,225, (*Mitra*) (132).  
 Brahmin bull system (*Ray*) 22,674-22,676.  
 Bullocks, number required for given holding (*Ray*) 24,546.  
 —————, smallness of, an obstacle to use of improved implements (*Finlow*)  
 (10).  
 —————, thought by cultivators to be too small for improved implements  
 (*Finlow*) (11), 18,788, 18,789.  
 Bulls, arrangements for providing (*Finlow*) 17,938, 17,939.  
 —————, demand for, comes chiefly from co-operative societies 17,951.  
 —————, increasing (*Finlow*) (11).  
 —————, distribution of, to District Boards (*Finlow*) 18,698-18,700, (*Ray*)  
 22,917-22,919.  
 —————, value of supplying good, to agriculturists (*Momen*) (325).  
 Cattle-breeding, difficult owing to lack of pastures (*Mulherjee*) 20,391-  
 20,399.  
 —————, farms for, employment of Veterinary Assistants at (*Kerr*)  
 (101), 19,314-19,320.  
 —————, need for (*Kerr*) (101).  
 —————, not carried out in Bengal (*Finlow*) (11), 17,930-17,932,  
 (*Kerr*) 19,229, 19,230, (*Ray*) 24,549.  
 —————, should remain under Agricultural Dept. (*Kerr*) 19,295.  
 Cattle cakes (*Kerr*) 19,226-19,228, (*Finlow*) 18,127-18,129.  
 Cattle Expert, forthcoming appointment of (*Kerr*) (101).  
 —————, may be under Agricultural or Veterinary Department  
 (*Kerr*) 19,343-19,346.  
 Cattle farms (*Finlow*) 18,692-18,697, (*Kerr*) (101).  
 —————, see also Ranghpur farm.  
 Cattle Improvement Committee, suggestion for (*Kerr*) (101).  
 Cattle in Bengal, bad condition of (*Ray*) (366).  
 —————, due to land being easily tilled (*Mitra*)  
 (132).

# INDEX.

## ANIMAL HUSBANDRY—*contd.*

- Cattle in Bengal, improvement of, compared with that in England (*Ray*) (365), 22,866-22,873.  
 ———, large numbers imported annually (*Kerr*) 19,153, 19,158-19,162, 19,325-19,329.  
 ———, number of, 25 million (*Kerr*) 19,159.  
 ———, small draft animals preferred (*Kerr*) 19,150, 19,151.  
 ———, too small (*Kerr*) 19,152.  
 ———, underbred (*Finlow*) 17,955-17,958 (*Momen*) (325), (*Ahmed M.*) (559), 24,605.  
 Common pastures, *see* Pastures.  
 Condition of country in rains and cost of feeding, prevent the keeping of good cattle (*Morgan*) (273).  
 Co-operative agricultural and dairy farm at Ranaghat, scheme for (*Mukherjee*) (179), 20,334-20,337, 20,464-20,469, 20,880-20,382.  
 Co-operative animal husbandry societies, scope for (*Momen*) 22,193.  
 Co-operative dairy farms, Government assistance for (*Ray*) 22,920.  
 Co-operative milk societies, success and work of (*Mitra*) (132).  
 Co-operative Milk Union, Calcutta, idea of, capable of expansion (*Kerr*) 19,215, 19,271.  
 ———, municipal subsidy for (*Kerr*) (98), 19,269, 19,270.  
 ———, success of, in inducing owners to take interest in their cattle (*Kerr*) (93).  
 ———, work of (*Kerr*) (98), 19,209-19,211, 19,266-19,268, (*Mitra*) (132), 19,888, 19,891.  
 Cows, food given to (*Ray*) 21,550-21,555.  
 ———, neglect of (*Kerr*) 19,170-19,173, (*Ray*) (365).  
 ———, often too small for good bulls to be used (*Mudiel*) 22,658-22,660, (*Peddle*) (480).  
 Crossing, of Indian breeds (*Kerr*) 19,156, 19,231.  
 ———, with European strains, more liable to disease (*Finlow*) 18,472-18,474.  
 ———, valuable only for milk supply (*Finlow*) 17,934-17,936, (*Kerr*) 19,119, 19,235-19,237.  
 Cultivators, measures necessary to interest, in animal husbandry (*Kerr*) (102).  
 Dairying, (*Mitra*) (132).  
 ———, almost unknown in Bengal (*Momen*) (326).  
 ———, can be improved by co-operative methods (*Mukherjee*) (179); *see also various headings, commencing* Co-operative.  
 ———, demand for products (*Kerr*) 19,219, 19,220.  
 ———, might be carried out at jails and Government farms (*Kerr*) (101).  
 ———, should be taught by Agricultural Department (*Momen*) (326).  
 ———, training in (*Finlow*) (11).  
 Dual purpose breed (*Finlow*) 17,933.  
 European cattle, susceptibility of, to rinderpest (*Kerr*) 19,335-19,338.  
 Fodder, effect of feeding with, on milk yield (*Kerr*) 19,287-19,291, 19,300-19,302, 19,339-19,341.  
 ———, famines of, not common in Bengal (*Finlow*) 18,026, (*Shebbare*) 20,633, 20,631.  
 ———, possibility of increasing, by village forests (*Shebbare*) (207).  
 ———, preservation of, in forest areas, for sale to cultivators (*Shebbare*) 20,632, 20,635-20,639.  
 ———, need for research on (*Finlow*) 17,971, 17,972.  
 ———, *see also* Silage.  
 ———, scarcity of, period of (*Finlow*) (11), (*Kerr*) (102), (*Mitra*) (133), (*Momen*) (326), (*Peddle*) (430), (*Burrows*) (474), (*Ahmed U.*) (530), (*Ray*) 21,337-21,339, (*Ahmed M.*), (559).  
 ———, due to cultivators selling their stock owing to high prices (*Mitra*) (133).  
 ———, due to transport difficulties (*Ahmed M.*) (559).

## INDEX.

## ANIMAL HUSBANDRY—contd

Podder, supply of, has decreased owing to pressure on land and jute cultivation (Ray) (366), 22,079-22,681.

Food crops (Inland) (9-11).

can be grown on paddy land (Key) 21,342-21,316

--, demonstrations to popularise (Women) (325), (Mullick)  
22 661, 22,665, (Bureau) (474).

, fertilisers to increase (Hutchinson) (200), 22,069.

growing of, as catch crop, should be encouraged  
(Ahmed, M.) (559).

- - , can be fitted in with present rotation  
(1hmed,  $\Pi$ ) 20,010-20,020.

—, might be encouraged by remission of revenue (Poulton) 17,975-17,978.

— — — — —, in winter months, necessary (Burrows) (171).  
— — — — — need for (Kerr) 19,163-19,165, (Ahmed, H.)

- - , irrigation needed for (Poudre) (11), 17,950, 17,960

(Ahmed, H ) (242), 21,232-21,241, (Morgan) (273), 21,608,  
(Row), 24,317.

—, must be substituted for grazing (Pinlow) (11).

—, not grown at present (Pinlou) 18,124-18,126, (Bentley) (242), (Morgan) 21,668, (Muller) 22,653, (Momen) (323).

reservation of land for (Momen) (320), (Ihmed. 31.) (559),  
24.606-24.610.

Milk, adulterated, deliberately bought in Calcutta (Finlora) 17,912-17,953.

— and milk products, increased consumption of, would be beneficial (Bentley) 21,239.

-----, increased production of, impossible without  
fodder and therefore irrigation (Bentley)

—, supply of in Calcutta, inspection of (Denley)

—, condensed, used for children even in villages (*Ray*) (306), 22,691-

—, condensed, used for children even in villages (*lay*) (306), 22,681-22,683

—, demand for good quality (Tintow) 11,937.  
—, harm done by lack of (Tow) (355, 356), 22,681.

legislation for purity: none exists outside Calif.

—, legislation for purity, none exists outside Calcutta (*Pintow*) 17910.  
—, —————, valuable but difficult to administer (*Pintow*)  
17911

17,911.  
 —————, enforcement of, in Calcutta (Pinlow) 17,912.  
 17,914

—, price of, to-day, compared with 57 years ago (May) 22,682, 22,635-  
 27,687

\_\_\_\_\_, in rural areas, too high to permit of general consumption  
(Henderson) 91 960 91 972

(Bentley) 21,260-21,273  
production of, decreased by underfeeding of cattle (Bent 22 520)

—, production of, decreased by under  
—, supports of (Rev) 21 218 34 219

—, security of (Roy) 21,318, 21,319.  
—, supply of, deteriorations (Roy) 21,251

—, supply of, deteriorating (Roy) 21,351.  
in Calcutta (Roy) 17,212-17,252

Mustard sold the surplus of its cattle (Zimbabwe) 18,187 to 18,190

Mustard cake, the giving of, to cattle (T'indo  
Glu. sure difficult to obtain (Hed. 84, 250)

Glu, pure, difficult to obtain (Roy) 21,350.

Grass-cutting, allowed in all forests (Shebbear)

Grasses grown in forest areas (Shebbear) 20,733.

Grazing, difficulty of, when land is flooded (Burrows) (474).

—, forest, a cause of fire (Shebbare) 20,607, 20,619, 20,649.  
—, allowed in some reserved forests (Shebbare) 20,622-20,624,

20,870-20,891.

\_\_\_\_\_, cannot be extended (*Shebbare*) (206).

\_\_\_\_\_, damage caused by excessive (Shebbear) (206, 207), 20, C18.  
20, C19

\_\_\_\_\_, many blocks open to, should be closed (Shebbear) (20G).

method of combating, by stall-feeding (q v.).

—————, only affects villages in immediate neighbourhood (Sheb-  
bore) 20.885-20,888.

\_\_\_\_\_, should be discouraged (*Shebbear*) 20,722.

## INDEX.

### ANIMAL HUSBANDRY—*contd.*

- Grazing, in private forests (*Shebbare*) 20,626.  
 —, result of cheap, in causing deterioration of cattle (*Shebbare*) (206), 20,630-20,632.  
 —, use of bamboos for (*Shebbare*) 20,739.  
 —, *see also* Pastures.  
 Improvement of breeds, by crossing and selection (*Finlow*) (11).  
 —, by castration of inferior animals (*Mukherjee*) (179).  
 —, by prohibition of slaughter of prime and dry cows (*Mukherjee*) (179), 20,257-20,260.  
 —, by provision of better bulls and grazing grounds (*Ahmed, II.*) (170).  
 —, importance of (*Finlow*) 17,962, (*Mitra*) 19,455, (*Ahmed, II.*) (170).  
 —, suggestions for (*Ahmed, U.*) (536)  
 Jails, herds kept at, their utilisation for cattle improvement (*Kerr*) (101), 19,284, 19,308-19,310.  
 —, might be used for dairy work (*Kerr*) (101).  
 Pastures, common, facilitate spread of disease (*Ahmed U.*) (536).  
 —, grazing on, of poor quality (*Finlow*) (11), (*Mitra*) (133).  
 —, lack of (*Momen*) (326), (*Peddle*) (429, 430).  
 —, overworked (*Finlow*) (11), (*Momen*) (326), (*Ahmed M.*) (559), (*Mitra*) (133), (*Peddle*) (430).  
 —, have been usurped by zamindars (*Roy*) 24,354-24,357.  
 —, have declined (*Roy*) (366), 21,680.  
 —, increase of, difficult (*Roy*) 22,890-22,892.  
 —, of no food value (*Kerr*) 19,303-19,307.  
 —, provision of land for (*Roy*) 22,816-22,819, (*Mukherjee*) (179), 20,294-20,299.  
 —, will be encouraged by remission of revenue (*Ahmed U.*) (536).  
 —, value of enclosed (*Roy*) 22,863-22,870, 22,877.  
 Ranghpur cattle farm, distribution of half-bred bulls from (*Finlow*) 18,466-18,475.  
 —, is under Agricultural Department (*Finlow*) 18,464, 18,465.  
 —, work at (11).  
 Sheep and goats, need for further study of breeding of (*Finlow*) 17,973, 17,974.  
 Silage (*Finlow*) 17,965-17,970, (*Kerr*) (102), 19,166-19,169, (*Mitra*) 19,456, 19,467, (*Mullick*) 22,668-22,672, (*Peddle*) (430).  
 Sindi cattle, liability of, to rinderpest (*Kerr*) 19,310, 19,331-19,338.  
 Stall-feeding, introduced by Forest Department to stop damage done by grazing (*Shebbare*) (206), 20,734.  
 —, not practised in plains (*Shebbare*) (207).  
 Underfeeding, the cause of poor quality of cattle (*Bentley*) (212), (*Mutchinson*) (299).  
 Water hyacinth, use of, as fodder (*Burrow*) 23,676-23,679, 23,821-23,824.

### ATTRACTING CAPITAL.

- Capital, its investment in moneylending rather than agricultural improvement (*Morgan*) 21,730-21,736, (*Peddle*) (433).  
 Capitalists, factors discouraging them from taking to agriculture (*Momen*) (327), (*Mullick*) (552), (*Peddle*) (433), (*Ahmed U.*) (537).  
 —, might be encouraged to take to agriculture by Government help (*Mukherjee*) (180), (*Ahmed M.*) (560).  
 Joint ownership, makes co-operation for land improvement impossible (*Morgan*) (274), 21,736, 21,736.  
 Land improvement, factors discouraging investment of money in (*Finlow*) (14), 18,122, 18,123, (*Mitra*) (130), (*Ahmed U.*) (537).  
 —, *see also* Tenancy Act.  
 Landlords, generally apathetic with regard to agriculture (*Finlow*) (12), 17,979, 17,980, (*Peddle*) (433).

# INDEX.

## ATTRACTING CAPITAL—*contd*

- Landlords, need for educating (*Peddle*) (433).
- Large farms, establishment of, would displace peasant proprietors and be unsound (*Finlow*) (14), (*Mitra*) (130).
- , income from, less than from small holdings (*Finlow*) (14), 18,299-18,309, 18,553.
- Renting of land, pays better than farming (*Momen*) (327).
- Tenancy Act, Bengal, reacts against investment of money in land improvement (*Mukherjee*) (180), 20,301-20,308, (*Mitra*) (130).
- Batal system, operation of (*Mukherjee*) 20,289-20,293, (*Ahmed Ali*) 24,597-24,601

**BENTLEY, Dr. C. A., M.B., D.P.H., Director of Public Health (240-247).**  
21 140-21,459

## ADMINISTRATION :

- Budget of Medical and Public Health Departments 21,293-21,296, 21,414.
- of Public Health Department, includes items for other subjects 21,294.
- , should be increased 21,296-21,298.
- Co-operative public health movement, good work done by (242), 21,429-21,431, 21,437-21,440.
- , has taken root in rural areas 21,432-21,436.
- , independent societies now formed for 21,377, 21,431.
- , relations of, with Union Boards 21,181-21,185, 21,376, 21,377.
- Director of Public Health, legal work of, prevents touring 21,400.
- Financing of public health work 21,175-21,177, 21,356-21,369, 21,456-21,459.
- Health officers, are under local bodies 21,160.
- , training of 21,167.
- Legislative Council, attitude of, towards public health matters 21,422-21,424.
- Loans policy for financing sanitary improvements, need for 21,364-21,368.
- Local Boards to deal with specific subjects, preferable to bodies having multiplicity of functions 21,445-21,448.
- Local bodies, attitude of, towards public health questions 21,172-21,175, 21,416-21,418.
- , continuity of policy of 21,419-21,421.
- , financial aid for, for public health work 21,175-21,177, 21,336 21,364, 21,368, 21,369.
- , local taxation by, for public health purposes 21,425-21,427.
- , midwives under 21,396-21,399.
- , public health staff under 21,160-21,169.
- , scheme for increasing 21,353-21,355.
- , should keep their own statistics 21,402.
- Private practitioners in rural areas, subsidising of 21,178, 21,179.
- Public Health Act, Bill for in Bengal, fate of 21,171, 21,378, 21,379.
- , for rural areas only, needed first 21,380.
- , need for 21,170.
- Public Health Department, co-operation of, with Agricultural Department 21,449.
- , with Education Department, 21,188.
- , with Irrigation Department, 21,289, 21,290, 21,450.
- , difficulties of, owing to cumbersome system of control 21,180.
- , in Bengal, wrongly regarded as minor department 21,349, 21,350.
- , staff of 21,162-21,169.

## INDEX.

### BENTLEY, Dr. C. A.—*cont.*

#### ADMINISTRATION—*contd.*

- Public Health Department, staff of, insufficient 21,353.
- Public health organisation in Bengal 21,151-21,169.
- Sanitary Board, duties of 21,416.
- Sanitary inspectors, are under local bodies 21,160.
- \_\_\_\_\_, inspection of schools by 21,195-21,200
- \_\_\_\_\_, numbers of 21,164.
- \_\_\_\_\_, training of 21,161-21,163.
- Union Boards, area of jurisdiction of 21,186, 21,187.
- \_\_\_\_\_, probability of failure of 21,182-21,185, 21,445-21,448.
- \_\_\_\_\_, relations of, with Co-operative Public Health Societies 21,181-21,185, 21,376, 21,377.
- \_\_\_\_\_, unit for, artificial 21,371-21,375.
- \_\_\_\_\_, see also Local bodies.

#### AGRICULTURAL INDEBTEDNESS:

- Causes of indebtedness (240).
- Cultivators, indebtedness of, a measure of prosperity rather than poverty (240).
- \_\_\_\_\_, usually indebted to full extent of their credit (240, 241).
- Rural indebtedness, a necessary evil (241).
- \_\_\_\_\_, methods of reducing (241).

#### AGRICULTURAL INDUSTRIES:

- Area sown twice compared with net cropped area (243).
- Area under fruit and vegetables, figures for (244).
- Cultivators, have usually time for subsidiary occupations (244).
- \_\_\_\_\_, number of, days worked by (243).
- Demand for products of subsidiary industries, creation of, the best means of encouraging them (244).
- Fruit and vegetable industry, dependent on local demand (244).
- Obstacles to subsidiary industries (244).
- Pisciculture (245), 21,277, 21,278, 21,281.
- Sericulture, decay of (245).

#### AGRICULTURAL LABOUR:

- Shortage of labour, partly due to ill-health (245).
- Uncultivated cultivable area, area of (245).
- \_\_\_\_\_, colonisation of, would be facilitated by irrigation (245).

#### ANIMAL HUSBANDRY:

- Fodder crops, almost non-existent (242).
- \_\_\_\_\_, irrigation necessary to permit of growing (242), 21,239-21,241.
- Milk, and milk products, increased consumption of, would be beneficial 21,239.
- \_\_\_\_\_, increased production of, impossible without fodder and therefore irrigation 21,240, 21,241.
- \_\_\_\_\_, supply of in Calcutta, inspection of 21,265-21,268.
- \_\_\_\_\_, price of, in rural areas, too high to permit of general consumption 21,269-21,273.
- Underfeeding, cause of poor quality of cattle (242).

#### \*CO-OPERATION:

- Co-operative public health movement, see under ADMINISTRATION.

#### CROPS:

- Cropped area in Bengal, has progressively declined through lack of irrigation (241, 242).
- Crop production, effect of irrigation on (241), 21,322-21,329.

#### DEMONSTRATION AND PROPAGANDA:

- Baby shows 21,441, 21,442.
- Propaganda for public health purposes 21,382-21,388, 21,402, 21,404, 21,441, 21,442.

## INDEX.

### BENTLEY, Dr. C. A.—*cont.*

#### EDUCATION

- Education Department, help given by, to public health work 21,188.
- Sanitary appliances in schools, defective 21,191.
- , inspection of 21,195-21,199.
- Schools, inspection of, by officers of Public Health Dept. 21,195-21,200.
- Teachers, training of, in elementary hygiene 21,193.
- Text books on hygiene, satisfactory 21,189, 21,192, 21,199.

#### FORESTS

- Afforestation, might be dangerous to health in neighbourhood of villages (216).
- , —, must have beneficial effect on rainfall (240).
- Denudation of forests, has led to soil erosion (216).

#### IRRIGATION

- Cropped area in Burdwan, has progressively declined through lack of irrigation (241, 242).
- Crop production, effect of irrigation on (241), 21,322-21,329.
- Distribution of water, methods of, unsatisfactory (242).
- Fodder, need for irrigation to produce (242, 246), 21,239-21,241.
- Higher lands, irrigating of 21,342-21,348.
- Irrigation, at one time extensive in Bengal (241).
- , decay of, cause of (241).
- , effect of, to cause economic decline 21,333, 21,339.
- , importance of and scope for further (241), 21,238, 21,370.
- Irrigation Department, co-operation of, with Public Health Dept. 21,289, 21,290, 21,450.
- Malaria, irrigation as a cause of 21,405, 21,406.
- , irrigation as a remedy for (246), 21,346.
- Non-perennial canals, need for (241).
- Obstacles to extension of irrigation (242).
- Rivers, confinement of, harmful effects of (241), 21,291, 21,292.
- Tanks, belong in most cases to private owners 21,379.
- , improvement of existing, financial difficulties of 21,286-21,288.
- , Government grant for 21,362-21,364.
- , legislation for 21,282-21,287.
- , obstacles to (246).
- , of no value without larger supply of water 21,290-21,293.
- , majority of, do not hold water throughout the year 21,278.
- , need for (241).
- , use of, for pisciculture (245), 21,277, 21,278, 21,281.
- Uncultivated cultivable lands, colonisation of, would be facilitated by irrigation (245).

#### RESEARCH

- Statistical research on agriculture and allied subjects, need for (210), 21,147-21,150.

#### SOILS.

- Drainage and bunds for reclamation of land (246).

#### STATISTICS:

- Agricultural statistics, inaccurate but valuable 21,317, 21,318.
- Bowie, Mr., his work on statistics (247), 21,315, 21,316.
- Danger of relying on present statistics, owing to frequent changes in methods of collecting and estimating (217).
- Graphic form for statistic, value of 21,401.
- Local bodies, should keep their own statistics 21,402.
- Medical statistics, reliability of 21,319-21,321, 21,330, 21,331.
- Modern statistical methods, need for employment of (247), 21,147.
- Statistical agricultural survey of India, need for (247).
- Statistical clerks, need for one in each Province 21,149.
- , training of 21,149.
- Statistics, value of, for administrators 21,401, 21,407, 21,408.
- Vital statistics, and economic conditions, close relationship between 21,150, 21,228.
- , improvement of 21,409, 21,410.

# INDEX.

BENTLEY, Dr. C. A.—cont.

## TARIFFS :

- Export duty on jute, affects cultivators adversely and should be reduced or abolished (246).
- , proceeds from, should be controlled by Bengal Government and largely utilised to benefit the industry (246).

## WELFARE :

- Asymptotic level, depends on standard of living 21,232.
- , has nothing to do with food supply 21,229-21,231.
- , not yet reached in Bengal 21,229.
- Bengal, is unhealthy compared with other Provinces 21,317, 21,348.
- Beri-beri, causes of 21,223-21,225.
- Birth control, not yet reached rural areas 21,234.
- Cholera, can be eradicated (247), 21,180, 21,353, 21,451.
- Cinchona cultivation 21,341.
- Diet in Bengal, badly balanced 21,218-21,221, 21,276, 21,303-21,310.
- , change in, in last 10 years 21,428.
- , education and propaganda, to secure improvement in 21,310-21,314.
- Economic surveys of villages, suggestion for (247).
- Epidemic diseases, staff to combat, could be provided at small expense (247).
- , would enable many diseases to be eradicated (246, 247).
- Fish, decline in consumption of (245), 21,277, 21,278, 21,281.
- Hookworm, campaign against 21,202-21,208.
- , ravages of 21,201.
- Housing in Eastern Bengal, fairly satisfactory 21,261-21,264.
- Kala-azar, can be eradicated (247).
- , is spreading 21,209-21,211.
- , mode of infection 21,212.
- Malaria, effect of, on prosperity of cultivators (247).
- , irrigation, effect on, *see under* IRRIGATION.
- , population infected with, 33 millions 21,330, 21,331.
- Malnutrition, prevalent 21,218, 21,306.
- Nutrition, work on, importance of 21,226, 21,227.
- , in Bengal 21,301-21,304.
- , should be carried out in each Province 21,274, 21,275, 21,299.
- , *see also* Diet.
- Population, growth of, has not reached asymptotic level 21,229.
- , increase in, governed by death rate rather than birth rate (245).
- , in Eastern Bengal, has declined as result of prosperity 21,232.
- , in Western Bengal, has declined as result of adversity 21,233-21,235.
- Phthisis, is spreading 21,215, 21,216.
- Quinine, distribution of, through post offices a failure 21,340.
- Standard of living, has increased in Eastern Bengal 21,233.
- , increase in, lowers birth rate 21,232-21,237, 21,351, 21,352.
- Water supply, demand for 21,252, 21,253.
- , finance the obstacle to provision of 21,253-21,256, 21,286-21,288, 21,305.
- , from tube wells, occasionally unsuitable 21,242-21,248.
- , grants to local bodies for wells and tanks for 21,250, 21,251.
- , importance of pure 21,249.
- , provision of, present policy for 21,362, 21,363.
- , should be financed from loans 21,364-21,369.
- Windmills, use of, for pumping water 21,258-21,260.

## INDEX

**BURROWS, Mr. L., B.A., Collector of Faridpur (171-493), 23,653-23,956.**

### ADMINISTRATION

- Communications, suggestions for improvement of, in Faridpur district (476).
- District and Union Boards and Civil Service, relations between 23,865-23,892, 23,907-23,911.
- Water hyacinth, Bill for eradication of, in Burma 23,717, 23,718.
- — — — —, conscription of labour for eradication of, difficult 23,853-23,855.
- — — — —, if not dealt with will choke waterways and fields 23,857.
- — — — —, interprovincial co-operation to check 23,719-23,721.
- — — — —, legislation against useless without scheme of operation 23,716.
- — — — —, proposed scheme for eradication of (Appendix II) (482-490), (478), 23,066-23,068, 23,722-23,730, 23,811.
- — — — —, use of, as fertiliser, *see under FERTILISERS.*
- — — — —, as fodder, *see under ANIMAL HUSBANDRY.*
- Waterways, the chief means of communication in Faridpur district (476).

### AGRICULTURAL INDUSTRIES

- Mortgages, redemption of 23,802-23,805
- Usurious Loans Act, not used in Faridpur district 23,766-23,769, 23,799-23,801, 23,859, 23,859, 23,899-23,902.

### AGRICULTURAL INDUSTRIES:

- Conditions for success of subsidiary industries (476).
- Cottage industries, Official Summary of, inaccurate (475)
- — — — —, prejudices against, likely to disappear under economic pressure (475).
- — — — —, reasons for survival of (475).
- — — — —, survey and study of, essential (475).
- Cultivators in Faridpur district, have ample spare time for subsidiary occupations (474).
- Failure of certain subsidiary occupations, reasons for (474).
- Government, must give lead in starting subsidiary occupations 23,659, 23,690.
- Pisciculture 23,686-23,688.
- Standard of living, desire for better, not a sufficient inducement to take up subsidiary occupations (475), 23,682-23,685.
- Weaving, handloom, the most promising subsidiary industry (475).
- — — — —, need for instruction in (475).

### ANIMAL HUSBANDRY:

- Feeding, importance of adequate, not recognised by cultivators 23,680, 23,681, 23,819, 23,820.
- Fodder, crops for, demonstration of (474).
- — — — —, growing of during winter the only remedy (471).
- — — — —, period of shortage of (474).
- Grazing, difficulty of, when land is flooded (474).
- Water hyacinth, use of, as fodder 23,676-23,679, 23,821-23,824.

### CO-OPERATION:

- Co-operative inspectors, not under district officers 23,794, 23,795, 23,816, 23,817.
- Co-operative societies, idea of, good but methods of forming capable of improvement 23,770, 23,771, 23,775, 23,776, 23,786-23,788.
- — — — —, might be helped by Collectors and Circle Officers 23,789-23,798, 23,883, 23,884.

## INDEX.

### BURROWS, Mr. L., B.A.—*contd.*

#### DEMONSTRATION AND PROPAGANDA:

Agricultural Department, should co-operate with Collectors in demonstrations (472).

\_\_\_\_\_, *see also under Collectors and Circle Officers*  
Agricultural survey of each district, need for detailed, on which to base plan for propaganda (472), 23,829-23,838, but does not come within Collector's duties 23,757-23,762.

Cinemas and magic lanterns, more valuable than pamphlets (472).

Circle Officers and agricultural work (472).

Collectors, importance of their collaboration in agricultural work (472), 23,672-23,675.

\_\_\_\_\_, resolution directing their attention to importance of assisting agriculture, desirable 23,870-23,874.

Co-operative societies and Agricultural Associations, not likely to be successful in demonstration work (472), 23,669-23,671. *See also Union Boards*

Cultivators, are not very conservative (472).

\_\_\_\_\_, will adopt improvements once their value is demonstrated (477).

\_\_\_\_\_, but are sceptical of those demonstrated under conditions beyond their means (472), 23,846-23,848.

Demonstration farms, possess resources not available to cultivators and are therefore unconvincing (472), 23,846-23,848.

Demonstrations on cultivators' own fields, have the best chance of success 23,849, 23,850.

Demonstrators, need for more (472).

District agricultural officers, their efficiency for propaganda 23,740-23,745.

Jute and paddy, value of improved varieties of (471).

Research, of no value unless its results are incorporated in general agricultural practice (471).

Union Boards, likely to be more successful for propaganda than co-operative societies 23,875-23,882.

#### EDUCATION:

Circle officers, instruction of, in agriculture and co-operation, desirable 23,885-23,889.

Middle-class youths, problem of unemployment amongst, serious (471).  
\_\_\_\_\_, scheme for utilisation of *khas mahal* land for settlement of (471), 23,731-23,738, 23,747-23,756, 23,839-23,845.

\_\_\_\_\_, alternative method of solving unemployment amongst, by diminishing supply, undesirable 23,860-23,869.

#### FERTILISERS:

Water hyacinth, use of, as manure 23,825.

#### FINANCE:

Agriculturists' Loans Act, loss of money lent under, small 23,780.

\_\_\_\_\_, only resorted to in times of scarcity 23,777-23,779.

\_\_\_\_\_, provision of joint security demanded by, not difficult 23,893-23,895.

Land Improvements Act, could be used to greater extent 23,782, 23,783, 23,818.

\_\_\_\_\_, lack of use of, due to want of enterprise of owners 23,784, 23,785.

\_\_\_\_\_, period allowed for repayment of loans under 23,896-23,898.

#### HOLDINGS:

Average cultivated holding in Faridpur district, size of (475), 23,930.

Consolidation, difficulties of 23,704-23,708, 23,812-23,815.

Land, availability of additional, and effect of occupancy rights thereon 23,747-23,752, 23,914-23,927, 23,937-23,949.

## INDEX

### BURROWS, Mr. L., B.A.—*contd.*

#### IRRIGATION

- Dellah rivers, control of 23,657-23,662.
- Irrigation, scope for minor in Faridpur district 23,656.
- Irrigation Department, scope for further activity by 23,655, 23,663-23,665

#### MARKETING

- Arachars, function of (476, 477).
- Boparis, function of (476).
- Co-operative jute sale societies, should limit their activities to collecting and storing crop and selling to large commercial firms (477), 23,666, 23,697
- Cultivators are in touch with market prices (477).
- \_\_\_\_\_ , hold up their crops for better prices (477, 478).
- Dadan system of advancing money against standing crops, not common (477), 23,691, 23,695.
- Farias, function of (476).
- Forecasters, margin of error in, probably constant (478).
- \_\_\_\_\_ , might be of demand as well as supply (477), 23,698-23,701.
- Hundis, not used in Faridpur district (477), 23,693.
- Information on market conditions, of little value to cultivators at present owing to their ignorance (477), 23,691.
- Middlemen, have their economic uses and cannot be advantageously eliminated at present (477).
- \_\_\_\_\_ , margins on which they work (477).
- \_\_\_\_\_ , may be partly eliminated by co-operative societies (477).

#### SOUS:

- Agricultural and Sanitary Improvements Act, a dead letter because too cumbersome (472, 473).
- \_\_\_\_\_ , engineers employed for works under 23,901-23,903.
- \_\_\_\_\_ , suggestions for improving (473), 23,903.
- Land improvement schemes, demand for (472).
- Major and minor works, need for alteration in definition of (473).
- Minor works, procedure for, should be simplified (473).
- \_\_\_\_\_ , value of, for improvement of agriculture (473).

#### VETERINARY:

- Compulsory notification, segregation and inoculation, not advisable at present (474).
- Contagious diseases, rules for reporting of 23,712-23,715.
- Diseased carcasses, disposal of (473, 474)
- Inoculation, advantages of, becoming recognised by cultivators (474)
- Thana dispensaries, scheme for (*Appendix I*) (479-481), 23,739, 23,806-23,810.

#### WELFARE

- Economic inquiry in Faridpur district by Major Jack 23,826-23,828.
- Economic survey of Talma village, note on (*Appendix III*) (487-493), 23,702-23,703, 23,763-23,765.
- Economic surveys of villages, difficulties and value of (478), 23,709-23,711.
- Standard of living of cultivators (476), 23,692.

### CARPENTER, Mr. P. H., *see* INDIAN TEA ASSOCIATION.

### CHATTERJEE, Rai Bahadur Dr. G. C., Secretary, Central Co-operative Anti-Malaria Society (225-237), 20,921-21,145.

#### CO-OPERATIVE PUBLIC HEALTH MOVEMENT

- Central Co-operative Anti-Malaria Society, aims of (226).
- \_\_\_\_\_ , constitution of 20,916-20,919.
- \_\_\_\_\_ , organisers of (*q.v.*)

## INDEX

CHATTERJEE, Rai Bahadur Dr. G. C.—*contd.*

Co-OPERATIVE PUBLIC HEALTH MOVEMENT—*contd.*

Central Co-operative Anti-Malaria Society, relations of, with village societies 20,050, 21,008.

—————, subscriptions to and expenditure of 21,038-21,093.

Co-operative Department, relations of, with village societies 20,925, 20,933, 20,934. (*See also* Village societies, registration of.)

—————, should pay travelling expenses of organisers engaged in co-operative health work (226), 20,986-20,991.

Co-operative public health movement, aims of (226).

—————, confidence of villagers in, gained by its success 20,926, 20,927.

—————, District Board assistance for 21,050, 21,051.

—————, Government assistance for (*q.v.*) growth of 20,969.

—————, history of 20,925, 20,933, 20,934.

—————, popularity of (226).

Fish for combating malaria 21,005-21,007.

Government assistance for co-operative health movement 21,013-21,049, 21,093-21,096.

Irrigation, defects in system of, a cause of malaria (225), 21,100-21,116.

Kala-azar, can be prevented at low cost (226).

—————, injection fund for 21,008, 21,009.

—————, ravages of (226).

Local bodies, are not giving a lead in public health work on account of defective franchise (226).

—————, grants given to, for water-supply, not always utilised (225), 21,100-21,103.

—————, official element in, too strong (226, 227) 21,037-21,042, 21,144, 21,146.

—————, relations of, with village societies 20,951-20,962, 21,028-21,035, 21,133-21,137.

Local Self Government Board, to guide autonomous local bodies, need for (227), 21,145.

Local Self Government system of England, should be adopted in India 21,146.

Malaria, can be prevented at low cost (226).

—————, due to negligence (225), 21,018-21,018.

—————, more prevalent in rural than urban areas 21,021.

—————, Panama canal as example of effectiveness of measures against (226).

—————, ravages of (226).

—————, season of 21,013, 21,014.

Medical officers, assistance given by 21,127-21,129.

—————, honorary, work of 21,084-21,087.

—————, subsidising of, for rural work 20,935-20,945, 21,073-21,083.

Nutrition questions, cannot at present be dealt with by co-operative health movement 20,977-20,983.

—————, not of primary importance 21,023-21,025.

Organisers under Central Society, should be increased (226).

—————, travelling allowance of, should be paid by Co-operative Department (226), 20,986-20,991.

Public Health Department, relations of, with village societies 20,923, 20,924, 21,054, 21,055.

Quinine, free distribution of 21,012.

Village health societies, are more in touch with Union Boards than Co-operative Department 20,952-20,962, 21,028-21,035.

—————, can successfully deal with malaria 21,019.

## INDEX.

### CHATTERJEE, Rai Bahadur Dr. G. C.—*contd.*

#### Co-operative Public Health Movement—*contd.*

- Village health societies, can undertake the making of wells (225).  
 ————, decline of interest in 20,967, 20,968.  
 ————, given interest-free loans by Central Society to enable them to use Government grants for water supply (225), 20,997-21,000.  
 ————, Government grants for, given through Union Boards 21,133-21,137.  
 ————, numbers of (220), 20,929, 20,960-20,972, 21,039-21,003.  
 ————, registration of, 20,929, 20,992-20,996.  
 ————, temporary suspension of 21,138-21,140.  
 ————, share capital of 20,930-20,932.  
 ————, work of 21,001-21,001, 21,119-21,121.  
 Village Improvement Board, need for 20,922.  
 Water supply, Government grant for, not always utilised (225), 21,100-21,103.  
 ————, interest-free loans for, by Central Society (225), 20,997-21,000.

#### IMPLEMENTS:

- Central Co-operative Implement Supply Company, need for (225).  
 Cultivators, will take to improved implements if proper demonstrations are given (225).

### CHAUDHURI, Mr. P. C., Deputy Director of Sericulture (119-123), 19,347-19,392.

#### SERICULTURE:

- Artificial silk, no competition from 19,385-19,390.  
 Castor leaves as food for silkworms 19,390, 19,391.  
 Climatic conditions, effect of and need for studying (119).  
 Co-operative sericulture societies (120, 123), 19,375-19,382.  
 Courses in sericulture (119, 120).  
 Demonstration of improved methods of sericulture, staff for (120).  
 ————, success of (120).  
 Irrigation for mulberry plants 19,350-19,352, 19,392.  
 Marloting (122, 123), 19,393, 19,394.  
 Mitha yarns, spinning of (121, 122).  
 Mulberry cultivation (121), 19,351-19,360, 19,392.  
 Profits from sericulture 19,361-19,370.  
 Rearing, causes of indebtedness of (121).  
 ————, sources of credit of (121).  
 Reeling 19,371-19,374.  
 Sericulture, improved apparatus for (122).  
 ————, possibilities of extending (122), 19,393.  
 ————, should usually be taken up as subsidiary occupation only (121).  
 Silk weaving factories in rural areas (122).

#### COMMUNICATIONS, *see under* ADMINISTRATION.

#### CO-OPERATION.

- Adult education, success of co-operative night-schools for (Mitra) (128), 19,395-19,400.  
 Agricultural co-operative inspectors, in close touch with Agricultural Dept., need for, to form and supervise agricultural co-operative societies (Poddie) (432).  
 Agricultural unions for financing co-operative societies, need for (Poddie) (431).  
 Agricultural and joint farming societies, value of (Ahmed M.) (560).  
 Anti-malaria societies, *see* Public health societies.  
 ————, *see also under* CHATTERJEE, Dr. G. C.  
 Assistant Registrars, work of (Mitra) 19,624, 19,625, 19,692-19,694.  
 Audit of co-operative societies, carried out by inspectors (Mitra) 19,409-19,603 *See also* Inspectors.

# INDEX.

## CO-OPERATION—contd.

- Audit of co-operative societies, defects of (*Ahmed II.*) 20,030-20,037, 20,055.
- \_\_\_\_\_, fees for, pay for audit staff (*Mitra*) 19,620.
- \_\_\_\_\_, should be reduced or abolished (*Ahmed U.*) (537).
- \_\_\_\_\_, must be carried out by Government (*Jute Mills Assn.*) (416).
- \_\_\_\_\_, need for strengthening (*Mitra*) 19,465, 19,466.
- \_\_\_\_\_, present system, better than audit by chartered accountant (*Mitra*) 19,855.
- \_\_\_\_\_, one auditor for every 100 societies (*Mitra*) 19,626-19,628.
- \_\_\_\_\_, of Provincial Bank (*Mitra*) 19,853-19,855.
- Audit fund, control of (*Mitra*) 19,856-19,858.
- Bengal Co-operative Organisation Society, constitution of (*Mitra*) 19,505, 19,506.
- \_\_\_\_\_, need for encouraging (*Mitra*) (135).
- \_\_\_\_\_, State aid for (*Mukherjee*) (180), 20,473-20,476.
- Bonemeal, co-operative factories for (*Finlow*) 17,890-17,892.
- Caste difficulties in connection with membership of societies, non-existent (*Momen*) 22,187-22,190.
- Central Banks, capital of (*Mitra*) 19,682-19,685.
- \_\_\_\_\_, have been of benefit to cultivators (*Ahmed U.*) (537).
- \_\_\_\_\_, meetings of, attended by members of primary societies (*Mitra*) 19,491-19,493.
- \_\_\_\_\_, conducted in vernacular (*Mitra*) 19,482-19,487.
- \_\_\_\_\_, procedure at (*Ahmed II.*) 20,016-20,019.
- \_\_\_\_\_, need for one, in each Union (*Momen*) 22,182, 22,183.
- \_\_\_\_\_, number of (*Mitra*) (120), 19,474.
- \_\_\_\_\_, number of primary societies under each (*Ahmed II.*) 20,026, 20,027.
- \_\_\_\_\_, often become dividend-earning machines (*Peddle*) (431).
- \_\_\_\_\_, procedure of, in dealing with loan applications (*Mitra*) 19,722-19,730, (*Ahmed II.*) 20,043, 20,044.
- \_\_\_\_\_, Ranaghat, capital of (*Mukherjee*) 20,418-20,420.
- \_\_\_\_\_, deposits in (*Mukherjee*) 20,421-20,427.
- \_\_\_\_\_, have to be refused on account of surplus (*Mukherjee*) 20,426.
- \_\_\_\_\_, directors of (*Mukherjee*) 20,430-20,432.
- \_\_\_\_\_, meetings of, are attended by members of primary societies (*Mukherjee*) 20,521-20,524.
- \_\_\_\_\_, conducted in vernacular (*Mukherjee*) 20,525-20,527.
- \_\_\_\_\_, primary societies under (*Mukherjee*) 20,428, 20,429.
- \_\_\_\_\_, should be linked to money market through Provincial Bank (*Mitra*) (129).
- \_\_\_\_\_, supervision by (*Ahmed II.*) 20,025, 20,028, 20,029.
- \_\_\_\_\_, in Bengal, take the place of Supervising Unions (*Mitra*) 19,470-19,473, 19,476-19,481.
- \_\_\_\_\_, use of, for seed distribution (*Mukherjee*) (178), (*Peddle*) (431).
- Compulsion of obstinate minorities, (*Mitra*) (136), 19,557, 19,558, 19,670-19,675, 19,964, 19,965, (*Momen*) (327), (*Peddle*) (432).
- \_\_\_\_\_, undesirable (*Mullick*) (352), 22,468, 22,469.
- Co-operative agricultural and dairy farm at Ranaghat, scheme for (*Mukherjee*) (179), 20,334-20,337, 20,464-20,469, 20,380-20,382.

# INDEX.

## CO-OPERATION—*contd.*

- Co-operative Department, co-operation of, with Agricultural Department  
(*Mitra*) 19,660-19,664, 19,765,  
19,774, 19,775.
- , with anti-malaria societies  
(*Chatterjee*) 20,923, 20,933,  
20,934, *see also* under  
Public health societies.
- , with Education Department  
(*Mitra*) 19,804-19,809
- , with Irrigation Department  
(*Das*) 18,912, (*Mitra*) 19,636-  
19,640, 19,966, 19,967.
- , with Revenue Department  
(*Mitra*) 19,643-19,655.
- , of great value and should receive more help  
(*Momen*) (319).
- , staff of, many belong to same class as members  
of primary societies (*Mitra*) 19,906,  
19,907.
- , requires strengthening (*Mitra*) (135),  
19,465, 19,466.
- , sent to other Provinces to study  
(*Mitra*) 19,850, 19,851.
- , should be increased (*Mukherjee*) (180).
- Co-operative Milk Union, Calcutta, *see* under ANIMAL HUSBANDRY.
- Co-operative movement, aims of (*Mitra*) (135)
- , chiefly confined to credit societies (*Ahmed H.*)  
(170), (*Peddie*) (431)
- , educative value of, greater than economic value  
(*Mitra*) 19,494.
- , existing system of, unsatisfactory (*Burrows*)  
23,770, 23,771, 23,775, 23,776, 23,786-23,788,  
(*Ahmed M.*) (560).
- , financial assistance for, 3 to 4 lakhs (*Mitra*) 19,620-  
19,623.
- , has 12,000 societies in Bengal (*Mitra*) 19,739.
- , illiteracy the main obstacle to extension of  
(*Ahmed H.*) (170).
- , lack of public demand for extension of (*Peddie*)  
(431).
- , might be helped by Revenue officers (*Burrows*)  
23,789-23,793, 23,833, 23,884.
- , periods of surplus and stringency in (*Mitra*)  
19,629, 19,630.
- , principles of, teaching of, in schools (*Mitra*)  
19,791-19,793
- , understood by members of primary  
societies (*Mitra*) 19,848, 19,849
- , propaganda through (*Tinlow*) 17,741-17,743,  
(*Mitra*) (123).
- , soundness of (*Mitra*) 19,641, 19,642, 19,695-19,699,  
19,703-19,705.
- , spread of, will lighten agricultural indebtedness  
(*Mitra*) (180).
- Credit societies, audit of, *see* Audit.
- , can give short and intermediate term loans (*Mitra*) (129).
- , defect of (*Mitra*) (135), 19,518-19,520, 19,718, 19,719,  
19,908.
- , distribution of short-term credit by, method for (*Mitra*)  
(135), 19,519, 19,520.
- , expert advice for (*Mitra*), 19,469, 19,737, 19,738.
- , failure of, due to lack of supervision (*Peddie*) (431, 432).

# INDEX.

## CO-OPERATION—*contd.*

- Credit societies, growing unpopularity of, due to unlimited liability of members (*Ahmed U.*) 24,174-24,177, 24,222-24,225, 24,243-24,250; *see also* Liability.
- \_\_\_\_\_, have reduced moneylenders' rates of interest (*Mitra*) (135), 19,496, 19,497.
- \_\_\_\_\_, interest charged by, (*Mukherjee*) 20,451-20,453.
- \_\_\_\_\_, as high as that of moneylenders (*Roy*) 24,201-24,205, 24,506-24,508.
- \_\_\_\_\_, and paid by (*Mitra*) 19,719, 19,720, 19,975-19,980.
- \_\_\_\_\_, lend money to townspeople (*Roy*) 21,300-21,309.
- \_\_\_\_\_, management of (*Mitra*), 19,468, 19,733-19,736.
- \_\_\_\_\_, maximum credit for, fixing of (*Mitra*), 19,867-19,877.
- \_\_\_\_\_, only to limited extent in touch with cultivators (*Jute Mills Association*) (416).
- \_\_\_\_\_, procedure of, in dealing with loan applications (*Mitra*) 19,722-19,730, *see also* Short-term loans.
- \_\_\_\_\_, reserve funds of (*q.v.*)
- \_\_\_\_\_, secretaries for (*Mitra*) 19,886-19,887.
- \_\_\_\_\_, should be linked to Central Banks (*Mitra*) (129).
- \_\_\_\_\_, should be under direct Government supervision (*Ahmed M.*) (558), 24,636.
- \_\_\_\_\_, success of (*Ahmed H.*) (170, 171).
- \_\_\_\_\_, undertake education, arbitration and social welfare work (*Mitra*) 19,706-19,708.
- \_\_\_\_\_, use of, for seed distribution (*Mukherjee*) (176).
- Development Department, need for, to co-ordinate work of agricultural, co-operative and industrial officers (*Peddle*) (432).
- Disputes between co-operative organisations, settlement of (*Mitra*) 19,715-19,717.
- District officers, their help welcomed, but should not be given definite responsibilities towards co-operative movement (*Mitra*) 19,643-19,655.
- Educative value of co-operative movement, greater than economic value (*Mitra*) 19,494.
- Fertilisers, co-operative distribution of (*Mitra*) (131), 19,706-19,771.
- Government, rôle of, in regard to co-operative movement (*Mitra*) (135), 19,689, (*Ahmed H.*) (170), (*Mukherjee*) (180), 20,485, (*Peddle*) (431), (*Ahmed M.*) (558), 24,636.
- \_\_\_\_\_, *see also* Organisation of co-operation.
- Grain banks, have not been successful (*Mitra*) 19,751, 19,752.
- Homo safes, *see* Savings deposits.
- Ignorance of majority of members of co-operative societies, renders them liable to exploitation by literate few (*Ahmed U.*) (537), 24,227-24,229, 24,234-24,242.
- Implement societies (*Mitra*) (132, 130), 19,913-19,916.
- Inspectors, for auditing co-operative societies, 80 in number, (*Mitra*) 19,500.
- \_\_\_\_\_, pay and prospects of (*Mitra*) 19,501, 19,600-19,604.
- \_\_\_\_\_, training of (*Mitra*) 19,605-19,609, 19,842-19,817.
- \_\_\_\_\_, work of, efficient (*Mitra*) 19,502, 19,503.
- \_\_\_\_\_, for propaganda and supervision (*Mitra*) 19,761-19,763.
- \_\_\_\_\_, not under district officers (*Burrows*) 23,794, 23,795, 23,816, 23,817.

# INDEX.

## CO-OPERATION—*contd.*

- Industrial societies (*Mitra*) 19,776-19,778.
- Irrigation societies, *see under* IRRIGATION.
- Joint farming societies (*Mitra*) (130), (*Peddle*) (432).
- Jute buying organisation, co-operative (*Pinlow*) (14), 18,061-18,068.
- Jute growers' association, attitude towards a possible, of jute trade (*Jute Mills Association*) 23,224, 23,230, 23,263, 23,261, 23,278.
- , no attempt made to form (*Jute Mills Association*) 23,222-23,224.
- Jute sale societies, *see under* MARKETING.
- Land improvement, co-operative societies for (*Mitra*) (131).
- Legislative Council, seats on, should be allotted to representatives of co-operative movement (*Mukherjee*) (180).
- Liability of members of co-operative societies, should be limited (*Ahmed U.*) (54), 21,178, 21,179.
- Liquidation of societies (*Mitra*) 19,709-19,714.
- Marketing, co-operative, *see under* MARKETING.
- Membership of co-operative societies, limited to well-to-do cultivators (*Peddle*) (432).
- Naogaon Ganja cultivators' society, success of (*Ahmed M.*) (560), 24,635.
- Non-credit societies, are independent of credit societies (*Mitra*) 19,747-19,750.
- , financing of (*Mitra*) 19,748, 19,749.
- , great demand for (*Mitra*) 19,743-19,746.
- , need for developing (*Mukherjee*) (180). (*Momen*) 22,181, (*Mullick*) (352).
- Non-official help for co-operative movement (*Mitra*) (135), 19,839-19,841, (*Ahmed U.*) (537).
- Organisation of co-operation in Bengal (*Mitra*) (135, 130), 19,405-19,478, 19,620-19,628, 19,856-19,858.
- Primary schools, financed by profits of co-operative societies, scheme for (*Mitra*) (128), 19,401, 19,794-19,803.
- Provincial Agricultural Federation, need for, to accelerate spread of co-operation (*Peddle*) (432).
- Public health movement, good work done by (*Bentley*) (212), 21,429-21,431, 21,437-21,440.
- , has taken root in rural areas (*Bentley*) 21,432-21,436.
- , independent societies now formed for (*Bentley*) 21,377, 21,431.
- , relations of, with Union Boards (*Bentley*) 21,181-21,185, 21,376, 21,377.
- Public health societies, are not on proper economic basis at present (*Mitra*) 19,547-19,556, 19,669.
- , conflict of, with Union Boards (*Mitra*) 19,548, 19,549, 19,665-19,668.
- , have been very useful (*Mitra*) (136), 19,543-19,547.
- , need for declaration of policy by Government regarding (*Mitra*) 19,547, 19,951-19,958.
- , possibility of replacing, by Union Boards (*Mitra*) 19,948-19,950.
- , registration of, has been stopped pending declaration of policy by Government (*Mitra*) 19,547, 19,948-19,947.
- , *see also under* CHATTERJEE, Dr. G. G.
- Purchase societies, are doing useful work but should handle larger quantities (*Mitra*) (135).
- , difficulties of (*Mitra*) 19,909, 19,910.
- , generally fail through ignorance of members (*Ahmed U.*) (537).
- , may be combined with sale societies (*Mitra*) (19,534-19,542).
- , scope for (*Peddle*) (432).
- Registrar, some of work done by, should be entrusted to private persons (*Ahmed H.*) (170), 20,049-20,054.

## INDEX.

### CO-OPERATION—*contd.*

- Registration of societies, policy in regard to (*Mitra* 20,006-20,010; of public health societies (*g.v.*)).
- Repayment of principal and interest, susceptible of improvement (*Mitra* 19,686-19,688, 19,700-19,702).
- Reserve funds, built up from margin between borrowing and lending rates  
 \_\_\_\_\_, (*Mitra*) 19,731.  
 \_\_\_\_\_, control of, by Registrar, undesirable (*Ahmed H.*) (170), 20,040-20,042.  
 \_\_\_\_\_, utilisation of (*Mitra*) 19,732, 19,859-19,866.
- Sale societies, need for (*Ahmed M.*) (560).  
 \_\_\_\_\_, generally fail through ignorance of members (*Ahmed U.*) (537).  
 \_\_\_\_\_, should also perform duties of supply societies (*Mitra*) 19,534-19,542.  
 \_\_\_\_\_, successful but limited in number (*Mitra*) (135)  
 \_\_\_\_\_, work of (*Mitra*) (135), 19,524-19,533, 19,533-19,539.  
 \_\_\_\_\_, *see also* Jute sale societies under **MARKETING**.
- Savings deposits, accepted by co-operative societies (*Mitra*) 19,410.  
 \_\_\_\_\_, in co-operative societies, will replace Post Office savings banks (*Mitra*) 19,410-19,414.  
 \_\_\_\_\_, home safes for (*Mitra*) 19,410-19,412.  
 \_\_\_\_\_, rate of interest on (*Mitra*) 19,670-19,678.
- Seed distribution, co-operative, *see* under **CROPS**.
- Short term loans, procedure for distributing from cash credit account in central banks by cheque (*Mitra*) (135), 19,519, 19,520, 19,878-19,882.
- Taceari, might be used as preliminary to formation of Co-operative Societies (*Finlow*) (9).
- Women's Societies (*Mitra*) 19,742.

### CRAWFORD, Mr. T. C., *see* INDIAN TEA ASSOCIATION.

### CROPS.

- Crop production, effect of irrigation (*Bentley*) (241, 242), 21,322-21,329.
- Crop Protection Act, sufficient protection against external infection (*Finlow*) (10).
- Crop returns and forecasts, *see* under **MARKETING**.
- Cultivators, prefer crops which occupy land for short time only (*Mitra*) (128), 19,405.
- Elephants, damage done by, near forests (*Indian Tea Association*) (338), 22,081-22,085, 23,126, 23,127.  
 \_\_\_\_\_, efforts by Forest Department to keep down, inadequate (*Indian Tea Association*) (338).
- Firearms, should be supplied to members of co-operative societies to prevent damage by wild animals (*Ahmed M.*) (558).
- Food crops, occupy 64 per cent. of land (*Finlow*) 17,903.  
 \_\_\_\_\_, replacement of, by money crops, not large (*Finlow*) 17,900-17,904.  
 \_\_\_\_\_, import and export of (*Finlow*) 18,488-18,490, 18,499-18,510.
- Gun licences, should be granted more freely (*Mitra*) (131), (*Mullick*) (351).
- Hybridisation, possibilities of, not yet explored (*Mullick*) (351).
- Improved crops, mean greater drain on soil (*Finlow*) (8), 18,297, 18,298.
- Improvement of existing crops, little scope for (*Momen*) (325), 22,288-22,291.  
 \_\_\_\_\_, suggestions for (*Peddie*) (429), (*Mukherjee*) (178).  
 \_\_\_\_\_, successful examples of (*Peddie*) (420).
- Indian hemp, dust in (*Finlow*) 18,077, 18,080.  
 \_\_\_\_\_, rotting water a cause of dust (*Finlow*) 18,078.
- Japanese millet, advantages of (*Finlow*) (9, 10).
- Jute, area under (*Finlow*) 18,340, (*Mitra*) 19,563-19,569.  
 \_\_\_\_\_, average quality of, has probably deteriorated (*Finlow*) (14).  
 \_\_\_\_\_, cess on, *see* under **TARIFFS**.  
 \_\_\_\_\_, cost of cultivation and return on (*Mullick*) (363, 364), 22,627-22,633.  
 \_\_\_\_\_, cultivators of, economic position of (*Finlow*) (5, 6), 18,490-18,494.  
 \_\_\_\_\_, improved, co-operation between trade and Agricultural Department in regard to (*Jute Mills Association*) (415).

# INDEX.

## CROPS—contd

- Jute, improved commands a premium (Morgan) 21,747-21,751.
- has tendency to revert (Morgan) 21,689-21,672.
- increased income due to (Finlow) 18,335-18,389.
- increased yield due to (Mulherjee) 20,156-20,165.
- mixed with ordinary varieties at mills (Morgan) 21,677, 21,678, 21,745-21,749.
- , more suitable for Calcutta mills than export (Morgan) 21,679.
- , seed for, distribution of, see Seed distribution.
- , is at a premium compared with ordinary seed (Finlow) (14), 18,815-18,819.
- , price of (Finlow) 18,580.
- , used for evolving variety of fibre which will suit both Dundee and Indian market (Mitra) (131), 19,570-19,573
- , research on (Finlow) (2), 18,221-18,227.
- , water requirements of (Morgan) 21,572-21,578.
- , yield of, per acre (Morgan) 21,680-21,682.
- , if increased, will bring down prices (Morgan) 21,787, 21,740-21,743.
- , see also under MARKETING.
- Monkeys, do great damage (Mitra) (131).
- , objections to destroying, gradually disappearing (Mitra) (131), 19,451-19,453.
- New crops, introduction of (Finlow) (9), (Mulherjee) (178), 20,393-20,395, (Momen) (325), (Poddie) (429)
- Paddy, area under (Finlow) 18,337-18,341, 18,720.
- , attempt to replace, in highlands, by heavier-yielding food crops (Finlow) (10).
- , cost of cultivation and return (Mullick) (363, 364), 22,627-22,633.
- , cultivators of, effect of high prices on (Finlow) (9).
- , increased income possible by adoption of improved, 3 crores (Finlow) 18,385.
- , low yield of, may be due to insufficient cultivation (Finlow) 18,478-18,487.
- , research on (Finlow) 18,101, 18,228-18,231, 18,233-18,244, 18,403, 18,404, 18,415-18,418.
- , lack of co-operation with Coimbatore in (Finlow) 18,233-18,241, 18,453-18,459.
- , lack of co-operation with Bombay in (Finlow) 18,452, 18,453.
- , need for co-ordination of, between Provinces (Finlow) 18,528.
- , objects of (Finlow) 18,103-18,107.
- , should be done locally rather than at Pusa (Finlow) 18,095.
- , seed for, distribution of (see Seed distribution).
- , single seedling method with (Finlow) 17,906-17,911.
- , straw of, used as fodder and not available for paper-making (Finlow) 18,315, 18,340.
- Pests and diseases affecting tea plants, under investigation by Scientific Department of Indian Tea Association (Indian Tea Association) (383).
- Potato cultivation (Finlow) (9), 17,905, 18,329-18,334, (Mulherjee) 20,337, 20,338.
- Pulses, organisation of research on (Finlow) 18,750-18,762.
- Puro lino cultures of staple crops, much work done on (Finlow) (9).
- Reporting of pests, if prompt, might enable precautions to be taken (Finlow) (10).
- Retting, difficulties of (Morgan) 21,683.
- , effect of, on quality of jute (Jute Mills Association) 23,251.
- , experiments on (Finlow) 18,236, 18,237, (Jute Mills Association) 23,252-23,253.
- Rauvolfia-producing crops (sugarcane, tobacco, etc.), scope for increase in (Finlow) (9).
- Rice, see Paddy.
- Seed, distribution of improved, commercialisation of (Finlow) 17,729

# INDEX.

## CROPS—contd.

- Seed, distribution of improved, co-operative (*Finlow*) 17,739, 17,740, (*Mitra*) (131), 19,408, 19,409, 19,559, 19,560, 19,892, 19,893, (*Mukherjee*) (178), (*Morgan*) 21,669, 21,670, (*Peddie*) (431).
- , danger of adulteration (*Finlow*) 17,782, (*Mullick*) 22,519, 22,520.
- , delay a cause of difficulty (*Mitra*) 19,561, 19,562.
- , demand for, growing (*Roy*) 22,724, 22,725.
- , Government agency for, limited (*Finlow*) 17,730.
- , jute, partially failed in 1926 (*Mukherjee*) 20,328-20,333, 20,410-20,417.
- , scheme for guaranteeing Agricultural Department against loss by Jute Mills Association (*Jute Mills Association*) (416).
- , through private seedsmen (*Finlow*) 17,726 - 17,728, 17,733 - 17,735, 18,315-18,319, 18,268.
- , may be profitable (*Momen*) (325).
- , need for care in (*Mukherjee*) (178).
- , need for better organisation of (*Mullick*) (351).
- , non-official seed farms for (*Peddie*) 429.
- , paddy, (*Finlow*) 18,101, 18,102, 18,268.
- , partially failed in 1925 (*Mukherjee*) (177), 20,031-20,089, 20,166-20,174.
- , private agency for (*Mitra*) (131), 19,446-19,450.
- , should be one of the chief activities of Government farms, (*Momen*) (325).
- , should be done on credit and cost routed after harvest (*Ahmed U.*) (553).
- , stores, co-operative, for, in each Union Board area (*Mukherjee*) (178).
- , sucrose of (*Mitra*) (128), 19,406, 19,407.
- , distribution of hazaar, is in hands of moneylenders (*Finlow*), 17,731.
- , farms for (*Finlow*) 18,689-18,691, (*Jute Mills Association*) (416), (*Peddie*) (429).
- , method of obtaining improved, for distribution (*Finlow*) 18,268-18,276.
- , policy of distributing free small packets of improved, success of (*Finlow*) 18,772.
- , testing of (*Finlow*) 18,272, 18,274, 18,277, 18,278.
- Sugarcane, adoption of Coimbatore varieties (*Finlow*) 18,137-18,144, 18,460-18,463.
- , handicaps to extension of (*Mullick*) 22,610.
- , more profitable than jute or paddy (*Mullick*) 22,606-22,609.
- Ten, acreage under (*Indian Tea Association*) 23,058.
- , intercultivation with indigo a failure (*Indian Tea Association*) 23,124, 23,125.
- , seed, demand for (*Indian Tea Association*) 23,518.
- Tobacco cultivation, spreading (*Finlow*) (9), 18,519, 18,520.
- Vegetables and fruit, growing of (*Roy*) 21,470-21,477.
- Water hyacinth, see under ADMINISTRATION.
- Wheat, difficulty of extending area of (*Finlow*) 18,495-18,498.
- Wild animals, do not do serious damage in Bengal (*Finlow*) (10).
- Wild pigs, need for campaign to destroy (*Ahmed U.*) (535).
- , rewards for destruction of (*Finlow*) (10).

# INDEX.

## CULTIVATION.

- Calcutta, effect of, on cultivation of the hinterland (*Finlow*) 18,320-18,328.
- Deep ploughing, unsuited to silted land (*Jute Mills Association*) (416).
- Dry cultivation, methods of tillage (*Finlow*) 17,634-17,639.
- \_\_\_\_\_, need for assisting (*Finlow*) 17,630-17,633.
- \_\_\_\_\_, research to assist (*Finlow*) 17,620-17,627, 17,640.
- Existing systems of tillage, satisfactory (*Jute Mills Association*) (416).
- \_\_\_\_\_, the results of centuries of experience (*Mullick*) (351).
- Improvement of cultivation, by hiring-out of improved implements (*Mulherjee*) (178).
- \_\_\_\_\_, would enhance productive power of soil (*Hutchinson*) (207), 22,004-22,011.
- Intensive cultivation of small holdings, the ideal to aim at (*Finlow*) (14).
- Jhumming, is causing anxiety in Chittagong hill tracts (*Finlow*) (13), 18,028-18,032.
- Jungles, need for reclamation of land covered by (*Ahmed M.*) (558).
- Kharif and rabi seasons, periods of (*Das*) 18,887-18,896.
- Rotations (*Finlow*) (10), 18,338, 18,339, (*Mullick*) 22,578-22,579.
- Soil examination, value of, to ensure proper rotation (*Ahmed U.*) (535).
- Taungya system of cultivation, *see under* SHEBBEARE.
- Tractors, *see under* IMPLEMENTS.

DAS, Rai Bahadur A. N., Officiating Chief Engineer and Secretary to Government, Irrigation Department (82), 18,815-19,134.

## CULTIVATION.

Kharif and rabi seasons, periods of 18,887-18,896.

## FORESTS.

- Afforestation, to prevent damage from floods (82).
- Deforestation, should not be undertaken in the Terai, near sources of hill streams or along coast (82).
- Forest Department, need for closer co-operation of Irrigation Department with 18,820-18,825, 19,120-19,123.

## IRRIGATION.

- Agricultural and Sanitary Drainage Act and minor irrigation works 18,879, 19,069-19,079.
- Area of Presidency short of water October-June, 25 per cent. 18,907.
- \_\_\_\_\_, none now irrigated 18,908.
- \_\_\_\_\_, part of, will be covered by Damodar project 18,908.
- \_\_\_\_\_, scope for irrigating 18,909-18,911.
- Budget of Irrigation Department, apportionment of 18,858-18,865, 19,013, 19,044, 19,048-19,052, 19,056, 19,057.
- Canals in Bengal, capital cost of 19,053.
- \_\_\_\_\_, certain of, used for navigation only 19,045-19,047.
- \_\_\_\_\_, none classified productive 18,831.
- \_\_\_\_\_, return on, 1 per cent. 19,054.
- \_\_\_\_\_, scope for further (82).
- \_\_\_\_\_, under construction 18,831-18,834, 18,908.
- \_\_\_\_\_, velocity of, low on account of navigation 18,999-19,004.
- Contour survey, does not exist in Bengal (82), 18,845, 18,846, 18,943-18,952.
- Co-operation of Irrigation Department, with Agricultural Department close 18,818, 18,819, 18,869-18,873.
- \_\_\_\_\_, with Co-operative Department 18,912.
- \_\_\_\_\_, with Forest Department, need for closer 18,820-18,825, 19,120-19,123.
- \_\_\_\_\_, with Public Health Department 18,923, 18,924, 19,119.

# INDEX.

DAS, Rai Bahadur A. N.—*contd.*

## IRRIGATION—*contd.*

- Co-operative irrigation societies, given free technical advice 19,110-19,112.
- \_\_\_\_\_, but undertake schemes on their own responsibility 19,113-19,115.
- Damedai canal project 18,831-18,834, 18,903.
- Data, need for further, before extension of irrigation is possible 18,845-18,848, 19,019.
- \_\_\_\_\_, staff of Irrigation Department should be extended to secure 18,847, 19,091.
- Deltaic irrigation schemes, not more difficult than those elsewhere 18,842-18,844.
- Distribution of water, is on acreage basis 18,917-18,922.
- \_\_\_\_\_, 80 acres to cubic foot for kharif 19,023-19,025.
- \_\_\_\_\_, unlimited for rabi 19,025, 19,026.
- Drainage schemes undertaken under Drainage Act, small 19,116-19,118.
- Dredgers owned by Irrigation Department 19,097-19,101.
- Dredging, land raised by, sold as village sites 19,102.
- Embankments, double, have deleterious effect on mouth of river 19,107, 19,108.
- \_\_\_\_\_, system of, double 19,103-19,106.
- Establishment charges of Irrigation Department, 20 per cent. 18,980-18,992.
- Flooding and flushing of soil, need for investigating possibilities of (82).
- Irrigation cess, collected by special officer 19,027-19,029.
- Irrigation Department, budget of, *see* Budget.
- \_\_\_\_\_, co-operation of, with other departments, *see* Co-operation.
- \_\_\_\_\_, effect of retrenchment on 19,086, 19,097.
- \_\_\_\_\_, is in charge of irrigation, drainage and navigation 18,987.
- \_\_\_\_\_, staff of, insufficient (82), 18,841.
- \_\_\_\_\_, scheme for increasing, held up by lack of funds 19,002, 19,093.
- \_\_\_\_\_, undertakes clearing of waterways from silt and weeds 18,849-18,857.
- Irrigation from canals, often taken for sake of silt rather than water 18,866, 19,124, 19,125.
- Irrigation schemes, scope for, limited owing to heavy rainfall 18,866, 19,065-19,068, 19,082-19,085.
- \_\_\_\_\_, programme for, limited to productive schemes 19,038-19,090.
- Lift irrigation, practised on small scale by cultivators 18,962-18,964.
- Minor irrigation works, are undertaken by co-operative societies under Agricultural and Sanitary Drainage Act 18,879, 18,880.
- \_\_\_\_\_, in Bunkura and Birbhum, now executive division for 18,876-18,878.
- \_\_\_\_\_, might be undertaken by Collector and Local Board 19,070.
- \_\_\_\_\_, preliminary cost of, at present falls on cultivators 18,880, 19,076-19,078.
- \_\_\_\_\_, might be borne partly by Government or Local Board 19,072-19,079.
- \_\_\_\_\_, proposal for, in Birbhum district, at cost of 5 lakhs 18,837, 18,991-18,996.
- Navigable channels, *see* Waterways.
- Paddy, charge for irrigation water for 19,020, 19,021.
- \_\_\_\_\_, irrigation of aman crop 18,968-18,971.
- \_\_\_\_\_, irrigation of, by excavation of abandoned mine works 19,123, 19,129.
- Productive and unproductive schemes, method of classification 18,827-18,830, 19,061-19,064.

# INDEX.

DAS, Rai Bahadur A. N.—*contd.*

## IRRIGATION—*contd.*

- Productive schemes, none exist at present 18,831.
- , one under construction 18,831-18,834.
- Rainfall, heavy in Bengal 18,866.
- , period of shortage of 18,897-18,906.
- Research on irrigation problems, is carried out in Bengal 18,915.
- Rivers, prevention of their tendency to change their course, has been disadvantageous 18,925, 18,926.
- , spilling over of, would reclaim land in vicinity 18,926-18,934.
- Silt, clearing of, from waterways, *see* Waterways.
- , value of, as fertiliser 18,866-18,868, 19,124, 19,125.
- Storage of water, not undertaken on large scale 18,826.
- Tanks, excavation of abandoned, desirable 19,128, 19,129, 19,132-19,134.
- , irrigation from, not a crying need 19,094-19,096.
- Tube wells, investigation of possibilities of irrigation from, desirable 19,131.
- , not used for irrigation 19,130.
- Unproductive schemes, two in existence 18,838, 18,839.
- , none in contemplation 18,840.
- Velocity of canals, *see* Canals.
- Wastage of water by absorption and evaporation, not acute (82).
- Waterlogging, affects one-tenth area of Presidency 18,942.
- , definition of 18,953-18,955.
- , drainage, permits land to recover 18,941, 18,956-18,958.
- , not required for more than half area, remainder draining itself when rivers go down 18,942.
- , due to rainfall 18,956.
- , has thrown large areas out of cultivation 18,940.
- , investigation of 18,935-18,939.
- , pumping of water back into canals, impossible 18,959-18,961.
- Water-table, depth of, in rabi and kharif seasons 18,883-18,886.
- Waterways, are beneficial as facilitating trade 18,972-18,978.
- , clearing of, from silt and weeds, undertaken by Irrigation Dept 18,849-18,857.
- , not undertaken by Co-operative agency 18,912-18,914.
- Wells, surface, can be constructed without technical advice 18,881.
- , give ample supply throughout year 18,882.

## DEMONSTRATION AND PROPAGANDA.

- Agricultural Dept., should co-operate with Collectors in demonstrations (Burrows) (472).
- Agricultural survey of each district, need for detailed, on which to base plan for propaganda (Burrows) (472), 23,767-23,769, 23,829-23,838.
- Agricultural shows, value of (Roy) 24,556.
- , at Dacca (q.v.).
- Cinemas (Finlow) 17,744-17,751, (Burrows) (472), (Hutchinson) 21,859-21,863, 21,874.
- Co-operative societies, use of, for agricultural propaganda (Finlow) 17,741-17,743, (Mitra) (129), (Burrows) (472), 23,669-23,671.
- Cultivators, are not in touch with Agricultural Dept. (Momen) (322), 22,198-22,204, 22,428, (Roy) 24,272, 24,282, 24,283, 24,436, 24,503-24,505.
- , conservatism of (Finlow) (6), (Mukherjee) (177), 20,443-20,445, (Hutchinson) (300), (Momen) (321), 22,099-22,100, 22,430-22,432, (Burrows) (172).
- , willingness of, to adopt expert advice (Ahmed H.) (169), (Hutchinson) (300), (Momen) (321), (Mullik) (349), (Jute Mills Assn.) (415), (Poddie) (425), (Burrows) (472, 477), 23,846-23,848, (Roy) 24,284-24,288, (Ahmed M.) (557).
- Dacca agricultural show, difficulty of obtaining information at (Roy) 24,273-24,278, 24,500-24,502.

# INDEX.

## DEMONSTRATION AND PROPAGANDA—contd.

- Demonstration farms, are run on expensive lines (*Ahmed U.*) (532), 24,207, 24,208.
- \_\_\_\_\_ , at present run at a loss (*Momen*) (322), 22,323-22,328, 22,426, 22,427.
- \_\_\_\_\_ , at Burdwan, existence of, unknown in neighbourhood (*Roy*) 21,279-24,281, 24,404-24,408, 24,424, 24,425, 24,432-24,435.
- \_\_\_\_\_ , can influence cultivators in their immediate neighbourhood only (*Indian Tea Association*) (387), (*Jute Mills Association*) (416).
- \_\_\_\_\_ , examples of success of (*Ahmed U.*) (532), 21,209-24,212.
- \_\_\_\_\_ , experiments at, must be kept distinct from demonstrations (*Ahmed U.*) 24,160.
- \_\_\_\_\_ , influence of, on cultivation in neighbourhood (*Finlow*) 18,773-18,776.
- \_\_\_\_\_ , must be run on economic basis (*Ahmed II.*) (169), (*Peddle*) (423).
- \_\_\_\_\_ , need for a small commercial, near Calcutta, to demonstrate that agriculture can be made to pay (*Mullick*) 22,641-22,646.
- \_\_\_\_\_ , need for one in each sub-division (*Momen*) (320, 322), 22,191.
- \_\_\_\_\_ , numbers of (*Finlow*) 17,574-17,577.
- \_\_\_\_\_ , profit and loss accounts of, should be kept (*Ahmed U.*) (532).
- \_\_\_\_\_ , possess resources not available to cultivators and are therefore unconvincing (*Peddle*) 23,291, (*Burrows*) (472), 23,846-23,848.
- \_\_\_\_\_ , work of (*Finlow*) 18,282, 18,293, (*Ahmed M.*) 24,629, 24,630.
- Demonstrations, conditions for success of (*Mukherjee*) (176, 177).
- \_\_\_\_\_ , examples of success of (*Mitra*) (128), (*Mukherjee*) (177).
- \_\_\_\_\_ , field, value of (*Peddle*) (423, 424).
- \_\_\_\_\_ , of scientific methods of production and conversion of raw material into finished products, need for (*Mukherjee*) (176), 20,374-20,379.
- \_\_\_\_\_ , on cultivator's own holdings, are conducted with guarantee against loss (*Finlow*) 17,721, 17,725.
- \_\_\_\_\_ , should be conducted with guarantee against loss (*Mukherjee*) 20,406-20,409, (*Mullick*) (319).
- \_\_\_\_\_ , demand large staff (*Finlow*) 18,768-18,772.
- \_\_\_\_\_ , difficulty of obtaining consent for (*Peddle*) 23,289, 23,290.
- \_\_\_\_\_ , suggested methods for (*Mitra*) (128).
- \_\_\_\_\_ , the best method (*Finlow*) 17,720 - 17,723, (*Ahmed II.*) 20,012-20,015, (*Momen*) 22,191 (*Indian Tea Association*) (387), (*Burrows*) 23,849, 23,850, (*Ahmed U.*) (532), 24,161, (*Roy*) 24,280-24,282.

## INDEX.

### DEMONSTRATION AND PROPAGANDA—*contd.*

- Demonstrators, difficulties of (*Momen*) 22,095-22,098.  
 \_\_\_\_\_, importance of personality of (*Momen*) (321).  
 \_\_\_\_\_, increased number required (*Mukherjee*) 20,077-20,080,  
     (*Momen*) 22,195-22,197, (*Burrows*) (472), *see also*  
     Agricultural Department, staff of, subordinate, under  
     ADMINISTRATION.  
 \_\_\_\_\_, methods of (*Finlow*) 18,279-18,281.  
 \_\_\_\_\_, one needed for each thana (*Mukherjee*) 20,226-20,233.  
 \_\_\_\_\_, pay of, (*Finlow*) 18,542.  
 \_\_\_\_\_, possibility of increasing, so that District Officers  
     may be selected from them (*Finlow*)  
     18,514-18,551.  
 \_\_\_\_\_, present and proposed numbers of (*Finlow*) 18,533-18,536.  
 \_\_\_\_\_, qualifications, training and pay of (*Momen*) 22,420-  
     22,425.  
 \_\_\_\_\_, quality of (*Finlow*) 18,533, 18,539.  
 \_\_\_\_\_, training of (*Finlow*) 17,516-17,560, (*Mukherjee*) 20,231-  
     20,245, 20,600-20,606.  
 District Agricultural Officers, propaganda by (*Peddie*) (424), (*Finlow*)  
     18,401, 18,402, (*Burrows*) 23,740-  
     23,745.  
 \_\_\_\_\_, *see also under* ADMINISTRATION.  
 Newspaper published by Agricultural Department, would be valuable  
     (*Roy*) 24,665.  
 Propaganda, by fertiliser industry, better than that of Agricultural  
     Department (*Roy*) 24,509, (*Ahmed M.*) 24,627, 24,628,  
     24,644, 24,645.  
 \_\_\_\_\_, for increasing use of fertilisers, co-operation in, of  
     Agricultural Department (*Hutchinson*) 21,915-21,952.  
 \_\_\_\_\_, need for (*Hutchinson*)  
     (301).  
 \_\_\_\_\_, for public health purposes (*Dentley*) 21,382-21,388, 21,402,  
     21,404, 21,441, 21,442.  
 Publication of research work (*Hutchinson*) 21,672, 21,673.  
 Pusa, effect of, on cultivation in neighbourhood (*Hutchinson*) 21,861.  
 Research, of no value unless its results are incorporated in general agri-  
     cultural practice (*Burrows*) (171).  
 School farms, use of, for demonstration purposes (*Finlow*) 18,631-18,637.  
 Seed, policy of distributing improved, in small packets, free, success of  
     (*Finlow*) 18,772.  
 \_\_\_\_\_, to large number of individuals in  
     one area, success of (*Peddie*)  
     (423, 424).  
 Union Boards, likely to be more successful for propaganda than co-opera-  
     tive societies (*Burrows*) 23,875-23,882.  
 \_\_\_\_\_, secretaries of, might act as demonstrators (*Mukherjee*)  
     20,327.  
 Village farms for demonstration purposes, value of (*Finlow*) 18,634-  
     18,637.

### DIET *see* WELFARE.

### EDUCATION.

- Adult education, central schools may be used for (*West*) 24,018, 24,027,  
     24,028.  
 \_\_\_\_\_, classes for, may be held in conjunction with Middle  
     English schools (*Peddie*) (423).  
 \_\_\_\_\_, co-operative movement, help by, for (*Mitra*) (123),  
     10,393-10,400, (*West*) 24,021-24,025.  
 \_\_\_\_\_, correspondence classes for, scheme of (*West*) (513,  
     514), 24,139, 24,139A.  
 \_\_\_\_\_, experiments in, need for further, before deciding  
     policy (*West*) 23,960.  
 \_\_\_\_\_, female (*Mitra*) 19,401-19,403, (*Oaten*) 23,515, 23,517.  
 \_\_\_\_\_, hindered by lack of money (*Oaten*) 23,463.

# INDEX.

## EDUCATION—contd.

- Adult education, importance of (*Oaten*) 23,461, 23,466-23,469, (*West*) 23,061, 24,016.  
 \_\_\_\_\_, night schools for (*Mitra*) (128), (*Mukherjee*) (176), 20,600, 20,601.  
 \_\_\_\_\_, note on (*Appendix*) (*Oaten*) (469, 470).  
 \_\_\_\_\_, requires non-official help (*Peddie*) (423).  
 \_\_\_\_\_, scheme for (*West*) (511), 24,020.  
 \_\_\_\_\_, schools for (*West*) (513).  
 \_\_\_\_\_, teachers for, importance of (*West*) 21,039-24,061.  
 \_\_\_\_\_, too important to be entrusted to private agency (*West*) 24,018-24,020.  
 Agricultural bias, in middle schools, system to be adopted for (*Finlow*) 18,263-18,265.  
 \_\_\_\_\_, in primary schools, not incompatible with attainment of literacy (*Oaten*) 23,446, 23,447.  
 \_\_\_\_\_, should be given to all education (*Mitra*) (136).  
 Agricultural bias schools, forthcoming introduction of (*Finlow*) (3).  
 \_\_\_\_\_, value of (*Finlow*) 17,693, 17,699.  
 Agricultural college, at Sabour, history and defects of (*Finlow*) (2, 3).  
 \_\_\_\_\_, habits of (*Finlow*) 18,251.  
 \_\_\_\_\_, need for, in Bengal (*Finlow*) 18,160-18,176, (*Momen*) (320).  
 Agricultural education, demand for, depends on agriculture becoming profitable (*Mullick*) 22,512, 22,543.  
 \_\_\_\_\_, lack of (*Finlow*) (3).  
 \_\_\_\_\_, facilities for, lack of (*Mukherjee*) (176), 20,332-20,342.  
 \_\_\_\_\_, in high schools, of little value (*West*) (510).  
 \_\_\_\_\_, in primary schools, unnecessary (*Momen*) (313).  
 \_\_\_\_\_, might be attempted (*Jute Mills Association*) (114).  
 \_\_\_\_\_, impossible (*West*) (510).  
 \_\_\_\_\_, need for practical (*Mukherjee*) (176).  
 \_\_\_\_\_, sought with view to Government service (*Finlow*) (3), (*Mitra*) (128), (*Mukherjee*) (176), (*Momen*) (320), (*Peddie*) (423), (*Ahmed M.*) (567).  
 Agricultural middle schools, need for (*Ahmed M.*) (171).  
 Agricultural students, lack of openings for (*Oaten*) 23,470-23,479, 23,556.  
 \_\_\_\_\_, may be encouraged by grants of Khas lands and loans (*Mullick*) (319), 22,416-22,461.  
 \_\_\_\_\_, might cultivate waste land in Assam (*Finlow*) 18,111, 18,112.  
 \_\_\_\_\_, need further practical training (*Finlow*) (1).  
 \_\_\_\_\_, should be provided with capital for purchase of implements and cattle (*Ahmed M.*) (567).  
 \_\_\_\_\_, waste land in Bengal, unsuitable for (*Finlow*) 18,111.  
 Agricultural text books for rural schools (*Momen*) (320).  
 Agriculture, as optional subject for matriculation (*West*) 24,031.  
 \_\_\_\_\_, training of teachers in (*West*) (511), 24,018-24,062.  
 \_\_\_\_\_, see also Agricultural education.  
 Books of knowledge, lack of vernacular (*West*) (512), 23,931, 24,140, 24,141.  
 Calcutta University Commission, proposals of, for higher agricultural education (*Oaten*) (463, 464).  
 Central schools, for adult education (*West*) 24,018, 24,027, 24,028.  
 \_\_\_\_\_, difficulties of (*West*) (511), 24,130-24,133.  
 \_\_\_\_\_, scheme for (*West*) (511), 23,061, 23,062.  
 \_\_\_\_\_, should be centres of village life (*West*) (511), 24,010-24,012.  
 \_\_\_\_\_, should be used by Agricultural and Co-operative Departments as centres for their work (*West*) (511), 24,013, 24,014.  
 Child labour, demand for, interferes with education (*Peddie*) (432, 433), (*Oaten*) (151), 23,630, 23,637, (*West*) (517), (*Ahmed M.*) (560).

# INDEX.

## EDUCATION—*contd*

- Child labour, demand for, may be met by adjustment of school hours  
(*Oaten*) 23,533-23,540.
- , may be met by continuation and part-time  
classes (*West*) (511), 24,041, 24,042.
- Chinsura agricultural school, failure of, due to apathy (*Mullick*) 22,533-  
22,542
- Compulsory primary education, adoption of, by local bodies (*West*) 23,978
- , cannot be introduced till present school  
system is altered (*West*) 23,979, 23,980.
- , cheaper per child and more effective than  
voluntary system (*West*) 24,013-24,017.
- , contracting-in by parents, suggestion for  
(*Oaten*) 23,483-23,486, 23,619, (*West*)  
23,968-23,971.
- , demand for (*Oaten*) 23,509, 23,510, 23,572.
- , effect of, on teachers (*West*) 23,979.
- , financing of (*Ray*) 22,806-22,809, (*Oaten*)  
23,510-23,518, 23,557-23,559, 23,601,  
23,608, 23,609.
- , legislation for in Bengal, proposed (*Peddie*)  
(423, 432), (*Oaten*) 23,478, 23,479, 23,497-  
23,504.
- , need for (*Ahmed II*) (171), (*Mulherjee*)  
(180), (*Ray*) (366), 22,932-22,934, (*West*)  
(511), (*Ahmed M*) (560), (*Ahmed U*) (537),  
24,232.
- , not introduced for financial reasons  
(*Mulherjee*) 20,134-20,145, 20,153-20,155
- , premature withdrawal of children under,  
means a waste of public money (*Oaten*)  
23,430-23,432.
- Co-operative principles, teaching of, in schools (*Mitra*) 19,791-19,793.
- Cultivators, their opinion of education (*Ahmed U*) (537), (*Roy*) 24,367-  
24,370.
- Dacca Agricultural Institute, course to be given at (*Finlow*) (3), 18,249,  
18,256-18,260
- , entrance standard for (*Finlow*) 18,250-18,253.
- , is in effect an agricultural college (*Finlow*)  
17,704-17,707.
- , practical and theoretical training at, will be  
kept distinct (*Finlow*) 18,259.
- , scheme for, held up for lack of funds  
(*Finlow*) 17,660, 17,661.
- , to be linked to Dacca University (*Finlow*)  
17,709-17,719.
- , will not be confined to training officers for  
Department (*Finlow*) 18,167.
- , but training of such officers will be its  
principal work (*Finlow*) 18,169.
- Dacca agricultural school, after-careers of pupils at (*Finlow*) (4), 17,700-  
17,702.
- , conditions of entry to (*Finlow*) (4).
- , has only half complement of students (*Finlow*)  
(3).
- , is controlled by Agricultural Department  
(*Finlow*) 18,784-18,786.
- , pupils at, about half come from agricultural  
classes (*Finlow*) 17,662-17,666.
- , syllabus of (*Finlow*) 17,667, 17,668.
- , teaching at is in the vernacular (*Finlow*)  
17,669-17,676.

# INDEX.

## EDUCATION—*contd.*

Dacca agricultural school, utilised for refresher courses for demonstrators (Finlow) (3).

Dacca training college, course at (West) 23,994, 24,071-24,073, 24,120-24,126.

-----, pupils at (West) 23,972, 23,999.

-----, numbers of (West) 24,118, 24,119

-----, instruction of, in improved educational methods (West) 23,995, 23,996.

-----, in work of Agricultural and other Departments (West) 24,074.

-----, visit Dacca farm (West) 24,032.

-----, relations of, with University (West) 24,116-24,117.

-----, teaching of agriculture at (West) 23,997, 23,998, 24,000-24,006.

District agricultural officers, training of (Finlow) (3), 17,659.

District farms, courses for cultivators at (Finlow) (4), 17,703.

District school committee (Oaten) 23,579-23,589, 23,639-23,648.

Education, expenditure on, *see* Expenditure.

-----, financing of, *see* Financing.

-----, higher, does nothing to raise agricultural efficiency (Peddie) (432).

-----, unsettles boys for the land (Morgan) (278).

-----, unrelated to rural economy (Oaten) (151).

-----, the panacea for most evils (Mukherjee) (181).

Education Department, co-operation of, with Co-operative Department (Mitra) 19,801-19,809, (Oaten) 23,620-23,622.

-----, with Public Health Department (Bentley) 24,183.

Educational advancement, essential for agricultural improvement (Oaten) 23,415.

Educational survey of Bengal, need for (Oaten) 23,575-23,577.

English educational methods, not necessarily successful in India (West) 23,966.

Examination at end of primary course, to prevent children leaving earlier, need for (Oaten) (454), 23,632-23,634.

Expenditure on education, figures for (Oaten) 23,497-23,504, 23,601-23,607. -----, in Bengal, compared with other Provinces (Oaten) 23,560, 23,561.

-----, on higher education, cannot be diverted to primary (Oaten) 23,552.

-----, on higher education, disproportionately high (Oaten) 23,500-23,507, 23,514-23,515.

Female education, adult (Oaten) 23,515, 23,517, (Mitra) 19,401-19,403.

-----, compulsory (Oaten) 23,505.

-----, difficulties and importance of (Oaten) 23,460, 23,546.

-----, inspectresses for (Oaten) 23,493-23,496.

-----, no demand for (Oaten) 23,543-23,545.

-----, teachers for (Oaten) 23,461-23,463.

-----, value of, from point of view of literacy of children (West) 23,967.

Financing of education (Finlow) 19,020-19,022, (Mukherjee) 20,145-20,155, 20,321, 20,322, 20,567-20,570.

-----, *see also* Expenditure on education and Grants-in-aid.

# INDEX.

## EDUCATION—contd.

- Fines for absence, deter parents from sending children to school (*Peddie*) (433).
- Grants-in-aid, harmful effects of system of (*West*) (510), 23,976, 23,977, 24,037-24,040, 21,066-24,070, (*Oaten*) 23,592-23,594.
- Guru training schools (*Oaten*) 23,595-23,597.
- , numbers of (*Oaten*) 23,487-23,489.
- , pupils at, might be taken over Government farms (*Oaten*) 23,619-23,652.
- Honours graduates of Bengal Universities, promising in research work (*Finlow*) 17,616-17,651, 18,164, 18,165.
- Hygiene in schools, teaching of (*West*) 24,102-24,108.
- Illiteracy, causes of relapse into (*West*) (512, 513), 24,017.
- , inefficiency of teachers as cause of (*West*) 21,053-24,058.
- , number of children leaving school without learning to read (*West*) (513).
- , vicious circle of (*West*) (512), 23,965.
- Indian research workers, training of, in India (*Finlow*) 17,646-17,652.
- , in Europe, after post-graduate course in India (*Finlow*) 17,654-17,658.
- , work of (*Finlow*) 17,653.
- Inspecting staff, for female education, *see* Female education.
- , lack training in problems of primary education (*West*) (510), 24,035, 24,136.
- , not selected from agricultural classes (*Oaten*) 23,615, 23,616.
- , qualifications of (*Oaten*) 23,593, (*West*) 24,079-24,082.
- , should have some acquaintance with agriculture (*Oaten*) (454).
- , taking certain percentage of agricultural graduates for, undesirable (*West*) 24,083-24,095.
- Intermediate colleges (*West*) 24,127, 24,128.
- Libraries, value of (*West*) 23,081, 23,082.
- Literacy, lapse from, owing to lack of reading matter (*Oaten*) 23,524-23,526.
- , once attained is rarely lost (*Finlow*) 17,691.
- , only attained by small proportion of those attending primary schools (*Finlow*) 17,687.
- , possibility of increasing (*Finlow*) 17,690.
- , tendency of, to unsettle boys for the land (*Oaten*) 23,532-23,535.
- , the primary aim of education (*Finlow*) 17,684, 17,685, (*Oaten*) 23,446.
- , value of, to agriculture (*Finlow*) 17,687-17,689, (*Oaten*) 23,527-23,631.
- Maktab schools (*Ahmed U*) 24,220.
- Middle-class youths, attracting of, to agriculture (*Finlow*) (4), 17,693-17,696, (*Mukherjee*) (176), 20,340-20,348, 20,366-20,379, (*Momen*) (321), (*Mulick*) 22,495-22,499, (*Peddie*) (423).
- , agricultural ventures by, have failed (*Mukherjee*) (176), 20,441, 20,442.
- , make suitable officers for agricultural work (*Mitra*) 19,610-19,619.
- , problem of unemployment amongst, serious (*Burrows*) (471).
- , scheme for utilisation of *Khas mahal* land for settlement of (*Burrows*) (471), 23,731-23,733, 23,747-23,756, 23,839-23,845.
- , alternative method of solving unemployment amongst, by diminishing supply, undesirable (*Burrows*) 23,860-23,869.

# INDEX.

## EDUCATION—contd.

Middle-class youths, *see also* Cultivable uncultivated lands. under **AGRI-CULTURAL LABOUR.**

Middle English school at Panchana, particulars of (*Roy*) 24,365, 24,366, 24,371-24,376, 24,380-24,384.

Moga type schools, value of (*Oaten*) 23,624-23,627.

Nature study, (*Finlow*) (3), 17,686, (*Mitra*) (128), (*Oaten*) (454), 23,449, 23,450, (*West*) (511), (*Ahmed U.*) (532).

\_\_\_\_\_, instruction of teachers in (*Oaten*) 23,451, 23,452.

Normal schools, numbers of (*Oaten*) 23,487-23,489, 23,491.

Post-graduate study for Indian research workers, abroad, unsatisfactory; should be given at Pusa (*Hutchinson*) (296), 21,815, 21,818, 21,819, 21,875-21,880, 21,918, 21,919, 21,926, 21,927, 22,044-22,047. \_\_\_\_\_, at Pusa, period of and preliminary training for (*Hutchinson*) 21,909-21,917, 22,037-22,043.

Poverty as a cause of illiteracy (*West*) (511, 512).

Primary education, compulsory (*q.v.*).

\_\_\_\_\_, concentration of, in fewer schools (*Oaten*) 23,568, 23,573, 23,574.

\_\_\_\_\_, curricula of (*Oaten*) (452), 23,599, 23,600.

\_\_\_\_\_, experiments in, needed in small areas to determine best system for (*West*) 23,959, 23,960.

\_\_\_\_\_, financing of, out of profits of by co-operative societies scheme for (*Mitra*) (128), 19,404, 19,794-19,803.

\_\_\_\_\_, need for adequate (*Oaten*) (452), 23,519, 23,520.

\_\_\_\_\_, (*Ahmed U.*) 24,563.

\_\_\_\_\_, further taxation for, impossible to bear (*Roy*) 24,563.

\_\_\_\_\_, grants-in-aid for, *see* Grants-in-aid.

\_\_\_\_\_, higher classes of, should be grouped in central schools (*West*) (511), *see also* Central schools.

\_\_\_\_\_, need for extension of (*Roy*) 24,562.

\_\_\_\_\_, objection of upper classes to (*Oaten*) 23,555.

\_\_\_\_\_, pupils, figures showing numbers leaving before completing education (*Oaten*) (454).

\_\_\_\_\_, less than 5 per cent. of, attain literacy (*Oaten*) 23,521-23,523, 23,616-23,618.

\_\_\_\_\_, majority leave before reaching top classes (*West*) (510, 511), 24,153-24,155.

\_\_\_\_\_, superfluous schools, method of closing (*West*) 24,145-24,147.

\_\_\_\_\_, system of, unsatisfactory (*Mukherjee*) (171).

\_\_\_\_\_, courses of unsatisfactory nature of (*West*) (510), 24,007, 24,008, 24,033-24,036.

\_\_\_\_\_, lack of (*Oaten*) (452).

\_\_\_\_\_, will never produce literacy (*West*) (511).

\_\_\_\_\_, taken by only 20 per cent. of boys in rural areas (*Finlow*) 18,631.

\_\_\_\_\_, teachers in, salaries of, too small without other sources of income (*West*) 23,970.

\_\_\_\_\_, training of (*West*) 23,973, 23,974.

\_\_\_\_\_, teaching of specific subjects at, hindered by smallness of schools and fact that pupils leave early (*West*) (510).

Primary Education Bill, provision of funds under (*West*) 24,148-24,152

Reading, ability of students, very limited (*West*) (512), 24,142, 24,143.

\_\_\_\_\_, method of teaching, in primary schools- (*West*) (513), 23,981-23,984.

# INDEX.

## EDUCATION—*contd.*

- Reading, method of teaching, suggestions for improving (*West*) 23,981
- Rural economics, degree in, should be given at Universities (*Oaten*) 23,492.
- \_\_\_\_\_, should be taught in normal schools (*West*) 24,076-24,078.
- \_\_\_\_\_, training in, not given to teachers (*Oaten*) 23,623.
- Rural schools, should be administered by local bodies (*Mitra*) (123), 19,788-19,790.
- \_\_\_\_\_, too much attention should not be paid to buildings for (*Mitra*) (128).
- Sanitary appliances in schools (*Bentley*) 21,194-21,200.
- School farms and plots (*Finlow*) (3, 4), 17,677-17,683, 18,634-18,637, (*Mitra*) (128), (*Momen*) (320), (*Mullick*) (349), (*Peddie*) (423), 23,285-23,287, (*Oaten*) (454), 23,448, 23,455, 23,456, (*Ahmed U.*) (532), (*Ahmed M.*) (560).
- Science courses at Indian Universities, high standard of (*Iluy*) 22,940.
- \_\_\_\_\_, laboratory skill of students lacking owing to system of teaching (*Indian Tea Association*) (357), 22,961-22,972
- \_\_\_\_\_, and owing to examination syllabus (*Indian Tea Association*) 23,138-23,139.
- \_\_\_\_\_, need for improving low standard of (*Indian Tea Association*) (357), 22,959-22,961.
- Secondary agricultural schools, experience of (*Finlow*) (3).
- \_\_\_\_\_, at Dacca (q.v.).
- Secondary school system, agricultural training in, as "practical arts" subject (*Oaten*) (454).
- \_\_\_\_\_, practical (*Oaten*) (453).
- \_\_\_\_\_, vocational (*Oaten*) (453), 23,458, 23,459.
- \_\_\_\_\_, examination standards for, have declined and should be raised (*Oaten*) 23,474-23,477.
- \_\_\_\_\_, has become inadequate (*Oaten*) (452, 453).
- \_\_\_\_\_, in rural areas, should be brought into relation with life of country (*Oaten*) (453).
- \_\_\_\_\_, suggestions for improving (*Oaten*) (453).
- \_\_\_\_\_, teachers, securing living wage for, the first essential (*Oaten*) (453).
- \_\_\_\_\_, training of (*Oaten*), 23,490.
- Teachers, better type of, would tend to keep children at school (*Oaten*) 23,610-23,614.
- \_\_\_\_\_, calibre of, at Gurm training schools, low (*Oaten*) 23,453
- \_\_\_\_\_, as cause of illiteracy (*West*) 21,053-21,058.
- \_\_\_\_\_, do not form part of village life (*Oaten*) 23,517, 23,518.
- \_\_\_\_\_, female, paid higher than male (*Oaten*) 23,635-23,637.
- \_\_\_\_\_, for agricultural bias schools, will take long time to train (*Oaten*) 23,457.
- \_\_\_\_\_, for central schools, see Central schools
- \_\_\_\_\_, for primary schools, see Primary education.
- \_\_\_\_\_, for secondary schools, see Secondary school system.
- \_\_\_\_\_, in rural areas, drawing of, from agricultural classes (*Mulhersee*) (176), (*Momen*) (320), 22,413-22,416, (*Peddie*) (423), (*Oaten*) 23,602, 23,603, (*West*) 24,062, 24,063, (*Ahmed M.*) 24,632-24,642.
- \_\_\_\_\_, salaries of, poor (*Oaten*) 23,454, 23,514.
- \_\_\_\_\_, training of, in elementary hygiene (*Bentley*) 21,193.
- Textbooks, method of production and selection of (*West*) 23,935-23,993, 24,100, 24,101, 24,111-24,114.
- \_\_\_\_\_, on hygiene, satisfactory (*Bentley*) 21,189, 21,192, 21,199.
- Vernacular middle schools, giving place to English middle schools in Bengal (*Finlow*) 18,265-18,267.
- Vocational agricultural education, scheme for (*Finlow*) 18,638-18,643.

# INDEX.

## FERTILISERS.

- Adulteration of fertilisers (*Finlow*) (8), (*Mitra*) (131), (*Morgan*) (272), (*Hutchinson*) 22,001-22,008, (*Indian Tea Association*) (388), (*Ahmed U.*) (534).
- Agricultural Department and fertiliser industry, co-operation between, lacking in the past (*Hutchinson*) (300), 21,915-21,948.
- , liaison officers for (*Hutchinson*) (300).
- , need for (*Hutchinson*) (300), 21,901, 21,958.
- , suggestion for joint committee for (*Hutchinson*) 21,852.
- Ammonium sulphate, use of (*Mitra*) (131), (*Ahmed M.*) (558), 24,602-24,604.
- Artificial fertilisers, ability of, to remain in soil, an important consideration (*Hutchinson*) 21,850, 21,851.
- , high cost of, militates against use (*Jute Mills Association*) (415).
- , information on, supplied by fertiliser industry (*How*) 24,438, 24,439.
- , manufacture of, from Indian raw material (*Hutchinson*) 21,967-21,973, 22,021-22,023, 22,031-22,035.
- , not needed on land covered by silt (*Jute Mills Association*) (415), 23,202.
- , price of, should be reduced (*Ahmed M.*) (558).
- , propaganda for, by private firms (*Ahmed M.*) 24,627, 24,628, 24,645, 24,646.
- , scope for employment of (*Ahmed M.*) (558).
- , should be supplied on credit and price recovered after harvest (*Ahmed M.*) (558).
- , supplementary and not alternative to cattle manure (*Hutchinson*) 21,818.
- Bonemeal, export of, should be prohibited (*Mitra*) (131), 19,772, 19,773.
- , caste prejudice against, disappearing (*Ray*) 22,860.
- , high price of, due to export (*Mitra*) (131), 19,767-19,771.
- , value of (*Mitra*) (131).
- Bone phosphates (*Finlow*) (9).
- Bones, export of, should not be prohibited (*Hutchinson*) 21,970-21,973.
- , removal of grease from (*Finlow*) 17,893, 17,894.
- , use of raw (*Finlow*) 17,895-17,899.
- Commercial fertiliser firms, help given to (*Finlow*) 18,779-18,783.
- , see also under Agricultural Department.
- Committee to examine fertiliser situation, need for (*Hutchinson*) (301), 22,078.
- Co-operative distribution of fertilisers (*Mitra*) (131), 19,766-19,771.
- Co-operative manure stores, suggestion for (*Mulherjee*) (178).
- Condensing as fuel, possibility of replacement of (*Finlow*) (9), (*Mitra*) (131), (*Morgan*) (272), (*Hutchinson*) (300), 22,001-22,003, (*Momen*) (325), (*Mullick*) (351), (*Indian Tea Association*) (388), (*Jute Mills Association*) (415), (*Ahmed M.*) (558), 24,643. (*Mulherjee*) (178), 20,253, 20,254, 20,577-20,580.
- Cultivators, conservatism of, an obstacle to their adoption of fertilisers (*Hutchinson*) (388).
- , in neighbourhood of tea gardens, are taking to fertilisers (*Hutchinson*) (388), 22,979, 22,980.
- , methods of encouraging, to use fertilisers (*Mulherjee*) (178).
- Demonstrations of fertilisers (*Indian Tea Association*) (388), (*Ahmed U.*) (534).
- Depots for fertilisers (*Hutchinson*) 22,026-22,039.
- District Boards and artificial fertilisers (*Hutchinson*) 22,090, 22,091.
- Economic return from fertilisers, information on, lack of (*Hutchinson*) (298) (300).
- , need for (*Hutchinson*) (298), 21,849.
- Expansion of use of depends on such information (*Hutchinson*) (300).
- Financial aid for fertiliser industry (*Hutchinson*) 21,902-21,908.

## INDEX

### FERTILISERS—*contd.*

- Fixation of nitrogen, best obtained by exposure of soil to air (*Hutchinson*) 22,012-22,014.  
 ————, research on (*Hutchinson*) (299), 21,936.  
 Green manuring (*Mullick*) (351).  
 Improved crops, mean greater drain on soil, which must be made good by fertilisers (*Pinlow*) (5), 18,297, 18,298.  
 Increased use of fertilisers, examples of (*Pinlow*) (9).  
 ————, extra profit from (*Pinlow*) (8).  
 ————, vital for improvement of agriculture (*Pinlow*) (8).  
 Indo-Agri, Limited, policy of (*Hutchinson*) 21,953-21,961.  
 Information as to proper use of fertilisers, need for reliable (*Hutchinson*) (300), 22,056-22,060.  
 Jute land, does not require fertilising when covered by silt (*Morgan*) 21,470, 21,480, 21,649-21,651.  
 ————, more than half of, is covered by silt (*Morgan*) 21,619.  
 Manurial experiments (*Pinlow*) 18,245-18,248.  
 Nitrate of soda, liable to be washed out of soil (*Hutchinson*) 22,080-22,084, (*Indian Tea Association*) 23,155.  
 Nitrogen, investigation of problems regarding (*Hutchinson*) 21,857, 21,858, 21,939, 21,940, 22,070, 22,071, *see also* Fixation of nitrogen.  
 ————, the limiting factor on silt soil (*Pinlow*) 17,878, 17,879.  
 Organic manures, need for increased use of (*Mullick*) (351).  
 Popularising of fertilisers, easy if credit facilities available (*Pinlow*) (9).  
 Potassium nitrate, too expensive to use on tea estates (*Indian Tea Association*) 23,150-23,161.  
 Railway facilities for fertilisers (*Hutchinson*) 21,962-21,965, 22,029, 22,030.  
 Research on fertilisers, causes of inadequate (*Hutchinson*) (297), 21,831-21,841.  
 ————, may be conducted at central institute and in Provinces (*Hutchinson*) 21,842-21,844.  
 ————, suggestions for (*Hutchinson*) (297, 298).  
 Rock phosphates, not so valuable as bone phosphates (*Pinlow*) (9), 18,557-18,559.  
 Silt from rivers, injurious as fertiliser (*Indian Tea Association*) 23,183, 23,184.  
 ————, use of artificial fertilisers unnecessary when present (*Jute Mills Association*) (415), 23,202.  
 Superphosphates, manufacture of, in India (*Hutchinson*) 21,967-21,973, 22,021-22,023, (*Ray*) 22,752-22,757.  
 ————, not useful for acid soils or those containing no calcium carbonate (*Pinlow*) (9).  
 Tea, fertilisers used for (*Indian Tea Association*) 23,120, 23,121, 23,125, 23,187-23,189.  
 Tea and rubber plantations, the chief users of artificial fertilisers (*Hutchinson*) 21,911-21,914, 22,077.  
 Water hyacinth, use of, as manure (*Pinlow*) 18,185, (*Burrows*) 23,825.

### FINANCE.

- Agricultural and Industrial Banks, need for establishing (*Mulherjee*) 20,486-20,499.  
 Agricultural and Sanitary Improvements Act, complexity of, hinders use (*Pinlow*) (5), 17,804, 17,805, (*Mulherjee*) (177), 20,288-20,288, (*Momen*) (325), (*Burrows*) (472, 473).  
 ————, extension of (*Pinlow*) (5), (*Ahmed U*) (534).  
 ————, engineers employed for works under (*Burrows*) 23,901-23,908.

# INDEX.

## FINANCE—*contd.*

- Agricultural and Sanitary Improvements Act, suggestions for improving (Burrows) (473), 23,903.  
 \_\_\_\_\_, value of, for construction of minor irrigation works (Das) 18,879, 19,069-19,079.
- Agriculturists Loans Act, grants under, should be made to subscribe propaganda programme of Agricultural Department (Peddie) (425), 23,419-23,423, 23,431-23,433.  
 \_\_\_\_\_, invoked only in time of distress (Finlow) 17,804, (Burrows) 23,777-23,779.  
 \_\_\_\_\_, loss of money lent under, small (Burrows) 23,780.  
 \_\_\_\_\_, practically a dead letter (Peddie) (425).  
 \_\_\_\_\_, provision of joint security demanded by, not difficult (Burrows) 23,893-23,895.
- Bengal Tenancy Act, difficulties caused by (Mitra) 19,515-19,517, (Mukherjee) (177).
- Co-operative movement, the best means of financing cultivators (Finlow) (5), (Ahmed II) (169), (Morgan) (272), (Momen) (322), (Jute Mills Association) (415), (Ahmed M) (558).
- District land improvement fund, need for (Momen) (322).
- Finance for jute cultivators, need for provision of easy (Morgan) 21,799-21,801.
- Land Improvements Act, could be used to greater extent (Burrows) 23,782, 23,783, 23,818.  
 \_\_\_\_\_, difficulty of taking loans under (Momen) 22,239-22,241.  
 \_\_\_\_\_, invoked only in time of distress (Finlow) 17,801.  
 \_\_\_\_\_, lack of use of, due to want of enterprise of owners (Burrows) 23,781, 23,785.  
 \_\_\_\_\_, period allowed for repayment of loans under (Burrows) 23,806-23,808.
- Land mortgage banks, at Naogaon, work of (Mitra) 19,507-19,514.  
 \_\_\_\_\_, co-operative, need for (Mitra) (129), (Morgan) (272).  
 \_\_\_\_\_, difficulties caused to, by Bengal Tenancy Act (Mukherjee) (177), (Mitra) 19,515-19,517.  
 \_\_\_\_\_, should be established with liberal financial help from Government (Mukherjee) (177).
- Long-term credit, should be given by land mortgage banks (Mitra) (129), (Mukherjee) (177).  
 \_\_\_\_\_, should be given on easy terms for purchase of land and cattle, and building (Ahmed U) (533).
- Short-term credit, should be provided by co-operative societies (Mitra) (129), (Mukherjee) (177).  
 \_\_\_\_\_, should be provided on easy terms for seed, fodder and wages (Ahmed U) (533).
- Taccavi, abuses in distribution of (Morgan) 21,475-21,477.  
 \_\_\_\_\_, Acts under which it is available (Finlow) 17,804-17,817.  
 \_\_\_\_\_, amount available of, insignificant compared with vastness of country (Mullick) (350), 22,452, 22,453.  
 \_\_\_\_\_, conditions under which it might be given (Momen) (323), 22,264-22,266.  
 \_\_\_\_\_, inelastic and unpopular (Finlow) (9), (Ahmed II) (169), (Momen) (323).  
 \_\_\_\_\_, joint liability system for, should be abolished (Momen) (323), (Ahmed II) (533).  
 \_\_\_\_\_, might be used as preliminary to formation of co-operative societies (Finlow) (9).  
 \_\_\_\_\_, might be used to greater extent (Peddie) (425).  
 \_\_\_\_\_, need for strict supervision of repayment of (Ahmed U) (533).  
 \_\_\_\_\_, no need for fuller use of (Mitra) (129), 19,521-19,523.  
 \_\_\_\_\_, only given in years of scarcity (Mitra) (129).

# INDEX.

FINLAYSON, Mr. J. T., *see* INDIAN JUTE MILLS ASSOCIATION.

FINLOW, Mr. R. S., Director of Agriculture, and McLEAN, Mr. K., Assistant Director of Agriculture (1-15, 81), 17,511-18,814.

## ADMINISTRATION

Acceuge cess for agricultural improvement, 17,599, 18,583

—, for education, 18,620-18,622.

—, for rural reconstruction generally, 18,625-18,630

—, on jute, *see* Jute.

Agricultural Department, budget of, before and after retrenchment.

19,378-18,380, 18,436-18,444, 16,777.

—, retrenchment of, *see* Retrenchment.

—, staff of, organisation of, 17,619-17,660.

—, proposals for increasing, 18,168, 18,693-18,699.

Annual meeting of Directors of Agriculture, desirable, 18,616.

Board of Agriculture, Bengal, 17,839-17,842.

Central Department of Agriculture, effect of strong, in U.S.A., has been to stimulate State Departments, 18,809-18,812.

Central Government, role of, in research, 17,601-17,608, 18,013-18,019

Central organisation for research, desirability of, 17,606.

—, might initiate research, but would principally deal with schemes put up by Provinces, 17,609.

—, must command support of Provinces, 17,609-17,611.

—, must not have executive authority, 17,612.

—, Provinces should be represented on, 17,607.

Co-operation between Provinces in research, 18,616.

Co-ordination of Provincial research, need for closer, 17,614-17,618.

Demonstrators, *see under* DEMONSTRATION AND PROPAGANDA.

Department of Fisheries, abolished through retrenchment (12), 18,374, 18,375

—, is to be revived, 18,394.

Departments allied to Agriculture, co-operation between, 18,644-18,653.

—, *see also* Development Commissioners.

Deputy Directors of Agriculture, duties of, 17,621-17,626, 18,170-18,172, 18,209-18,213, 18,284, 18,285.

—, need for further, 18,214.

Development Commissioners, provincial, to secure co-operation between departments allied to Agriculture, 18,648-18,653, 18,793, 18,794, 18,804, 18,805.

District agricultural officers, pay and prospects of, 17,540-17,545, 18,543

—, present and proposed numbers of, 18,537.

—, possibility of recruiting, from ranks of demonstrators, 18,544-18,551.

—, qualifications of, 17,534-17,539.

—, training of (9), 17,659.

District Boards, help given by, to agriculture, 18,604-18,612

—, may allot money for agricultural improvements, 18,088-18,091.

District farms, *see* Farms.

Farms (Government) are worked on economic basis, 18,283, 18,286-18,290.

—, combine experiments with demonstration, 18,282.

—, need for one in each district, 18,575, 18,576.

—, proposal for central, near Calcutta, 18,410-18,413, 18,701-18,719.

Jute, extra cess on, to aid Agricultural Department, 18,399-18,392,

—, present cess on, goes to Government of India, 18,581.

—, scope for enhancement of, 18,797-18,799

## INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

### ADMINISTRATION—*contd.*

Jute, present cess on, should be used for agricultural improvement  
18,622, 18,623.

Meteorological Department, work of, 17,787-17,789.

Organisation of provincial research, *see under* RESEARCH.

————— research by crops, *see under* RESEARCH.

————— research in Bengal, *see under* RESEARCH.

Personal Assistant to Director of Agriculture, status and work of,  
17,770, 17,771, 17,776.

Provinces, role of, in research, 17,612, 18,613-18,619.

Pusa, examples of help given by, to Bengal, 18,220, 18,221.

————, high standard of research work at, 17,532-17,535.

Railways, making representations to, 17,772-17,778.

Recording of results of experiments and administrative experience,  
machinery for, capable of improvement, 17,752-17,759.

Retrenchment of Agricultural Department, 50 per cent., 18,145-18,151.

—————, does not prevent submission of new schemes,  
18,152-18,159.

—————, due to financial reasons  
only, 18,199-18,201.

—————, effect of, on budget, *see under*  
Agricultural Department.

Revenue officers, interest taken by, in agriculture, 18,667-18,669.

—————, should be instructed to pay special attention to agriculture,  
18,665-18,666, 18,670.

—————, value of interest of, in agriculture, 18,654-18,657.

Roads, condition of, in Western Bengal, 17,781, 17,782, 18,414, 18,415

————, under local authorities, have deteriorated, 17,783, 17,784.

Routine administrative work, dealt with by Personal Assistant to  
Director of Agriculture, 17,760-  
17,769.

—————, is increasing, 17,769.

Waterways, take the place of roads in Eastern Bengal, 17,780.

### AGRICULTURAL INDEBTEDNESS:

Causes of borrowing (5).

Causes preventing repayment (5).

Cultivators, comparative incompetence of, a cause of indebtedness (5),  
17,818, 17,819.

————, cultivating jute, no better off than others (5), 18,490-18,494.

————, income of, per acre (5), 18,366-18,373.

————, income of, per acre, 18,357-18,359.

————, present economic position of, 18,671-18,677.

————, proportion of, in debt (5), 17,820-17,822.

Inquiry into indebtedness of cultivators, desirable, 17,797-17,801.

Jute and rice, effect of high prices of, on prosperity of cultivators,  
(5, 6).

Jute, note on the average price of, and on the profits of its  
cultivation (51)

### AGRICULTURAL INDUSTRIES:

Committees on lines of Indian Central Cotton Committee, might foster  
subsidiary industries (12).

Co-operative and Industries Departments, should organise societies for  
cotton-ginning, rice-husking,  
&c. (12).

—————, should study market facilities  
for subsidiary industries  
(12).

Cultivators, number of days worked by, no indication of their ability to  
adopt subsidiary occupations (12).

—————, should be occupied all year round in intensive agriculture  
(12).

## INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

### AGRICULTURAL INDUSTRIES—*contd.*

- \_\_\_\_\_ Cultivators, can be so occupied in irrigated tracts (12).
- \_\_\_\_\_, usually have some subsidiary occupation (12).
- \_\_\_\_\_ Fruit-growing (12), 18,002, 18,003.
- \_\_\_\_\_ Hydro-electric development 18,004-18,006, 18,008.
- \_\_\_\_\_ Industries in rural areas, effect of 18,007-18,013.
- \_\_\_\_\_ Lac culture (12), 17,992-17,996.
- \_\_\_\_\_ Marketing, importance of facilities for, for subsidiary industries (12).
- \_\_\_\_\_, provision of better facilities for, should be taken up by Co-operative and Industries Departments (12).
- \_\_\_\_\_ Part-time occupations, are under Industries Department 17,990
- \_\_\_\_\_, distinct from subsidiary industries 17,981, 17,982.
- \_\_\_\_\_, suggestions for 17,990-17,992.
- \_\_\_\_\_, value of, in areas where one paddy crop only is grown annually, 17,982-17,989.
- \_\_\_\_\_ Pisciculture 18,183-18,185, 18,374-18,377, 18,384.
- \_\_\_\_\_ Sericulture (12).
- \_\_\_\_\_ Tree cotton growing (12).

### AGRICULTURAL LABOUR:

- \_\_\_\_\_ Importation of labour into Bengal, considerable (12).
- \_\_\_\_\_ Migration of labour from Bengal (13), 18,014-18,019, 18,360-18,365.
- \_\_\_\_\_ Shortage of labour, intermittent (13).
- \_\_\_\_\_, largely depends on size of jute crop (13).
- \_\_\_\_\_ Unemployment amongst *bhadralog* and Anglo-Indian classes (12)
- \_\_\_\_\_, proposal for meeting, by establishing larger farms (12, 13).
- \_\_\_\_\_, report of committee of investigation (12), 18,370.
- \_\_\_\_\_, scope for settlement, in Assam (13).
- \_\_\_\_\_ Waste lands in Bengal, area of 18,347-18,352, 18,419-18,423, 18,428.
- \_\_\_\_\_, difficulties of cultivating 18,424-18,431.
- \_\_\_\_\_, inhospitable (13), 18,108-18,110, 18,354-18,356
- \_\_\_\_\_, unsuitable for giving to agricultural graduates 18,111.

### ANIMAL HUSBANDRY:

- \_\_\_\_\_ Bullocks, smallness of, an obstacle to use of improved implements (10).
- \_\_\_\_\_, thought by cultivators to be too small for improved implements (11), 18,788, 18,789.
- \_\_\_\_\_ Bulls, arrangements for providing 17,938, 17,939.
- \_\_\_\_\_, demand for, comes chiefly from co-operative societies 17,954.
- \_\_\_\_\_, increasing (11).
- \_\_\_\_\_, distribution of, to District Boards 18,698-18,700.
- \_\_\_\_\_ Cattle-breeding, not practised in Bengal (11), 17,930-17,932
- \_\_\_\_\_, see also Improvement of breeds.
- \_\_\_\_\_ Cattle farms 18,692-18,697, see also Ranghpur farm.
- \_\_\_\_\_ Cattle in Bengal, mostly underfed 17,955-17,958
- \_\_\_\_\_ Common pastures, grazing on, of poor quality (11).
- \_\_\_\_\_, overcrowded (11).
- \_\_\_\_\_ Crossbreds, are more liable to disease 18,472-18,474.
- \_\_\_\_\_, valuable only for milk production 17,934-17,936.
- \_\_\_\_\_ Dairying, training in (11).
- \_\_\_\_\_ Disease, causes great loss to cultivators 18,807, 18,808.
- \_\_\_\_\_ Dual purpose breed, evolution of, the aim 17,933.
- \_\_\_\_\_ Fodder, period of scarcity of (11).
- \_\_\_\_\_, preservation of, need for research on 17,971, 17,972.
- \_\_\_\_\_ Fodder crops, (9-11).
- \_\_\_\_\_, might be encouraged by remission of land revenue 17,975-17,978.
- \_\_\_\_\_, must be substituted for grazing (11).
- \_\_\_\_\_, not grown in Bengal at present 18,124-18,126
- \_\_\_\_\_, with irrigation can be grown between two ordinary crops (11), 17,959, 17,960.

## INDEX.

**FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.***

### **ANIMAL HUSBANDRY—*contd.***

- Fodder famines, not common in Bengal 18,026.
- Improvement of breeds, by crossing (11).
- , by selection (11).
- , one of the most important agricultural problems in Bengal 17,962.
- , special officer for, about to be appointed 17,963, 17,964.
- Irrigation, importance of, for improvement of breeds 17,961.
- Milk, adulterated, deliberately bought in Calcutta 17,942-17,953.
- , demand for good quality 17,937.
- , legislation for purity, none exists outside Calcutta 17,940.
- , valuable but difficult to administer 17,941.
- , enforcement of, in Calcutta 17,942-17,944.
- , supply of, in Calcutta 17,942-17,953.
- Mustard cake, the giving of, to cattle 18,127-18,129.
- Ranghpur cattle farm, distribution of half-bred bulls from 18,466-18,475.
- , is under Agricultural Department 18,464, 18,465.
- , work at (11)
- Sheep and goats, need for further study of breeding of 17,973, 17,974.
- Silago 17,965-17,970.
- Waste areas, must be utilised for growing fodder crops (11).

### **ATTRACTING CAPITAL:**

- Factors discouraging landlords and tenants from introducing improvements (14), 18,122, 18,123.
- Landowners in Bengal, generally apathetic with regard to agriculture (12), 17,979, 17,980.
- Large farms, establishment of, would displace peasant proprietors and be unsound (14).
- , income from, would be less than that from small holdings (14), 18,299-18,309, 18,553.

### **CO-OPERATION:**

- Bonemeal, co-operative factories for 17,890-17,892.
- Co-operative movement, the best means of financing cultivators (5).
- , use of, for agricultural propaganda 17,741-17,743.
- , use of, for seed distribution 17,739, 17,740.
- Jute-buying organisation, co-operative (14), 18,061-18,068.
- Marketing, co-operative, scope for 18,037-18,039.
- Taccavi, might be used as preliminary to formation of co-operative societies (9).

### **CROPS AND CROP PROTECTION:**

- Crop protection Act, sufficient protection against external infection (10).
- Food crops, occupy 84 per cent. of land 17,903.
- , replacement of, by money crops, not large 17,900-17,904.
- Import and export of food crops 18,488-18,490, 18,499-18,510.
- Improved crops, mean greater drain on soil, which must be made good by fertilisers (8), 18,297, 18,298.
- Indian hemp, dust in 18,077, 18,080.
- , retting water a cause of dust 18,078.
- Japanese millet, advantages of (9, 10).
- Jute, area under 18,340.
- , average quality of, has probably deteriorated (14).
- , cess on (*see under ADMINISTRATION*).
- , cultivators of, are better off than others 18,490-18,494.
- , effect of high prices on (5, 6).
- , increased income possible by adoption of improved, 5 acres 18,385-18,389.
- , research on (2), 18,221-18,227.
- , seed for improved, distribution of (*see Seed distribution*).

# INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

## CROPS AND CROP PROTECTION—*contd.*

Jute, seed for improved, is at a premium compared with ordinary seed (14), 18,315-18,319.

—, price of 18,580.

New crops, varieties of, introduced (9).

Paddy, area under 18,337-18,341, 18,720.

—, attempt to replace, in highlands, by heavier-yielding food crops (10).

—, cultivators of, effect of high prices on (8).

—, increased income possible by adoption of improved, 3 crores 18,385.

—, low yield of, may be due to insufficient cultivation 18,478-18,487.

—, research on, 18,101, 18,228-18,231, 18,238-18,244, 18,403, 18,404, 18,445-18,448.

—, lack of co-operation with Coimbatore in 18,238-18,244, 18,453-18,459.

—, lack of co-operation with Bombay in 18,452, 18,453.

—, need for co-ordination of, between Provinces 18,528.

—, objects of 18,103-18,107.

—, should be done locally rather than at Pusa 18,095.

—, seed for, distribution of (see Seed distribution).

—, single seedling method with 17,906-17,911.

—, straw of, used as fodder and not available for paper-making 18,315, 18,316.

Potato cultivation (9), 17,005, 18,329-18,331.

Pulses, organisation of research on 18,766-18,767.

Pure line cultures of staple crops, much work done on (9).

Reporting of pests, if prompt, might enable precautions to be taken (10).

Retting, experiments on 18,236, 18,237.

Revenue-producing crops (sugarcane, tobacco, &c.), scope for increase in (10).

Rice, see Paddy.

Seed distribution, of improved varieties, commercialisation of 17,729.

—, co-operative 17,739, 17,740.

—, danger of adulteration 17,732.

—, of jute, through private seedsmen 17,726-17,728, 17,733-17,738, 18,315-18,319, 18,268.

—, of paddy 18,101, 18,102, 18,268.

—, possibility of, by Government, limited 17,730.

—, of barnar seeds, is in hands of moneylenders 17,731.

Seed, method of obtaining improved, for distribution 18,268-18,276.

—, policy of distributing small packets of improved, free, success of 18,772.

Seed farms 18,689-18,691.

Seed testing 18,272, 18,274, 18,277, 18,278.

Sugarcane, adoption of Coimbatore varieties 18,137-18,144, 18,460-18,463.

Tobacco cultivation, spreading (9), 18,519, 18,520

Water hyacinth, destruction of 18,180-18,182.

—, first appeared 15 years ago 18,560.

—, need for concerted action against 18,183, 18,184.

—, valuable as manure 18,185.

—, very great damage done by 18,186-18,189.

Wheat, difficulty of extending area of 18,495-18,498

Wild animals, do not do serious damage in Bengal (10).

Wild pigs, suggested rewards for destruction of (10).

## INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

### CULTIVATION :

- Calcutta, effect of, on cultivation of the hinterland 18,320-18,328.
- Dry cultivation, methods of tillage 17,634-17,639.
- , need for assisting 17,630-17,633.
- , research to assist 17,620-17,627, 17,640.
- Intensive cultivation of small holdings, the ideal to aim at (14).
- Jhuming, is causing anxiety in Chittagong hill tracts (13), 18,028-18,032.
- Rotations, introduction of good, will be easier when irrigation problem is solved (10).
- , of paddy and jute 18,338, 18,339.
- Tractors, might be of use for highland cultivation and in low hilly land (10).

### DEMONSTRATION AND PROPAGANDA.

- Co-operative societies, use of, for propaganda 17,741-17,743.
- Cinemas, use of, for propaganda 17,744-17,751.
- Cultivators, cannot afford to be other than conservative (6).
- Demonstrations, on cultivators' holdings, are conducted with guarantee against loss 17,721, 17,726.
- , demand large staff 18,763-18,772.
- , the most effective method 17,720-17,723.
- , on Government farms 18,282, 18,283.
- Demonstrators, methods of 18,279-18,291.
- , pay of 18,512.
- , possibility of increasing pay of, so that district officers might be selected from them 18,514-18,551.
- , present and proposed numbers of 18,533-18,539.
- , quality of, not altogether satisfactory 18,533, 18,539.
- , training of, in commercial farming 17,556-17,560.
- , insufficient 17,516-17,555.
- District agricultural officers, propaganda by 18,401, 18,402.
- District farms, facilities for demonstrations at 18,400, 18,401.
- Farms (Government), experimental and demonstration, numbers of 17,574-17,577.
- , influence of, on cultivation in neighbourhood 18,773-18,776.
- School farms, their use for demonstration purposes 18,631-18,637.
- Seed, policy of free distribution of small packets of improved, successful 18,772.
- Village farms for demonstration purposes, value of 18,634-18,637.

### EDUCATION.

- Agricultural bias in middle schools, system to be adopted for 18,203-18,205.
- Agricultural bias schools, forthcoming introduction of (3).
- , value of 17,692-17,699.
- Agricultural college, at Sabour, history and defects of (2, 3).
- , failure of 18,254.
- , need for 18,160-18,165.
- Agricultural education, lack of demand for (3).
- , sought only as leading to Government posts (3).
- Agricultural graduates, might cultivate waste land in Assam 18,111, 18,112.
- , waste land in Bengal, unsuitable for 18,111.
- , need further practical training (4).
- Dacca Agricultural Institute, course to be given at (3), 18,240, 18,250-18,260.
- , entrance standard for 18,250-18,253.
- , is in effect an agricultural college 17,704-17,707.

# INDEX

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

## EDUCATION—*contd.*

- Dacca Agricultural Institute, linked to Dacca University 17,709-17,719.  
 \_\_\_\_\_, practical and theoretical training at, will  
 be kept distinct 18,239.  
 \_\_\_\_\_, scheme for, held up for lack of funds  
 17,680, 17,681.  
 \_\_\_\_\_, will not be confined to training officers  
 for Department 1, 167.  
 \_\_\_\_\_, but training of such officers will be its  
 principal work 18,169.  
 Dacca agricultural school, after-career of pupils at (4), 17,700-17,702.  
 \_\_\_\_\_, conditions of entry to (4).  
 \_\_\_\_\_, has only half complement of students (3).  
 \_\_\_\_\_, is controlled by Agricultural Department  
 18,784-18,786.  
 \_\_\_\_\_, pupils at, about half come from agricultural  
 classes 17,662-17,666.  
 \_\_\_\_\_, syllabus of 17,667, 17,668.  
 \_\_\_\_\_, teaching at, is in the vernacular 17,669-  
 17,676.  
 \_\_\_\_\_, utilised for refresher courses for demon-  
 strators (3).  
 District agricultural officers, training of (3), 17,659.  
 District farms, courses for cultivators at (4), 17,703.  
 Financing of education, by means of acreage cess 18,620-18,622.  
 Honours graduates of Bengal Universities, promising an research work  
 17,646-17,651, 18,164, 18,165.  
 Indian research workers, training of, in India 17,646-17,652.  
 \_\_\_\_\_, in Europe, after post-graduate  
 course in India 17,654-17,658.  
 \_\_\_\_\_, work of 17,653.  
 Literacy, once attained is rarely lost 17,691.  
 \_\_\_\_\_, only attained by small proportion of those attending primary  
 schools 17,687.  
 \_\_\_\_\_, possibility of increasing 17,690.  
 \_\_\_\_\_, the first aim of primary education 17,684, 17,685.  
 \_\_\_\_\_, very important from agricultural angle 17,687-17,689.  
 Middle-class youths, may take to agriculture from economic considera-  
 tions if it is taught in ordinary education (4), 17,693-17,696.  
 Nature study (3), 17,636.  
 Primary schools, attended by only 20 per cent. of boys in rural areas  
 18,631.  
 \_\_\_\_\_, *see also* Literacy.  
 School farms, (3, 4).  
 \_\_\_\_\_, management of 17,677-17,683.  
 \_\_\_\_\_, use of, for demonstration purposes 18,634-18,637.  
 Secondary agricultural schools, experience of (3).  
 \_\_\_\_\_, at Dacca (*q.v.*).  
 Vernacular middle schools, giving place to English middle schools in  
 Bengal 18,265-18,267.  
 Vocational agricultural education, scheme for 18,639-18,643.

## FERTILISERS

- Adulteration of fertilisers, common (8).  
 \_\_\_\_\_, co-operative supply as remedy (8).  
 \_\_\_\_\_, legislation to prevent (8).  
 Bonemeal, co-operative factories for 17,890-17,892.  
 \_\_\_\_\_, effect of export tax on 17,883-17,889.  
 \_\_\_\_\_, price of 17,882.  
 Bone phosphates, value of, recognised (9).  
 Bones, removal of grease from 17,893, 17,894.  
 \_\_\_\_\_, use of law 17,895-17,899.  
 Commercial fertiliser firms, help given to 18,779-18,789.  
 Comdung, must continue to be used as fuel (9).

## INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

### FERTILISERS—*contd.*

- Improved crops, mean greater drain on soil, which must be made good by fertilisers (8), 18,297, 18,298.
- Increased use of fertilisers, examples of (9).
- , extra profit from (8).
- , vital for improvement of agriculture (3).
- Manurial experiments 18,245-18,248.
- Nitrates, results with (9).
- Nitrogen, the limiting factor on salt soil 17,878, 17,879.
- Popularising of fertilisers, easy if credit facilities available (9).
- Red soils, limiting factors on 17,879.
- , very deficient in phosphates 17,881.
- Rock phosphates, not so valuable as bone phosphates (9), 18,557-18,559.
- Silt soils, limiting factors on 17,879.
- Superphosphates, not useful for acid soils or those containing no calcium carbonate (9).
- Water hyacinth, valuable as manure 18,185.

### FINANCE :

- Agricultural and Sanitary Improvements Act, contemplated extension of (5).
- , difficult to work 17,804, 17,805.
- , effect of (5).
- Agricultural Loans Act, invoked only in time of distress 17,801.
- Co-operative movement, the best means of financing cultivators (5).
- Credit, difficulty of controlling (6).
- , for productive measures, should be made available on easy terms (6).
- Interest, excessive, should be prohibited (6).
- Land Improvements Act, invoked only in time of distress 17,801.
- Taccari, Acts under which it is available 17,804-17,817.
- , might be used as preliminary to formation of co-operative societies (9).
- , unpopular in Bengal (9).

### FORESTS.

- Deterioration of forests, has led to soil erosion (8, 13).
- , retaining as a remedy (8, 13).
- Forest Department, is in close touch with Agricultural Department 18,020, 18,021.
- Forests, chiefly confined to the hills in Bengal (13).
- , in Western Bengal, mainly zamindari 18,022, 18,023.
- , problem of grazing in, does not arise (13).
- Jhuming, is causing anxiety in Chittagong hill tracts (13), 18,028-18,032.

### HOLDINGS :

- Consolidation, impossible owing to system of tenure (6), 18,291-18,296, 18,586, 18,587.
- Holdings, size of, in Bengal 17,828-17,833, 18,405-18,409.
- Intensive cultivation of small holdings, the ideal aimed at (14).
- Large farms, establishment of, would displace peasant proprietors and be unsound (14).
- , income from, would be less than that from small holdings (14), 18,299-18,800, 18,553.

### IMPLEMENTS :

- Bar point, should be fitted to all general purpose ploughs (11).
- Bullocks, smallness of, an obstacle to use of improved implements (10).
- Cultivators, believe their animals not strong enough to draw improved implements (11), 18,788, 18,789.
- Hire-purchase system for implements, might be adopted by commercial firms (5), 17,921-17,923.

# INDIA.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd*

## IMPLEMENTS—*contd.*

Hiring out of expensive implements, desirable (5).  
 Implement manufacturers, are ignorant of Indian conditions (11).  
 -----, Indian, two in Calcutta 17,910-17,919.  
 -----, sell by direct sales 17,920.  
 -----, might adopt hire-purchase system 17,921-17,923.  
 -----, should have practical representative in India (11).  
 Improved implements, high cost of, prevents adoption on large scale (11), 17,912-17,918.  
 Improved plough, which will be light, strong and cheap, scope for (11).  
 Indian plough, attempts to improve, by fitting up-to-date body, unsatisfactory (10).  
 Iron ploughs, use of, adds to fertility of soil (10).  
 Sugarcane mills, popularity of hiring, owing to special terms given by manufacturers (4).  
 Tractors, might be used for highland cultivation and in low *khil* land (10).  
 -----, will be a cause of loss unless facilities provided for repair (10).

## IRRIGATION.

Agricultural Department, responsible for well irrigation 17,580.  
 Agricultural Engineer, appointment of, to deal with wells and tube wells (7), 17,563.  
 Area irrigated in Bengal 18,476.  
 Canal irrigation, lack of (6).  
 Deterioration of rivers, effect of (7).  
 Irrigation, held up for lack of funds 18,113-18,119, 18,673-18,681.  
 -----, importance of, for ensuring fodder supply (1).  
 -----, for improvement of cattle 17,961.  
 -----, the only key to hot weather cultivation (1).  
 Irrigation Department, co-operation of, with Agricultural Department 18,120, 18,121.  
 -----, responsible for works involving flow irrigation 17,580.  
 Lift irrigation, possibilities of 18,511-18,513.  
 Minimum area requiring protection 18,729-18,743.  
 Minor irrigation works, are constructed by co-operative agency 17,845.  
 -----, have been held up by lack of funds 18,113-18,119.  
 -----, irrigation officers to advise on 17,846, 17,847.  
 -----, need for small commission to investigate possibilities of (7).  
 -----, provisions of Act 6 of 1920 concerning 18,682-18,688.  
 -----, repair and construction of, now being undertaken (6).  
 -----, scope for (8), 17,848.  
 -----, standing commission to investigate, desirable 17,801-17,805.  
 Paddy, water required for 18,721-18,724.  
 Productive irrigation schemes, none in Bengal 17,843, 17,844.  
 Rainfall, area affected by uncertainty of 18,725-18,736.  
 Tanks, usually in need of repair (6), 18,588.  
 Tube wells, not used for irrigation 17,856.  
 Waterlogging 17,837-17,861.  
 Well irrigation, by ordinary wells, can be constructed locally 17,853-17,855.  
 -----, capable of development 17,849, 17,850.  
 -----, funds for 17,851, 17,852.

# INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

## MARKETING:

- Commission agents, registration of 18,010-18,019.
- Co-operative jute buying organisation (14), 18,001-18,008.
- Co-operative marketing, scope for 18,037-18,039.
- Crop forecasts (14, 15).
- Cultivators, are keenly interested in jute prices 18,032.
- , essential to secure them fair share of value of their produce 18,052, 18,073.
- , should be given fuller information as to crops and prices 18,071-18,076.
- Inquiry into channels of marketing, value of 18,050, 18,051, 18,069, 18,070.
- Jute forecasts, methods of compiling (15).
- , more accurate than forecasts of other crops (14, 15).
- Jute, India's position in regard to, secure in immediate future 18,073-18,075, 18,083-18,085, 18,813.
- , methods of marketing (13, 14), 18,030-18,044.
- , need for watching world demand and affording information to cultivators 18,076, 18,081, 18,082.
- , note on average price of, and on the profits of its cultivation (81).
- Middlemen, to some extent prevented in case of export crop like jute from extravagant exactions by buyers from large concerns touring countryside 18,030.
- , profits taken by (13).
- , methods of 18,030-18,049.
- , room for eliminating (13).
- Weights and measures, should be standardised 18,055-18,060.

## RESEARCH:

- Central Government, role of, in research 17,601-17,608, 18,613-18,619.
- Central organisation for research, desirability of 17,606.
- , might initiate research but would principally deal with provincial schemes 17,603.
- , must command provincial support 17,609-17,611.
- , must not have executive authority over provincial 17,612.
- , provincial representation on, essential 17,607.
- Co-operation between Provinces in research 18,616.
- Co-ordination of provincial research, need for closer 17,614-17,616.
- Dry cultivation, research to assist 17,620-17,627, 17,640.
- Farms, experimental, numbers of 17,574-17,577.
- Honours graduates of Bengal Universities, promising in research work 17,646-17,651, 18,164, 18,165.
- Indian research workers, training of, in India 17,646-17,672.
- , in Europe, after post-graduate course in India 17,674-17,678.
- , work of 17,653.
- Jute, research on (2), 18,221, 18,227.
- Manurial experiments 18,245-18,248.
- Organisation of provincial research by crops 18,173.
- Organisation of research by crops, on lines of Indian Central Cotton Committee; financing of 17,595-17,603.
- Organisation of research by crops, on lines of Indian Central Cotton Committee; might be applied to jute, pulses, oilseeds, tobacco and paddy 17,590-17,593, 18,627.
- Organisation of research by crops, on lines of Indian Central Cotton Committee; value of (2), 17,588, 17,589.
- Organisation of research in Bengal 17,561-17,577, 18,174-18,179, 18,190-18,198, 18,393-18,393.
- Paddy, research on (*see under Crops*).
- Provinces, complete control of provincial research by possible disadvantages of, but must be retained (2), 17,612, 18,200-18,208.

# INDEX.

FINLOW, Mr. R. S. and McLEAN, Mr. K.—*contd.*

## RESEARCH—*contd.*

- Provinces, role of, in research 18,618-18,619.
- Pulses, organisation of research on 18,756-18,762.
- Pusa, examples of help given by, to Bengal 18,220, 18,221.
- , high standard of research work at 17,582-17,585.
- Recording results of experiments, machinery for, capable of improvement 17,752-17,759.
- Research, necessary not only on crops but on the same crop in different districts 18,529-18,531.
- Research staff, Indian (*q.v.*).
- , particulars of 17,564-17,569.
- Retting, experiments on 18,236 18,237.

## SOILS:

- Deltaic land in Lower Bengal, problems caused by (7, 8), 17,873.
- , suggestions for improving (7), 17,874-17,877.
- Deterioration, of forests, has led to soil erosion (8, 13).
- , of land in Bengal, partly due to keeping rivers confined to present channels (7).
- , of rivers, effect of (7).
- Iron ploughs, use of, adds to fertility of soil (10).
- Silt-bearing water, control of 17,874-17,877.
- Silt and red soils, qualities of 17,879-17,881.
- Soil erosion (8, 13).
- Soil surveys 17,867-17,872, 18,554, 18,555.
- Waterlogging 17,857-17,861.

## STATISTICS:

- Agricultural statistics in Bengal, discrepancies between 18,562-18,574, 18,747-18,749.
- Agricultural surveys 18,202.
- Crop forecasts, *see under* MARKETING.
- Interprovincial rail-borne trade, value of statistics regarding 18,092-18,094.

## TARIFFS:

- Cess on exported agricultural produce 17,595-17,603.

## VETERINARY:

- Veterinary Department, in Bengal, is independent of Agricultural Department 17,926-17,928.
- , must work in close collaboration with Agricultural Department (11).
- , should be independent of Agricultural Department (11).

## WELFARE:

- Board of Economic Inquiry, would be valuable in Bengal (14), 18,310, 18,311.
- Economic surveys of villages, (14).
- , money spent on would be better used for agricultural improvement 18,074, 18,675.
- , value of 18,750-18,755.
- Medical attention, need for increased (14).
- Sanitation, need for improved (14).
- Water supply, importance of pure (14).
- , pure, may be secured by tube wells (14).

FODDER, *see under* ANIMAL HUSBANDRY.

## FORESTS.\*

- Afforestation, to prevent damage from floods (*Das*) (82).
- , to prevent soil erosion (*Mitra*, (131).
- , might be dangerous to health in neighbourhood of villages (*Bentley*) (246).
- , must have beneficial effect on rainfall (*Bentley*) (246).

---

\* *See also under* SHEBBEARE.

## INDEX.

### FORESTS—*contd.*

- Denudation of forests, has led to soil erosion (*Finlow*) (8, 13), (*Bentley*) (240) and damage from floods (*Indian Tea Association*) (389).  
 ———, should not be allowed near sources of hill streams or along coast (*Das*) (82).  
 Forest Department, co-operation of, with Agricultural Department (*Finlow*) 18,020, 18,021, (*Shebbeare*) 20,600, 20,610, 20,735-20,737.  
 ———, need for closer co-operation of, with Irrigation Department (*Das*) 18,820-18,823, 19,120-19,123.  
 Forest products, difficult to obtain by those living in neighbourhood of forests (*Indian Tea Association*) (389).  
 Forests, chiefly confined to hills in Bengal (*Finlow*) (13), (*Mitra*) (131).  
 ———, in Western Bengal, mainly zamindari (*Finlow*) 18,022, 18,023.  
 ———, problem of grazing in, does not arise (*Finlow*) (13).  
 Fuel, may be provided by planting uncultivable waste land near villages under management of Union Boards or co-operative societies (*Mitra*) (184).  
 Housing, is causing anxiety in Chittagong hill tracts (*Finlow*) (13), 18,022-18,032.  
 Land suitable for tea gardens, sometimes re-erected for forest (*Indian Tea Association*) (389), 23,016-23,020, 23,021-23,026, 23,092, 23,093.  
 ———, with consequent loss to Government (*Indian Tea Association*) 23,016, 23,021-23,023, 23,028-23,091, 23,091-23,103.

### HOLDINGS.

- Consolidation, compulsion of obstinate minorities to achieve (*Peddie*) (427); *see also* Compulsion of obstinate minorities under CO-OPERATION.  
 ———, co-operative (*Mitra*) (130), 19,415-19,417, (*Peddie*) (427), (*Roy*) 24,392.  
 ———, impossible (*Finlow*) (6), 18,201-18,203, 18,556, 18,587, (*Momen*) 22,147-22,152, 22,301-22,306, 22,378-22,399.  
 ———, investigation of possibilities of, need for (*Mitra*) (130).  
 ———, legislation for, *see* Legislation.  
 ———, obstacles to (*Mitra*) (130), (*Mukherjee*) (177), (*Burrows*) 23,701-23,708, 23,812-23,815, (*Ahmed M.*) (558), (*Peddie*) (427).  
 ———, of doubtful value as tending to extinguish peasant proprietor class (*Mullick*) (350), 22,622-22,626, 22,634.  
 ———, permanent settlement, effect of on (*Momen*) 22,365, 22,366.  
 ———, propaganda for, value of skilled (*Mukherjee*) 20,513-20,515.  
 ———, will be helped by spread of education (*Roy*) 24,391-24,398.  
 ———, *see also* under Union Boards and Zamindars.  
 Co-operative consolidation societies, need for (*Mukherjee*) (177).  
 Cultivators, may be compelled to cultivate land co-operatively to minimise effect of sub-division (*Ahmed M.*) (558).  
 ———, *see also* Joint cultivation.  
 Disputes, may be kept out of courts by co-operative societies with Government assistance (*Ahmed M.*) (558).  
 ———, need for legislation to keep them out of courts (*Ahmed II.*) (170).  
 Emigration of surplus population, the only remedy for excessive sub-division (*Indian Tea Association*) (388).  
 Fragmentation, difficult to check (*Peddie*) 23,356.  
 ———, disadvantages of, can be brought home to cultivators (*Peddie*) 23,377, 23,358.  
 ———, prevalence of (*Roy*) 24,319, 24,320, 24,385-24,391.  
 Hindu and Mohammedan law, an obstacle to consolidation (*Ahmed M.*) (558).  
 Holdings, size of average (*Finlow*) 17,828-17,832, 18,405-18,409, (*Momen*) 22,143-22,146, 22,249-22,254, 22,303, (*Peddie*) 23,375, (*Burrows*) (475), 23,390.

## INDEX.

### HOLDINGS—*contd*

- Intensive cultivation of small holdings, the ideal aimed at (*Finlow*) (14).  
 Joint cultivation, may minimise loss due to excessive sub-division  
     (*Ahmed U.*) (534).  
     —, see also under Cultivators.  
 Land, availability of additional, and effect of occupancy rights thereon  
     (*Burton*) 23,747-23,752, 23,914-23,927, 23,937-23,949.  
 Legislation for consolidation, should be avoided if possible (*Mulherjee*)  
     (177).  
     —, should provide for ample compensation  
     (*Ahmed U.*) (534).  
 Occupancy rights of cultivators (*Mullick*) 22,503-22,507.  
 Subdivision, avoidance of, by system of valuation (*Roy*) 24,321-24,327.  
 Union Boards should have authority to make consolidation binding for  
     several years with consent of majority (*Mukherjee*) (177), 20,090-20,098.  
 Zamindars, are opposed to consolidation (*Roy*) 24,443-24,445.  
     —, charge too high, commutation fees (*Roy*) 24,327-24,335.

**HUTCHINSON, Mr. C. M.**, late Imperial Agricultural Bacteriologist, and  
**MAURER, Mr. F. E.**, Manager Fertiliser Department, Messrs Shaw  
 Wallace & Company, Calcutta (296-301), 21,808-22,092.

### ADMINISTRATION AND RESEARCH:

- Advisory Council representing Provinces, for co-ordination of research  
 (297), 22,061-22,063.  
 Agricultural Adviser, should not be Director of Pusa but should be  
     responsible for co-ordinating research (296), 21,821-21,825.  
 Board of Agriculture, sectional meetings of, unsatisfactory 21,899,  
     21,900.  
     —, should meet annually 21,896-21,898.  
     —, Co-ordination of research, at present unsatisfactory (297).  
     —, by Advisory Council (*q r*)  
     —, should be undertaken at Pusa (297).  
 Indigo, research on, stopped owing to retrenchment 21,889-21,891.  
 Irrigation research, see under IRRIGATION.  
 Leo Commission, recommendations of, and failure to attract best class  
     of Indians, have militated against progress of research (296), 21,971-  
     21,981, 22,030-22,041.  
 Provincial research, handicapped by loss of experienced men (296).  
     —, see also Leo Commission.  
 Pusa, continuity of research at, lacking 21,931-21,935.  
     —, continuous policy at, importance of 21,825, 21,826.  
     —, educational work at, should be conducted by additional staff  
     (297).  
     —, should not be allowed to interfere with  
     research (296).  
     —, see also under EDUCATION.  
     —, geographical position of, unsatisfactory (297), 21,832, 21,833,  
     21,864.  
     —, should be changed if funds become  
     available (297), 21,885.  
     —, is better equipped to provide instruction on research work on  
     Indian problems than any foreign institution (296).  
     —, joint directorship system at, unsatisfactory (296).  
     —, must carry weight with Central Government (296).  
     —, post of Director of, should be separated from that of Agricultural  
     Adviser (296), 21,821-21,825.  
     —, type of man required for 21,881-21,884,  
     21,880-21,888, 21,978-21,980.  
     —, prestige of, high 21,813, 21,814, 21,928, 21,929.  
     —, should afford such facilities for Indian research workers as will  
     make it unnecessary for them to go abroad (296), 21,815-  
     21,819.  
     —, should have whole-time Director (296), 21,820.  
     —, should maintain high standard of research for benefit of India  
     as a whole (296).

# INDEX.

## HUTCHINSON, Mr. C. M. and MAURER, Mr. F. E.—*contd.*

### ADMINISTRATION AND RESEARCH—*contd.*

- Pusa, should serve as nucleus for co-ordination of research (297).
- Pusa Council 21,886-21,888.
- Research, importance of, for agricultural development (290).
- , on fertilisers, soils, &c., *see various items under FERTILISERS.*
- Research workers, and teachers, attitude of mind of, different (297),  
21,937, 21,938, 22,073-22,075.
- , Indian, training of, *see under EDUCATION.*
- , who give too much time to teaching, lose their value  
for research (296, 297), 21,827-21,831.
- Sericulture, research on 21,892-21,895.
- Soil fertility and crop production, many problems of, may be investi-  
gated in any part of India (297).

### ANIMAL HUSBANDRY:

- Fodder, increase of, by means of fertilisers (299), 22,060.
- Inefficiency of cattle, due to malnutrition (299).

### CULTIVATION:

- Fixation of nitrogen, best obtained by exposing soil to air 22,012-  
22,014.
- Improved cultivation, a method of enhancing productive power of soil  
(297), 22,004-22,011.

### DEMONSTRATION AND PROPAGANDA:

- Cinema films for propaganda 21,850-21,863, 21,871.
- Cultivators, have of necessity to be conservative (300).
- , reasons why they have not taken to fertilisers (301).
- , will take up new methods which are shown to be profitable  
(300).
- Propaganda for increasing use of fertilisers, co-operation in, of  
Agricultural De-  
partment 21,045-  
21,052.
- , need for (301).
- Publication of research work, in English 21,873.
- , in the vernacular 21,872.
- Pusa, effect of, on cultivators in neighbourhood 21,864.

### EDUCATION:

- Post-graduate study for Indian research workers, abroad, unsatisfactory;  
should be given at  
Pusa (296), 21,815,  
21,818, 21,819, 21,875-  
21,880, 21,918, 21,919,  
21,926, 21,927, 22,044-  
22,047.
- , at Pusa period of  
and preliminary train-  
ing for 21,000-21,917,  
22,037-22,043.
- Study leave abroad, not objectionable 21,816-21,818.

### FERTILISERS AND SOILS:

- Adulteration of fertilisers with river silt 22,001-22,008.
- Agricultural Department and fertiliser industry, co-operation between:  
lacking in the past (300), 21,915-21,948.
- , liaison officers for (300).
- , need for (300), 21,901, 21,958.
- , suggestion for joint committee for 21,852.

# INDEX.

HUTCHINSON, Mr. C. M., and MAURER, Mr. F. E.—*contd.*

## FERTILISERS AND SOILS—*contd.*

Artificial fertilisers ability of, to remain in soil, an important consideration 21,850, 21,851.

—————, manufacture of, from Indian raw material 21,967-21,973, 22,021-22,023, 22,031-22,035.

—————, supplementary and not alternative to cattle manure 21,848.

Bones, export of, should not be prohibited 21,970-21,973.

Committee to examine fertiliser situation, need for (301), 22,078.

Cowdung as fuel, its replacement by firewood impracticable (300), 22,001-22,003.

Depots for fertilisers 22,080-22,089.

District Boards and artificial fertilisers 22,090, 22,091.

Economic return from fertilisers, information on, lack of (298).

—————, need for (298), 21,849.

Financial aid for fertiliser industry 21,002-21,008.

Fixation of nitrogen, best obtained by exposure of soil to air 22,012-22,014.

—————, research on (299), 21,936.

Indo-Agri Limited, policy of 21,953-21,961.

Information as to proper use of fertilisers, need for reliable (300), 22,035-22,040.

Nitrate of soda, liable to be washed away by heavy rainfall 22,080-22,084.

Nitrogen problems, investigation of 21,857, 21,838, 21,939, 21,940, 22,070, 22,071. *See also* Fixation of nitrogen.

Railway facilities for fertilisers 21,962-21,965, 22,029, 22,030.

Research on fertilisers, causes of inadequate (297), 21,831-21,841.

—————, may be conducted at central institute and in Provinces 21,842-21,844.

—————, suggestions for (297, 298).

Soil bacteriology, expert on, should be appointed in each Province (299), 22,064-22,068.

—————, need for research on (299).

Soil fertility, improved cultivation as method of enhancing (297), 22,004-22,011.

—————, intensive cultivation of cereals (improved implements and crops) leads to loss of, which must be made good (298, 299), 21,846, 21,847, 22,048-22,051.

—————, research on, can be undertaken in any part of India (297).

—————, result of intensive cultivation on, recognised by cultivators (298), 21,846.

Superphosphates, difficulty of manufacturing, in India 21,967-21,973, 22,021-22,023.

—————, storing of 21,966.

Tea and rubber plantations, the chief users of artificial fertilisers 21,941-21,944, 22,077.

Use of fertilisers, depends on provision of information on their economic utilisation by cultivators (300).

—————, practically non-existent in India (300).

## IRRIGATION:

Decrease in fertility of soil due to canal irrigation, importance of investigating alleged 21,993-22,000.

Irrigation, need for special laboratory to study problems connected with (301), 21,856, 21,982-21,992, 21,999, 22,000.

—————, utilisation of, to best advantage, depends on accurate knowledge of relationship between soil water supply and activities of soil bacteria (301), 21,854, 21,855.

## RESEARCH:

*See under* ADMINISTRATION (except Irrigation for which *see under* Irrigation).

## SOILS:

*See under* FERTILISERS

## INDEX.

### IMPLEMENTS.

- Agricultural engineer to deal with implements, lack of, a handicap (*Mitra*) 19,917-19,920.
- Bullocks, smallness of, an obstacle to use of improved implements (*Finlow*) (10).
- Co-operative implement societies (*Mitra*) (136), 19,913-19,916.
- Cultivators, believe their animals too weak to draw improved implements (*Finlow*) (11), 18,788, 18,789.
- Demonstrations of improved implements, need for (*Mukherjee*) (178), (*Ahmed U.*) (535).
- Depots for improved implements, need for (*Mukherjee*) (178).
- Foreign implements, of no value in Bengal (*Mullick*) (351).
- Hire-purchase system for implements, value of (*Finlow*) (5), 17,921-17,923.
- Hiring-out of implements, desirable (*Finlow*) (5), (*Mukherjee*) (178).
- Implement manufacturers, are ignorant of Indian conditions (*Finlow*) (11).
- , Indian, two in Calcutta (*Finlow*) 17,916-17,919.
- , sell by direct sales (*Finlow*) 17,920.
- , might adopt hire-purchase system (*Finlow*) 17,921-17,923.
- , should have practical representative in India (*Finlow*) (11).
- , should utilise co-operative societies for distribution (*Mitra*) (132).
- Improved implements, conditions for adoption of (*Mitra*) (132).
- , extra cost of, prevents adoption on large scale (*Finlow*) (11), 17,912-17,918.
- , should be borne by Government to start with (*Ahmed U.*) (535).
- , lack of suitable (*Mitra*) (132), 19,913-19,923.
- , may be supplied to co-operative societies on long-term credit (*Ahmed M.*) (559).
- Improved plough, which will be light, strong and cheap, scope for (*Finlow*) (11).
- Indian plough, attempts to improve, by fitting up-to-date body, unsatisfactory (*Finlow*) (10).
- Iron ploughs, use of, adds to fertility of soil (*Finlow*) (10).
- Loans for purchase of machinery (*Mullick*) (351).
- Mechanical cultivator suitable for tea, has yet to be devised (*Indian Tea Assn.*) (338).
- Sugarcane mills, popularity of hiring, owing to special terms given by manufacturers (*Finlow*) (4).
- Tractors, replacement of bullocks by (*Mullick*) 22,649-22,651.
- , scope for (*Finlow*) (10), (*Mullick*) 22,651.
- , will be a cause of loss unless facilities provided for their repair (*Finlow*) (10).

**INDIAN JUTE MILLS ASSOCIATION**, Calcutta (Messrs. J. Sime, J. T. Finlayson, J. W. A. Simpson and W. J. Soutar) (414-417), 23,190-23,278.

### ADMINISTRATION :

- Agricultural Department, understaffed through lack of funds (414).
- Associations representing jute industry 23,193-23,197.
- Indian Central Cotton Committee, suggestion for similar organisation for jute 23,197-23,201.
- Meteorological Department, work of (415).
- Railways, are apt to starve stations where there is no steamer competition (415).
- , facilities provided by, on the whole satisfactory (414).
- , freight rates of, for jute, unduly high (415), 23,265-23,271.
- Steamer facilities, on the whole satisfactory (414).
- Water hyacinth and the choking of waterways (415).
- Waterways, danger of silting up of (415).
- , take the place of roads in Eastern Bengal (415).

## INDEX.

### INDIAN JUTE MILLS ASSOCIATION—*contd.*

#### Co-operation

- Audit of co-operative societies, must be carried out by Government (110).
- Co-operative credit system, is only to limited extent in touch with cultivators (116).
- Jute growers' association, attitude towards a possible, of jute trade 23,221, 23,237, 23,263, 23,264, 23,278.
- , no attempt made to form 23,222-23,224.

#### Coops

- Co-operation between jute trade and Agricultural Department in regard to improved varieties (115).
- Cultivators, prefer to grow jute crop for fibre rather than keep some of it for seed (115).
- Indian Jute Mills Association, scheme for guaranteeing Agricultural Department against loss by, to ensure full supply of seed (116).
- , seed farms under (q.v.).
- Improvements in jute, of value both to growers and trade 23,236-23,238.
- Retting, effect of, on quality of jute 23,251.
- , research on 23,252-23,253.
- Seed farms under Indian Jute Mills Association, proposal for, abandoned (416).

#### CULTIVATION.

- Deep ploughing, unsuited to silted land (110).
- Existing systems of tillage, satisfactory (416).

#### DEMONSTRATION AND PROPAGANDA:

- Cultivators, will adopt improvements showing immediate financial return (415).
- Demonstration farms, can influence cultivation in their immediate vicinity only (116).

#### EDUCATION:

- Agricultural education (elementary) in schools, might be attempted (111).

#### FERTILIZERS:

- Artificial fertilizers, high cost of, militates against use (416).
- , not needed on land covered by silt (115), 23,202.
- Condung as fuel, must be used owing to lack of substitutes (415).

#### FINANCE.

- Co-operative credit movement, the best means of financing agricultural operations (415).
- Cultivators, seem unable to save money even when in position to do so (415).

#### MARKETING:

- Existing market facilities, satisfactory from point of view of jute trade (416).
- , but not necessarily so from point of view of cultivators, 23,215, 23,216.
- Jute Forecasts Joint Committee (416, 417), 23,203.
- Jute forecasts, need for greater accuracy of (116).
- , staff for, curtailed by retrenchment and should be increased (416).
- , usefulness of, 23,204, 23,205.
- Jute in storage, making figures of, known to cultivators, 23,206-23,214.
- Jute prices, making known to cultivators, 23,272, 23,273.
- Middlemen, functions of, in jute trade, 23,216-23,219.
- , value of reducing number of, 23,261-23,263.

## INDEX.

**INDIAN JUTE MILLS ASSOCIATION--cont'd.**

### RESEARCH :

Provinces, should conduct research on crops grown mainly in their area (414).

Pusa, should control research of All-India importance (114).

**TARIFFS :**

23,227  
 23,226

---, for Provincial Government, incidence of and revenue from,  
23,230, 23,231.

- - - - - , increase of, would be detrimental, 23,232-23,235, 23 250, 23,260.

INDIAN TEA ASSOCIATION, Calcutta (Messrs. T. O. Crawford, P. H. Carpenter and J. A. Milligan) (326-397, 113), 22,911-23,189.

### ADMINISTRATION :

Communications, improvement of, of vital importance to cultivators, as affording choice of markets (387)

Meteorological Department, causes of unsatisfactory nature of information given by (387), 22,976-22,978.

---, observations made by, in ten districts,  
23,140-23,141.

Railways, lack hitherto of progressive policy of development of, but position improving (357).

scope for further (387), 22,973-22,975.

Tramways, possibilities of, 23,128-23,130.

### AGRICULTURAL INDEBTEDNESS.

**Agricultural indebtedness, retards development of agriculture (398)**

## AGRICULTURAL LABOUR.

Labour for tea gardens, amount required, 23,059-23,065.

area of recruitment, 23,076-23,082, 23,104-23,106

difficulty of obtaining, 22,987, 22,988.

not due to treatment  
being bad, 23,195,  
23,131, 23,132.

20,702, 23,102.  
 \_\_\_\_\_, difficulty of tapping new sources, 23,082-23,084.  
 \_\_\_\_\_, money allowances and land given to, 23,149-  
 23,151.

\_\_\_\_\_ permanently settled labour preferred, 22,489,  
22,800.

restrictions on, 23,082-23,097.

Obstacles to migration of labour, (389), 22,980.

### ATTRACTING CAPITAL:

Ten industry, capital invested in (886).

\_\_\_\_\_, Indian capital being increasingly invested in (386), 22 940-22,952.

**Crops :**

District Reports on, not always satisfactory (387).

Elephants, damage done by, near forests (388), 22,081-22,085, 28,126, 28,127.

\_\_\_\_\_, efforts by Forest Department to keep down, inadequate (388).

Pests and diseases affecting tea plants, under investigation by Scientific Department of Indian Tea Association (388).

Ten, acreage under 23,058.

—, intercultivation with indigo a failure 23,121, 23,125.

—, seed, demand for 23,158.

## INDEX.

### INDIAN TEA ASSOCIATION—*contd.*

#### DEMONSTRATION AND PROPAGANDA:

Demonstration farms, too scattered to influence small cultivators (337).  
 Demonstrations on cultivators' own holdings, need for (337).

#### EDUCATION:

Readers in primary schools, might be given agricultural bias (390).  
 Science courses at Indian Universities, laboratory skill of students lacking  
     owing to system of teaching  
     (337), 22,961-22,972.  
 —————, and owing to examination syllabus  
     23,136-23,139.  
 —————, need for improving low standard of  
     (337), 22,959-22,961.

#### FERTILISERS:

Adulteration, legislation against, not desirable at present (388).  
 —————, rule drawn up by Tea Association to prevent, not suitable  
     for governing sales to cultivators (388).  
 Cudung as fuel, use of, may be discouraged by demonstrating its advantages  
     as manure (388).  
 Cultivators, conservatism of, an obstacle to their adoption of fertilisers  
     (388).  
 —————, in neighbourhood of tea gardens, are taking to fertilisers  
     (388), 22,979, 22,980.  
 Demonstrations of fertilisers, should be arranged by Government officials  
     in collaboration with fertiliser industry (388).  
 Nitrate of soda, washed out of soil fairly rapidly 23,156.  
 Potassium nitrate, not used for tea on account of high price 23,159-23,161.  
 Silt from rivers, injurious as fertiliser 23,183, 23,184.  
 Tea, fertilisers used for 23,120, 23,121, 23,125, 23,187-23,189.

#### TOWNS:

Afforestation of river banks to avoid floods, value of (399).  
 Forest products, difficult to obtain by those living in neighbourhood of  
     forests (389).  
 Land suitable for tea gardens, sometimes reserved for forest (389),  
     23,016-23,020, 23,021-23,026, 23,092,  
     23,093.  
 —————, with consequent loss to Government  
     23,016, 23,021-23,023, 23,038-23,091,  
     23,091-23,103.  
 Tea gardens, have in some cases spare land for future extension 23,175-  
     23,179.

#### HOLDINGS:

Emigration of surplus population, the only remedy for excessive sub-  
 division (388).

#### IMPLEMENTS:

Mechanical cultivator suitable for tea, has yet to be devised (388).

#### MARKETING:

China tea, manufacture of, in Almora district 23,116-23,118.  
 Competition of Java and China for export tea market (390), 23,066-23,073,  
     23,147, 23,148.  
 Indian Tea Association, membership of 23,031, 23,038.  
 Indian Tea Cess Committee, expenditure of, on propaganda (397), 23,074.  
     23,075.  
 —————, finance of 23,015.  
 —————, is concerned only with advertising 22,913.  
 —————, memorandum on (*Appendix*) (396, 397).  
 —————, relations of, with Indian Tea Association  
     22,942.  
 —————, results of work of 22,946-22,948.  
 Indian tea, chiefly exported to England 23,073, 23,103.

## INDEX.

### INDIAN TEA ASSOCIATION—*contd.*

#### MARKETING—*contd.*

- Indian tea industry, position of, in world market (*Appendix*) (413)  
 Kurdistan, requires green tea which is chiefly supplied by Russia 23,109-23,116.  
 Middlemen in tea marketing 23,152-23,151.  
 Standard of quality for tea, for consumption in India, desirability of (389), 23,027-23,029.  
 \_\_\_\_\_, steps taken to effect (389)  
 \_\_\_\_\_, for export, no steps taken to ensure 23,156, 23,157.

#### RESEARCH:

- Board of Agriculture, meetings of, not suitable for discussion of purely scientific problems (386), 23,052-23,055.  
 Conferences of research workers, need for revival of (386), 23,056.  
 Co-ordination of scientific work in agriculture, need for (386)  
 Pusa, inadequate for whole of India and requires enlarging (386).  
 Scientific Department of Indian Tea Association, closer touch with Pusa desirable 22,053-22,055, 23,048  
 \_\_\_\_\_, no Government representation on 23,043, 23,044, 23,047, 23,048.  
 \_\_\_\_\_, work of (*Appendix*) (391-395).  
 Subjects suggested for research (386, 387).  
 Tea research, at Government stations, possibility of 23,051.  
 \_\_\_\_\_, need for central station for, with number of small district stations owing to differences in climate, soil, etc. 23,039-23,042.

#### SOILS:

- Soil bacteriology, need for research on (387).

#### STATISTICS:

- Statistical tables in "Note on the Production of Tea in India," need for earlier publication of (390).  
 Statistics of tea production prepared by Government, legislation for compulsory returns of planting statistics for, not objectionable (390) 23,033-23,037.  
 Statistics of tea production prepared by Government, not so accurate as Tea Association's figures (390).

#### TARIFFS:

- Export duty on tea, amount raised by and incidence of 23,162, 23,163.  
 \_\_\_\_\_, detrimental to interests of agricultural classes (389), 23,071, 23,164-23,174.  
 \_\_\_\_\_, effect of, on production of tea in India compared with Java (390).  
 \_\_\_\_\_, has no effect on prices in India 23,080-23,082.  
 \_\_\_\_\_, in Ceylon, compared with India 23,145, 23,146.

#### WELFARE:

- Drinking water, attention paid to, on tea estates 23,133, 23,134.  
 Hookworm, satisfactory results of campaign against in tea gardens 22,993, 22,995-23,000.  
 Labour in tea gardens, conservatism of with regard to hygiene an obstacle 22,991, 22,992, 23,001, 23,002.  
 \_\_\_\_\_, medical attention for 23,003-23,005.  
 Malaria surveys conducted by Tea Association 22,993, 22,994.  
 Sanitary Commissioner's Department, should be brought in closer touch with rural population (390).

# INDEX.

## IRRIGATION.

- Agricultural and Sanitary Drainage Act and minor irrigation works  
(*Das*) 18,879, 19,069-19,079
- Agricultural Department, is responsible for well irrigation (*Finlow*)  
17,580
- Agricultural Engineer, appointment of, to deal with wells (*Finlow*) (7),  
17,863
- Area irrigated in Bengal (*Finlow*) 18,476
- Area of Presidency short of water October-June, 25 per cent (*Das*)  
18,907, 18,908.
- , none now irrigated  
(*Das*) 18,903.
- , part of, will be  
covered by Damodar  
project (*Das*)  
18,908.
- , scope for irrigating  
(*Das*) 18,909-18,911.
- Budget of Irrigation Department, apportionment of (*Das*) 18,858-18,865.  
19,019, 19,014, 19,048-19,052, 19,056, 19,057
- Canals in Bengal, capital cost of (*Das*) 19,053
- , certain of, used for navigation only (*Das*) 19,045-  
19,047.
- , none classified productive (*Das*) 18,831.
- , return on, 1 per cent. (*Das*) 19,054.
- , scope for further (*Das*) (82), (*Mitra*) (130).
- , under construction (*Das*) 18,831-18,834, 18,908.
- , velocity of, low on account of navigation (*Das*)  
18,999-19,004.
- Contour survey, does not exist in Bengal (*Das*) (82), 18,845, 18,846,  
18,913-18,932
- Co-operation of Irrigation Department, with Agricultural Department,  
close (*Das*) 18,818, 18,819,  
18,869-18,873, (*Finlow*) 18,120,  
18,121.
- , with Co-operative Department  
(*Das*) 18,912.
- , with Forest Department, need  
for closer (*Das*) 18,820-18,825,  
19,120-19,123.
- , with Public Health Department  
(*Das*) 18,923, 18,924, 19,119,  
(*Bentley*) 21,289, 21,290, 21,450.
- Co-operative irrigation societies, aims of (*Mitra*) 19,959-19,963
- , can construct minor irrigation works  
(*Mitra*) (130), 19,418-19,411, 19,753-  
19,760.
- , compulsion of obstinate minorities  
(*Mitra*) (136), 19,557, 19,558, 19,670-  
19,675, 19,984, 19,965
- , have been very successful (*Mitra*) (136)
- , technical advice for (*Das*) 19,110-  
19,115, (*Mitra*) 19,422-19,430, 19,574-  
19,577, 19,636-19,640, 19,966-19,972.
- , value of (*Momen*) (324).
- Cropped area in Burdwan, has progressively declined through lack of  
irrigation (*Bentley*) (241, 242).
- Crop production, effect of irrigation on (*Bentley*) (241), 21,322-21,329.
- Damodar canal project (*Das*) 18,831-18,831, 18,908
- Data, need for further, before extension of irrigation is possible (*Das*)  
18,845-18,848, 19,019.
- , staff of Irrigation Department should be extended to secure (*Das*)  
18,847, 19,091.
- Decrease in fertility of soil due to canal irrigation, importance of investi-  
gating alleged (*Hutchinson*) 21,993-22,000
- Deltaic irrigation schemes, not more difficult than those elsewhere (*Das*)  
18,842-18,844.
- Deltaic rivers, control of (*Burrows*) 23,657-23,662

# INDEX.

## IRRIGATION—*contd.*

- Deterioration of rivers, effect of (Finlow) (7).
- Distribution of water to cultivators (Das) 18,917-18,922, 19,023-19,026. (Mitra) (130), (Bentley) (242)
- Drainage schemes undertaken under Drainage Acts, small (Das) 19,116-19,118.
- Dredgers, owned by Irrigation Department (Das) 19,097-19,101.
- Dredging, land raised by, sold as village sites (Das) 19,102.
- Embankments, double, have deleterious effect on mouth of river (Das) 19,107, 19,108.
- , system of, double (Das) 19,103-19,106.
- Establishment charges of Irrigation Department, 20 per cent. (Das) 18,989-18,992.
- Flooding and flushing of soil, need for investigating possibilities of (Das) (82).
- Fodder crops, cannot be grown without irrigation (Bentley) (242, 246), 21,239-21,241, (Peddie) 23,331.
- Higher lands, irrigating of (Bentley) 21,342-21,345.
- Irrigation, at one time extensive in Bengal (Bentley) (241).
- , decay of, causes and effect of (Bentley) (241), 21,338, 21,339.
- , from canals, often taken for sake of silt (Das) 18,966, 19,124, 19,125.
- , importance of (Finlow) (1), 17,981. (Bentley) (241), 21,238, 21,370, (Momen) (324), 22,153.
- , lack of funds for, the chief obstacle (Finlow) 18,113-18,119, 18,678-18,681, (Ahmed M.) (558).
- , need for comprehensive policy for (Mitra) (131).
- , scope for (Das) 18,866, 19,065-19,068, 19,082-19,085, (Bentley) (241), 21,232, 21,370, (Mullick) (350), 22,454-22,456, (Momen) 22,407-22,409, (Peddie) (427, 428), 23,318-23,325, 23,328-23,330, 23,397-23,400, 23,404, 23,405, (Burrows) 23,656, (Ahmed U.) (534), 24,181, 24,181, (Roy) 24,478, 24,479, (Ahmed M.) (558).
- , programme for, limited to productive schemes (Das) 19,088-19,090.
- , utilisation to best advantage of, depends on knowledge of relationship between soil water supply and activities of soil bacteria (Hutchinson) (301), 21,854, 21,855.
- Irrigation cess, collected by special officers (Das) 19,027-19,029.
- Irrigation Department, budget of, *see* Budget.
- , co-operation of, with other departments, *see* Co-operation.
- , effect of retrenchment on (Das) 19,086, 19,087.
- , indifferent to interests of cultivators (Roy) 24,496-24,498.
- , is in charge of irrigation, drainage and navigation (Das) 18,987.
- , scope for further activity by (Burrows) 23,655, 23,663-23,665.
- , staff of, insufficient (Das) (82), 18,841.
- , scheme for increasing, held up by lack of funds (Das) 19,092, 19,093.
- , undertakes clearing of waterways from silt and weeds (Das) 18,849-18,857.
- Lift irrigation, possibilities of (Finlow) 18,511-18,513.
- , practised on small scale by cultivators (Das) 18,962-18,964.
- Malaria and irrigation, connection between (Bentley) (246), 21,346, 21,405, 21,406, (Roy) 24,255-24,263, (Chatterjee) (225), 21,106-21,116.
- Minimum area requiring protection (Finlow) 18,729-18,743.
- Minor irrigation works, co-operative construction of (Finlow) 17,845, (Das) 18,879, 18,880; *see also* Co-operative irrigation societies.
- , have been held up by lack of funds (Finlow) 18,113-18,119.
- , have fallen into decay in many places (Mitra) (130).

# INDEX.

## IRRIGATION—*contd.*

- Minor irrigation works, in Bankura and Birbhum, now executive division for (Das) 18,876-18,878.
- , increased fertility due to (Mitra) 19,440.
- , irrigation officers to advise on (Finlow) 17,846, 17,847.
- , might be undertaken by Collectors and Local Boards (Das) 19,070.
- , need for small commission to investigate possibilities of (Finlow) (7).
- , preliminary cost of, at present falls on cultivators (Das) 18,880, 19,076-19,078.
- , might be borne partly by Government or Local Board (Das) 19,072-19,079.
- , progress made in, by co-operative effort (Mitra) (130), 19,418-19,441.
- , provisions of Act 6 of 1920 concerning (Finlow) 18,682-18,688.
- , proposals for, in Birbhum district (Das) 18,837, 18,991-18,996.
- , repair and construction of, now being undertaken (Finlow) (6).
- , scope for (Finlow) (6), 17,848, (Mitra) (130), 19,418.
- , standing commission to investigate, desirable (Finlow) 17,864-17,866.
- Non-perennial canals, need for (Bentley) (241).
- Obstacles to extension of irrigation (Bentley) (242), (Peddie) (428).
- Paddy, charge for irrigation water for (Das) 19,020, 19,021.
- , irrigation of aman crop (Das) 18,966-18,971.
- , irrigation of, by excavation of abandoned minor works (Das), 19,128, 19,129.
- , water required for (Finlow) 18,721-18,724.
- Productive and unproductive schemes, method of classification (Das) 18,827-18,830, 19,061-19,064.
- Productive schemes, none exist at present (Das) 18,831, (Finlow) 17,843, 17,844.
- , one under construction (Das) 18,831-18,831.
- Rainfall, area affected by uncertainty of (Finlow) 18,725-18,736.
- , heavy in Bengal (Das) 18,866.
- , period of shortage of (Das) 18,897-18,906.
- Research on irrigation questions, need for special laboratory (Hutchinson) (301), 21,850, 21,982-21,992, 21,999, 22,000.
- Rivers, need for controlling (Mitra) (131).
- , prevention of their tendency to change their course, has had harmful effects (Das) 18,925, 18,926, (Bentley) (241), 21,291, 21,292, (Finlow) (7).
- , spilling over of, would reclaim land in vicinity (Das) 18,926-18,934.
- Storage of water, not undertaken on large scale (Das) 18,826.
- Tanks, belong in most cases to private owners (Bentley) 21,279.
- , co-operative re-excavation of (Peddie) (428), (Roy) 24,487-24,490.
- , excavation of abandoned, desirable (Das) 19,128, 19,129, 19,132-19,134.
- , improvement of existing, financial difficulties of 21,286-21,288.
- , Government grant for 21,362-21,364.
- , legislation for 21,282-21,287.
- , obstacles to (215).
- , of no value without larger supply of water 21,280-21,283.
- , irrigation from, not an urgent need (Das) 19,094-19,096.
- , majority of, do not hold water throughout the year (Bentley) 21,278.
- , method of distributing water from (Roy) 24,480.
- , need for (Bentley) (241).
- , need for loans for re-excavation of (Roy) 24,481.

# INDEX.

## IRRIGATION—*contd.*

- Tanks, silting up of, common (*Finlon*) (6), 18,598, (*Momen*) (324), (*Peddle*) (128).  
 Tube wells, investigation of possibilities of irrigation from, desirable (*Das*) 19,131.  
 ———, not used for irrigation (*Das*) 19,130, (*Finlon*) 17,856.  
 Unproductive schemes, two in existence (*Das*) 18,833, 18,839.  
 ———, none in contemplation (*Das*) 18,840.  
 Velocity of canals, *see* Canals.  
 Wastage of water by absorption and evaporation, not acute (*Das*) (82)  
 Waterlogging, *see* under SOILS.  
 Water rate in permanent settlement areas, Acts governing (*Peddle*) 23,410-23,414.  
 ———, method of charging (*Peddle*) 23,409.  
 ———, presents no difficulty (*Peddle*) 23,406-23,408.  
 Water table, depth of (*Das*) 18,883-18,886.  
 Wells, ordinary, can be constructed locally (*Finlon*) 17,833-17,855, (*Das*) 18,881.  
 ———, give ample supply throughout the year (*Das*) 18,882.  
 ———, funds for (*Finlon*) 17,851, 17,852.  
 ———, unsuitable for irrigation in Bengal (*Peddle*) 23,326, 23,327, 23,384, 23,385, (*Momen*) (324), 22,307, 22,308, (*Hoy*) 21,482-24,485, 21,490-24,492.

KERR, Mr. P. J., M.R.C.V.S., I.V.S., Veterinary Adviser (98-102), 10135-19,346.

## ANIMAL HUSBANDRY.

- Animal nutrition, importance of studying (101), 19,163, 19,201, 19,202, 19,225.  
 ———, investigation of 19,201-19,208.  
 ———, need for physiological chemist to study (101).  
 Cattle in Bengal, are too small 19,162.  
 ———, large numbers imported annually 19,153, 19,158-19,162, 19,325-19,329.  
 ———, number of, 25 millions 19,159.  
 ———, small draught animals, preferred 19,150, 19,151.  
 Cattle breeding, Farms for, need for establishment of (101).  
 ———, employment of veterinary assistants at (101), 19,314-19,320.  
 ———, not carried out in Bengal 19,229, 19,230.  
 ———, should remain under Agricultural Department 19,295.  
 Cattle cakes 19,226-19,228.  
 Cattle Expert, forthcoming appointment of (101).  
 ———, may be under Agricultural or Veterinary Department 19,313-19,316.  
 Cattle Improvement Committee, suggestion for (101).  
 Co-operative Milk Union, Calcutta, idea of, capable of expansion 19,215, 19,271.  
 ———, municipal subsidy for (98), 19,269, 19,270.  
 ———, success of, in inducing owners to take interest in their cattle (98).  
 ———, work of (98), 19,209-19,214, 19,206-19,264.  
 Cows, neglect of 19,170-19,173.  
 Crossing, of Indian breeds 19,156, 19,231.  
 ———, with European strains, valuable only for milk supply 19,149, 19,235-19,237.  
 Cultivators, measures necessary to interest, in animal husbandry (102).  
 Dairy products, demand for 19,219, 19,220.  
 Dairy work, might be carried out at jails and district and central farms (101).  
 District agricultural farms, herds at, might be utilised for improvement of cattle (101).  
 ———, might be utilised for dairy work (101).  
 European cattle, susceptibility of, to, underpest 19,335-19,338.

## INDEX

### KERR, Mr. P. J.—*contd.*

#### ANIMAL HUSBANDRY—*contd.*

- Fodder, effect of feeding with, on milk yield 19,287-19,294, 19,300-19,302, 19,339-19,341.
- , need for growing 19,183-19,185
- , period of shortage of (102).
- , preservation of. *see* Silage.
- Grazing grounds, in Bengal, of no food value (101), 19,303-19,307.
- Jails, herds kept at, their utilisation for cattle improvement (101), 19,234, 19,303-19,310.
- , might be used for dairy work (101).
- Milk yield, improvement in, through feeding with fodder crops 19,287-19,291, 19,300-19,302, 19,330-19,341.
- Plantain leaves as fodder (101).
- Silage, dry, need for experiments with (102), 19,166-19,168.
- , difficulties of ordinary methods of preserving 19,169.
- Sudi cattle, more liable to rinderpest 19,310, 19,331-19,335.

#### VETERINARY:

- Cattle mortality statistics, untrustworthy 19,249-19,255.
- Central Veterinary Bureau for control of contagious diseases, need for (98).
- Compulsory inoculation, would tend to stop voluntary notification (100).
- Contagious diseases, control of, by segregation, impossible (100).
- , Central Veterinary Bureau for (98)
- , legislation for, difficult to enforce (99, 100), 19,190, 19,200.
- , must be vested in Provincial Government, not District Boards (98), 19,137, 19,138.
- , should be subject to advisory control of Government of India (98).
- , difficulties of dealing with (99).
- , emergency staff for 19,167-19,169.
- , failure to notify, should be penalised (100), 19,321-19,324.
- , need for adequate organisation to deal with when reported (100).
- , notification of (100), 19,250-19,255, 19,272-19,276.
- Co-ordination of provincial veterinary work, need for (98).
- Cultivators, attitude of, towards veterinary work (99), 19,281-19,283
- Dispensaries, at district headquarters, should be transferred to provincial control (99).
- , clinical, one should be provided for each *thana*, by arrangement with Union Boards (99), 19,181-19,185, 19,246-19,248, 19,296-19,299.
- , control of, by District Boards, unsatisfactory (99)
- , defects of, suggestions for improving (99).
- , supervision of (99), 19,242-19,245.
- , touring, none in Bengal (99).
- District Boards, control of dispensaries by, *see* Dispensaries
- , control of Veterinary Assistant Surgeons by (q.v.).
- , their attitude to veterinary work 19,174, 19,280-19,284.
- European cattle, their susceptibility to rinderpest 19,335-19,338
- Financing of veterinary research (98), 19,223, 19,224.
- Foot and mouth disease 19,239.
- Inoculation, charging of fees for, by District Boards, a handicap to its use (100).
- , discouraged by Government (100)
- , serum for, cost of, in Bengal, Rs.60,000 to Rs.1,00,000 a year (100).
- , should be paid from provincial revenues 19,138.
- , sterilisation of, impossible at present 19,237, 19,239.
- , suggestions for supply of 19,210, 19,241.
- Muktesar Institute, should be enlarged and reorganised (98, 101).

# INDEX.

KERR, Mr. P. J.—*contd.*

## VETERINARY—*contd.*

- Muktesar Institute, should co-ordinate provincial research (101).  
 Propaganda to demonstrate value of veterinary work (100), 19,285, 19,286.  
 Provincial Government, should control contagious disease staff and district headquarters dispensaries (99).  
 Provincial research laboratories, need for (98).  
 Research, at Veterinary College 19,258-19,263.  
 ———, need for provincial (98, 100, 101).  
 Rinderpest, avenues of infection 19,191-19,196.  
 ———, cyclic tendency of 19,195, 19,196.  
 ———, inoculation against, simultaneous method, success of 19,191  
 ———, adoption of, by cultivators 19,192, 19,193.  
 ———, *see also* inoculation.  
 ———, prevention of spread of, by blocks of immunised villages, difficult 19,197, 19,198.  
 ———, susceptibility to, of Sindi and European cattle 19,310, 19,331-19,333.  
 ———, the most formidable disease in Bengal 19,190.  
 ———, *see also* Contagious disease.  
 Serum, *see* Inoculation.  
 Sindi cattle, are more liable to rinderpest 19,310, 19,331-19,333.  
 Union Board, scheme for co-operation by, to maintain a clinical dispensary in each *thana* 19,181-19,185, 19,246-19,248, 19,290-19,299.  
 Veterinary Adviser with Government of India, need for appointment of (94).  
 ———, should be Director of Muktesar (99).  
 ———, work of (101).  
 ———, would not have time to conduct research (101), 19,140  
 ———, but should have general direction of research 19,141-19,144.  
 Veterinary Assistant Surgeons, control of, by District Boards, unsatisfactory (99), 19,171-19,172.  
 ———, two needed for each subdivision 19,177.  
 Veterinary college, work of laboratory at 19,258-19,263.  
 Veterinary Department, in Bengal, staff of, duties of 19,186-19,189.  
 ———, subordinate, corruption amongst 19,179.  
 ———, superior, need for increasing 19,180.  
 ———, should be independent of Agricultural Department and under Veterinary Adviser to Government of India (98, 99), 19,145

McLEAN, *et* FINLOW.

## MARKETING.

- Araddars, function of (*Morgan*) 21,426-21,428, 21,503, 21,504, 21,528, 21,592, (*Burrows*) (476, 477).  
 Beparis, do not as a rule engage in moneylending (*Morgan*) 21,490.  
 ———, function of (*Morgan*) 21,492-21,495, 21,626, (*Burrows*) (476).  
 Calcutta Jute Dealers Association (*Morgan*) 21,586-21,593, 21,635-21,638.  
 Cardamom, marketing of (*Mittra*) (134).  
 Chain of marketing from cultivators onwards (*Morgan*) 21,481-21,485, 21,581-21,583, 21,626-21,631, 21,693-21,695, 21,700-21,705.  
 Communications, *see* under ADMINISTRATION.  
 Consumption of jute, stable (*Morgan*) 21,618-21,620, 21,737-21,742.

# INDEX.

## MARKETING—*contd.*

- Co-operative jute-buying organisation (*Tinlow*) (14), 18,061-18,068.  
 Co-operative jute sale societies, aim of, to eliminate middlemen (*Mitra*)  
 10,926, 10,927.  
 -----, 5 already working (*Mitra*) 19,921, 19,925,  
 -----, capital of (*Mitra*) 19,536.  
 -----, great possibilities of (*Morgan*) 21,505,  
 21,506, 21,659, 21,659.  
 -----, have established good reputation in  
 Calcutta (*Mitra*) (135).  
 -----, hire their own godowns (*Morgan*) 21,503,  
 21,509.  
 -----, methods and work of (*Mitra*) 19,536-  
 10,540, 10,926-10,932, (*Burrows*) (477),  
 23,096, 23,097.  
 -----, opposition to from vested interests  
 (*Mitra*) 10,928.  
 -----, spreading (*Morgan*) 21,726-21,729.  
 -----, trading risk of, borne by members  
 (*Morgan*) 21,514-21,516.  
 -----, will arrange their own transport and take  
 jute to final market (*Morgan*) 21,507,  
 21,511-21,513, 21,753.  
 Crop forecasts, (*Tinlow*) (14, 15); *see also* Jute forecasts.  
 -----, margin of error in, probably constant (*Burrows*) (478).  
 -----, might be of demand as well as supply (*Burrows*) (477),  
 23,692-23,701.  
 Crop returns, should be made available to cultivators (*Mitra*) (134, 135).  
 -----, are fairly accurate (*Morgan*) 21,621, 21,622.  
 Cultivators, are in touch with market conditions (*Morgan*) (273), 21,497,  
 21,498, 21,614-21,616, 21,711-21,718, 21,761-21,764, (*Burrows*)  
 (477), (*Roy*) 21,400, 21,401.  
 -----, are interested in jute prices (*Tinlow*) 18,032.  
 -----, do not sell direct to large jute firms (*Morgan*) 21,499, 21,500,  
 21,579, 21,580.  
 -----, essential to secure fair share of value of produce for (*Tinlow*)  
 18,052, 18,053.  
 -----, financing of (*Morgan*) 21,489.  
 -----, hold up their crops for better prices (*Burrows*) (477, 478).  
 -----, making jute forecasts known to, *see* Jute forecasts.  
 -----, not in a position to hold up their jute, whatever information  
 they receive (*Morgan*) 21,722, 21,723.  
 -----, price received by, governed chiefly by supply and demand  
 (*Morgan*) 21,493-21,496.  
 -----, should be given fuller information as to crops and prices  
 (*Tinlow*) 18,071-18,076, (*Mitra*) (134), (*Mukherjee*) (181),  
 20,101-20,108, (*Burrows*) (477), (*Jute Mills Association*)  
 23,272, 23,273, *see also* under Jute.  
 -----, where communications are bad, do not get proper price for  
 their produce (*Roy*) 21,401-21,403.  
 Dadan system of advancing money against crops, not common (*Burrows*)  
 (477), 23,694, 23,695.  
 Existing market facilities, satisfactory from point of view of jute trade  
 (*Jute Mills Association*) (416)  
 -----, but not necessarily so from point of view of  
 cultivators (*Jute Mills Association*) 23,215,  
 23,216.  
 -----, unsatisfactory (*Ahmed M.*) (560).  
 Farias, function of (*Morgan*) 21,482-21,485, 21,696-21,708, 21,753, (*Burrows*)  
 (476).  
 Fluctuations in price of jute, publishing of (*Morgan*) 21,555-21,572.  
 -----, sometimes violent (*Morgan*) 21,529, 21,554,  
 21,617.  
 Government certificates of purity and packing would be valuable for export  
 trade (*Mitra*) (134).  
 Hundi, not used in Faridpur district (*Burrows*) (477), 23,693.

# INDEX.

## MARKETING—*contd.*

- Indian Tea Association, membership of (*Indian Tea Association*) 23,031, 23,038.
- Indian Tea Cess Committee, expenditure of, on propaganda (*Indian Tea Association*) (397), 23,074, 23,075.
- , finance of (*Indian Tea Association*) 22,945.
- , is concerned only with advertising (*Indian Tea Association*) 22,048.
- , memorandum on (*Appendix*) (*Indian Tea Association*) (396, 397).
- , relations of, with Indian Tea Association (*Indian Tea Association*) 22,942.
- , results of work of (*Indian Tea Association*) 22,946-22,948.
- Indian tea, chiefly exported to England (*Indian Tea Association*) 23,073, 23,108.
- Indian tea industry, position of, in world market (*Appendix*) (*Indian Tea Association*) (413).
- Information on market conditions, of little value to cultivators at present owing to their ignorance (*Mullick*) (352), (*Burrows*) (477), 23,691; see also under Cultivators
- , showing possible demand for agricultural produce, need for (*Mitra*) (135), (*Burrows*) (477).
- Inquiry into channels of marketing, value of (*Finlow*) 18,050, 18,051, 18,069, 18,070.
- June, 65 lakhs of bales consumed in Indian mills and 35 exported (*Morgan*) 21,664, 21,711, 21,712.
- , finished product, chiefly exported (*Morgan*) 21,560-21,568
- , 4 grades of, recognised by trade (*Morgan*) 21,794.
- , basis of grading (*Morgan*) 21,802.
- , improved varieties of, are mixed with ordinary varieties at mills (*Morgan*) 21,677, 21,678, 21,745-21,749.
- , command a premium (*Morgan*) 21,747-21,751.
- , if resulting in increased yield, would lower the price (*Morgan*) 21,787, 21,740-21,743.
- , more suitable for Calcutta mills than for export (*Morgan*) 21,679.
- , India's position in regard to, secure in immediate future (*Finlow*) 18,073-18,075, 18,089-18,095, 18,813.
- , in storage, making information concerning known to cultivators (*June Mills Association*) 23,200-23,214, (*Ahmed M.*) 24,588.
- , marketing of (*Finlow*) (13, 14), 18,030-18,041, (*Mitra*) (*Appendix*) (137, 138).
- , minimum price of, should be fixed and broadened before sowing commences (*Ahmed M.*) (560), 24,586-24,596.
- , need for evolving variety fibre of which will suit both Dundee and India (*Mitra*) (131), 19,570-19,573.
- , need for watching world demand and affording information to cultivators (*Finlow*) 18,076, 18,081, 18,092.
- , note on average price of, and profits of cultivation (*Finlow*) (81).
- , number of bales of, sold (*Mitra*) 19,936-19,941.
- , pressing of (*Morgan*) 21,501, 21,509, 21,510, 21,584.
- , producers of, do not get fair price owing to intervention of middlemen (*Mitra*) 19,929-19,942.
- , quality of, required for Dundee and Calcutta (*Morgan*) 21,675-21,677.
- , regulation of quantity of, by better dissemination of market intelligence (*Morgan*) 21,713.
- , speculation in (*Morgan*) 21,528, 21,604-21,606, 21,707, 21,708.
- , stable supply of, desirability of (*Morgan*) 21,526
- , lack of, harm done by (*Morgan*) 21,519, 21,526, 21,618-21,620.
- , lack of, more pronounced than formerly (*Morgan*) 21,527-21,529.

# INDEX.

## MARKETING—contd

- Jute, substitutes for, not a serious menace (*Morgan*) 21,681-21,686.  
 Jute brokers (*Morgan*) 21,517-21,551.  
 Jute forecasts, accuracy of (*Morgan*) 21,621-21,625, (*Jute Mills Association*) (416), (*Finlow*) (15)  
 ———, assistance of, to millowners (*Morgan*) 21,725.  
 ———, to speculators (*Morgan*) 21,721.  
 ———, effect of, on cultivators (*Morgan*) 21,690, 21,691.

 Turmeric, marketing of (*Mitra*) (138).  
 Vegetables, marketing of (*Mitra*) (138).  
 Weights and measures, standardisation of (*Finlow*) 18,055-18,060, (*Morgan*) 21,710.  
 ———, variations in (*Morgan*) 21,705, 21,709, (*Mitra*) (138)

MAURER, see HUTCHINSON.

MILLIGAN, see INDIAN TEA ASSOCIATION.

MITRA, Rai Bahadur J. M., M.A., Registrar of Co-operative Societies (127-138), 19,393-20,010.

## ADMINISTRATION

- Agricultural Service, is too understaffed to be efficient (128).  
 All-India Research Board, need for, to co-ordinate agricultural and veterinary research (127), 19,781-19,783.  
 Branch and feeder lines, Government assistance for (129).  
 ———, need for further (129).  
 Communications, effect of, on market facilities (134).

## INDEX.

**MITRA, Rai Bahadur J. M.—contd.**

### ADMINISTRATION—contd.

- Financing of research, from revenue (127).
- , by small export cess (127), 19,783-19,787
- Railways and steamships, competition between, has not benefited the cultivator (129).
- Roads, lack of (129).
- Veterinary Service, is too understaffed to be efficient (128).

### AGRICULTURAL INDEBTEDNESSES:

- Bengal Tenancy Act, effect of 19,515-19,517.
- Causes of borrowing (129).
- Control of credit, except in case of backward tribes, undesirable (130), 19,825, 19,826.
- , may raise rate of interest 19,801, 19,895
- Fabrication of accounts by moneylenders as a cause of indebtedness (129), 19,813
- Jute, fluctuations in price of, a serious cause of indebtedness (129), 19,810-19,812.
- Moneylenders, rates of interest of, have been reduced by credit societies 19,496, 19,497.
- Moneylending landlords 19,896-19,901.
- Mortgage and sale, right of, should not be limited (130).
- Non-terminable mortgages, should be restricted (130).
- Reasons preventing repayment (129).
- Rural debt in Bengal, amounts to about 60 crores 19,819, 19,823
- , is more or less stationary 19,828, 19,829, 20,000-20,003.
- , relief of, by spread of co-operative movement and land mortgage banks (130).
- , from savings of agriculture 19,815-19,818.
- , special measures to deal with, unnecessary (129)
- , statistics regarding, value of 19,050-19,659.
- Sources of credit (129).
- Usurious Loans Act, should not be enforced (129), 19,811.

### AGRICULTURAL INDUSTRIES:

- Co-operative rice mill, experiment with (133).
- Cultivators, number of days worked by (133).
- , their attitude towards subsidiary industries (133).
- Government, should take steps to promote subsidiary industries (133)
- Industries for using agricultural produce (133).
- Inquiry into subsidiary industries, not needed (133), 19,835, 19,836
- Jute spinning and weaving (133).
- Marketing of products, need for facilities for (133), 19,830.
- , question of, does not arise when products consumed at home 19,831, 19,832.
- Rope-making (133).
- Spinning, advantages of (133).
- Tree-cotton growing and spinning (133), 19,458-19,462.
- Village improvement by spare-time labour, possibility of 19,833, 19,834

### AGRICULTURAL LABOUR:

- Cultivable uncultivated lands, migration of labourers to, may be encouraged by grants of land on equitable terms (134)
- Seasonal migration of labour (134).
- Shortage of labour, seasonal (134).
- Unemployment in rural areas, is seasonal only (134).

### ANIMAL HUSBANDRY:

- Animal nutrition, importance of investigating (133).
- Cattle in Bengal, bad condition of, partly due to fact land is easily tilled (133).
- Co-operative Milk Societies, success and work of (132).

# INDEX.

MITRA, Rai Bahadur J. M.—*contd.*

## ANIMAL HUSBANDRY—*contd.*

- Co-operative Milk Union, Calcutta, objects of 19,888, 19,891.  
—, success and work of (132).
- Dairy industry (132).
- Fodder, insufficiency of dry, due to cultivators selling their stock owing to high prices (133).
- , green, period of scarcity of (133).
- Grazing, poor through overstocking of common pastures (133).
- Improvement of breeds, importance of 19,455.
- Silage, need for investigation of 19,456, 19,457.

## ATTRACTING CAPITAL.

- Land tenure system and Bengal Tenancy Act, react against investment of money in land improvement (136).
- Large farms, will replace peasant proprietors and are undesirable (136).

## CO-OPERATION.

- Adult education, success of co-operative night schools for (128), 19,395-19,400.
- Assistant Registrars, work of 19,624, 19,625, 19,692-19,694.
- Audit, of co-operative societies, carried out by inspectors 19,499-19,503.  
—, *See also* Inspectors.
- , fees for, pay for audit staff 19,620.
- , need for strengthening 19,465, 19,466.
- , present system, better than audit by chartered accountant 19,855.
- , one auditor for every 100 societies 19,626-19,628.
- of Provincial Bank 19,853-19,855.
- Audit fund, control of 19,856-19,858.
- Bengal Co-operative Organisation Society, constitution of 19,505, 19,506.  
—, need for encouraging (135).
- Central Banks, capital of 19,682-19,685.
- , meetings of, attended by members of primary societies 19,491-19,493.
- , conducted in vernacular 19,482-19,487.
- , number of 19,474.
- , procedure of, in dealing with loan applications 19,722-19,730. *See also* Short-term loans
- , should be linked to money market through Provincial Bank (129).
- , take the place of Supervising Unions in Bengal 19,470-19,473, 19,479-19,481.
- Compulsion of obstinate minorities (136), 19,537, 19,538, 19,670-19,675, 19,964, 19,965.
- Co-operative Department, co-operation of, with Agricultural Department 19,660-19,664, 19,765, 19,774, 19,775.
- , with Education Department 19,804-19,809.
- , with Irrigation Department 19,636-19,640, 19,966, 19,967.
- , with Revenue Department 19,643-19,655.
- , staff of, many belong to same class as members of primary societies 19,906, 19,907.
- , requires strengthening (135), 19,465, 19,466.
- , sent to other Provinces to study 19,850, 19,851.

# INDEX.

MITRA, Rai Bahadur J. M.—*contd.*

## Co-operation—*contd.*

- Co-operative Milk Union, Calcutta, *see under* ANIMAL HUSBANDRY.
- Co-operative Movement, aims of (135).
- , educative value of, greater than economic value 19,404.
- , Government financial assistance for, 3 to 4 lakhs, 19,620-19,624.
- , has 12,000 societies in Bengal 19,739.
- , periods of surplus and stringency in 19,621-19,645.
- , principles of, teaching of, in schools 19,791-19,793.
- , understood by members of primary societies 19,818, 19,849.
- , propaganda through (128).
- , soundness of 19,611, 19,612, 19,697-19,699, 19,703-19,705.
- , spread of, will lighten agricultural indebtedness (130).
- , the only satisfactory way of financing agricultural operations (129).
- Credit societies, audit of, *see* Audit.
- , can give short and intermediate term loans (129).
- , defects of (135), 19,519-19,520, 19,718, 19,719, 19,905.
- , distribution of short-term credit by, method for (135), 19,519, 19,520.
- , expert advice for 19,469, 19,737, 19,738.
- , have reduced moneylenders' rates of interest (135), 19,490, 19,497.
- , interest charged and paid by 19,719, 19,720, 19,975-19,980.
- , management of 19,469, 19,733-19,736.
- , maximum credit for, fixing of 19,567-19,577.
- , procedure of, in dealing with loan applications 19,722-19,730, *see also* Short-term loans.
- , reserve funds of (*q.v.*).
- , secretaries for 19,885-19,887.
- , should be linked to Central Banks (129).
- , undertake education, arbitration and social welfare work 19,700-19,703.
- Disputes between co-operative organisations, settlement of 19,715-19,717.
- District officers, their help welcomed, but should not be given definite responsibilities towards co-operative movement 19,613-19,655.
- Educative value of co-operative movement, greater than economic value 19,404.
- Fertilisers, co-operative distribution of (131), 19,766-19,771.
- Government, role of, towards co-operative movement (135), 19,680.
- , *see also* Organisation of co-operation.
- Grain banks, have not been successful 19,761, 19,762.
- Home sales, *see* Savings deposits.
- Implement societies (132, 130), 19,913-19,916.
- Industrial societies, 19,770-19,778.
- Inspectors, for auditing co-operative societies, number of, 19,500.
- , pay and prospects of 19,501, 19,600-19,604.
- , training of 19,605-19,609, 19,812-19,817.
- , work of, efficient 19,502, 19,603.
- Inspectors, for propaganda and supervision 19,761-19,769.
- Irrigation societies, *see under* IRRIGATION.
- Joint farming societies (130).
- Joint sale societies, aim of, to eliminate middlemen 19,926, 19,927.

## INDEX.

MITRA, Rai Bahadur J. M.—*contd.*

### CROPS AND CROP PROTECTION:

- Crop returns (131, 135).
- Cultivators, prefer crops which occupy land for short time only (128), 19,405.
- Gun licences, should be liberally granted to cultivators (131).
- Jute, area of, under improved and ordinary seed 19,563-19,569.
- , need for evolving variety fibre of which will suit Dundee and Indian market (131), 19,570-19,573.
- Monkeys, do great damage (131).
- , objections to destroying, gradually disappearing (131), 19,451-19,453.
- Seed distribution, by co-operative societies (131), 19,408, 19,409, 19,559, 19,560, 19,892, 19,893.
- , by private agency (131), 19,446-19,450.
- , delay a cause of difficulty 19,561, 19,562.
- , success of, primarily due to efficacy of seeds (128), 19,406, 19,407.

### DEMONSTRATION AND PROPAGANDA:

- Co-operative societies and propaganda (128).
- Demonstrations, examples of success of (128).
- , on cultivators' own fields, suggested methods for (128).
- Lectures, value of (128).

### EDUCATION:

- Adult education, female, no demand for 19,401-19,403.
- , may be popularised by means of night schools (128).
- , co-operative night schools for, classes at, 19,400.
- , —, —, success of (128).
- , —, —, teachers for, 19,395-19,399.
- , use of magic lanterns and cinemas for (128).
- Agricultural bias, should be given to all education (130)
- Agricultural education, usually sought with aim of Government service (128).
- Co-operative principles, teaching of, in schools, 19,791-19,793.
- Middle-class youths, lack of land a hindrance to their taking to agriculture (128).
- , make suitable officers for agricultural work, 19,610, 19,611.
- , salaries required to attract, 19,617-19,619.
- , training required, 19,612-19,616.
- Nature study, necessity for (128)
- Primary schools, financed by co-operative society profits, scheme for (128), 19,404, 19,794-19,803.
- Rural schools, should be administered by local bodies (128), 19,788-19,790.
- , too much attention should not be paid to buildings for (128).
- School plots or farms, should be attached to middle and high schools in rural areas (128).

### FERTILISERS:

- Ammonium sulphate, value of (131).
- Adulteration, may be prevented by legislation (131).
- , and by co-operative distribution (131)
- Bonemeal, export of, should be prohibited (131), 19,772, 19,773.
- , high price of, due to export (131), 19,767-19,771.
- , value of (131).
- Co-operative distribution of fertilisers (131), 19,766-19,771.
- Cowdung, cannot be replaced as fuel unless a cheap substitute is provided (131).

## INDEX.

MITRA, Rai Bahadur J. M.—*contd.*

### FINANCE.

Central Banks, *see under* Co-operation.

Land mortgage banks, at Naogaon, work of 19,507-19,514.

\_\_\_\_\_, difficulties caused by Bengal Tenancy Act 19,515-19,517.

\_\_\_\_\_, need for co-operative, for long term loans (129).

Long term loans, should be provided by land mortgage banks (129).

Short term loans, procedure for distributing, by co-operative societies (127), 19,519, 19,520, 19,578-19,592.

\_\_\_\_\_, should be provided by co-operative societies (129).

Taccavi, no need for fuller use of (129), 19,521-19,523.

\_\_\_\_\_, only given in years of scarcity (129).

### FORESTS.

Afforestation as a remedy for soil erosion (131).

Forests in Bengal, confined to hill tracts (134).

Fuel, may be provided by planting uncultivable waste land near villages under management of Union Boards or co-operative societies (134).

### HOLDINGS.

Consolidation, co-operative (130), 19,415-19,417.

\_\_\_\_\_, need for investigating possibilities of (130).

\_\_\_\_\_, obstacles to (130).

Land tenure system, effect of, on consolidation (130).

### IMPLEMENTS:

Agricultural engineer to deal with implements, lack of, a handicap 19,917-19,920.

Co-operative implement societies (136), 19,913-19,916.

Foreign implement manufacturers, might utilise co-operative societies for distribution (132).

Improved implements, conditions for adoption (132).

\_\_\_\_\_, lack of suitable (132), 19,913-19,923

### IRRIGATION.

Canal irrigation, scope for further (130).

Co-operative irrigation societies, aims of 19,959-19,963.

\_\_\_\_\_, can construct minor irrigation works (130), 19,418-19,441, 19,753-19,760.

\_\_\_\_\_, compulsion of obstinate minorities (136), 19,557, 19,558, 19,670-19,675, 19,964, 19,965.

\_\_\_\_\_, have been very successful (136).

\_\_\_\_\_, technical advice for 19,422-19,430, 19,574-19,577.

\_\_\_\_\_, technical advice for, by Irrigation Dept unsatisfactory 19,636-19,640, 19,966, 19,967.

\_\_\_\_\_, technical advice for, should be provided by whole-time irrigation officer under Co-operative Dept. 19,968-19,972.

Distribution of canal water, suggestions for improving (130).

Irrigation, need for comprehensive policy of, in Western Bengal (131).

Minor irrigation works, co-operative construction of, *see* Co-operative irrigation societies.

\_\_\_\_\_, have fallen into decay in many places (130).

\_\_\_\_\_, increased fertility due to 19,440.

\_\_\_\_\_, progress made in, by co-operative effort (130), 19,418-19,441.

\_\_\_\_\_, scope for further (130), 19,418.

River system in Presidency division, need for controlling (131).

## INDEX.

MITRA, Rai Bahadur J. M.—*contd.*

### MARKETING:

- Cardamom, marketing of (138).  
 Communications, effect of, on markets (131).  
 Crop returns, are sometimes used to detriment of cultivators (134, 135).  
 \_\_\_\_\_, should be made available to cultivators (134, 135).  
 Government certificates of purity and packing, valuable for export trade (134).  
 Information on market conditions, should be made readily available to cultivators (134).  
 \_\_\_\_\_, showing possible demand for agricultural produce, need for (135).  
 Jute, marketing of, note on (*Appendix*) (137, 138).  
 \_\_\_\_\_, middlemen employed in, methods, charges and numbers of (137), 19,929-19,942, 19,995-19,999.  
 —, need for evolving variety fibre of which will suit both Dundee and India (131), 19,570-19,573.  
 —, number of bales of, sold 19,936-19,941.  
 —, producers of, get only three-quarters proper price owing to intervention of middlemen 19,929-19,942.  
 —, sale societies for, *see under* Co-operation.  
 Marketing of products of subsidiary industries, need for facilities for (133), 19,830-19,832.  
 Methods of marketing, note on (*Appendix*) (137, 138).  
 \_\_\_\_\_, unsatisfactory (134).  
 Middlemen, *see* Jute, marketing of.  
 Paddy, marketing of (137).  
 Sale societies, *see under* Co-operation.  
 Tobacco marketing of (138).  
 Turmeric, marketing of (138).  
 Vegetables, marketing of (138).  
 Weights and measures, variations of, enable large profits to be made by middlemen (138).

### RESEARCH:

- All-India Research Board, need for, to co-ordinate agricultural and veterinary research (127), 19,751-19,753.  
 Financing of research, by small export cess (127), 19,783-19,787.  
 Indigenous methods of agriculture, need for studying (127).  
 Provinces, must have complete scientific staff of their own (127, 128).  
 Subjects suggested for research (127).

### SOILS.

- Drainage in Burdwan division, special features of and suggestions for improving (131).  
 Embankments to prevent ingress of salt water, investigation of, needed (131).  
 \_\_\_\_\_, co-operative societies for (131).  
 \_\_\_\_\_, need for (130, 131).  
 \_\_\_\_\_, obstacles to construction of (130, 131), 19,442-19,445.  
 Erosion, might be prevented by afforestation (131).  
 Soil survey, need for (128).

### STATISTICS:

- Crop returns (134, 135).

### TRIFFS:

- Export cess for financing of research (127), 19,783-19,787.

# INDEX.

MITRA, Rai Bahadur J. M.—*contd.*

## VETERINARY

- Cattle insurance societies (132).
- Contagious diseases, legislation to control (132).
- Dispensaries (132).
- Indigenous medicines should be investigated (132).
- Inoculation, efficacy of, doubted by cultivators (132)
- - - , fee for, acts as deterrent (132).
- Veterinary Department, should not be under Director of Agriculture (132).
- - - , too understaffed to be efficient (128).

## WATER

- Diet, need for research on (128).
- Economic surveys of typical villages, conducting of (136).
- - - - - , value of (136).
- Public health societies. *see under* Co-operation.
- Water supply, importance of puro (136).

MOMEN, K. B. M.A., Magistrate Collector (on leave), late officiating Director of Land Records and Surveys (319-330), 22,093-22,441.

## ADMINISTRATION:

- Agricultural Department, need for increasing subordinate staff of (322), 22,419, 22,428, 22,429.
- - - - - , out of touch with cultivators and unpopular (322), 22,193-22,204, 22,428.
- - - - - , too heavy (322), 22,329-22,337, 22,417, 22,418
- - - - - , understaffed and not properly financed (321)
- All-India Agricultural Service, unnecessary (321).
- Central All-India scientific organisation for agriculture, unnecessary (321), 22,104.
- Circle officers, might act as secretaries of Union Boards 22,442.
- Co-operation between Provinces in agricultural matters (321).
- Deputy Directors of Agriculture, out of touch with cultivators (322), 22,319-22,322.
- District Agricultural Officers, do not take sufficient interest in their work (321), 22,318.
- - - - - , relations of, with Collectors 22,221-22,225
- - - - - , should ascertain requirements of cultivators and report to Collectors and Director of Agriculture (319).
- - - - - , should have more freedom of action (319), 22,410-22,412.
- - - - - , work of (322), 22,220
- District Boards, Chairmen of, non-official less satisfactory than official 22,117-22,125, 22,392-22,397, 22,438.
- - - - - , committees of 22,127-22,129.
- - - - - , inspection of 22,140-22,142
- - - - - , members of 22,126-22,131
- - - - - , relations of, with Government officers 22,398-22,400.
- - - - - , Secretaries of, need for paid 22,123, 22,124, 22,133, 22,135-22,139, 22,439-22,441.
- - - - - , Circle officers for 22,442.
- Meteorological Department, of no assistance to cultivators (322).
- Motors, effect of, on roads 22,105-22,107.
- - - , taxation of 22,108-22,116.
- Roads, effect of motor traffic on, *see* Motors.
- - - , under District Boards, deteriorating 22,117, 22,118.
- Union Boards, can do great deal to improve condition of agriculturists (319), 22,212-22,214.
- - - - - , should receive more help from Collectors (319), 22,215-22,218.

## INDEX.

### MOMEN, K. B.—*contd.*

#### AGRICULTURAL INDEBTEDNESS:

- Causes of borrowing (323).
- Co-operative societies, the only means of lightening rural debt (323).
- Credit as a cause of debt 22,279-22,287.
- Cultivators, alleged improvidence of (323).
- , income of (323, 328), 22,404-22,406.
- , poverty of (323, 328), 22,271-22,297.
- , percentages in and below comfort and above and in want (323), 22,403.
- , prosperity of, is declining 22,316-22,353, 22,434-22,437.
- , through indebtedness are becoming landless labourers (328), 22,294, 22,295.
- Economic survey in Jessore, in 1920-4 (326-330), 22,212-22,217.
- Mortgage and sale, right of, should not be limited (323).
- Usurious Loans Act, of no assistance (323), 22,294, 22,295.

#### AGRICULTURAL INDUSTRIES:

- Cultivators, subsidiary industries adopted by 22,176-22,180.
- Factories in rural areas, establishment of, hindered by bad communications (327).
- , should be started or subsidised by Government (327).
- Government, role of, in regard to subsidiary industries (326, 327), 22,369-22,374.
- Suggestions for subsidiary industries (326).

#### AGRICULTURAL LABOUR:

- Publicity to assist migration (327)
- Waste land, availability of, in various districts 22,154-22,161.
- , method of obtaining, by ryots 22,162-22,172.

#### ANIMAL HUSBANDRY:

- Agricultural Department, has neglected animal husbandry 22,192.
- Bulls, value of supplying good, to agriculturists (325).
- Cattle, proper care for and feeding of, rare in Bengal (325).
- Common pastures, lack of (326).
- , overstocked (326).
- Co-operative animal husbandry societies, scope for 22,193.
- Dairying industry, almost unknown in Bengal (326).
- , should be taught by Agricultural Department (326).
- Fodder crops, need for propaganda for growing of (325).
- , not grown in Bengal (325).
- , one-tenth of holdings should be reserved for (326).
- , shortage of (326).

#### ATTRACTING CAPITAL:

- Reasons preventing men of capital from taking to agriculture (327)
- Renting of land, pays better than farming (327).

#### CO-OPERATION:

- Caste difficulties in connection with membership of societies, non-existent 22,187-22,190.
- Central Bank, need for, in each Union 22,182, 22,183.
- Compulsion of obstinate minorities, need for (327).
- Co-operative Department, of great value and should receive more help than at present (319).
- Non-credit societies, developing 22,181.

#### CROPS:

- Improvement of existing crops, little scope for (325), 22,288-22,291.
- New crops, introduction of, important (325).
- Seed growing, and distribution, should be one of the chief activities of Government farms (325).
- , can be made profitable (325).

## INDEX

**MOMEN, K. B.—*contd***

### DEMONSTRATION AND PROPAGANDA

- Agricultural Department, not in touch with cultivators, *see under* ADMINISTRATION
- Cultivators, conservatism of (321), 22,099-22,100, 22,430-22,432
- , will adopt expert advice if easily available (321).
- Demonstration farms, at present run at a loss (322), 22,323-22,328, 22,426, 22,427.
- need for one in each sub-division (320, 322), 22,194
- Demonstrations on cultivator's own fields, necessary 22,194.
- Demonstrators, difficulties of 22,093-22,098.
- , importance of personality of (321).
- , increased number required 22,195-22,197.
- , qualifications, training and pay of 22,420-22,425.
- Deputy Directors of Agriculture, *see under* ADMINISTRATION.
- District Agricultural Officers, *see under* ADMINISTRATION

### EDUCATION

- Agricultural college, need for (320)
- Agricultural education in rural schools, unnecessary (319)
- Agricultural textbooks for rural schools (320).
- Government service, the inducement to take agricultural and other education (320)
- Middle-class youths, will be attracted to agriculture by proof that it will pay (321)
- School farms, preferable to plots (320).
- value of (320).
- Teachers, Preference need not be given to agricultural classes (320), 22,413-22,416.

### FERTILISERS

- Cowdung, not largely used for fuel in Bengal (325).

### FINANCE

- Agricultural and Sanitary Improvements Act, too cumbrous (325)
- Compulsory thrift 22,261-22,263.
- Credit societies, the best means of financing cultivators (322).
- District Land Improvement Fund, need for (322).
- Land Improvements Act, difficulty of taking loans under 22,239-22,241
- Taccari, conditions under which it might be given (323), 22,264-22,266
- , inelastic and unpopular (323).
- , joint liability system for, should be abolished (323)

### HOLDINGS

- Average holdings in Jessore, size of 22,143-22,146, 22,249-22,254, 22,303.
- Consolidation, impracticable owing to number of persons interested in land 22,147-22,152, 22,304-22,306, 22,378-22,389.
- , effect of permanent settlement on 22,365, 22,366.

### IRRIGATION :

- Co-operative irrigation societies, need for (324).
- , should be financed by Government (324).
- Irrigation, and drainage, importance of, in Bengal (324), 22,153.
- , scope for 22,407-22,409.
- Tanks, silting up of, owing to lack of interest of landlords and poverty of tenants (324).
- Well irrigation, unsuitable for Bengal (324), 22,367. 22,368.

### RESEARCH

- District Agricultural Officers, should carry out research (319).
- Provinces, must carry out research (319).

## INDEX.

**MOMEN, K. B.—contd.**

### SOILS :

- Floods, can be prevented by system of embankments, which should be erected by Government (325).
- , do great damage in Burdwan division (325).
- Productivity of land, has declined 22,302-22,361.
- Waterlogging, damage done by (325).
- , reclamation of land affected by, should be undertaken by Government (325).

### VETERINARY.

- Serum, not supplied promptly or in sufficient quantities (325).
- Veterinary Department, is understaffed (321).
- , should be under Director of Agriculture (325).

### WELFARE.

- Economic surveys of villages, elaborate, unnecessary (325).
- , particulars of survey in Jessore district.  
*see under AGRICULTURAL INDEBTEDNESS.*
- Education, a pre-requisite of economic and sanitary improvement (327).
- Settlement reports, value of (319).

**MORGAN, Mr. G., M.L.C., Proprietor, Morgan, Walker & Co. (272-274)**  
21,460-21,807.

### ADMINISTRATION

- Central organisation for agriculture, should act as co-ordinating body (272), 21,463-21,465, 21,660.
- Conferences of research workers, would be useful 21,663.
- Government of India, scientific staff with, need not be increased (272).
- Meteorological information, dissemination of 21,661-21,667.
- Provinces, should have complete scientific staff of their own (272).
- , co-operation between 21,661, 21,662.
- Railway Advisory Committee, constitution of 21,467-21,469.
- , does not hear complaints from actual growers 21,470.
- Railways, are apt to stave stations where there is no steamer competition (272), 21,466.
- , but on the whole give satisfactory service 21,471, 21,474.
- Transport of jute, difficulties of, co-operative societies to solve 21,755, 21,756.
- , give rise to number of middlemen 21,753.
- , improvement of 21,754.
- , rates for 21,791, 21,792.
- Wagons, supply of, for jute traffic 21,472-21,474.
- Waterways, use of, for transport of jute 21,607-21,614, 21,640-21,643.

### AGRICULTURAL INDEBTEDNESS :

- Capital, its investment in moneylending rather than agricultural improvement 21,730-21,736.
- Causes of indebtedness (272).
- Low price of produce when there is over-production, a cause preventing repayment (272).
- Sources of credit (272).

### AGRICULTURAL INDUSTRIES :

- Cultivators, work done by, during different periods of the year (273).
- Horticulture and fruit growing, work on, by Agricultural Society of India 21,803-21,807.
- Industrial concerns, cannot move to rural areas as they require whole-time skilled labour (273).
- Unemployment, does not exist in rural areas (273)

## INDEX.

### MORGAN, Mr. G.—*contd*

#### ANIMAL Husbandry

- Condition of country in rains and cost of feeding, prevent the keeping of good cattle (273).
- Fodder, hardly grown at all at present 21,668.
- , might be grown with manuring and irrigation (273), 21,668.

#### ATTRACTING CAPITAL.

- Capital, its investment in moneylending rather than agricultural improvement 21,730-21,736.
- Joint ownership, makes co-operation for land improvement impossible (274), 21,735, 21,736

#### Co-OPERATION.

- Co-operative jute societies, *see under* MARKETING.
- Government supervision and audit of co-operative societies will always be necessary (273).
- Non-official agencies, will not command confidence.

#### CROPS

- Crop forecasts, *see under* MARKETING.
- Jute, improved variety of, commands a premium 21,747-21,751.
- , has tendency to revert 21,660-21,672
- , mixed with ordinary varieties at mills 21,677, 21,678, 21,745-21,749.
- , more suitable for Calcutta mills than export 21,679.
- , water requirements of 21,572-21,678.
- , yield of, per acre 21,680-21,682.
- , if increased, will bring down prices 21,787, 21,740-21,743.
- , *see also under* MARKETING.
- Rotting, difficulties of 21,693.
- Seed, distribution of improved, through co-operative societies (273).
- , importance of testing 21,660, 21,670.

#### EDUCATION:

- Higher education, unsettles boys for the land (273).

#### FERTILISERS:

- Adulteration, prevalent and difficult to detect (272)
- Cowdung as fuel, should not be discouraged unless very cheap substitute available (272).
- Jute land, does not require fertilising when covered by silt 21,479, 21,480, 21,649-21,654.
- , more than half of, is covered by silt 21,649.

#### FINANCE:

- Co-operative movement, the best means of financing agricultural operations (272).
- Finance, need for provision of easy, for jute cultivators 21,799-21,801.
- Land mortgage banks (co-operative) to enable mortgages to be paid off, need for (272).
- Taccavi, abuses in distribution of 21,475-21,477.

#### MARKETING:

- Adulteration of jute, 21,707.
- Aratdars, function of 21,486-21,488, 21,503, 21,504, 21,623, 21,632.
- Beparis, do not as a rule engage in moneylending 21,490.
- , function of 21,482-21,485, 21,626.
- Calcutta Jute Dealers' Association, amount of trade controlled by 21,635-21,636.
- , composition and functions of 21,686-21,593.
- Chain of marketing from cultivators onwards 21,481-21,485, 21,681-21,583, 21,626-21,631, 21,693-21,695, 21,700-21,705.

# INDEX.

## MORGAN, Mr. G.—*contd.*

### MARKETING—*contd.*

- Consumption of jute, stable 21,618-21,620, 21,737-21,742.
- Co-operative jute societies, great possibilities of 21,503, 21,506, 21,658, 21,659.
- , hire their own godowns 21,508, 21,509.
- , spreading 21,726-21,729.
- , trading risk of, borne by members 21,514-21,516.
- , will arrange their own transport and take into to final market 21,507, 21,511-21,513, 21,768.
- Cultivators, are fully informed of market conditions (273), 21,407, 21,498, 21,644-21,646, 21,714-21,718, 21,761-21,761.
- , do not sell direct to large jute firms 21,499, 21,500, 21,579, 21,580.
- , financing of 21,489.
- , making jute forecasts known to, *see* Jute forecasts.
- , not in a position to hold up their jute, whatever information they receive 21,722, 21,723.
- , price received by, governed chiefly by supply and demand 21,493-21,496.
- Farias, function of 21,482-21,485, 21,696-21,706, 21,753.
- Fluctuations in price of jute, publishing of 21,555-21,558.
- , sometimes violent 21,529, 21,554, 21,617.
- Improved varieties of jute, are mixed with ordinary varieties at mills 21,677, 21,678, 21,745-21,749.
- , command a premium 21,747-21,751.
- , if resulting in increased yield, would lower the price 21,787, 21,740-21,743.
- , more suitable for Calcutta mills than for export 21,679.
- Jute, 55 lakhs of bales consumed in Indian mills and 35 exported 21,564, 21,711, 21,712.
- , finished product, chiefly exported 21,508-21,568.
- , 4 grades of, recognised by trade 21,791.
- , basis of grading 21,802.
- Jute brokers 21,547-21,551.
- Jute forecasts, accuracy of 21,621-21,625.
- , assistance of, to millowners 21,725.
- , to speculators 21,724.
- , effect of, on cultivators 21,690, 21,691.
- , should be made known to cultivators 21,519-21,526, 21,765-21,777.
- , time of issue of 21,687.
- Middlemen, margins on which they operate 21,501, 21,502, 21,594-21,600, 21,655-21,657, 21,758-21,760.
- , possibility of eliminating 21,752-21,754.
- , transport difficulties a cause of large numbers of 21,763.
- Moneylenders, have lion on crop if they advance money against it 21,491-21,494.
- Paikars, *see* Farias.
- Pressing of jute, done at godowns 21,504, 21,509, 21,510, 21,584.
- Quality of jute required for Dundee and Calcutta mills 21,676-21,677.
- Regulation of quantity of jute produced through better dissemination of market intelligence 21,713.
- Speculation in jute, 21,628, 21,601-21,606.
- , Bill to prevent, withdrawn 21,797, 21,798.
- Stable supply of jute, desirability of 21,620.
- , lack of, harm done by 21,519, 21,526, 21,618-21,620.
- , lack of, more pronounced than formerly 21,527-21,629.
- Substitutes for jute, not a serious menace 21,684-21,686.
- Weights and measures, standardisation of 21,710.
- , variations in 21,708, 21,709.

## INDEX.

### MORGAN, Mr. G.—*contd.*

#### SOILS :

- Jute land, large proportion of, is covered with silt and does not require fertilisers 21,479, 21,480, 21,649-21,654.
- , is not deteriorating 21,615-21,617.
- Soil analyses, necessity for 21,669.

#### STATISTICS :

- Cadastral survey, necessary to secure accurate agricultural statistics (274), 21,623-21,625.
- Crop returns, fairly accurate 21,621, 21,622.
- Jute forecasts, *see under* MARKETING.

#### TARIFFS :

- Jute cess, amount of 21,781-21,785.
- , possibility of increasing 21,784.

#### WELFARE :

- Economic surveys of villages, desirable 21,518.
- Malaria, not necessarily associated with jute cultivation 21,788-21,790.
- Sanitary conditions in up-country towns, good 21,530-21,532.
- Sweepers, in towns, mainly come from outside Bengal 21,533-21,539.
- , not found in villages 21,510.
- Water supply, tanks for 21,517, 21,518.

MUKHERJEE, Babu N. N., Secretary, Ranaghat Central Co-operative Bank (178-181), 20,076-20,606.

#### ADMINISTRATION :

- Agricultural Department, subordinate staff of, requires increasing (177), 20,077-20,080, 20,226-20,233.
- District Boards, revenue of 20,146-20,155, 20,177-20,185, 20,212-20,215
- Roads, bridging of 20,188-20,190.
- , improvement of, will have good effect on agricultural, economic and sanitary conditions (177, 181), 20,109-20,118.
- , financing of, by means of tolls (181), 20,118-20,133, 20,309-20,315, 20,529-20,532.
- , must go hand in hand with improvement or education 20,117.
- Rural development, financing of 20,118-20,155, 20,177-20,185, 20,212-20,215, 20,309-20,315, 20,318-20,326, 20,400-20,405, 20,529-20,532, 20,545-20,576.

#### AGRICULTURAL INDEBTEDNESS :

- Agricultural income of Bengal, is decreasing 20,540-20,544.
- Availability of money, not a cause of borrowing 20,504-20,507.
- Causes of borrowing (177).
- Control of credit of cultivators, undesirable (177).
- Dishonest accounting by moneylenders, not common 20,508, 20,509.
- Farming, difficulty of making money by (176), 20,246-20,252, 20,344-20,373 (on farm owned by witness).
- Litigation as a cause of debt (177), 20,446-20,450.
- Medical charges as a cause of debt (177), 20,279-20,282.
- Reasons preventing repayment (177).
- Rural indebtedness, special measures for, unnecessary (177).

#### AGRICULTURAL INDUSTRIES :

- Cultivators, need for instruction of, in subsidiary industries (179).
- , number of days worked by, about 300 a year (179), 20,470-20,472.
- Industries on co-operative or joint-stock basis should be established in rural areas (179).
- Obstacles to subsidiary industries (179).

## INDEX.

**MUKHERJEE, Babu N. N.—contd.**

### AGRICULTURAL LABOUR:

Cultivable uncultivated land, suggestions for colonising (180).  
Shortage of labour, due to prevalence of malaria (180).  
Wage rates for labourers 20,588-20,595.

### ANIMAL HUSBANDRY:

Cattle-breeding, difficult owing to lack of pastures 20,391-20,399.  
Co-operative agricultural and dairy farm at Ranaghat, scheme for (179),  
20,334-20,337, 20,464-20,469, 20,380-20,382.  
Dairy industry, can be improved by co-operative methods (179).  
Improvement of cattle, by castration of inferior animals (179).  
\_\_\_\_\_, by growing of fodder crops (179).  
\_\_\_\_\_, by prohibition of slaughter of primo and dry  
cows (179), 20,257-20,260.  
Zamindars, should be compelled to set aside land for grazing (179),  
20,294-20,299.

### ATTRACTING CAPITAL:

Farming, difficulty of making money by, *see under* AGRICULTURAL  
INDENTMENTS.  
Government, might guarantee interest on capital to encourage capitalists  
to take to agriculture (180).  
Tenancy Act, prevents investment of money in land improvement (180).  
20,301-20,308.

### CO-OPERATION:

Bengal Co-operative Organisation Society, State aid for (180), 20,473-  
20,476.  
Central Bank, Ranaghat, capital of 20,418-20,420.  
\_\_\_\_\_, deposits in, 20,421-20,427.  
\_\_\_\_\_, have to be refused on account  
of surplus 20,426.  
\_\_\_\_\_, directors of 20,430-20,432.  
\_\_\_\_\_, meetings of, are attended by members of  
primary societies 20,521-20,524.  
\_\_\_\_\_, conducted in vernacular 20,525-  
20,527.  
\_\_\_\_\_, primary societies under 20,428, 20,429.  
Central Banks, use of, for seed distribution (178).  
Consolidation, co-operative (177).  
Co-operative agricultural and dairy farm at Ranaghat, scheme for  
(179), 20,334-20,337, 20,464-20,469, 20,380-20,382.  
Co-operative Department, staff of, should be increased (180).  
Credit societies, interest charged by 20,451-20,453.  
\_\_\_\_\_, use of, for seed distribution (178).  
Government, role of, towards co-operative movement (180), 20,485.  
Legislative Council, seats on, should be allotted to representatives of  
co-operative movement (180).  
Non-credit societies, value of (180).  
Seed and manure stores, co-operative, value of (178).  
\_\_\_\_\_, one should be provided for each  
Union Board area (178).

### CROPS:

Central banks and primary societies, use of, for seed distribution (178).  
Co-operative seed and manure stores, value of (178).  
\_\_\_\_\_, one should be provided for each  
Union Board area (178).  
Improvement of existing crops, factors for (178).  
Jute, increased yield due to introduction of improved 20,156-20,165.  
New crops, introduction of (178), 20,383-20,388.  
Potato cultivation, extending 20,387, 20,388.  
Seed distribution, co-operative (178).  
\_\_\_\_\_, need for care in, since failure shakes faith of  
cultivators (178).

## INDEX.

### MUKHERJEE, Babu N. N.—*contd*

#### CROPS—*contd*

- Seed distribution, of *charanah* paddy, failed in 1925 (177), 20,081-20,089, 20,166-20,174.  
 , of jute, partially failed in 1926 20,328-20,339, 20,410-20,417.

#### CULTIVATION

- Hiring out of improved implements, would improve cultivation (178).

#### DEMONSTRATION AND PROPAGANDA

- Cultivators, conservatism of, due to ignorance and illiteracy (177), 20,443-20,445.  
 Demonstrations, conditions for success of (176, 177).  
 —, examples of success of (177).  
 —, of scientific methods of production and conversion of raw material into finished products, need for (176), 20,374-20,379.  
 —, on cultivators' own holdings, with guarantee against loss 20,406-20,409.  
 Demonstrators, importance of increasing number of 20,077-20,080.  
 —, one needed for each *thana* 20,226-20,233.  
 —, training necessary for 20,234-20,245, 20,600-20,606.  
 Middle-class youths, suggestions for interesting, in agriculture, see under EDUCATION.  
 Union Board secretaries, might act as demonstrators 20,327.

#### EDUCATION

- Adult education, need for night schools for (176), 20,500, 20,501.  
 Agricultural education, generally sought with view of Government service (176).  
 —, lack of facilities for (176), 20,339-20,342.  
 —, need for practical (176).  
 Compulsory primary education, need for (180).  
 —, not introduced for financial reasons 20,134-20,145, 20,153-20,155.  
 Education, method of financing 20,145-20,155, 20,321, 20,322, 20,567-20,570.  
 —, the panacea for most evils (181).  
 Middle-class youths, agricultural ventures by, have failed (176), 20,441, 20,442.  
 —, can be interested in agriculture by proof that it will pay (176), 20,340-20,348, 20,360-20,373.  
 —, other suggestions for interesting (176), 20,374-20,379.  
 Night schools, see Adult education.  
 Teachers in rural areas, cannot at present be drawn from agricultural classes (176).

#### FERTILISERS:

- Co-operative seed and manure stores, value of (178).  
 —, one should be provided for each Union Board area (178).  
 Cowdung as fuel, use of, may be checked by offering high price for (178), 20,253, 20,254.  
 —, and by making other fuels available more cheaply (178), 20,577-20,580.  
 Cultivators, methods of encouraging, to use fertilisers (178).

#### FINANCE:

- Agricultural and Industrial Banks, need for establishing 20,486-20,499.  
 Agricultural and Sanitary Improvements Act, complexity of, hinders use (177), 20,283-20,288.  
 Land mortgage banks, should be established with liberal financial help from Government (177).  
 Long term loans provisions of Bengal Tenancy Act an obstacle to (177).  
 Short term loans, should be provided by co-operative societies (177).

## INDEX.

### MUKHERJEE, Babu N. N.—*contd.*

#### HOLDINGS:

- Consolidation, difficulties of (177).
- , value of skilled propaganda for 20,513-20,515.
- Co-operative consolidation societies, need for (177).
- Legislation, should be avoided if possible (177).
- Union Boards, should have authority to make consolidations binding for several years with consent of majority (177), 20,090-20,098.

#### IMPLEMENTS

- Demonstrations of improved implements, need for (178).
- Depots for improved implements, need for (178).
- Hiring of improved implements, value of (178).

#### IRRIGATION.

- Scope for irrigation (177).

#### MARKETING:

- Information on market conditions, should be afforded to jute cultivators (181), 20,101-20,108.

#### VETERINARY.

- Contagious diseases, obstacles to dealing with (178, 179).
- Dispensaries (178).
- Inoculation, obstacles to popularising (179).
- Serum, free supply of, necessary (179).
- Veterinary Department, should be under Director of Agriculture (178), 20,099-20,108.

#### WELFARE.

- Drinking water, at present obtained from tanks and wells 20,193, 20,194.
- , importance of pure (181).
- , precautions taken to ensure purity 20,195-20,206.
- Malaria, prevalence of, leads to shortage of labour (180).
- Medical and educational facilities, lack of, and bad communications, responsible for drift to towns (181).
- Rural development, financing of, *see under* ADMINISTRATION.
- Sanitary conditions in rural areas, improvement of (181).
- , money spent by District Boards on improvement of 20,209-20,211.

### MULLICK, R. B. K. N., Ranaghat (319-352), 22445-22672.

#### ADMINISTRATION:

- Board of Agriculture, Bengal, not yet functioning 22,503-22,515.
- Central institution for research, need for (349, 350).
- Meteorological information, summaries of, might be published in rural areas (350).
- Railways and steamers, should give better facilities for agricultural produce and provide cold storage (350).
- Roads, need for improvement of (350).
- Scientific staff of Government of India, should be increased (350).

#### AGRICULTURAL INDEBTEDNESS

- Causes of indebtedness (350).
- Moneylenders, the chief source of credit (350).
- Occupancy rights of cultivators 22,503-22,507.
- Reasons preventing repayment (350).
- Standard of living, increase in, harmful because due to borrowing (350), 22,610-22,621a.

#### AGRICULTURAL INDUSTRIES:

- Cottage industries, cannot be reorganised on bigger scale (351), 22,465, 22,466.
- Cultivators, are confined to bed for 60 to 90 days a year through illness (351), 22,457-22,461, 22,483, 22,481.
- Future of spare-time industries, doubtful owing to industrial competition (351), 22,462-22,461.
- Industrialisation of rural areas, undesirable (351).
- Spinning and weaving 22,470-22,482.

## INDEX.

MULLICK, R. B. K. N.—*contd.*

### AGRICULTURAL LABOUR

Migration of labour, local 22,485-22,495.

Shortage of labour, sometimes due to malaria (352)

— — — usually temporary and due to migration (352), 22,467.

### ANIMAL HUSBANDRY

Cows in Bengal, sometimes too small to allow good bulls to be used 22,658-22,660

Fodder crops, importance of demonstrations to secure growing of 22,661, 22,667.

— — —, not generally grown 22,653.

Stilos, construction of 22,665-22,672.

### ATTRACTING CAPITAL

Agriculture, will attract capital if found to be paying (352)

### CO-OPERATION.

Compulsion of obstinate minorities, undesirable and should be avoided by compensation (352), 22,468, 22,469.

Non-credit societies, need for developing (352).

### CROPS

Cost of cultivation and return from sugarcane and paddy (363, 364), 22,627-22,637

Gun licences, should be granted more freely (351).

Hybridisation, possibilities of, not yet explored (351).

Seed distribution, when seed comes from department, satisfactory; when from middlemen contains admixture of inferior seed 22,619, 22,620

— — —, need for better organisation of (351).

Sugarcane cultivation, handicaps to extension of 22,610.

— — —, more profitable than jute or paddy 22,600-22,609.

### CULTIVATION.

Present methods of cultivation, the result of centuries of experience and investigation (351).

Rotations 22,576-22,578.

### DEMONSTRATION AND PROPAGANDA:

Cultivators, will adopt expert advice if given more energetically than at present (349).

Demonstration farm, need for small commercial, near Calcutta, to demonstrate that agriculture can be made to pay 22,641-22,646.

Demonstrations in Ranaghat district 22,546-22,574, 22,681.

Demonstrations on cultivators' own holdings, should be with guarantee against loss (349).

### EDUCATION:

Agricultural education, demand for, depends on agriculture becoming profitable 22,542, 22,543.

Agricultural students, may be encouraged by grants of khas lands and loans (349), 22,446-22,451.

Chinsura agricultural school, failure of, due to apathy 22,538-22,542.

Middle class youths, may take to agriculture with Government help 22,495-22,499.

School farms and plots, valuable (349).

### FERTILISERS.

Cowdung, difficult to stop use as fuel (351).

— — —, insufficient available for fertiliser (350).

Green manuring (351).

Organic manures, need for increased use of (351)

Soil in Bengal, requires more organic matter (350).

## INDEX.

MULLICK, R. B. K. N.—*contd.*

### FINANCE:

Taccavi, amount available of, insignificant compared with vastness of country (350), 22,452, 22,453.

### HOLDINGS:

Consolidation, of doubtful value as tending to extinguish peasant proprietor class (350), 22,622-22,623, 22,634.

Litigation, artificial checks to, undesirable (350).

Occupancy rights of cultivators 22,603-22,507.

### IMPLEMENTS:

Foreign implements, of no value in Bengal (351).

Loans for purchase of machinery, may be useful (351).

Tractors, replacement of bullocks by 22,649-22,651.

———, scope for 22,661.

### IRRIGATION:

Irrigation schemes, scope for and obstacles to (350).

———, demand for, increasing 22,454-22,456.

### MARKETING:

Market and crop statistics, in Bengal, are inaccurate and should be corrected or stopped (352).

———, of little service to cultivators (352).

Middlemen, cause undue disturbance in crop market (352).

### RESEARCH:

Fodder, need for research on (349).

Water requirements of crops, need for research on (349).

### SOILS:

Soil in Bengal, requires more organic matter (350).

### STATISTICS:

Agricultural statistics, need for improvement of (352).

Foreign demands for Indian raw material, publication of (352).

OATEN, Mr. E. F., M.A., LL.B., M.L.O., Director of Public Instruction (452-454), (469, 470), 23,443-23,652.

### EDUCATION:

Adult education, female, *see* Female education.

———, hindered by lack of money 23,465.

———, importance of 23,464.

———, note on (*Appendix*) (469, 470).

———, value of, for preventing lapse into illiteracy of children 23,466-23,469.

Agricultural bias in education, not incompatible with attainment of literacy 23,446, 23,447.

Agricultural graduates, lack of openings for 23,470-23,473, 23,556.

Calcutta University Commission, proposals of, for higher agricultural education (453, 454).

Child labour, demand for, a hindrance to education (454), 23,536, 23,537.

———, may be met by adjustment of school hours 23,538-23,540.

Compulsory primary education in rural areas, cess for 23,510-23,513, 23,557-23,559, 23,601, 23,608, 23,609.

———, demand for 23,509, 23,510, 23,572.

———, legislation for, scope of and finance available, 23,478, 23,479, 23,497-23,504.

# INDEX.

OATEN, Mr. E. F.—*contd*

## Education—*contd*

- Compulsory primary education in rural areas, premature withdrawal of children under, means waste of public money 23,480-23,482.
- \_\_\_\_\_, suggestion for contracting—in by parents 23,483-23,486, 23,610.
- Co-operative Department, co-operation with, in education matters 23,620-23,622.
- District school committees, Government grants for 23,639-23,648.
- \_\_\_\_\_, staff and functions for 23,579-23,589.
- Educational advancement, essential for agricultural improvement 23,145.
- Educational survey of Bengal, need for 23,575-23,577.
- Examination at end of primary course, to prevent children leaving earlier, need for (151), 23,632-23,631.
- Expenditure on education, figures for 23,197-23,501, 23,601-23,607.
- \_\_\_\_\_, in Bengal, compared with other Provinces 23,560, 23,561.
- \_\_\_\_\_, on higher education, cannot be diverted to primary 23,562.
- \_\_\_\_\_, on higher education, disproportionately high 23,506-23,509, 23,548-23,551.
- Female education, adult 23,515, 23,547.
- \_\_\_\_\_, compulsory 23,565.
- \_\_\_\_\_, difficulties and importance of 23,460, 23,546.
- \_\_\_\_\_, inspectresses for 23,493-23,496.
- \_\_\_\_\_, lack of demand for 23,513-23,545.
- \_\_\_\_\_, teachers for 23,461-23,463.
- Guru training schools, 23,595-23,597.
- \_\_\_\_\_, pupils at, might be taken over by Government farms 23,640-23,652.
- \_\_\_\_\_, numbers of 23,487-23,489.
- Higher education system in Bengal, unrelated to rural economy (451).
- Inspecting staff, for female education, *see* Female education.
- \_\_\_\_\_, not selected from agricultural classes 23,615, 23,616
- \_\_\_\_\_, qualifications of 23,598.
- \_\_\_\_\_, should have some acquaintance with agriculture (454).
- Literacy, lapses from, owing to lack of reading matter 23,521-23,526.
- \_\_\_\_\_, tendency of, to unsettle boys for the land 23,532-23,535.
- \_\_\_\_\_, the primary aim of education 23,446.
- \_\_\_\_\_, value of, to agriculture 23,527-23,591.
- Moga type schools, value of 23,624-23,627.
- Nature study, instruction of teachers in 23,451, 23,452.
- \_\_\_\_\_, teaching of, a special art 23,449, 23,450.
- \_\_\_\_\_, value of (454).
- Normal schools, numbers of 23,487-23,489, 23,491.
- Primary education, adequate finance for, the first essential (452).
- \_\_\_\_\_, will be well repaid (452), 23,519, 23,520.
- \_\_\_\_\_, concentration of, in fewer schools 23,568, 23,573, 23,574.
- \_\_\_\_\_, curricula (452), 23,599, 23,600
- \_\_\_\_\_, grants in aid for, system of, defective 23,592-23,594.
- \_\_\_\_\_, need for efficient (453).
- \_\_\_\_\_, objection of upper classes to 23,551.
- \_\_\_\_\_, pupils at, figures showing numbers leaving before completing education (451).
- \_\_\_\_\_, less than 5 per cent. of attain literacy 23,521-23,523, 23,616-23,618
- \_\_\_\_\_, system for, lack of (152).
- \_\_\_\_\_, *see also* Expenditure on education.

## INDEX.

### OATEN, Mr. E. F.—*contd.*

#### EDUCATION—*contd.*

- Rural economics, degree in, should be given at Universities 23,492.
- \_\_\_\_\_, training in, not given to teachers 23,623.
- School farms, expenso of, generally prohibitive 23,455.
- \_\_\_\_\_, managment of, difficult 23,456.
- School gardens, value of (454), 23,448.
- Secondary school system, agricultural training in, as "practical arts" subject (454).
- \_\_\_\_\_, praotional (453).
- \_\_\_\_\_, vocational (453), 23,458, 23,459.
- \_\_\_\_\_, examination standards for, have declined and should be raised 23,474-23,477.
- \_\_\_\_\_, has become inadequate (452, 453).
- \_\_\_\_\_, in rural areas, should be brought into relation with life of country (453).
- \_\_\_\_\_, suggestions for improving (453).
- \_\_\_\_\_, teachers, securing living wage for, the first essential (453).
- \_\_\_\_\_, training of 23,490.
- Teachers, better type of, would tend to keep children at school 23,610-23,614.
- \_\_\_\_\_, calibre of, at Guru training schools, low 23,453.
- \_\_\_\_\_, do not form part of village life 23,617, 23,618.
- \_\_\_\_\_, for agricultural bins schools, will take long time to train 23,457.
- \_\_\_\_\_, female, paid higher than male 23,635-23,637.
- \_\_\_\_\_, not at present drawn from agricultural classes 23,602, 23,603.
- \_\_\_\_\_, salaries of, poor 23,454, 23,614.
- \_\_\_\_\_, *see also* Female education and Secondary school system.

### PEDDIE, Mr. J., L.C.S., Magistrate Collector, Malda (429-442), 23,270-23,412.

#### ADMINISTRATION:

- Railways and steamer facilities, adequate (425).
- Road Board, need for provincial (425).
- Roads, bad condition of, under District Boards, due to lack of money (425), 23,298.
- \_\_\_\_\_, need for extra taxation (such as cart tax) to improve (425). 23,299, 23,300, 23,429, 23,430.

#### AGRICULTURAL INDULTRDNESS:

- Causes of borrowing (425, 426).
- Courts, often inaccessible to poorer classes (426, 427).
- Interest charged by moneylenders, excessive (426, 427).
- \_\_\_\_\_, may be reduced by activities of credit societies 23,309, 23,310.
- \_\_\_\_\_, should be limited (427).
- Land, is passing out of hands of real cultivators (426), 23,301.
- \_\_\_\_\_, effect of this on cultivation 23,302-23,306, 23,316.
- Moneylenders, are in many areas the only source of credit (426).
- \_\_\_\_\_, dishonest accounting by 23,436; prevention of 23,437-23,440.
- \_\_\_\_\_, interest charged by, *see* Interest.
- \_\_\_\_\_, large numbers of "amateur" 23,442.
- \_\_\_\_\_, need for more control of, by licensing and inspection (427), 23,310-23,351, 23,437-23,441.
- \_\_\_\_\_, numbers and capital of, increasing 23,431, 23,435.
- Mortgage and sale, right of, should not be limited (427).
- Non-terminable mortgages, should be prohibited (427).
- Primary education and social reforms, need for, to lighten burden of debt (426).
- Usurious Loans Act, provisions of, too vague (427), 23,307.
- \_\_\_\_\_, should be more rigorously enforced (427), 23,367-23,393.

## INDEX.

### PEDDIE, Mr. J.—*contd.*

#### AGRICULTURAL INDUSTRIES:

- Cultivators, have ample time for subsidiary industries (430).
- Factories, difficult to establish in rural areas owing to bad communications (431).
- Government, role of, in regard to subsidiary occupations (430)
- Industrial unions and sale and purchase societies, need for starting (431).
- Investigation of possibilities of rural industries, need for (431).
- Necessity for subsidiary industries, should be taught in schools (430).
- Non-official help, essential for subsidiary industries (430).
- Obstacles to subsidiary industries (430).
- Sericulture, average income from 23,339.
- , note on (*Appendix*) (435-442), 23,280-23,284, 23,310.
- , should be made whole-time occupation where possible 23,314, 23,345.

#### AGRICULTURAL LABOUR:

- Migration, confined to wandering tribes 23,337-23,395

#### ANIMAL HUSBANDRY:

- Cows, often too small for good bulls to be of use (430).
- Fodder, need for growing (430)
- , scarcity of (430).
- Pasture lands, lack of (429, 430).
- , overstocking of available (430).
- Silage, need for development of (430).

#### ATTRACTING CAPITAL.

- Men of capital and enterprise, methods of inducing, to invest money in agriculture (433).
- Moneylending, profits from, too large to attract capital to land improvement (433).
- Owners of land, need for educating (433).
- , take little interest in land improvement (433).

#### CO-OPERATION

- Agricultural co-operative inspectors, in close touch with Agricultural Department, need for, to form and supervise agricultural co-operative societies (432).
- Agricultural unions for financing co-operative societies, need for (431).
- Central Banks, often become dividend-earning machines (431).
- , should undertake seed supply work, &c. (431).
- Compulsion of obstinate minorities, need for (432).
- Co-operative movement, chiefly confined to credit societies (431)
- , lack of public demand for extension of (431).
- Credit societies, failure of, due to lack of supervision (431, 432).
- Development Department, need for, to co-ordinate work of agricultural, co-operative and industrial officers (432).
- Government, must lead the way in development of co-operative movement (431).
- Joint farming societies, not possible at present (432).
- Membership of co-operative societies limited to well-to-do cultivators (432).
- Provincial Agricultural Federation, need for, to accelerate spread of co-operation (432).
- Purchase and sale societies, scope for (432).

#### CROPS:

- Improvement of existing crops, suggestions for (429).
- , successful examples of (429).
- New crops, suggestions for (429).
- Seed distribution, cannot be done by Agricultural Department unaided (429).
- , co-operative (431).
- , non-official registered and supervised seed farms for, need for (429).

## INDEX.

### PEDDIE, Mr. J.—*contd.*

#### DEMONSTRATION AND PROPAGANDA :

- Agricultural Associations, need for, in each Union Board area (424), 23,283-23,297.
- Agricultural Department, difficulties due to lack of staff of (424), 23,292.
- Circle officers, agricultural training for 23,418.
- \_\_\_\_\_, should interest themselves in agricultural development (424), 23,415-23,417.
- Cultivators, necessity for getting into close touch with (425).
- \_\_\_\_\_, will adopt improvements showing financial return (425).
- Demonstration farms, must be run on economic basis, possibly with non-official help (423).
- \_\_\_\_\_, suspected by cultivators 23,291.
- Demonstrations on cultivators' own fields, difficulty of obtaining consent for 23,289, 23,290.
- District officers, agricultural propaganda by (424).
- Field demonstrations, value of (423, 424).
- Seed, policy of distributing improved, to large number of individuals in one area, success of (423, 424).

#### EDUCATION :

- Adult education, classes for, might be held in conjunction with Middle English schools (423).
- \_\_\_\_\_, requires non-official help (423).
- Child labour, demand for, interferes with education (432, 433).
- Compulsory education, proposed legislation for, in Bengal (423, 432).
- Fines for absence, deter parents from keeping children at school (433).
- Government service, the main inducement to study agriculture (423).
- Higher education, at present does nothing to raise agricultural efficiency (432).
- Middle-class youths, can be attracted to agriculture by proof that it will pay (423).
- School farms, advantages of, compared with plots (423), 23,285-23,337.
- \_\_\_\_\_, financing of (423).
- Teachers in rural areas, should be drawn where possible from agricultural classes (423).
- Teaching facilities, scope for extension of (423).

#### FINANCE :

- Agriculturists Loans Act, grants under, should be made to subserve propaganda programme of Agricultural Department (425), 23,419-23,423, 23,431-23,433.
- \_\_\_\_\_, practically a dead letter (425).
- Co-operative societies, the best means of financing cultivators (425).
- Taccavi, might be used to greater extent (425).

#### HOLDINGS :

- Compulsion of obstinate minorities, desirable (427).
- Co-operative consolidation, the only satisfactory method (427).
- Fragmentation, difficult to check 23,356.
- \_\_\_\_\_, disadvantages of, can be brought home to cultivators 23,357, 23,358.
- Holdings, size of average 23,355.
- Obstacles (sentimental and practical) to consolidation (427).

#### IRRIGATION :

- Fodder crops, cannot be grown without irrigation 23,331.
- Irrigation in Malda district, scope for (427, 428), 23,318-23,325, 23,328-23,330, 23,397-23,400, 23,404, 23,405.
- Obstacles to extension of irrigation (428).
- Tanks, have largely silted up (428).
- \_\_\_\_\_, re-excavation of, by co-operative effort (428).

## INDEX

### PEDDIE, Mr. J.—*contd.*

#### IRRIGATION—*contd.*

- Water rate in permanent settlement areas, Acts governing 23,410-23,414.  
 \_\_\_\_\_, method of charging 23,409.  
 \_\_\_\_\_, presents no difficulty 23,406-23,408.
- Wells in Malda district, would not afford sufficient water for irrigation 23,326, 23,327, 23,334, 23,385.

#### SOILS

- Denudation of forests, has led to soil erosion (429).

#### STATISTICS

- Agricultural statistics, bound to be inaccurate owing to low level of general education (434).
- Market prices of agricultural produce, should be displayed in villages (434).

#### WELFARE:

- Condition of agricultural classes, deteriorating 23,111-23,116, 23,401-23,403.
- Conservatism of cultivators, an obstacle to hygienic improvements (431).
- District Boards, should enforce by-laws for removal of insanitary conditions (433).
- \_\_\_\_\_, should take loans for improvement of rural water supply (433).
- Economic surveys of typical villages, very necessary (433).
- Malaria, caused by insanitary conditions (433).
- \_\_\_\_\_, effect of, on cultivators 23,333-23,337.
- Workers in rural areas, honorary, difficult to obtain 23,333.

RAY, Sir P. C., Kt., D.Sc. University College of Science and Technology, Calcutta (365-367), 22,673-22,690.

#### AGRICULTURAL INDENTURES:

- Impvidence of cultivators (366), 22,690, 22,691.
- Indebtedness of cultivators, is increasing 22,691-22,697.

#### AGRICULTURAL INDUSTRIES:

- Bengalis, are backward in matters of trade and industry 22,802, 22,803, 22,837-22,846, partly owing to permanent settlement 22,862.
- Cultivators in Bengal, have ample spare time for subsidiary occupations (366, 367), 22,693.
- Government help for subsidiary industries 22,921-22,928.
- Mat making 22,711-22,713.
- Rural industries, decay of, has increased pressure of population on soil (365, 366), 22,697-22,699, 22,697, 22,698.
- \_\_\_\_\_, due to importation of manufactured products (366), 22,804-22,806.
- Spinning and weaving, economics of 22,777-22,781, 22,794-22,801, 22,804, 22,805, 22,822-22,836, 22,902-22,916, 22,929, 22,930.
- \_\_\_\_\_, formerly the universal subsidiary occupation of India 22,787-22,793, 22,816-22,820.
- \_\_\_\_\_, generally undertaken by women 22,810-22,821.
- \_\_\_\_\_, most suitable subsidiary occupation for cultivators (367), 22,714, 22,764-22,769.
- \_\_\_\_\_, must go together 22,782-22,786, 22,931.
- \_\_\_\_\_, propaganda for, effect of 22,714-22,716, 22,770-22,776.

# INDEX.

RAY, Sir P. C.—*contd.*

## ANIMAL HUSBANDRY:

- Brahmini bull system 22,674-22,676.
- Bulls, distribution of, to local bodies 22,917-22,919.
- Cattle, improvement of, in England (365), 22,866-22,873.
- , need for, in Bengal (365).
- , poor quality of (366).
- Co-operative dairy farms, Government assistance for 22,920.
- Cows, do not receive the same attention as formerly (365).
- Fodder, need for growing of 22,874-22,878.
- , supply of, has decreased owing to pressure on land and jute cultivation (366), 22,679-22,681.
- Milk, condensed, used for children even in villages (366), 22,681-22,683.
- , harm done by lack of (365, 366), 22,694.
- , price of, to-day, compared with 55 years ago, 22,682, 22,685-22,687.
- , production of, decreased by underfeeding of cattle. 22,730.
- Pastures, decline of (366), 22,680.
- , difficulty of increasing, 22,890-22,892.
- , provision of land for, 22,846-22,849.
- , value of enclosed, 22,808-22,870, 22,877.

## CROPS:

- Seed, improved varieties of jute and paddy, growing demand for, 22,721, 22,725.

## EDUCATION.

- Compulsory primary education, financing of, 22,806-22,809.
- , necessary if agriculturists are to benefit by results of research (366), 22,932-22,931.
- Science courses at Indian Universities, high standard of, 22,910.

## FERTILISERS:

- Bone-meal, caste prejudice against, disappearing, 22,860.
- Superphosphates, manufacture of, in India, 22,762-22,767.

## RESEARCH:

- Indian students, their aptitude for research, 22,728, 22,729.

## WELFARE:

- Absentee landlords, problem of, due partly to permanent settlement, 22,861, 22,862.
- , more acute than formerly, 22,705-22,709, 22,899-22,901.
- Co-operative public health societies, possibilities of, 22,733-22,736.
- Diet of cultivators (365, 366), 22,694, 22,879-22,886.
- Drink evil, is spreading, 22,718, 22,719.
- Health of cultivators, effect of malnutrition on, 22,703, 22,704.
- , has deteriorated owing to spread of malaria, etc., 22,700-22,703.
- Migration to prosperous tracts, hindered by attachment of cultivators to their homes, 22,850-22,857.
- Pressure of population on land, has become enormous through decay of rural industries (365, 366), 22,697-22,699, 22,897, 22,898.
- Standard of living of cultivators, 22,688-22,693, 22,850, 22,851.
- Tobacco (cigarette) habit, spreading, 22,720-22,723.
- Tube wells for improvement of water supply, cost of, 22,745-22,748.
- , department for, at Bengal Chemical Works, 22,737, 22,738, 22,743, 22,741.
- , great demand for, 22,739-22,742, 22,750, 22,751.
- , scope for, 22,749.
- Villages, were formerly self-sufficient (365, 366).
- , should be self-sufficient (365, 366).
- Water supply, improvement of, by tube wells, see Tube wells.

# INDEX.

## RESEARCH:

- Advisory Council for co-ordination of research (*Hutchinson*) (297), 22,061-22,063.
- All-India Research Board, need for, to co-ordinate agricultural and veterinary research (*Mitra*) (127), 19,781-19,783.
- Central Government, role of, in research (*Finlow*) 17,604-17,608, 18,618-18,619.
- Central organisation for research, desirability of (*Finlow*) 17,606.
- \_\_\_\_\_, might initiate research, but would principally deal with provincial schemes (*Finlow*) 17,608.
- \_\_\_\_\_, must command provincial support (*Finlow*) 17,609-17,611.
- \_\_\_\_\_, must not have executive authority (*Finlow*) 17,612.
- \_\_\_\_\_, provincial representation on, essential (*Finlow*) 17,607.
- Conferences of research workers, need for revival of (*Indian Tea Association*) (386), 23,056.
- Co-ordination of research (*Finlow*) 17,614-17,618, 18,616, (*Hutchinson*) (297), (*Indian Tea Association*) (386).
- District Agricultural Officers, should carry out research (*Momen*) (319).
- Dry cultivation, research to assist (*Finlow*) 17,620-17,627, 17,640.
- Financing of research, by small export cess (*Mitra*) (127), 19,783-19,787.
- Fodder, need for research on (*Mullick*) (319).
- Honour graduates of Bengal Universities, promising in research (*Finlow*) 17,646-17,651, 18,164, 18,165.
- Indian research workers, training of, in India (*Finlow*) 17,646-17,652.
- \_\_\_\_\_, in Europe, after post-graduate course in India (*Finlow*) 17,654-17,658.
- \_\_\_\_\_, work of (*Finlow*) 17,653.
- Indian students, their aptitude for research (*May*) 22,728, 22,729.
- Indigenous methods of agriculture, need for studying (*Mitra*) (127).
- Indigo, research on, stopped owing to retrenchment (*Hutchinson*) 21,889-21,891.
- Irrigation research, need for special laboratory (*Hutchinson*) (301), 21,856, 21,982-21,992, 21,999-22,000.
- Jute, research on (*Finlow*) (2), 18,221, 18,227.
- Mineral experiments (*Finlow*) 18,245-18,248.
- Organisation of provincial research by crops (*Finlow*) 18,173.
- Organisation of research by crops, on lines of Indian Central Cotton Committee financing of (*Finlow*) 17,595-17,603.
- Organisation of research by crops, on lines of Indian Central Cotton Committee: might be applied to jute, pulses, oil-seeds, tobacco and paddy (*Finlow*) 17,590-17,593, 18,527.
- Organisation of research by crops, on lines of Indian Central Cotton Committee: value of (*Finlow*) (2), 17,588, 17,589.
- Organisation of research in Bengal (*Finlow*) 17,561-17,577, 18,174-18,179, 18,190-18,198, 18,393-18,399.
- Paddy, research on (*see under CROPS*).
- Personnel, Lee Commission, recommendations of, and failure to attract best class of Indians, have militated against progress of research (*Hutchinson*) (296), 21,974-21,981, 22,076-22,041.
- \_\_\_\_\_, provinces, handicapped by loss of experienced men (*Hutchinson*) (296); *see also* Lee Commission.
- Provinces, role of, in research (*Finlow*) (2), 17,612, 18,200-18,208, 18,613-18,619, (*Mitra*) (127, 128), (*Momen*) (319), (*Jute Mills Association*) (414).
- Pulses, research on (*Finlow*) 18,756-18,762.
- Pure, continuity of research at, lacking (*Hutchinson*) 21,931-21,935.
- \_\_\_\_\_, continuous policy at, importance of (*Hutchinson*), 21,825, 21,826.
- \_\_\_\_\_, educational work at, should be conducted by additional staff (*Hutchinson*) (297).
- \_\_\_\_\_, should not be allowed to interfere with research (*Hutchinson*) (296).

# INDEX.

## RESEARCH—contd.

- Pusa, examples of help given by, to Bengal (*Finlow*) 18,220, 18,221.
- , geographical position of, unsatisfactory (*Hutchinson*) (297), 21,832, 21,833, 21,864.
- , should be changed if funds become available (*Hutchinson*) (297), 21,885.
- , high standard of research work at (*Finlow*) 17,582-17,635.
- , inadequate for whole of India and requires enlarging (*Indian Tea Association*) (386).
- , is better equipped to provide instruction on research work on Indian problems than any foreign institution (*Hutchinson*) (296).
- , joint directorship system at, unsatisfactory (*Hutchinson*) (296).
- , post of Director of, should be separated from that of Agricultural Adviser (*Hutchinson*) (296), 21,821-21,825.
- , type of man required for (*Hutchinson*) 21,881-21,884, 21,886-21,888, 21,978-21,980.
- , prestige of, high (*Hutchinson*) 21,813, 21,814, 21,928, 21,929.
- , should afford such facilities for Indian research workers as will make it unnecessary for them to go abroad (*Hutchinson*) (296), 21,815-21,819.
- , should have whole-time Director (*Hutchinson*) (290), 21,820.
- , should maintain high standard of research for benefit of India as a whole (*Hutchinson*) (290).
- , should serve as nucleus for co-ordination of research (*Hutchinson*) (297).
- , vitally important that it should carry weight with Central Government (*Hutchinson*) (296).
- Pusa Council (*Hutchinson*) 21,886-21,888.
- Recording results of experiments, machinery for, capable of improvement (*Finlow*) 17,752-17,759.
- Research, necessary not only on crops but on the same crop in different districts (*Finlow*) 18,529-18,531.
- , staff for, in Bengal (*Finlow*) 17,564-17,569.
- Research workers, and teachers, attitude of mind of, different (*Hutchinson*) (297), 21,937, 21,938, 22,073-22,075.
- , Indian, training of, *see under EDUCATION*.
- , who give too much time to teaching, lose their value for research (*Hutchinson*) (296, 297), 21,827-21,831.
- Rotting, experiments on (*Finlow*) 18,236, 18,237.
- Scientific Department of Indian Tea Association, closer touch with Pusa desirable (*Indian Tea Association*) 22,953-22,958, 23,048.
- , no Government representation on (*Indian Tea Association*) 23,043, 23,044, 23,047, 23,048.
- , work of (*Appendix*) (*Indian Tea Association*) (391-395).
- Sericulture, research on (*Hutchinson*) 21,892-21,895.
- Statistical research on agriculture and allied subjects, need for (*Bentley*) (240), 21,147, 21,150.
- Subjects suggested for research (*Mifia*) (127), (*Indian Tea Association*) (386, 387).
- Tea research, at Government stations, possibility of (*Indian Tea Association*) 23,051.
- , need for central station for, with number of small district stations owing to differences in climate, soil, &c. (*Indian Tea Association*) 23,039, 23,042.
- Water requirements of crops, need for research on (*Mallik*) (349).

## INDEX.

ROY, Mr. S. N., Member of a Deputation of Representatives from Districts in Bengal 24,253-24,571

### ADMINISTRATION

- Circle officers, duties of 24,511-24,516.
- Circles, formed of four or five Unions 24,522, 24,523.
- , principal landholders in, do not meet to discuss topics of common interest 24,524, 24,525.
- Union Boards, could be made very effective rural organisations 24,450, 24,451.
- , income and area of 24,456-24,458, 24,519, 24,520.
- , largely run by their chairmen 24,449, 24,452, 24,510.
- , secretaries of, salary and duties of 24,453-24,455.

### AGRICULTURAL INTERESTS:

- Cultivators, are not selling their land in any numbers 24,567-24,568
- Landlords, discourage meetings of cultivators 24,525, 24,526.
- , rents charged by 24,527-24,533.
- , take little interest in village affairs 24,526.
- Moneylenders, interest charged by, rate of 24,301-24,304.
- , from ordinary cultivators, taken in paddy 24,318.
- , prefer to let interest accumulate to get compound rate and take possession of holding 24,318.

### AGRICULTURAL INDUSTRIES:

- Cultivators, have ample spare time for subsidiary industries 24,353-24,364

### ANIMAL HUSBANDRY:

- Breeding, not carried out in Burdwan district 24,549.
- Bullocks, number required for given holding 24,548.
- Cows, food given to 24,550-24,555.
- Fodder crops, can be grown on paddy land 24,343-24,346
- , need for water for 24,347.
- , opportunities of growing 24,342.
- Fodder shortage, lasts throughout the year 24,337-24,339
- Ghi, pure, difficult to obtain 24,350.
- Milk, scarcity of 24,348, 24,349.
- , supply of, deteriorating 24,351.
- Pasture land, has been usurped by zamindars 24,355-24,357.

### CO-OPERATION:

- Anti-malaria society in Burdwan district, success of 24,311-24,318.
- , works in conjunction with Union Board 24,315, 24,316
- Co-operative societies, interest charged by, as high as that of money-lenders 24,294-24,305, 24,500-24,508.
- , lend money to town-people 24,306-24,309.
- , propaganda for, lack of 24,311, 24,312.

### CROPS:

- Crops grown in Burdwan district and method of cultivation 24,264-24,270.
- Vegetables and fruit, growing of 24,470-24,477.

### DEMONSTRATION AND PROPAGANDA:

- Agricultural shows, value of 24,566.
- , at Dacca (q.v.).
- Cultivators in Burdwan district, are anxious to adopt improvements 24,284-24,288.
- , are not in touch with Agricultural Department 24,272, 24,282, 24,283, 24,436, 24,503-24,505.
- Dacca agricultural show, difficulty of obtaining information at 24,273-24,278, 24,500-24,502.

## INDEX.

### ROY, Mr. S. N.—*contd.*

#### DEMONSTRATION AND PROPAGANDA—*contd.*

- Demonstration farm at Burdwan, existence of, unknown in neighbourhood 24,279-24,281, 24,401-24,402, 24,421, 24,425, 24,432-24,435.  
 Demonstrations on cultivators' own holdings, the best method 24,289-24,292.  
 Newspaper published by Agricultural Department, would be valuable if cheap 24,565.  
 Propaganda by fertiliser industry, better than that of Agricultural Department 24,509.

#### EDUCATION:

- Cultivators, their opinion of education 24,367-24,370.  
 Middle English school at Panchana, teachers at, salaries of, 24,373-24,376; paid by local subscriptions and grant from District Board 24,382-24,391; have other sources of income 24,380, 24,381.  
 \_\_\_\_\_, unsatisfactory 24,365, 24,386, 24,371, 24,372.  
 Primary education, further taxation of, impossible to bear 24,563.  
 \_\_\_\_\_, need for extension of 24,562.

#### FERTILISERS:

- Artificial fertilisers, information on, supplied by fertiliser industry 24,438, 24,439.

#### HOLDINGS:

- Consolidation, will be helped by spread of education 24,394-24,396.  
 Co-operative cultivation, possibility of 24,392.  
 Fragmentation, prevalence of 24,319, 24,320, 24,355-24,391.  
 Subdivision, avoidance of, by system of valuation 24,321-24,327.  
 Zamindars, are opposed to consolidation 24,443-24,445.  
 \_\_\_\_\_, charge too high commutation fees 24,327-24,335.

#### IRRIGATION:

- Eden canal, supply of water from 24,492-24,494.  
 Irrigation, and malaria, connection between 24,255-24,263.  
 \_\_\_\_\_, in Panchana district, scope for 24,478, 24,479.  
 Irrigation Department, indifferent to interests of cultivators 24,495-24,498.  
 Tanks, co-operative re-excavation of 24,487-24,490.  
 \_\_\_\_\_, method of distributing water from 24,480.  
 \_\_\_\_\_, need for loans for re-excavation of 24,481.  
 Wells, not used for irrigation in Burdwan district 24,482-24,485, 24,490-24,492.

#### MARKETING:

- Cultivators, in Panchana district, are acquainted with market prices 24,400, 24,401.  
 \_\_\_\_\_, where communications are bad, do not get proper price for their produce 24,401-24,403.  
 Paddy, marketing of 24,397-24,399.

#### WELFARE:

- Diet of people, is slowly changing 24,474, 24,475.  
 Malaria, due to interference with drainage 24,255-24,257, 24,264, 24,266, 24,556-24,558.  
 \_\_\_\_\_, incidence of, is increasing 24,260-24,262.  
 \_\_\_\_\_, renders cultivators unfit for work 24,265, 24,259, 24,317.

SEEDS, *see under CROPS.*

SERICULTURE, *see under AGRICULTURAL INDUSTRIES.*

# INDEX.

**SHEBBEARE, Mr. E. O.**, Conservator of Forests (206, 207), 20,607-20,920.

## FODDER AND GRAZING.

- Fodder, famines of, not common in Bengal 20,633, 20,634.
- , necessity for storing 20,632.
- , possibility of increasing, by village forests (207).
- , preservation of, for sale to cultivators 20,635.
- , should be under Forest Department 20,636-20,639.
- Goats, do great damage in forests 20,903.
- Grass-cutting, allowed in all forests 20,623-20,625.
- Grasses, grown in forest areas 20,731.
- Grazing, forest, a cause of fires (206, 207), 20,648, 20,649.
- , allowed in some reserved forests 20,622-20,624, 20,879-20,881.
- , cannot be extended (206).
- , damage caused by excessive (206, 207), 20,648, 20,649.
- , many blocks open to, should be closed (206).
- , method of combatting, by stall-feeding (q.v.).
- , only affects villages in immediate neighbourhood 20,885-20,888.
- , should be discouraged 20,722.
- , in private forests 20,626.
- , result of cheap, in causing deterioration of cattle (206), 20,630-20,632.
- , use of bamboos for 20,739.
- Lopping of trees for fodder 20,882-20,885.
- Sheep-graziers, do not make use of forests 20,902-20,905.
- Stall-feeding, introduced by Forest Department to stop damage done by grazing (206), 20,731.
- , not practised in plains (207).

## FORESTS:

- Afforestation of hill-tops and headwaters, need for (207), 20,661-20,665.
- Agricultural education for junior Forest officers 20,611.
- Area under forest in Bengal 20,666-20,669, 20,636-20,642.
- Bamboos, use of, for grazing 20,739.
- , for paper-making 20,733-20,712.
- Charcoal, manufacture of, difficulties of 20,691-20,694.
- , need for investigating 20,774-20,777.
- , sale of 20,820, 20,821.
- Cinchona cultivation, is under a special department 20,718, 20,719.
- Classification of forests in Bengal 20,612, 20,613, 20,670-20,672.
- Communications in forest areas, have improved in recent years 20,728.
- , importance of 20,729.
- Co-operation of Agricultural and Forest Depts., close 20,609, 20,610, 20,735-20,737.
- Cultivators, giving of trees to, for plantation 20,815-20,817, 20,897-20,901.
- , privileges of, in reserved forests 20,692-20,707.
- Denudation of forests, caused by excessive grazing (207), 20,658, 20,659.
- , has led to floods and soil erosion (207), 20,655-20,660, 20,730-20,732.
- , process of, still continuing (207).
- , to provide space for tea cultivation, not now practised 20,891, 20,892.
- Fires, the inevitable result of forest grazing (206, 207), 20,648, 20,649.
- Firewood, from forests, cost of, compared with coal 20,687-20,690.
- , cost of transport of 20,681, 20,684-20,686, 20,756, 20,757.
- , demand for 20,680.
- , provision of, method for 20,673-20,679, 20,778, 20,779.
- , regarded from commercial rather than agricultural angle 20,695-20,697.
- , provision of, by village forests, ~~see~~ Village forests.

# INDEX.

## SHEBBEARE, Mr. E. O.—*contd.*

### Forests—*contd.*

- Floods, caused by denudation of forests (207), 20,780-20,782.
- Forest Department, revenue and expenditure of, 20,766-20,773
- \_\_\_\_\_ , compared with Bombay 20,780-20,784, 20,835
- \_\_\_\_\_ , revenue of, could be increased by increased expenditure 20,787-20,789.
- Grasses, use of, for paper making 20,744-20,755.
- Labour, great shortage of, for forest work 20,694, 20,725-20,727, 20,809, 20,810.
- \_\_\_\_\_ , wages paid to 20,807, 20,808
- Land cultivation 20,724, 20,724.
- Leaf mould, little demand for 20,812.
- Match factories 20,802-20,805.
- Paper making from bamboo and grasses 20,732-20,755
- Private forests, extensive 20,620, 20,621.
- \_\_\_\_\_ , hiring out of grazing in 20,626.
- \_\_\_\_\_ , responsibility of Forest Department in regard to 20,627-20,629.
- Railway requirements for timber, meeting of 20,712-20,715, 20,791-20,801, 20,803, 20,806a, 20,834.
- Soil erosion, caused by denudation of forests (207), 20,655-20,660.
- Tamra system, efforts being made to increase (208), 20,670.
- \_\_\_\_\_ , particulars of (208), 20,641-20,647, 20,843-20,851, 20,862-20,867, 20,912-20,915.
- Terracing 20,829-20,833.
- Trees grown in forests 20,709-20,719, 20,790, 20,822-20,825, 20,875-20,877, 20,862-20,871, 20,895-20,899.
- Unclassed forests, control of 20,615, 20,616.
- Village forests, control of, by panchayats 20,619, 20,872-20,881.
- \_\_\_\_\_ , experiments with, at Bankura (207), 20,960, 20,872.
- \_\_\_\_\_ , 20,876.
- \_\_\_\_\_ , for providing firewood and fodder (207).
- \_\_\_\_\_ , possibilities of (207), 20,650-20,654.
- \_\_\_\_\_ , special section for, need of 20,652.
- Waterways in the Sunderbunds 20,782-20,786.

## SIME, see INDIAN JUTE MILLS ASSOCIATION.

## SIMPSON, see INDIAN JUTE MILLS ASSOCIATION.

### SOILS.

- Barind land, has deteriorated for want of manure (Ahmed M.) (558).
- Deltaic land in Lower Bengal, problems caused by (Finlow) (7, 8), 17,873.
- \_\_\_\_\_ , suggestions for improving (Finlow) (7), 17,874-17,877.
- Denudation of forests, has led to soil erosion (Finlow) (8, 13), (Poddie) (429).
- Drainage, in Burdwan division, special features of and suggestions for improving (Mitra) (131).
- \_\_\_\_\_ , and bunds, for reclamation of land (Bentley) (210).
- Embankments to prevent ingress of salt water, investigation of, needed (Mitra) (131).
- \_\_\_\_\_ , co-operative societies for (Mitra) (131).
- \_\_\_\_\_ , need for (Mitra) (130, 131).
- \_\_\_\_\_ , obstacles to construction of (Mitra) (130, 131), 19,442-19,445.
- Floods, prevention of (Momen) (325).
- Iron ploughs, use of, adds to fertility of soil (Finlow) (10).
- Jungles, need for reclamation of land covered by (Ahmed M.) (558)
- Jute land, large proportion of, is covered with silt and does not require fertilizing (Morgan) 21,470, 21,480, 21,619-21,654

## INDEX.

### SOILS—*contd.*

- Jute land, is not deteriorating (*Morgan*) 21,615-21,617.  
 Land improvement schemes, demand for (*Burrows*) (472).  
 Major and minor works, need for allocation in definition of (*Burrows*) (473).  
 Minor works, procedure for, should be simplified (*Burrows*) (473).  
 \_\_\_\_\_, value of, for improvement of agriculture (*Burrows*) (473).  
 Productivity of land, has declined (*Momen*) 22,362-22,364.  
 Red soils, characteristics of (*Finlow*) 17,879, 17,881.  
 Silt-bearing water, control of (*Finlow*) 17,874-17,877.  
 Silt soils, characteristics of (*Finlow*) 17,879, 17,881.  
 Soil analyses, necessity for (*Morgan*) 21,669.  
 Soil bacteriology, expert on, should be appointed in each Province (*Hutchinson*) (290), 22,064-22,068.  
 \_\_\_\_\_, need for research on (*Hutchinson*) (290), (*Indian Tea Association*) (337).  
 Soil erosion, denudation of forests as cause of (*Finlow*) (8, 13), (*Peddie*) (429).  
 \_\_\_\_\_, may be prevented by afforestation (*Mitra*) (131),  
 \_\_\_\_\_, (*Finlow*) (8, 13).  
 Soil fertility, improved cultivation as method of enhancing (*Hutchinson*) (297), 22,001-22,011.  
 \_\_\_\_\_, intensive cultivation of cereals (improved implements and crops) leads to loss of, which must be made good (*Hutchinson*) (293, 299), 21,846, 21,817, 22,018-22,054.  
 \_\_\_\_\_, research on, can be undertaken in any part of India (*Hutchinson*) (297).  
 \_\_\_\_\_, result of intensive cultivation on, recognised by cultivators (*Hutchinson*) (293), 21,846.  
 Soil surveys, need for (*Finlow*) 17,867-17,872, 18,551, 18,555, (*Mitra*) (128), (*Ahmed U.*) (535).  
 Waterlogging, affects one-tenth area of Presidency (*Das*) 18,942.  
 \_\_\_\_\_, damage done by (*Finlow*) 17,857-17,861, (*Momen*) (325), (*Ahmed U.*) (534).  
 \_\_\_\_\_, definition of (*Das*) 18,953-18,955.  
 \_\_\_\_\_, drainage, permits land to recover (*Das*) 18,941, 18,956-18,958.  
 \_\_\_\_\_, not required for more than half area, remainder draining itself when rivers go down (*Das*) 18,942.  
 \_\_\_\_\_, due to rainfall (*Das*) 18,956.  
 \_\_\_\_\_, has thrown large areas out of cultivation (*Das*) 18,940.  
 \_\_\_\_\_, investigation of (*Das*) 18,935-18,939.  
 \_\_\_\_\_, pumping of water back into canals, impossible (*Das*) 18,959-18,961.  
 \_\_\_\_\_, reclamation of land affected by, should be undertaken by Government (*Momen*) (325).

### SOUTAR, *see* INDIAN JUTE MILLS ASSOCIATION.

### STATISTICS.

- Agricultural statistics in Bengal, found to be inaccurate owing to low level of general education (*Peddie*) (431).  
 \_\_\_\_\_, discrepancies between (*Finlow*) 18,562-18,574, 18,747-18,749.  
 \_\_\_\_\_, inaccurate but valuable (*Bentley*) 21,317, 21,318.  
 Agricultural surveys (*Finlow*) 18,202.  
 Bowse, Mr., his work on statistics (*Bentley*) (247), 21,315, 21,316.  
 Cadastral survey, necessary to secure accurate agricultural statistics (*Morgan*) (274), 21,623-21,625.  
 Crop forecasts and returns, *see* under MARKETING.  
 Danger of relying on present statistics, owing to frequent changes in methods of collecting and estimating (*Bentley*) (247).  
 Graphic form for statistics, value of (*Bentley*) 21,491.

# INDEX.

## WEST, Mr. M.—*contd.*

### EDUCATION—*contd.*

- Central schools, scheme for (511), 23,961, 23,962  
 \_\_\_\_\_, should be centres of village life (511), 24,010-24,012.  
 \_\_\_\_\_, should be used by Agricultural and Co-operative Departments as centres for their work (511), 24,013, 24,014.
- Child labour, demand for, interferes with education (511).  
 \_\_\_\_\_, may be met by continuation and part-time classes (511), 24,041, 24,042.
- Compulsory education, adoption of, by local bodies 23,978.  
 \_\_\_\_\_, cannot be introduced till present school system is altered 23,979, 23,980.  
 \_\_\_\_\_, cheaper per child and more effective than voluntary system 24,043-24,047.  
 \_\_\_\_\_, contracting-in system by parents for 23,968-23,971.  
 \_\_\_\_\_, effect of, on teachers 23,979.  
 \_\_\_\_\_, need for (511).
- Dacca Training College, course at, 23,991, 24,071-24,073, 24,120-24,126.  
 \_\_\_\_\_, pupils at, 23,972, 23,999.  
 \_\_\_\_\_, numbers of, 24,118, 24,119.  
 \_\_\_\_\_, instruction of, in improved educational methods 23,995, 23,996.  
 \_\_\_\_\_, in work of Agricultural and other Departments 24,074.  
 \_\_\_\_\_, visit Dacca farm 24,032.  
 \_\_\_\_\_, relations of, with University 24,115-24,117.  
 \_\_\_\_\_, teaching of agriculture at 23,997, 23,998, 24,000-24,006.
- East Bengal, conditions in, differ from those in West Bengal 24,097, 24,098.
- English educational methods, not necessarily successful in India 23,966.
- Female education, importance of, from point of view of literacy of children 23,967.
- Grants-in-aid, harmful effects of system of (510), 23,976, 23,977, 24,037-24,040, 24,066-24,070.
- Hygiene in schools, teaching of 24,102-24,108.
- Illiteracy, causes of relapse into (512, 513), 24,017.  
 \_\_\_\_\_, inefficiency of teachers as cause of 24,053-24,058.  
 \_\_\_\_\_, number of children leaving school without learning to read (513).  
 \_\_\_\_\_, vicious circle of (512), 23,965.
- Inspectors, lack training in problems of primary education (510), 24,035, 24,130.  
 \_\_\_\_\_, qualifications of candidates for 24,079-24,082.  
 \_\_\_\_\_, taking certain percentage of agricultural graduates for, undesirable 24,083-24,095.
- Intermediate colleges 24,127, 24,128.
- Libraries, value of 23,981, 23,982.
- Nature study, teaching of (511).
- Poverty as a cause of illiteracy (511, 512).
- Primary Education Bill, provision of funds under 24,148-24,152.
- Primary schools, experiments in, needed in small areas to determine best system for 23,959, 23,960.  
 \_\_\_\_\_, grants-in-aid system for, unsatisfactory, see, Grants-in-aid.  
 \_\_\_\_\_, higher classes of, should be grouped in central schools (511), see also Central schools.  
 \_\_\_\_\_, pupils at, majority leave before reaching top classes (510, 511), 24,153-24,155.  
 \_\_\_\_\_, superfluous, method of closing 24,145-24,147.

# INDEX.

WEST, Mr. M.—*contd.*

## EDUCATION—*contd.*

- Primary schools, system of, present, causes of unsatisfactory nature of (510), 24,007, 24,008, 24,033-21,036.
- , will never produce literacy (511).
- , teachers in, salaries of, too small without other sources of income 23,976.
- , training of 23,973, 23,974.
- , teaching of specific subjects at, hindered by smallness of schools and fact that pupils leave early (510).
- Reading, ability of students, very limited (512), 24,142, 24,143.
- , method of teaching, in primary schools (513), 23,931-23,984.
- , suggestions for improving 23,931.
- Rural economics, should be taught in Normal Schools 24,076-24,078.
- Teachers, for central schools, *see* Central schools.
- , for primary schools, *see* Primary schools.
- , inefficiency of, as cause of illiteracy 24,053-24,058.
- , should be drawn where possible from agricultural classes, but energy and initiative more important 24,062, 24,063.
- , trained at Guru training schools, agricultural bias for (511).
- Textbooks, method of production and selection of 23,985-23,993, 24,100, 24,101, 24,111-24,114.

## WELFARE.\*

- Absentee landlords, problem of, due partly to permanent settlement (*Ray*) 22,801, 22,862.
- , more acute than formerly (*Ray*) 22,705-22,709, 22,899-22,901.
- Board of Economic Inquiry, would be valuable in Bengal (*Finlow*) (14), 18,310, 18,311.
- Condition of agricultural classes, deteriorating (*Peddle*) 23,111-23,116, 23,401-23,403.
- Conservatism of cultivators, an obstacle to hygienic improvements (*Peddle*) (431).
- Co-operative public health societies, possibilities of (*Ray*) 22,733-22,736.
- , *see also* under CHATTERJEE, R. B.
- Diet, need for research on (*Mitra*) (123).
- , of cultivators (*Ray*) (365, 366), 22,681, 22,879-22,886, (*Roy*) 24,474, 24,475.
- District Boards, should enforce by-laws for removal of insanitary conditions (*Peddle*) (433).
- , should take loans for improvement of rural water supply (*Peddle*) (433).
- Drink evil, is spreading (*Ray*) 22,718, 22,719.
- Drinking water, *see* under Water supply.
- Economic surveys of villages, conducting of (*Mitra*) (136).
- , elaborate, unnecessary (*Momen*) (323).
- , in Faridpur district, by Major Jack (*Burrows*) 23,826-23,828.
- , in Jessore (*Momen*) (328-330), 22,242-22,247.
- , in Talma (*Burrows*) (*Appendix*) (487-493), 23,702, 23,703, 23,763-23,765.
- , money spent on, would be better used for agricultural improvement (*Finlow*) 18,674, 18,675.
- , should be carried out by Government (*Ahmed U.*) (500).
- , value of (*Finlow*) 18,750-18,755, (*Mitra*) (136), (*Morgan*) 21,518, (*Peddle*) (433), (*Burrows*) (478), 23,709-23,711, (*Ahmed U.*) (537).

\* *See also* under BENTLEY.—D.F.

# INDEX.

## WELFARE—*contd.*

- Education, a pre-requisite of economic and sanitary improvement (*Momen*) (327).
- Government, should take the initiative in promoting sanitary measures in rural areas (*Ahmed U*) (537).
- Hookworm, satisfactory results of campaign against in tea gardens (*Indian Tea Association*) 22,993, 22,995-23,000.
- Labour in tea gardens, conservatism of with regard to hygiene an obstacle (*Indian Tea Association*) 22,991, 22,992, 23,001, 23,002.
- , medical attention for (*Indian Tea Association*) 23,003-23,005.
- Malaria, caused by insanitary conditions (*Peddle*) (433).
- , due to interference with drainage (*Roy*) 24,255-24,257, 24,263, 24,266, 24,556-24,558.
- , effect of, on cultivators (*Mukherjee*) (180), (*Peddle*) 23,333-23,337, (*Roy*) 22,700-22,703, (*Roy*) 24,253, 24,259, 24,347.
- , incidence of, is increasing (*Roy*) 24,260-24,262.
- , not necessarily associated with jute cultivation (*Morgan*) 21,785-21,790.
- , *see also* under CHATTERJEE, R. B.
- Malaria surveys conducted by Indian Tea Association (*Indian Tea Association*) 22,993, 22,994.
- Malnutrition, effect of, on health of cultivators (*Roy*) 22,703, 22,704.
- Medical facilities, need for increased (*Finlow*) (14), (*Mukherjee*) (181).
- Pressure of population on land, has become enormous through decay of rural industries (*Roy*) (365, 366), 22,697, 22,699, 22,697, 22,698.
- Sanitary Commissioner's Department, should be brought in closer touch with rural population (*Indian Tea Association*) (399).
- Sanitary conditions, in rural areas, improvement of (*Finlow*) (11), (*Mukherjee*) (181), 20,209-20,211.
- , in up-country towns, good (*Morgan*) 21,530-21,532.
- Settlement Reports, value of (*Momen*) (319).
- Standard of living of cultivators (*Roy*) 22,658-22,693, 22,850, 22,851, (*Burrows*) (475), 23,692.
- Tube wells for improvement of water supply, cost of (*Roy*) 22,745-22,749.
- , department for, at Bengal Chemical Works (*Roy*) 22,737, 22,738, 22,744.
- , great demand for (*Roy*) 22,739-22,742, 22,750, 22,751.
- , scope for (*Roy*) 22,740.
- Villages, were formerly self-sufficient (*Roy*) (365, 366).
- , should be self-sufficient (*Roy*) 22,758-22,762.
- Water supply, at present obtained from tanks and wells (*Mukherjee*) 20,193, 20,194.
- , attention paid to, on tea estates (*Indian Tea Association*) 23,133, 23,134.
- , importance of pure (*Finlow*) (14), (*Mitra*) (136), (*Mukherjee*) (181).
- , improvement of, by tube wells, *see* Tube wells.
- , precautions taken to ensure purity (*Mukherjee*) 20,195-20,206.
- , tanks for (*Morgan*) 21,517, 21,518.
- Workers in rural areas, honorary, difficult to obtain (*Peddle*) 23,393.

# GLOSSARY

Abwab ..	.. Illegal addition to rent demanded by a superior from an inferior holder of land.
Adhi ..	.. Half produce rent (the share of the produce of landlord and tenant is half and half).
Adhidar ..	.. One who cultivates on a yearly agreement giving half the crop to his landlord.
Ails ..	.. Boundaries of fields.
Aman (paddy)	.. Main rice crop ripening in December.
Amlas ..	.. Clerks (especially zamindar's clerks).
Aratdar ..	.. Seller of commodities on behalf of the growers and of middlemen with godowns for hire for storage of goods.
Arath (arat)	.. Godown; place where goods are stored and sold.
Aus (paddy)	.. Variety of rice crop ripening in September.
Babu ..	.. An educated man.
Barga (see Adhi)	
Barind ..	.. A tract of high land extending through certain districts in the north of Bengal.
Benami ..	.. Transaction in the name of another.
Bepari ..	.. Dealer or commission agent (according as to whether he buys with his own or with borrowed money from an <i>aratdar</i> or financier.— <i>Mahajan</i> , <i>Marwari</i> , etc.)
Bersati or Bursati	.. Disease of horses. Name given to a particular diseased condition of the skin and subcutaneous tissues of Equines. It gives rise to the formation of fibrous tumours and ulceration of the overlying skin.
Bhadra ..	.. 5th Bengali month (August-September).
Bhadralog	.. Gentlemen.
Bhil (Bil)	.. Depression more or less permanently covered with water.
Bigha ..	.. One-third of one acre.
Birti ..	.. (1) A small percentage of sale money contributed to a religious fund generally (say one or half a pice in the rupee). (2) A rent free grant (in origin for religious purposes, usually permanent and transferable, despite the purpose to which it may be put).
Boro (paddy)	.. A variety of rice transplanted in January from nurseries and harvested in March. Grown in marshy land.
Bund ..	.. Embankment or dam; also the water reservoir created by the dam.
Char lands	.. Lands recently thrown up by river or sea.
Charka ..	.. Indigenous spinning wheel.
Chowkidar	.. Village watchman.
Chowkidari rates	.. Tax levied on villages to defray the cost of the maintenance of village watchman.
Chowkidari Union	.. A local board consisting of representatives of a group of villages in a particular area formed under the Bengal Chowkidari Act.
Chowkidari year	.. Equivalent to a Bengali year (beginning from mid-April).
Dadans ..	.. Advances (to cultivators from brokers against standing crops).
Dafadar ..	.. Supervisor of Chowkidars.
Dai ..	.. Midwife.
Dal ..	.. A generic term for food pulses.
Dalal ..	.. Broker.
Damdopat	.. An ancient Hindu provision by which the total interest on a loan may not exceed the amount of the principal.
Danga ..	.. High arable land.
Darpatndar	.. Holder of land from the <i>Patnidar</i> (q. vi)
Deshi ..	.. Native to the country; indigenous.
Dhulta ..	.. Dryage allowance.
Niara ..	.. Alluvial formations.
Doctorkhana	.. Dispensary.

# GLOSSARY

Dofasi lands	.. Twice cropped lands.
Done ..	.. A pan used for lifting water from a tank or river. (It is common in West Bengal.)
Dudhar (paddy)	.. A variety of fine rice.
Faria ..	.. A small dealer.
Ganja ..	.. Preparation of hemp and an intoxicating drug.
Gowalas or Goalas	.. Milkmen
Gul ..	.. Unrefined Indian sugar.
Guru ..	.. A teacher, especially a religious teacher.
Hakim ..	.. A practitioner of the Unani system of medicine (Vaid). Also landlord or Magistrate or Judge
Halot ..	.. Patch (village highway broader than a path) (East Bengal).
Hat ..	.. Market (held on fixed days in a week).
Hundi ..	.. A promissory note.
Indrakail	.. A variety of paddy.
Izardar ..	.. Holder of a farming lease.
Jamiat land	.. Land appertaining to a tenancy. Generally used of rent paying as distinct from produce paying tenancies.
Jacol (Jhil)	.. A lake.
Jhuming	.. Temporary cultivation in jungle clearings.
Jotdars ..	.. Tenants, cultivators, etc.
Juar ..	.. The large millet. ( <i>Sorghum vulgare</i> )
Kaku bombai	.. A variety of jute.
Kala azar	.. A kind of persistent and malignant fever (Leishman—Donovan infection)—(not black water fever)
Kalai ..	.. A variety of pulse (dal).
Kamat ..	.. Proprietor's private land—also called khamar or nij-jote.
Katarkara (aus)	.. A variety of rice.
Khadkar	.. Home-made cloth.
Khal ..	.. A water channel or stream, sometimes an artificial water course.
Khana ..	.. Place, only used in combination, e.g., dastarkhana—place of office
Kharif ..	.. Summer sown (crops).
Khasmahals	.. Estates owned and managed direct by Government.
Khesari ..	.. A variety of pulse (dal) ( <i>Lathyrus sativus</i> .)
Kist ..	.. Instalment of rent or revenue.
Koyal ..	.. Weighman
Kutcha (Kachha)	.. Literally "not solid" and thus an equivalent of "poor quality." (Opposite Purca)
Kyahi ..	.. Marwari. (A class of merchants and traders coming from Marwar.)
Lakiraj (land)	.. Lands held revenue free (used loosely also for rent-free land).
Mabajan	.. A moneylender.
Maktab schools	.. Mahomedan primary schools for teaching the Koran.
Marwari ..	.. A class of merchants and traders coming from Marwar.
Mashkahi	.. A black variety of pulse (dal)
Misra ..	.. A fair.
Mistri ..	.. A mechanic.
Mutti Labari	.. Staff allowance.
Nagar ..	.. A prefix to a superior person, generally a zamindar, on a ceremonial occasion or for permission to transfer lands, effect improvements thereon, etc., etc.
Nakar ..	.. A wholesaler or dealer.
Pan ..	.. Betel leaf
Paschimwallas	.. Upcountry men.
